CHAMBERS'S ENCYCLOPÆDIA

A DICTIONARY OF UNIVERSAL KNOWLEDGE

NEW EDITION

Edited by

DAVID PATRICK, M.A., LL.D.

AND

WILLIAM GEDDIE, M.A., B.Sc.

VOLUME IX

SACRAMENT TO TEIGNMOUTH

W. & R. CHAMBERS, LIMITED

LONDON and EDINBURGH

J. B. LIPPINCOTT COMPANY, PHILADELPHIA

1927

All Rights Reserved

Printed in Great Britain.
W. & R. CHAMBERS, LTD., LONDON and EDINBURGH.

LIST OF MAPS IN VOLUME IX.

SCOTLAND facing page	184
KINGDOM OF THE SERBS, CROATS, AND SLOVENES	" "	257
SOUTH AFRICA	" "	529
CAPE OF GOOD HOPE	" "	536
SOUTH AUSTRALIA AND TASMANIA	" "	544
SPAIN	" "	552
NORWAY AND SWEDEN	" "	808
SWITZERLAND	" "	817
SPECTRA, TABLE OF	" "	569

Among the more important articles in this Volume are the following:

SACRIFICE.....	Rev. Professor H. T. ANDREWS, D.D.	SKIN; SKULL.....	Professor DAVID HEPBURN.
SADDUCKES.....	HERBERT LOWE.	SLAUGHTER-HOUSES.....	LOUDON MACQUEEN DOUGLAS.
SAFETY-LAMP.....	Professor HENRY BRIGGS.	SMITH, ADAM.....	JOHN HILL BURTON.
ST ANDREWS.....	Dr HAY FLEMING.	SNAKES; SPIDERS.....	Professor J. ARTHUR THOMSON.
SAINT-BEUVE.....	Professor P. HUME BROWN.	SNOW.....	R. T. OMOND; R. CORLESS.
SALISBURY.....	Alderman C. HASKINS.	SOCIALISM.....	E. R. PHASE.
SALMON.....	W. L. CALDERWOOD.	SOCIOLOGY.....	VICTOR V. BRANFORD.
SALVAGE (Law).....	Sheriff J. M. IRVINE, LL.D.	SOCRATES; SOPHISTS.....	Professor D. G. RITCHIE.
SALVAGE (Methods).....	ARCHIBALD P. MACFARLANE.	SOILS.....	Professor J. A. S. WATSON.
SALVATION ARMY.....	THEODORE KITCHING; SAMUEL TUCKER.	SONNET.....	THEODORE WATTS-DUNTON.
SAMARIA.....	Dr A. COWLEY.	SOPHOCLES.....	Professor LEWIS CAMPBELL.
SANCHUNIATHON.....	HERBERT LOWE.	SOUND.....	Dr KNOTT.
SAND, GEORGE.....	Professor GEORGE SAINTSBURY.	SOUTH AFRICA.....	J. LIDDELL GEDDIE.
SANSKRIT.....	Professor ECKLING; Professor KEITH.	SOUTH AUSTRALIA.....	A. W. JOSE.
SARDINIA.....	Dr T. ASHEY.	SOUTHEY.....	F. HINDS GHOOHE.
SATELLITES.....	Sir FRANK DYSON.	SPECTACLES.....	THOMAS HADDOW.
SCHILLER.....	J. T. BRALEY.	SPECTRUM.....	Dr KNOTT; Dr DANIELL.
SCHLEIERMACHER.....	Professor PELKIDERR.	SPINAL CORD.....	Dr ALEXANDER BRUCE; Dr A. NINIAN BRUCE.
SCHOLASTICISM.....	Professor P. HUME BROWN.	SPINNING.....	Professor ROBERTS BEAUMONT.
SCHOPENHAUER.....	Professor WILLIAM CALDWELL.	SPINOZA.....	EMANUEL DEUTSCH.
SCHUBERT.....	HENRY WHITEHEAD.	SPIRITUALISM.....	Dr ALFRED RUSSELL WALLACE.
SCHUMANN.....	Professor FRANKLIN PETERSON.	SPITSBERGEN.....	Dr R. N. RUDKOE BROWN.
SCIENCE.....	Professor PATRICK GEDDES.	SPOKE.....	GEORGE WEST.
SCOTT, SIR WALTER.....	ANDREW LANG.	STAEL, MME. DE.....	THOMAS DAVIDSON.
SCOTT, WINFIELD.....	Professor J. P. LAMBERTON.	STARS; SUN.....	Sir FRANK DYSON.
SCOTTISH PHILOSOPHY.....	Professor PRINGLE-PATTISON.	STATUTES.....	Sir PETER BENSON MAXWELL.
SCULPTURE.....	CHARLES WHIBLEY.	STEAM; STEAM-ENGINE; STEAM-TURBINE.....	Sir THOMAS HUDSON BEARE.
SEA; SOUNDING.....	Sir JOHN MURRAY; Professor J. JOHNSTONE.	STERE, SIR R.....	AUSTIN DOBSON.
SEAWEEDS.....	Professor R. J. HARVEY GIBSON.	STEREOTYPING.....	C. T. JACOMI.
SECRET SOCIETIES.....	NORTHCOTE W. THOMAS.	STIPEND.....	Sheriff J. M. IRVINE, LL.D.
SECULARISM.....	J. G. HOLYOAKE.	STOCK-EXCHANGE.....	R. MABSON.
SEMITES.....	Dr STANLEY A. COOK.	STOMACH.....	Dr JOHN D. COMRIE.
SENSATION.....	Dr A. NINIAN BRUCE.	STONE AGE.....	Professor R. A. S. MACALISTER.
SKPTUAGINT.....	Rev. Professor H. T. ANDREWS, D.D.	STORMS.....	Lieut.-Colonel E. GOLD.
SERVITUDE.....	Sheriff J. M. IRVINE, LL.D.	STRATEGY.....	Captain H. M. JOHNSTONE.
SEVIGNÉ.....	THOMAS DAVIDSON.	STRATFORD-UPON-AVON.....	CHARLES NOWELL.
SEWARD.....	Professor HAMILTON KIRK.	SUN-CULT.....	W. J. PERRY.
SEWERAGE.....	Sir T. HUDSON BEARE.	SURGERY.....	Dr JOHN D. COMRIE.
SEX.....	Professor J. ARTHUR THOMSON.	SUSSEX.....	H. DAVEY.
SHAKESPEARE.....	G. B. HARRISON.	SWANSEA.....	W. H. JONES.
SHALE; SIOILLARIA.....	Dr ROBERT CAMPBELL.	SWKATING SYSTEM.....	Dr D. F. SCHLOSS.
SHEFFIELD.....	CHARLES DRURY.	SWIFT.....	Dr STANLEY LANE POOLE.
SHELL; SHOT.....	Colonel Sir HILARIO BARLOW, Bt.	SWIMMING.....	F. I. WATSON.
SHELLEY.....	Professor DOWDEN.	SYDNEY.....	A. W. JOSE.
SHERIDAN, P. H.; SHER- MAN.....	General GRANT WILSON.	SYMBIOSIS.....	Professor J. ARTHUR THOMSON.
SHERIDAN, R. B.....	Mrs OLIPHANT.	SYRIA.....	Dr E. W. G. MASTERMAN.
SHIPBUILDING.....	J. R. BARNETT.	T.....	Dr HENRY BRADLEY.
SHILLY.....	Dr T. ASHEY.	TABU; TATU.....	NORTHCOTE W. THOMAS.
SIDNEY, SIR PHILIP.....	F. T. PALGRAVE.	TACITUS.....	Dr J. P. STEELE.
SIEGE.....	Captain H. M. JOHNSTONE.	TACTICS (MILITARY).....	Captain JOHNSTONE.
SIGNALLING.....	J. BOLAM.	TACTICS (NAVAL).....	Admiral Sir REGINALD TUPPER.
SILK.....	Sir THOMAS WARDLE; Professor ROBERTS BEAUMONT.	TALMUD; TARGUM.....	EMANUEL DEUTSCH.
SILK (ARTIFICIAL).....	A. B. STEVEN.	TASMANIA.....	A. W. JOSE.
SILURIAN SYSTEM.....	Professor JAMES GRIEKE.	TECHNICAL EDUCATION.....	Dr H. F. STOCKDALE.
SILVER.....	Professor HENRY BRIGGS.	TENTH.....	J. GIRDWOOD.
SIMONY.....	Sheriff JOHN CHISHOLM.	TAI-PINGS.....	Professor LEOGE.
SINAL.....	Dr E. W. G. MASTERMAN.	TALLEYRAND.....	Dr WILLIAM WALLACE.
SIRIUS.....	Sir FRANK DYSON.	TAMERLANE; TATARS.....	Professor E. H. PARKER.
SIVA.....	Professor A. BERRIEDALE KEITH.	TASSO.....	Signora CANTAGALLI.
		TASTE.....	Professor HAYCRAFT; Dr A. NINIAN BRUCE.
		TAYLOR, JEREMY.....	THOMAS DAVIDSON.

A great many of the articles named above are new; others written for earlier issues of this Encyclopedia have been so thoroughly revised by their authors as to be virtually new. In addition to these many other revisers have taken part, including Professor J. A. S. WATSON (Agriculture), Professor DAVID HEPBURN (Anatomy), Dr DRINKWATER (Chemistry), Dr R. CAMPBELL (Geology), Miss M. A. MURRAY (Egypt), Mr G. E. SHEPHERD (India), Dr THOMAS ASHBY (Italy), Mr W. A. FLEMING, Advocate, and Mr NORMAN MACDONALD, Advocate (Law), Professor RALPH STOCKMAN (Materia Medica), Dr J. D. COMRIE (Medicine), Admiral Sir REGINALD TUPPER (Navy), Dr ALFRED DANIELL (Physics), Professor A. BERRIEDALE KEITH (Sanskrit Subjects), Dr S. A. COOK and Mr HERBERT LOWE (Semitic Subjects), and Professor J. ARTHUR THOMSON (Zoology). Thanks are due to many town-clerks and others for information and corrections.

CHAMBERS'S ENCYCLOPÆDIA

A DICTIONARY OF UNIVERSAL KNOWLEDGE

sacrament (Lat. *sacramentum*, *mysterium*, Gr. *mysterion*), the name given by theological writers to certain religious rites, the number and effects of which are the subject of much controversy between various bodies of Christians.

The word *sacramentum*, in primitive classical usage, meant either the oath taken by soldiers on their first enrolment, or the sum of money deposited by suitors on entering upon a cause, and forfeited 'to sacred uses' by the unsuccessful party; and the corresponding classical Greek word *mysterion* meant not merely the secret religious ceremonies practised in the worship of certain gods, but also any revealed secret. At a very early period of the Christian Church both the Latin word and its Greek equivalent came to be applied specially to certain rites of the Christian ceremonial, and chiefly (or as is commonly held by Protestants, exclusively) to those of Baptism and the Eucharist. Of the catechetical lectures of St Cyril of Jerusalem the lectures devoted to the subject of Baptism and the Eucharist are called 'mystagogic lectures.' Here it will be enough to state concisely what are the views of the several religious communities on this much controverted subject, which formed one of the main grounds of division between the Roman Catholic Church and the Reformers of the 16th century.

In the Roman Catholic Church it is held that there are seven sacraments—viz. Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. The special teaching of Catholics on each of these rites will be found under the several heads; but there are certain general principles regarding them all on which the Roman Catholic doctrine differs widely from that of the Reformed communities. Catholics define a sacrament to be a visible or sensible sign permanently instituted by God, and conveying real interior grace to the recipient, and they teach that all sacraments contain within themselves, as instruments, and, when they are received with proper

dispositions, produce, such grace by the virtue imparted to them by God, and not merely through the faith of the recipient; although they hold that proper dispositions on the part of the recipient, as sorrow for sin, love of God, pious resolves, &c., are conditions indispensable for the efficacy of the sacramental rite (see *OPUS OPERATUM*). They divide the sacraments into two classes, 'sacraments of the living' and 'sacraments of the dead.' The first class comprises the Eucharist, Confirmation, Holy Orders, and Matrimony—all which sacraments can only be received fruitfully by persons in a state of grace or justification. The second includes Baptism, Penance, and Extreme Unction, the special purpose of which is to remit sin, and which therefore can be received by persons in a state of sin, but penitent for that sin, and resolved to amend their lives. Of three of the sacraments—viz. Baptism, Confirmation, and Holy Orders—it is held that they imprint a 'character,' and therefore that they can only be received once. The others may be repeatedly received, but under conditions which will be learned under each separate head. Two things are held to enter into the constitution of the sacrament—viz. the 'matter' and the 'form.' By the former is meant the material element or the physical action whereby that element is applied to the recipient of the sacrament; as water in baptism, oil in extreme unction, and in both the act of washing or of anointing. By the latter is understood the form of words employed by the minister in communicating to the recipient the external rite in which the sacramental act consists. The minister of a sacrament is the person who is supposed to be divinely authorised to impart it. The Council of Trent anathematises those who teach that there are more or less than seven sacraments. The Greek Church also recognises the seven sacraments.

The Reformed Churches have for the most part rejected these views. By the majority of them the sacraments are held to be merely ceremonial observances, partly designed as a solemn act, by which each individual is admitted to membership,

or desires to make solemn profession thereof; partly intended to stimulate the faith and excite the fervour and the pious dispositions of the recipient, to which dispositions alone all the interior effects are to be ascribed. As to the number of rites called by the name, almost all Protestants agree in restricting it to two—viz. Baptism and the Lord's Supper; although some of the rites which Catholics regard as sacramental are retained by some of the Protestant communities as religious observances. Calvin defends the ceremony of ordination by imposition of hands, once even calling it a sacrament, though evidently not in the strictest sense of the word. In the English Church, however, there has always been a school in which opinion tending towards the Catholic view has prevailed. Not only have English Churchmen ascribed to the two rites of Baptism and the Eucharist or Lord's Supper (q.v.) the power of producing an interior grace (which in the former is called Regeneration, q.v.), but since the Tractarian movement many of them have been willing to call the other rites, especially Confirmation, Penance, and Holy Orders, by the name of sacrament, although of a secondary character, and not 'generally necessary to salvation.'

See the separate articles on the sacraments, especially BAPTISM, and LORD'S SUPPER, and works there cited; also ROMAN CATHOLIC CHURCH; and for the sacraments as recognised by the Orthodox Eastern Communion, see GREEK CHURCH.

Sacramentarians, a term used in more senses than one. (1) Ordinarily in England it means one who holds a 'high' or extreme doctrine of the efficacy of the sacraments, especially of the Eucharist (see LORD'S SUPPER). (2) Technically, however, the word is used in church history in an almost diametrically opposite sense for persons holding a 'low' doctrine on the subject of the sacraments—for the party among the Reformers who separated from Luther on the doctrine of the Eucharist. Luther taught the doctrine of the real presence of the body and blood of Christ along with the bread and wine (see LORD'S SUPPER). Carlstadt, Capito, and Bucer were the leaders of those who called this doctrine in question. This sacramentarian party became so considerable that in the diet of Augsburg they claimed to present a special confession known in history by the name of the Tetrapolitan Confession—so called from the four cities, Strasburg, Constance, Lindau, and Memmingen. The Tetrapolitan Confession rejects the doctrine of a corporeal presence, and although it admits a spiritual presence of Christ which the devout soul can feel and enjoy, it excludes all idea of a physical presence of Christ's body. Simultaneously with this German movement, yet independent of it, was that of the Swiss reformer Zwingli, whose doctrine on the Eucharist was identical with that of Carlstadt, and who himself presented a private confession of faith to the Augsburg diet in which this doctrine is embodied. The four cities named above continued for many years to adhere to this confession presented to the diet of Augsburg in their name; but eventually they accepted the so-called Confession of Augsburg, and were merged in the general body of Lutherans. On the contrary, the article of Zwingli upon the Eucharist was in substance embodied in the confession of the Helvetic Church.

Sacramento, the largest river of California, rises in the north-eastern part of the state, its head-stream, Pitt River, draining Goose Lake, and flows south-west through the Sierra Nevada to Shasta, south to Sacramento, and thence south-south-west into Suisun Bay, through which its waters pass into San Pablo Bay and so to the Pacific Ocean. Its length is about 500 miles, and

it is navigable for small vessels to Red Bluff, nearly 250 miles. A few miles above its mouth it receives the San Joaquin; and with this and other tributaries it drains the great central valley of the state.

Sacramento, the capital of California, is on the east bank of the Sacramento River, at the mouth of the American River, 178 miles N.E. of San Francisco. The streets are laid down at right angles on a level plain. The business portion is built of brick, the dwellings of wood, with shade-trees and gardens. The principal public buildings are the state capitol, the county court-house (formerly the capitol) and hospital, the post-office, a Roman Catholic cathedral, the Crocker Art Gallery, and the Masonic and Odd-fellows' halls. Sacramento is an important point of shipment for fruit and agricultural produce. It has rice and flour mills, brick works, manufactories of pottery and leather, and machine and railroad shops. It was settled in 1839 by a Swiss named Sutter, who built a fort here in 1841; but it was not till 1848, after the discovery of gold, that the city—at first as a canvas town—was laid out. Inundations led to the building of a levee in 1862. In 1854 Sacramento became the state capital. Pop. (1880) 21,420; (1920) 65,908.

Sacrarium (Lat., 'a place where sacred objects are deposited'), the part of a church where the altar is.

Sacred Heart of Jesus, FEAST OF, a modern festival of the Roman Catholic Church. Its origin is traced to a vision which is recorded of a French Visitation nun named Marguerite Marie Alacoque (1647-90), who lived at Paray-le-Monial (q.v.). This devotion was gradually propagated in France, approved by Clement XIII. in 1765, and extended to the whole church in 1856, Sister Marguerite Marie being beatified in 1864. The festival is held on the Friday (in England on the Sunday) after the octave of Corpus Christi. Of many churches dedicated to the Sacred Heart by far the most splendid is that erected on Montmartre, the highest point of Paris, in 1874-91, at a cost of nearly a million sterling. The faithful worship the heart of Jesus, considered 'not as mere flesh, but as united to the divinity;' and the heart is chosen because it is a symbol of charity and of the inner life. The heart of the Blessed Virgin, on the same principle, is venerated by the Roman Catholic Church.

See Nilles, *De Rationibus Fectorum Sacratissimi Cordis* (1875); and works in French by Rainvel (1906) and Garriquet (1920), and in English by Petrovits (St Louis, 1918).

Sacred Music. See MUSIC, ANTHEM, CHANT, CHOIRS AND CHORAL SINGING, CHORAL, HYMN, INTONING, MASS, ORATORIO, PLAIN-SONG, SERVICE.

Sacred Wars. See AMPHICTYONIC COUNCIL, PHILIP OF MACEDON.

Sacrifice is one of the fundamental institutions in all types of religion. 'The root of these sacrificial observances,' as Tiele says, 'consists in the yearning of the believer for abiding communion with that superhuman power whose operations compel him to recognise its existence as a postulate of his thinking faculty, of whose sublimity his imagination has formed a conception, to which he feels himself inwardly akin, and in which he strives, so far as humanly possible, more and more to assimilate himself.'

Many theories have been propounded as to the origin of sacrifice. (1) The older theologians used to argue that sacrifice was a Divine institution established by an express command of God given in the form of a primitive revelation. The facts,

however, derived from the comparative study of religion have put the theory of a primitive revelation out of court. The only tenable form of the theory is to suppose that sacrifice originated in a universal instinct implanted in the human heart by God, and that it was in obedience to the Divine prompting within his soul that man began to seek communion with God by means of offerings and sacrifices. But this hypothesis does not solve the problem. It only raises the further question, In what way did this instinct work? What specific value did it attach to sacrifice? (2) In answer to this question many modern anthropologists—Tylor and Herbert Spencer among them—hold that the original motive of sacrifice was the bestowal of a gift upon the supernatural beings who were the object of worship. Herbert Spencer, for instance, says, 'The origin of the practice is to be found in the custom of leaving food and drink at the graves of the dead, and as the ancestral spirit rose to divine rank the refreshments placed for the dead developed into sacrifices' (*Principles of Sociology*, § 139 ff.). This theory seems to afford an adequate explanation of certain forms of sacrifice, e.g. the thank-offering. Primitive religions were very largely anthropomorphic. And naturally the worshippers felt that what would please their fellow-men would be equally acceptable to the gods. The object of the gift was partly to avert wrath and partly to express gratitude and so secure future favours. But though the 'gift theory' explains the origin of certain types of sacrifice, it does not seem to account for its more complex forms. The offering of the blood of the victim slain in sacrifice requires further elucidation, since it seems impossible to bring it under the category of thank-offering. (3) Another hypothesis finds the root idea of sacrifice in the attempt to establish communion or fellowship with the deities through a sacrificial meal of which both gods and worshippers alike partook. The common meal was the symbol of friendship, and established a kindly relationship between the gods and their worshippers. 'On this view,' as W. P. Paterson says, 'sacrifice has more virtue than a mere gift: it knits the god and the worshippers together by the interchange of hospitality.' It is not easy, however, to suppose that primitive man was on such terms of friendly equality with his gods as to admit of such an explanation of sacrifice. (4) The theory that the sacrificial meal represented a sacramental communion with the gods has more to be said for it. It has been elaborated in modern times by Frazer in *The Golden Bough* and by W. Robertson Smith in his *Religion of the Semites*. Frazer, referring to the 'widespread custom of eating the god sacramentally, either in the shape of the man or animal who represents the gods or in the shape of bread made in human or animal form,' says, 'By eating the body of the god the worshipper shares in the god's attributes or powers.' Robertson Smith starts from the premise that 'the notion that, by eating the flesh, or particularly by drinking the blood, of another living being, a man absorbs its nature or life into his own is one which appears among primitive peoples in many forms' (p. 295), and maintains that in the primitive stage of Semitic religion certain animals, which were usually proscribed as food, were regarded as sharing in the life of the god and possessing divine attributes. The sacrifice of these animals, and the fact that the worshippers partook of them, involved the establishment of a mystic sacramental union between God and man. 'The fundamental idea of sacrifice,' he says (p. 327), 'is not that of a sacred tribute, but of communion between the god and his worshippers by joint participation in the living flesh and blood of a sacred victim.' It cannot be denied that the

sacramental idea was very widespread, and that it entered very largely into religious practice. As Macculloch says, 'The sacramental principle, the partaking of a divine life, energy, or holiness through some material vehicle, which, generally speaking, is eaten or drunk, is universal and primitive. Everywhere men have desired to be filled with the fullness of divine life as a means of protection or a source of strength.' But in spite of this fact, the theory which makes the sacramental idea the root principle of sacrifice is open to question. The hypothesis has not won the acceptance of the majority of English anthropologists, and has been subjected to severe criticism by the French scholar Marillier. There is no doubt that it has always been an element in the development of the sacrificial system, but there is much less ground for supposing that it formed the basic principle from which sacrifice originated. (5) A fifth theory finds the explanation of the origin of sacrifice in the desire of man to seek expiation for his sin. Conscious that he had offended his gods, primitive man sought expiation for his crimes by offering an animal sacrifice to bear the punishment which ought to have fallen upon his own head. Once again it must be acknowledged that the idea of expiation is constantly present in the conception of sacrifice. Even Robertson Smith admits that 'the sacramental rite is also an atoning rite which brings the community again into harmony with its alienated God, and the idea of sacrificial communion includes within it the rudimentary conception of a peculiar ceremony' (p. 302). But whether the expiatory idea was original or derivative is open to serious question. The very fact that in almost every religion there are types of sacrifice which do not seem to contain the expiatory idea at all points decisively to the conclusion that it cannot be regarded as the originating cause of sacrifice.

The conclusion to which we seem to be inevitably led from a consideration of these various theories is that in all probability there is no single principle which can be said to be the germinal idea out of which sacrifice developed. The interpretation placed upon sacrifice is always coloured by the particular type of religion with which it is associated. When fear is the predominant note of religion, then the sacrifices were used as a means of expiating the wrath of the Divine Being and securing his favour and support. When, on the other hand, joy and worship are its outstanding features the sacrifices are used as a way of expressing the thankful devotion of the worshippers. There seems to be an invariable relationship between the prevalent conception of the objects of worship and the prevalent interpretation of the significance of sacrifice, and as the one conception grows, the other is gradually modified to suit the new development.

The most complex system of sacrifice known to us is to be found in the Old Testament, especially in the Priestly Code embodied in the Book of Leviticus. The sacrifices may be divided into two kinds: (a) the peace-offerings which assumed that the covenant relation between God and his people was unbroken and gave expression to the spirit of gratitude and intercessory prayer; (b) the burnt-offering (with its later developments, 'the sin-offering' and 'the guilt-offering'), which attempted to restore a broken relationship between God and his people. There can be little doubt that with the increasing emphasis which was laid upon the holiness of God, in the later developments of the religion of Israel, there arose in the heart of the nation a new and deeper sense of sin; and the growing importance of the second class of sacrifices in the Priestly Code is to be explained by the

desire to find some remedy, some 'act of atonement,' which could blot out and destroy the sin of the people. What exactly was the mode in which this end was effected by the sacrifices is not easy to determine. There are some factors, especially in the sacrifices on the great Day of Atonement, which seem to suggest that the victim was offered to God as a substitute for the sin of the nation or the individual worshipper: the victim was required to be 'free from blemish'; the imposition of hands seems to represent the transference of the offerer's guilt to it: the killing of the animal signified the infliction of the penalty upon it: the burning of the body indicated that the substitute had been consigned to 'the eternal fire.' But there is another set of factors which seem to throw grave doubts upon the accuracy of this interpretation. Sacrifices (according to the express statement of Numbers, xv. 30) could only be offered for venial offences and not for sins that merited capital punishment, and hence the death of the victim could not have been a substitutionary atonement. Moreover, atonement might also be made by cereal offerings (Leviticus, v. 11-13), and there could be no equation between this form of sacrifice and the killing of an animal. Another explanation finds the validity of the sacrifice that it symbolised the attitude of soul which the offerer was taking up towards God—his utter abasement in the Divine presence and the complete surrender of his life to the service of God. It is probably quite impossible to obtain a consistent explanation. The Jewish sacrificial system is the growth of centuries. A new interpretation was often superimposed upon old forms, without any attempt being made to remove anachronisms or to square the old ritual to the new theory. The new wine of the developed religious faith of Israel had to be poured into old bottles, and very often these bottles proved unsuitable.

The sacrificial system not only of Israel but of all other religions as well represents a deep instinct in the human which craves for communion with God and seeks for the removal of all barriers which disturb or interfere with that communion. At any rate that seems to have been the ideal that underlies the practice; and from this point of view we say that sacrifice everywhere is a *preparatio evangelica* of the perfect mediation between man and God which was given to the world in Jesus Christ. The recognised inadequacy of all sacrificial systems, and their impotence to destroy the real barrier of sin, only intensified the sense of need, and made men see in the death on Calvary 'the one perfect oblation and offering' for the sin of the world.

Smith, *Religion of the Semites* (1889); Maurice, *Doctrine of Sacrifice* (1879); Wellhausen, *Prolegomena to the History of Israel* (1885); Tylor, *Primitive Culture* (1891); Frazer, *The Golden Bough* (1900); H. Spencer, *Principles of Sociology* (1876); Jevons, *An Introduction to the History of Religion* (1896); Farnell, *Cults of the Greek States* (1896); Lang, *Making of Religion* (1898); Macculloch, *Comparative Theology* (1902); R. Dussaud, *Les origines cananéennes du sacrifice israélite* (1921); G. B. Gray, *Sacrifice in the Old Testament* (1925).

Sacrilege is not now a legal, but is a popular term used to denote the breaking into a place of worship and stealing therefrom. In England whoever breaks and enters any place of divine worship and commits any felony therein, or whoever, being in such a place, shall commit any felony therein, and break out of the same, is guilty of felony and liable to penal servitude for life, or to imprisonment for a term not exceeding seven years. The legal offence of breaking and entering a place of worship with intent to steal comes under the head

of burglary or housebreaking. In Scotland there is no increase of severity in the punishment by reason of the sacred character of the things stolen.

Sacristan, an official attached to a church who is charged with the care of it, and in particular of the sacred vestments and utensils. These are kept in the *sacristy*, or vestry, which in Continental churches is often a spacious building.—The English name *sextion* is an early corruption of this word.

Sacro Bosco, JOANNES DE (or JOHN HOLYWOOD), an English mathematician of whom little is known, except that he seems to have been a native of Halifax, to have studied at Oxford, and taught at Paris as professor of Mathematics, where he died in 1244 or 1256. He was one of the first doctors of the middle ages who made use of the astronomical writings of the Arabians. His treatise, *De Sphæra Mundi*, a paraphrase of a portion of Ptolemy's *Almagest*, enjoyed great renown as a manual among the scholastics. First published in 1472, it passed by 1647 through forty editions, besides translations and commentaries. See an article by C. L. Kingsford in vol. xxvii. of the *Dict. Nat. Biog.* (1891).

Sacrum, or OS SACRUM, is a triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. It is readily seen to consist of five vertebrae with their bodies and processes, all consolidated into a single bone. Its anterior surface (see illustrations at PELVIS) is concave, not only from above downwards, but also from side to side. The posterior surface is convex, and presents in the middle vertical line a crest, formed by the fusion of the spines of the vertebrae, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected. The sacrum of man differs from that of the lower animals by its greater breadth in comparison with its length. This proportion is expressed in the following way: $100 \times \frac{\text{breadth}}{\text{length}} = \text{sacral index}$. In

the male European the average sacral index is 112, in the negro 106, in the Australian aboriginal 99, in the orang 87, in the gorilla 72. In the female the sacrum is broader than in the male, the sacral index of the European female being about 116 (Turner, *Challenger Reports*, Zoology, xvi.). The sacrum and its connections are illustrated at PELVIS.

Various reasons have been assigned for the name given from of old to this bone; Littré accepts the view that it was because it was a part that had special significance with the ancients in sacrifices. Another reason is based on the view maintained by the Jewish rabbins, who held that this part of the skeleton, which they called 'luz,' resisted decay, and became the germ from which the body would be raised.

Sacy, ANTOINE ISAAC, BARON SILVESTRE DE, the founder of the modern school of scientific Arabists, was born at Paris on 21st September 1758. He was trained for the civil service, and whilst labouring in the Mint he made himself master of the chief Semitic languages as well as of Persian, and to some extent of Turkish. He had already gained the reputation of a sound Oriental scholar through papers contributed to Eichhorn's *Repertorium* and other learned journals, when the excesses of the republicans caused him to retire from government service, and devote himself wholly to his favourite pursuits. He published in 1793 his first ambitious work, a translation of the Persian *Annales de Mirkhond* along with *Mémoires sur Diverses Antiquités de la Perse*.

Two years later he was called to fill the chair of Arabic in the newly-founded Institute of Oriental Languages; and to this he added in 1806 the duties appertaining to the professorship of Persian. He held besides several public appointments, nearly all simultaneously with his professorships, such as that of a member of the Corps Législatif (1808), rector of the university of Paris (1815), perpetual secretary of the Academy of Inscriptions, founder and member of the Asiatic Society, and member of the Chamber of Peers. As a teacher he was held in the very highest esteem; he wrote valuable text-books—*Grammaire Arabe* (2 vols. 1810), the fruits of fifteen years' labour; *Chrestomathie Arabe* (3 vols. 1806), and its supplement, *Anthologie Grammaticale* (1829)—which helped to train many of the best Arabic scholars of the 19th century; and he himself had for his pupils several of the best teachers of that language who laboured in both France and Germany in succeeding years. He died in Paris on 21st February 1838. Besides the works already noted he also published Abd-Allatif's *Relation de l'Égypte* (1810), an edition of the tales of Bidpai (*Catila et Dinna*, 1816), Farid ed-Din Attar's *Pendameh* (1819), Hariri's *Makamat* (1822), *Exposé de la Religion des Druses* (1838), &c. See *Lives in French* by Reinaud (1838) and by Derenbourg (1895).

Sacy, SAMUEL USTAZADE SILVESTRE DE (1801–79), a journalist, son of the preceding, was long one of the leading writers on the staff of the *Journal des Débats*, and in 1864 was appointed a member of the Council of Public Instruction. In 1855 he was elected a member of the Academy, and in 1867 of the senate. In 1858 he published a collection of his literary articles as *Variétés Littéraires, Morales, et Historiques* (2 vols.); and he edited in 1861–64 the *Letters of Madame de Sévigné* in 11 volumes.

Sadd. See **SUDD**.

Saddleback, or **BLENCATHARA**, a Cumberland mountain (2847 feet) of the Skiddaw group, 4½ miles NE. of Keswick.

Saddleworth, a town in the West Riding of Yorkshire, 14 miles NE. of Manchester, 12 SW. of Huddersfield. It has cotton and woollen manufactures, and in the neighbourhood are numerous early earthworks and tumuli. Pop. 13,000.

Sadducees, one of the Jewish parties mentioned by Josephus, in the Talmud and in the New Testament. The name is derived (1) through the Greek, from the Hebrew *Qadugi* or *Zadokite*, denoting the descendants of Zadok, the chief of the priesthood in the days of David and Solomon (1 Kings i. 34, ii. 35; 1 Chron. xxix. 22). (2) According to the Talmudic account preserved in *Aboth de R. Nathan* v., the name comes from Zadok, a disciple, like Boethus, of Antigonus of Socho who studied under Simon the Just [date doubtful; either Simon I., a contemporary of Alexander the Great, or Simon II., high priest from 226–198 B.C.]. Antigonus's motto was 'be not as servants who serve the master for the sake of receiving a reward,' but serve from a sense of duty. This motto was adopted by the Zadokite and Boethusian schools, which, according to the hostile account in *Aboth de R. Nathan*, in consequence rejected the belief in the future life and impenetrable worldly happiness as the desirable goal (p. 26, ed. S. Schechter, London, 1887). (3) A. E. Cowley (*Ency. Bib.*, 4236) maintains that the name is a corruption of *Zindik*, a Persian word meaning *Zoroastrian* and hence *infidel* when used by non-Zoroastrians. (4) The name may be an intentional variation of *Qaddiq*, Hebrew *righteous*, applied derisively by opponents. (1) is the most probable etymology. For other explanations see *Jew. Ency.*

The Sadducees were a priestly, aristocratic party. When Ezra reorganised the community in Judaea, he imposed the Mosaic Law as the constitution, and caused a solemn oath of fidelity to its tenets to be taken by the people (Neh. x. 30). The law thus became the only authority, and the priests, Ezra's successors, were the official teachers and interpreters. They were the *Soferim*, or scribes, so called because, like Ezra the *Sofer* (scribe), they taught the *Sefer*, book or Bible, and nothing else. During the third pre-Christian century conditions changed. Under Greek rule the authority of priests weakened and a new class of lay teachers, later called Pharisees, arose. As this influence of non-priests is late, the distinction between Sadducees and Pharisees cannot be extremely old, the original teachers being, so far as existing evidence tends to show, Sadducees exclusively.

With regard to the differences between Sadducees and Pharisees it must be remembered that our main sources of information are not impartial. The Pharisaic supremacy, no doubt, colours the Talmudic evidence: Sadducean tenets tended to be forgotten when obsolete and when the practical necessity for recording them ceased. It is chiefly, therefore, with regard to controversial matters that statements concerning Sadducean enactments and practices are preserved. New Testament writers, on the other hand, had no reason to be interested in Jewish religious divergences. By the time of the early church the Sadducees were extinct. Of Sadducean literature practically nothing remains. The principal exception is the 'Zadokite' work discovered by Schecter (*Documents of Jewish Sectaries*, Cambridge, 1910) in the Cairo Genizah; even this book, moreover, is regarded by R. H. Charles (*Apocrypha and Pseudopigrapha*, Oxford, 1913, vol. ii. p. 791) as not typically Sadducean but as representing the standpoint of 'a reformed Sadduceanism.' It follows that our information about this religious body is by no means complete. According to Josephus (*Antiquities*, xiii. 10, 6, § 297, and xviii. 1, 4, § 16) and the Talmud (see, for example, *Sanhedrin* 33b, *Horiyoth* 4a) the Pharisees and Sadducees differed in their attitude towards the traditional laws not contained in the Pentateuch. Josephus says 'they deny destiny (= God) and they assert that everything lies in our power . . . they deny the immortality of the soul and future punishment and reward.' According to Mark xii. 12 they rejected the doctrine of resurrection. That their disbelief in the world to come may have been a logical and inevitable corollary from the teaching of Antigonus of Socho, cited above, is very probable. But the controversy over the non-Pentateuchal laws has been difficult to explain. Seeing that the Sadducees were conservatives and the Pharisees progressives one would have expected the reversal of their respective rôles: it is reformers rather than traditionalists who may be expected to repudiate the past and emphasise the needs of the present. The most satisfactory solution of the problem is that given by J. Z. Lauterbach in 'The Sadducees and Pharisees' (pp. 176 fol. of the *Studies in Jewish Literature . . . in honour of K. Kohler* . . . G. Reimer, Berlin, 1913) and his subsequent works. Lauterbach shows brilliantly and conclusively that the Sadducees were literalists; their ordinances were *Gevairah*, or temporary enactments. Thus in *Megillath Ta'anith* (ed. Neubauer, p. 8) the abrogation of this book of ordinances, on 14 *Tammuz*, is recorded. S. Zeitlin (*Megillath Ta'anith*, Philadelphia, 1922, pp. 77 and 83) holds a different view, but Lauterbach's footnote (p. 186 *op. cit.*) may be said to afford a satisfactory answer to Zeitlin's objections. The Sadducees maintained the rigour of the old institutions and refused to acknowledge the modifications

which the Pharisees introduced, e.g. compensation instead of *lex talionis*. They based their principles on the maxim 'the scriptures speak in human language'; the plain sense and literal exegesis of the Pentateuch was to be paramount. The Pharisees, on the other hand, took the attitude later typified by Aquila and Aquila, that every particle must be considered; delicate shades of meaning were to be observed by a study of grammatical usage, by etymology, by lexicographical research and comparison, and by an investigation of particles seemingly otiose. The inner meaning might thus not infrequently be obtained, the spirit deduced from the letter itself and the requirements of future ages found to be implicit in the ancient words of scripture which had a validity for all time.

The main points of difference thus included, besides the rejection of the future life, a denial of angels (Acts xxiii. 8); a maintenance of the strict *lex talionis* (the day on which their code was abrogated by Simon b. Shetah, in the reign of Salome Alexandra, was observed as a holiday); they held a master answerable for damage done by a slave, whereas the Pharisees made the master responsible only for damage by his animals; they took Deut. xxi. 17 literally; they allowed a daughter to inherit as a son's daughter, if the son were dead; they began to count the *Omer* (seven weeks from Passover to Pentecost, Lev. xxiii. 15-16) from the 'day after the Sabbath,' and, in consequence, always observed Pentecost on a Monday; they caused the cost of the daily sacrifice to be borne by the High Priest, because of their priestly privileges, while the Pharisees maintained that this was a national obligation and devolved on the Temple exchequer; they insisted that the meal offering was the priests'; they advocated strict levitical purity with regard to the red heifer (Num. xix.); they held that on the day of atonement the high priest should kindle the incense *outside* the Holy of Holies, for mystic reasons which the Pharisees repudiated; they made the power of contamination more rigorous; they would not tolerate the ceremonial willow-beating at the Tabernacles water-libation on Sabbath; they did not hold that the scrolls of the law were holy; they did not accept the *Erub*, a declaration and act rendering carrying on Sabbath permissible in certain limits; they dated their documents 'After the High Priest.'

On the whole it may be said that the Sadducees were priestly aristocrats, friends of Rome, less pious than their opponents, and less concerned with the poor. 'The Sadducees were the hypocrites of the Jewish world, just as the Epicureans were the hypocrites of the Greek world' (Hart, *Ency. Brit.*, 11th ed., vol. xxiii., p. 990). Their interests were centred on the Temple, with which their privileges and rank were bound up, and when the Temple fell, the Sadducees disappeared from Judaism. In the New Testament they are scarcely known, and by the time of the Church Fathers they were frequently confounded with the Samaritans. Nevertheless the party had its great men; and mass verdicts, such as that of Hart, need a saving clause.

Sade, DONATIEN ALPHONSE FRANÇOIS, MARQUIS DE, a notorious French romancer, was born at Paris, 2d June 1740, fought in the Seven Years' War, and was in 1772 condemned to death at Aix for his unnatural sexual vices. He made his escape, but was afterwards imprisoned at Vincennes and in the Bastille, where he wrote his fantastically scandalous romances, *Justine* (1791), *La Philosophie dans le Boudoir* (1793), *Fuñette* (1798), and *Les Crimes de l'Amour* (1800). He became incurably mad, and died at Charenton, 2d December 1814. The term sadism (Fr. *sadisme*), denoting a form of sexual perversion marked by a love of cruelty, is derived from his name. See the study in French by Janin (1835).

Sâdî (also spelt *Sa'dî*, *Saadi*, and *Sa'adi*), the assumed name of the SHEIKH MUSLÎH ADDIN, one of the most celebrated of Persian poets, who was born at Shiraz about the year 1184. Little is known of the circumstances of his life. His father's name was Abdallah, and he was a descendant of Ali, Mohammed's son-in-law; notwithstanding his noble lineage, however, he held but an insignificant position. Sâdî was early left fatherless. He received his education in science and theology at Bagdad, and from here he undertook, together with his master, his first pilgrimage to Mecca, a pilgrimage which he subsequently repeated no less than fourteen times. He travelled for a great number of years, and is said to have visited parts of Europe, Barbary, Abyssinia, Egypt, Syria, Palestine, Armenia, Asia Minor, Arabia, Persia, Tartary, Afghanistan, and India. Near Jerusalem he was taken prisoner by the Crusaders, not while fighting against them, but while practising religious austerities in the desert. He was ransomed for ten dinars by a merchant of Aleppo, who recognised him, and gave him his daughter in marriage; this union, however, did not prove happy. He married a second time, but lost his only son. The later part of his life Sâdî spent in retirement near his native town, and he died at a very old age in 690 A.H., or 1263 A.D.; according to others, however, he did not die until 1291 or 1292 A.D. In person he is described as having been of rather insignificant appearance, short, slim, and spare. His was a contemplative, pious, and philosophical disposition. The years of his retirement he occupied in composing those numerous works which have made him justly famous through East and West. Although European critics would hardly be inclined to endorse to the full the judgment passed upon him by his countrymen, that he was 'the most eloquent of writers, the wittiest author of either modern or ancient times, and one of the four monarchs of eloquence and style,' yet there is no doubt that this 'nightingale of thousand songs' fully merited the honours showered upon him by princes and nobles, both during his lifetime and after his death. A mausoleum, with a mosque and college attached to it, was erected in his honour at the foot of the hills about 2 miles to the north-east of Shiraz, and the people, who soon wound a halo of legend around his life, flocked thither in pilgrimage.

The catalogue of his works comprises twenty-two different kinds of writings in prose and verse, in Arabic and in Persian, of which *ghazels* and *kassidas* ('odes,' 'dirges') form the predominant part. The most celebrated and finished of his works, however, is the *Gulistan*, or Flower-garden,

a kind of moral work in prose and verse, consisting of eight chapters on Kings, Dervishes, Contentment, Taciturnity, Love and Youth, Decrepitude and Old Age, Education, and the Duties of Society, the whole intermixed with a number of stories, maxims, philosophical sentences, puns, and the like. Next to this stands the *Bostan*, or Tree-garden, a work somewhat similar to the *Gulistan*, but in verse, and of a more religious nature. Third in rank stands the *Fend-Naméh*, or Book of Instructions. Elegance and simplicity of style and diction form the chief charm of Sâdî's writings. For wit he has been likened to Horace, with whose writings he may not have been unacquainted, since he is said to have known Latin.

The first complete printed edition of his works, called the *Salt-cellar of Poets*, by Harrington, was published in Calcutta (1791-95), and has been reprinted since by native presses in India. The *Gulistan*, first edited with a Latin translation by Gentius (Amsterdam, 1651), has been reprinted very frequently, and has been translated into a number of European tongues, into English by Gladwin, Ross, Eastwick, and Platts; and see Robinson's *Persian Poetry for English Readers* (1883). The *Bostan* was first published complete in Calcutta in 1828 (Vienna, 1858), and has likewise been translated into other languages; with *Sâdî in the Garden*, by Sir Edwin Arnold (1889), is a translation of part of the *Bostan*. Many manuscript copies of Sâdî's works exist. A carefully collated MS. of the *Bûstân of Shaikh Muhiu-d-Din Sâdî*, prepared by Platts, was photographed and published in London, with annotations by Rogers, in 1891.

Sadler, MICHAEL THOMAS (1780-1835), English social reformer, was born at Snelston, Derbyshire. He engaged in business at Leeds as an importer of Irish linens, but gave his strength to public life, and in 1829-32 sat in parliament. He advocated a poor-law for Ireland, took part in the Malthusian controversy, championed the cause of the agricultural poor in England, but is principally remembered as a leader in the agitation for the abolition of child labour in factories. He died at Belfast, whither he had retired. See Seeley, *Memoirs of M. T. Sadler* (1842), and Hutchins and Harrison, *History of Factory Legislation* (1903, new ed. 1926).

Sadler, SIR RALPH, was born in 1507, and was employed by Cromwell, Henry, and Elizabeth in diplomacy with Scotland. He was left one of the twelve councillors of Edward VI.'s minority, fought at Pinkie, sat in the commission on Queen Mary at York, and was her gaoler at Tutbury. He was perhaps sent to carry the news of her execution to her son, and died himself soon after in 1557.

His *Papers*, of great value for Border and Scottish history generally, were edited by A. Clifford, with a Memoir by Sir Walter Scott (3 vols. 1809).

Sadler's Wells Theatre, familiarly known as 'The Wells,' a historic theatre of London, in Clerkenwell. It stands on the site of a holy well long celebrated for the reputed miraculous healing virtues of its mineral waters. From early times mystery plays had been here performed, but with the Reformation the spring was overlaid. In 1572, however, one Forcer sought leave from parliament to carry on a place of amusement on the spot, and in the following century a 'music-house' and garden were conducted on the site by one Sadler, his name becoming associated with the by then forgotten well following its fortuitous rediscovery by his servants (1683) and its repopularisation by him. In 1765, in the time of one Rosomon (also Rosamon, born Rosamond), the old wooden building was replaced by one of brick, and this in 1879 was reconstructed. The well has associations with Edward IV., with Queen Elizabeth, with Samuel Pepys; the stage with Grimaldi, Edmund Kean, Braham, the Dibbins, but most notably with Samuel Phelps (q.v.), who in 1844-62 put on almost the complete

cycle of Shakespeare's plays. Later, however, the prosperity of the theatre departed, and when closed in 1916 it was a cinematograph house, and in 1925 was derelict when purchased by public subscription with a view to its development as a popular home of Shakespeare and of grand opera.

Sadoletto, JACOPO, was born at Modena in 1477. His father, a distinguished jurist in Ferrara, was in a position to give his son every advantage of a liberal education. Sent by his father to Rome in 1502, he there found a patron in Olivero Caraffa (under whose roof he lived for some years), and eventually entered the church. On the accession of Leo X. the polished Latin style of Sadoletto gained him the position of apostolical secretary, an appointment he held under two other popes, Clement VII. and Paul III. By Leo he was also made bishop of Carpentras in 1517, though he did not leave Rome till four years later. Settled in his charge, he performed its duties with a devotion that commanded the respect even of those who had broken with the Church of Rome. Both by Clement VII. and Paul III. he was successively summoned to Rome to give his aid in the councils of the church. By the latter of these popes he was in 1536 made cardinal, greatly, he affirms, against his own will, as his chief desire was the pursuit of his favourite studies and the faithful performance of the duties of his charge. In 1544 he acted as legate to Francis I. on a fruitless mission to effect peace with Charles V. He died at Rome in 1547.

By his high character and his literary gifts and accomplishments Sadoletto ranks as one of the most distinguished churchmen of his age. While he cultivated classical studies with all the enthusiasm of the dissolute Bembo, he still preserved his Christian feeling and the sense of the responsibilities of his profession. He had sincerely at heart the reform at least of the discipline of the church, and had his counsels and example been followed Rome would have played a worthier part in the religious revolution of the 16th century. He corresponded with many of the Protestant leaders, and did his utmost to find a common basis on which reunion might be possible. His works mainly consist of his personal and official letters, and of commentaries on the Psalms and on the Epistles of St Paul. On these last Erasmus passes the curious criticism 'that their very polish of expression will with some take off the edge of their pious suggestion.' Sadoletto's complete works were published at Rome in 1759, with an annotated life prefixed. See Joly's *Étude sur Sadoletto* (Caen, 1856).

Sadowa. See KÖNIGGRÄTZ.

Safad, or ZEPHAT, one of the four holy cities of the modern Jews in Palestine, spreads in horseshoe shape round a hill 2700 feet above the Mediterranean, 6 miles NW. of the Sea of Galilee. Population, about 9000. The town was overthrown by earthquakes in 1759 and 1837. A castle of the Christians, built during the Crusades, was destroyed by the sultan of Damascus in 1220, and, having been rebuilt by the Templars, was again taken and destroyed by Beybars of Egypt in 1266. The Jewish colony has been settled here since the 16th century, and embraces many immigrants from Poland. There is an American Zionist hospital.

Safe-conduct. See PASSPORT.

Safes. The foundation of the plan on which fireproof safes are still constructed was laid by a Mr Richard Scott in 1801. Mr Thomas Milner in 1840 patented a fireproof safe embodying the same principle, but with some improvements. In 1843 letters-patent were granted to Messrs Tann for the use of a mixture of pounded alum and gypsum, previously heated and cooled, as a fire-resisting medium placed between two plates of

iron, from 3 to 6 inches apart, which together form the wall of the safe. Milner's plan was to fill the jacket formed by the double-plated sides with sawdust, in which were packed a number of small tubes filled with an alkaline salt. These tubes burst when exposed to heat, and the sawdust becomes pervaded with moisture. When alum or sulphate of alumina is used there can be no charring till the large quantity of water these salts contain is expelled; and this is a slow process, as the heat causes a protecting crust of the anhydrous salt to form on the inside of the outer plate. Fireproof safes are still made on similar principles.

In the past safes were made of composite hard and soft iron or steel plates with a view to defeating the drill and cutting tools or the explosives of the burglar, but the introduction of the oxy-acetylene cutting flame has rendered it necessary to seek other means of protection, since, given privacy and a reasonable time, a section can be removed from the strongest metal door. Safes are now more usually placed where they can periodically be seen by watchmen or the police, and consist of steel plates and bars, associated with layers of refractory material arranged as described above to afford protection from fire, while at the same time making the process of flame cutting as lengthy as possible.

Public safe-deposits for the safe-keeping of important documents, cash, gold and silver plate, and other valuables, have now been built in most large business centres. Some of these contain a large number of safes, the building of the National Safe Deposit Company, Queen Victoria Street, London, having room for as many as 20,000. The brick walls of this company's great safe-vault are 3 feet thick, faced externally with firebrick and lined internally with cast-iron plates, $\frac{1}{2}$ inches thick, strengthened by imbedded wrought-iron bars. The separate compartments of the vault have doors, 12 inches thick, formed of metal plates of different degrees of hardness. These weigh 4 tons each, and are raised and lowered, portcullis-like, by hydraulic power. The chief portion of the Chancery Lane safe deposit consists of four strong rooms 'armour-plated' and built on iron columns in vaults, but completely isolated from the external walls, so that armed patrols (armed watchmen guard the above safe-vault also) can, during the night, walk round, over, and under them. These rooms contain about 5000 separate safes and have doors weighing 2 tons each, which by a clockwork arrangement can only be opened at certain hours. The lock of a single safe cannot be opened unless both renter and custodian are present, as each has a different key for the same safe. In the case of the Safe Deposit, opened in 1891, in St James Street, London, the walls, roof, and floor are formed of a triple thickness of Siemens-Martin steel together having a minimum thickness of $\frac{1}{2}$ inch. The middle plate is of hard and the two outer plates are of soft steel, and these three plates were riveted together by hydraulic pressure in such a way that the rivets swell out into the wider holes of the centre plate and therefore cannot be punched. As the rivets are made with a strand of hard steel, neither can they be drilled. Fireproof chambers are built with vaulted roofs and sides of strong masonry.

Protection from theft is obtained by the use of locks requiring the simultaneous production of two or more keys to open, or time-locks, which will only respond to the keys at a certain predetermined time, or, with or without either of the above, a Combination lock, which requires certain discs or pointers to be set to an arranged combination of letters or figures before the lock will

respond to the keys, the agreed Combination being capable of change if necessary.

See H. W. Chubb on 'Locks and Safes' in the *Journal of the Society of Arts* (1893).

Safety-fuse. See BLASTING, and FUSE.

Safety-lamp. The *firelamp* of the miner is principally marsh-gas or methane (CH_4). When mixed with air the gas is explosive between the limits 5.4 and 14.3 per cent. It still forms one of the principal dangers the miner has to face, and before the invention of the safety-lamp it was the most important of his foes. A safety-lamp is not intended to enable men to work where there is an ignitable percentage of firelamp; men are not allowed to work in British mines, even with safety-lamps, where $\frac{2}{3}$ per cent. of the gas occurs; but the safety-lamp protects a person who unwittingly or otherwise enters air containing a dangerous proportion of firelamp, or when the gas invades his working-place to an unexpected degree. The first safety-lamp was invented and used by Dr W. R. Clanny in 1813; in the original form air was blown by a bellows, through a water-seal, to a candle in a closed vessel having a glass window; the products of combustion escaped through a second water-seal above the vessel. Later, he dispensed with the water-seals, forcing the air through the oil in the oil-vessel of the lamp and allowing the products to escape through a narrow metal chimney. There were other modifications. Their clumsiness prevented these early forms coming into general use. George Stephenson, the famous railway engineer, was in early life engaged in mining, and invented a safety-lamp in which air was admitted to the flame through one or more metal tubes passing up through the oil-vessel; afterwards he substituted a perforated sheet of metal for the tubes, and otherwise improved it. Stephenson's lamp appears to have antedated that of Davy by a few months, and to some extent anticipated the latter's invention. Sir Humphry Davy's lamp (1815) was the outcome of a brilliant research on the nature of flame. He was the first to demonstrate, and to state the reason for, the protection afforded by a cylinder of iron wire-gauze surrounding the flame. The 'Davy' (see figure) consisted of an oil-vessel surmounted by a gauze cylinder, 6 inches long and $\frac{1}{2}$ inch in diameter, with a short gauze cap placed over the top of the cylinder. Perhaps the greatest life-saving invention of all time, the 'Davy' remained in use for one hundred years. It is now obsolete. Subsequent forms have evolved from it and still retain the gauze he introduced. Should gas ignite within the lamp, the gauze (unless red-hot) prevents the flame from passing out by cooling the issuing gases to a temperature below that at which firelamp burns. It was soon found that the 'Davy' was unsafe in rapid currents, and eventually (1865) it was protected by being placed in a cover having a glass window. This variant was known as the 'tin-can Davy.' A great objection to the Davy was its feeble illuminating power, amounting only to about one-fifth of that of a candle.

Davy Lamp.

An important new principle was established by the Mueseler lamp (1840) invented in Belgium. The lowest part of Davy's gauze cylinder was replaced by a thick glass cylinder, 3 $\frac{1}{2}$ inches high. A narrow, tapering metal chimney was fitted within the gauze and over the flame. Fresh air entered through the gauze, passing downwards to

feed the flame; the products of combustion passed up the metal chimney and out at the top of the gauze. About 1842 Dr Clanny, who had never ceased working at the problem, brought out, independently of Mueseler, a lamp with a glass surrounding the flame. The 'Clanny,' as it is still called, does not possess the metal chimney of the Mueseler. The introduction of the glass added considerably to the illuminating power; all modern lamps have such glasses. Of the safety-lamps used in Britain in 1868, 60 per cent appear to have been Davy's, 30 per cent. Stephenson's, and 10 per cent. Clanny's. About this time lamps were devised having an additional gauze ring placed under the glass; the air entered through the latter ring; the lighting power was thereby improved. Some modern lamps are of this class. Two important improvements were introduced about 1870. The first was the sheet-metal shield or bonnet surrounding the gauze and efficiently protecting it from the effects of high-velocity currents; the second was the arrangement of double or treble concentric gauzes due to the French engineer, Marsaut. The majority of flame safety-lamps used in Britain to-day are double-gauze Marsauts, and all modern safety-lamps are bonneted. A few *electric safety-lamps* were in use as far back as 1883. Their introduction was, however, slow, and in 1909 only 2155 were employed. The equivalent figure for 1923 was almost 323,000. For modern development of flame and electric safety-lamps see MINING.

Safety-valve, an apparatus, the duty of which is to allow the steam to escape from a boiler when it reaches a certain pre-determined safe pressure, and thus to prevent undue stress on the boiler-plates. The apparatus consists of a valve, which is kept in a closed condition by various methods until the internal steam pressure rises to the blow-off pressure, when the valve at once opens automatically. When closed, the valve is held upon its seat either by the action of a spiral spring or by means of a dead weight applied directly or through the intervention of a lever. The valve-box should be fitted directly on the top of the boiler; the valve-face should be narrow— $\frac{1}{4}$ inch to $\frac{1}{2}$ inch in width; and the lift of the valve from its seat, when freely discharging any surplus steam, should not exceed $\frac{1}{4}$ th of its diameter. It is important to make the valve of such a shape that the reaction of the escaping steam will assist in maintaining the requisite pressure on the underside of the valve in order to keep the valve fully open as long as steam is being discharged. The valve should at once return to its seat, and close tightly when the internal steam pressure has, owing to the discharge of the steam, fallen to a pressure of 3 or 4 lb. below the blowing pressure. When a spring is employed, the length of the spring should be sufficiently great to prevent an undue increase of pressure on the valve as the spring is compressed. The area of the valve-opening is determined by considering both the area of the grate surface upon which the fuel is burned, and also the amount of heating surface provided in the boiler. In large boilers it is desirable to distribute the necessary valve area so determined over two independent valves. One of these may be, in the case of land boilers, a lever safety-valve, the other a dead-weight valve. To test the efficiency of a safety-valve, the stop and feed valves of the boiler should be shut when the boiler is under full steam, and the firing continued steadily for a period of about twenty minutes. Under these conditions, the steam pressure in the boiler should not rise more than 10 per cent. above the pressure at which the safety-valve is set to blow off steam. There are stringent official rules with regard to the design, size, and general arrangements of safety-valves.

Similar valves are frequently fitted to the receivers in compound steam-engines, and to many other types of vessels containing liquids or gases under pressure.

Safflower (*Carthamus tinctorius*), an annual herbaceous plant with large orange-red flower-heads, belonging to the Compositae. It is believed to be indigenous to India and adjoining countries, but it may have had a wide distribution in the wild state, as safflower seeds have been found in ancient tombs in Egypt. Safflower is cultivated all over India, and to some extent also in Persia and Egypt, for the dye obtained from its flowers. It has likewise been cultivated in southern France and other countries. Formerly it was largely exported from India, but its importance in western Europe as a dyestuff has greatly diminished since the introduction of the coal-tar colours. It is still used in India for ceremonial purposes. The flowers yield both a red and a yellow dye, but the latter is of little value. A peculiar treatment of the flowers with an alkaline solution is required to obtain the red dye, which is called Carthamine (q.v.). It is not permanent. It is used as a colouring matter of toilet Rouge (q.v.). Safflower is now grown in India as an oil-seed crop, mainly for local use. The oil resembles sunflower oil. It is used for cooking and burning, and for making varnish. The young shoots are eaten. The seeds of the safflower plant are given to fatten poultry.

Saffron consists of the dried stigmas of the flowers of the Saffron Crocus (*Crocus sativus*). It is used as a colouring material for some articles of food and medicinal tinctures. Formerly it was employed for dyeing fabrics yellow, and, to a slight extent, is so still in some countries. In Persia it is much consumed as a condiment, and for this purpose it is also used in Spain; whilst, according to Giraldus Cambrensis, it forms with milk the diet of the fairies. Saffron is cultivated in various districts in the south of Europe; and in England, where it is said to have been introduced from the East in 1339, it was much grown till about 1768 in Essex (round Saffron Walden, q.v.) and Cambridgeshire. It is also cultivated in Persia, Afghanistan, and Kashmir. The gathered stigmas of the plant are pressed under a weight, and heat applied till the cake-shaped mass is quite dry. From so small a portion of the plant being useful, a vast number of flowers are required to make a small quantity of saffron. There is accordingly a strong temptation to adulterate it, the flowers of Safflower (q.v.) being much used for this purpose, for which reason they are sometimes called bastard saffron. The strong tinctorial power of saffron is owing to the presence of a body called *polychroite* or *safranin*.

Saffron was of much greater importance centuries ago than it is now. It was in favour with the ancient Greeks as a dye, and with both them and the Romans as a perfume. In the middle ages it was employed in cookery and as a drug. It is on record that as late as the 15th century persons were burned alive in Nürnberg for adulterating saffron.

Crocus sativus.

The yellow colour of this dyeing substance seems to have been applied to the dress of royal persons at an early time in Greece and in Ireland, and to the shirts of persons of rank in the Western Islands of Scotland down to a comparatively late period.

Saffron Walden, a municipal borough of Essex, 15 miles S. of Cambridge, 27 NNW. of Chelmsford. The Saffron Crocus (see SAFFRON) formerly cultivated here (from Edward III.'s time) gives its name to the town. The parish church, crowning a hill, is a stately Perpendicular structure, with a spire 193 feet high, and brasses and monuments—one to Lord Chancellor Audley (1488-1544). There are also remains of a Norman castle, a corn exchange (1848), a town-hall (1879), a cattle-market (1834), and a grammar-school, founded in 1423. Andley End, 1½ mile SW., the seat of Lord Braybrooke, was built in 1603 by Thomas Howard, Earl of Suffolk, and is still a magnificent mansion, though partly demolished since 1701. Area of borough, 7416 acres; pop. (1921) 5876.

Safi, or **ASFI**, a seaport of French Morocco, stands on a little bay on the Atlantic coast, 120 miles WNW. of the city of Morocco. It is a compactly built place, dominated by a fine ruined castle of the sultans of Morocco dating from the 16th century. The place was held by the Portuguese for several years; they abandoned it in 1648. The fortifications they built still stand in part. The shrine of the Seven Sleepers here is visited by both Moslems and Jews. Safi was at one time the chief seat of the trade of Morocco with Europe, and, though it has declined since the rise of Mogador, it still exports beans, maize, pease, wool, olive-oil, &c., and imports cottons, sugar, &c. Pop. 26,000.

Saga, a town of Japan, in Kiusiū, 40 miles NW. of Nagasaki. It is important commercially in metal-working, and in the making of electrical plant. Pop. 34,000.

Saga. See ICELAND (*Icelandic Language and Literature*) and the works there cited; also Hermannsson's bibliographies of Icelandic and other sagas in vols. i. (1908), iii. (1910), v. (1912) of *Islandica* (Ithaca).

Sagaling, a decayed town, once capital, of Burma, on the Irawadi, opposite Ava.

Sagan, a town of Prussian Silesia, the chief place (from 1397) in the principality of Sagan, on the Bober, 33 miles by rail W. by S. of Glogau. It has manufactures of cotton and woollen cloths, beer, &c. At the castle, Wallenstein was visited (1629-30) by Kepler. Pop. 15,000.

Sagar, or **SAUGOR**, a well-built town in the Central Provinces of India, is situated in a hilly tract, on a feeder of the Jumna. There are here a Mahratta fort, now converted into British stores, barracks, and a magazine, as well as a gaol (1846) and a park (1862); and there were formerly a college (removed to Jabalpur) and a mint (removed to Calcutta). Sagar has a trade in salt, sugar, and cloth. Pop. 39,000.—The district has an area of 3962 sq. m.; pop. 528,000.

Sagar, a low, swampy island at the mouth of the Hūgli, the holiest branch of the Ganges; it is particularly sacred in the estimation of the Hindus. Multitudes of pilgrims annually resort to it in January, and after the three days' festival of purification is over a great fair is held. The island has an area of 225 sq. m., but is very thinly inhabited, the greater part being jungle, the haunt of tigers and other wild animals. A lighthouse (1808), a meteorological observatory, and a telegraph station are the chief buildings.

Sagasta, **PRAXEDES MATEO** (1827-1903), Spanish statesman, was born at Torrecilla de Cameros, Logroño, became an engineer, but taking

part in insurrections in 1856 and 1866 had twice to flee for a time to France. He had a place in Prim's cabinet (1868), supported Amadeus, held office under Serrano, and under the new monarchy became leader of the Liberals, being minister in 1881-83, 1885-90, 1892-95, and again in 1898-99, during the disastrous war with the United States and the peace negotiations. His subsequent programme of internal reforms was hampered by ill-health and political difficulties. Earlier he had carried universal male suffrage and the institution of trial by jury. He died at Madrid.

Sage (*Salvia*), a genus of Labiatae, containing many species, herbaceous and half-shrubby, natives of temperate and warm regions. There are only two perfect stamens, the filaments of which bear at their summit a cross thread fastened by a joint. Common Sage, or Garden Sage (*S. officinalis*), so much grown in gardens as an aromatic herb for flavouring purposes in cookery, is a native of the south of Europe. It is possessed of active properties, as its powerfully aromatic odour and bitter taste indicate. The leaves and flowering parts of the plant, infused as tea, are considered tonic and astringent. Oil of Sage has been used in liniments against rheumatism; but its reputation has sunk. It contains much stearoptene. Sage grows best in a dry soil, and is easily propagated by slips or cuttings.

Clary (q.v.) is a species of sage. Meadow Clary, or Meadow Sage (*S. pratensis*), is a common ornament of meadows and borders of fields in most parts of the continent of Europe and in the south of England. It has bluish-purple flowers. The Apple-bearing Sage (*S. pomifera*) is a native of the south of Europe and of the East, remarkable for its very large reddish or purple bracts, and for the large gall-nuts which grow on its branches, as on the leaves of the oak. The peasantry of Crete collect these nuts and sell them in the towns for the purpose of making sweetmeats; they have an aromatic sweet taste. Some of the species of *Salvia* have very beautiful flowers, and are prized ornaments of gardens and greenhouses. The finest species, from the gardening point of view, are from Mexico.

Sage-brush, or **SAGE-BUSH**, a plant-formation characteristic of salt deserts in the western United States, composed of *Artemisia tridentata* and other species (see WORMWOOD).

Sage-cock. See GROUSE.

Saghalien. See SAKHALIN.

Saginaw, a city of Michigan, is built on an elevated plateau on the left bank of the Saginaw (including since 1890 what was once East Saginaw), 108 miles NNW. of Detroit. It has some handsome public buildings, and is a flourishing city. It contains railroad and machine shops, and lumber yards. Large quantities of salt are exported, and coal is mined. Saginaw is the centre of an

Sage (*Salvia officinalis*):
a, a flower.

important beet-sugar producing district. Pop. (1880) 10,525; of East Saginaw, 19,016; of the whole (1920) 61,903.—SAGINAW BAY, an arm of Lake Huron, the largest indentation of the southern peninsula of Michigan, is 60 miles long by 30 wide, and has several fine harbours. The river Saginaw (30 miles) falls into it.

Sagitta, or **ARROW-WORM**, a genus of small pelagic worms, included along with *Krohnia* and *Spadella* in the class *Chætognatha*. The arrow-worms occur in all seas; they often measure about an inch in length, and are quite translucent. They feed on diatoms, infusorians, small crustaceans, larval fishes, and the like. The animal is divided by two partitions into three regions, head, body, and tail. In the mouth there are sickle-shaped bristles or 'jaws,' to which the term *Chætognatha* refers. There are two pairs of thin lateral 'fins,' and the tail is similarly fringed. The animals are hermaphrodite, the paired ovaries and testes developing from two cells which appear at a very early stage in the history of the embryo. Each cell divides into two—an ovarian and a testicular rudiment.

See *Cambridge Natural History*, vol. ii.; *I Chætognathi* (1883), by Grassi, in the monographs on the Fauna of the Gulf of Naples; 'Die Chætognathen' by O. Hertwig, in *Jenaische Zeitschrift f. Naturwiss.* xiv. (1880).

Sago, a nutritive, farinaceous substance obtained from the pith of several species of palms, principally, however, from *Metroxylon Rumphii*, the spiny, and *M. lacc*, which is spineless. For the natives of the Eastern Archipelago this palm is a source of vegetable food naturally more abundant and less variable in its yield than rice. The stem consists of a thin hard wall, about 2 inches thick, and of an enormous volume of a spongy medullary substance, which is edible. Each tree is from 15 to 20 feet high. There are three well-marked varieties of this palm. The tree grows in Java, Sumatra, Celebes, Borneo, Malacca, and Siam. The only countries, however, where it is found growing in large forests are New Guinea, the Moluccas, Celebes, Mindanao, Borneo, and Sumatra. It is widely spread over the Moluccas, but confined to particular parts of the others. There is no regular fixed season for extracting

the farinaceous pith, which is taken as occasion requires, and as the individual tree becomes mature, which is at about fifteen years.

These palms propagate themselves by lateral shoots as well as by seed, and they die after producing fruit, so that a sago-plantation once formed is perpetual. Sago-meal is eaten by the natives in the form of pottage, and also partially baked in earthenware moulds into small square biscuits. Large quantities of the meal from the eastern islands to Singapore, where it

pearled, and bleached by the Chinese for shipment to Europe. It comes into commerce in three forms, the common brown sago, pearl-sago, and sago-flour. It is made by two processes, the starch grains being burst in some samples and not in others. Sago is used in Europe for feeding stock, making starch, and by cocoa manufacturers for grinding up and giving thickness or consistency to the dietetic beverage made with it. From the sago palms of Papua alcohol has been produced. Sago is got also from *Arenga*, *Caryota* (q.v.), *Cycas* (see *CYCADS*), and *Oreodoxa*.

The stem of the sago-palm is cut into lengths, split open, and the pith dug out and placed in a vessel with a sieve bottom. Water is applied to separate the flour and carry it into a second vessel, where it is soon deposited. The water is then run off, and the flour dried and put into little baskets made of sago-leaves. The produce of a tree ranges from 600 to 750 lb. Pearl-sago (which the Chinese of Malacca prepare and send to Singapore) is in small white spherical grains, varying in size from that of a poppy-seed to a grain of millet. There are several varieties which differ much in colour, some being white and others reddish brown like radish-seed. One kind of granulated sago from India has been introduced under the name of tapioca—the real Tapioca (q.v.) being a totally different substance. Sago is not entirely soluble in hot water like ordinary starch, and can therefore be employed in making puddings, &c., and in this way forms a valuable article of food, being cheap, light, nutritious, and easy of digestion.

Saguenay, a large river of Canada, falling into the estuary of the St Lawrence on the north side, about 115 miles below Quebec. It drains Lake St John, and flows in an almost straight line about 100 miles east-south-east. In its upper part, amid a wilderness of hills, it has numerous cataracts; but in the lower course, from the village of Chicoutimi down, it flows between precipitous cliffs, often from 500 to 1500 feet high, and is in many places 2 or 3 miles broad, while the depth varies from 17 to 170, and even, near the mouth, to 500 fathoms. The largest vessels can ascend to Ha Ha Bay, 10 miles S. of Chicoutimi; and during the summer great numbers of tourists visit the river, attracted by its magnificent scenery. On the upper course great possibilities of industrial development have been opened up with the construction of huge hydro-electric power plants, notably at the Grande Décharge (Lake St John) and at Chute-à-Caron lower down.

Saguntum, a wealthy and warlike town of ancient Spain, in Hispania Tarraconensis, stood on an eminence near the mouth of the Pallantias. Founded, according to Strabo, by Greeks from Zacynthus, it became at an early period celebrated for its commerce, and attained to great wealth. But the one event in its history was its siege and destruction by the Carthaginians, under Hannibal, in 219 B.C. Having held out the greater part of a year against an army of 150,000 and a consummate general, the famished Saguntines concluded their resistance with an act of heroic self-sacrifice. Heaping their valuables into one vast pile, and placing their women and children around it, the men made their last sally against the enemy, and the women fired the pile they had prepared, cast themselves upon it with their children, and so found in the flames the fate their husbands met in battle. The destruction of Saguntum directly led to the second Punic war. The modern Valencian town of Sagunto, formerly known as Murviedro, from the Latin *murvi veteres*, 'old walls,' occupies the site. Pop. 10,000.

Sahara (Arab. *Sāh'ra*), the vast desert region of North Africa, stretching from the Atlantic to the

Sago Palm (*Metroxylon Rumphii*):
a, inflorescence; b, fruit.

meal in its pure state are sent to islands to Singapore, where it

Nile, and from the southern confines of Morocco, Algeria, Tunis, and Tripoli southwards to the vicinity of the Niger and Lake Chad. It is usual to regard the Libyan Desert, lying between Egypt, the central Sudan, and Tripoli, as a separate division. Both are, however, links in the chain of great deserts that girdle the Old World from the Atlantic coast across Africa, Arabia, Persia, Turkestan, and Mongolia to the Pacific. The Sahara has not been fully explored, but owing mainly to the work of French explorers, a roughly accurate knowledge of the region has been obtained. The surface is highly diversified, and attains in one place an altitude of fully 11,000 feet. The more outstanding features of the Sahara will now be considered.

From the neighbourhood of Cape Blanco in the west a vast bow or semicircle of sand-dunes stretches round the northern side of the Sahara to Fezzan, skirting the Atlas Mountains and the mountains of Algeria. This long belt of sand-hills varies in width from 50 to 300 miles, and is known by the names Ighid and Erg, both meaning 'sand-hills.' The hills rise to 300 feet (in one place, it is said, to more than 1000 feet), though the average elevation is about 70 feet. They are composed of pure quartz sand, reddish-brown in colour; are stationary in character, though constantly changing their outward form and configuration; and lie as a rule in parallel chains, whose outward slopes are fairly gentle, but their inward slopes steep. Water is nearly always to be found below the surface in the hollows between the different chains of these sand-hills, and there a few dry plants struggle to maintain a miserable existence. South of Algeria, on the other side of the Erg, the country rises into the lofty plateau of Ahaggar (4000 feet), which fills all the middle parts of the Sahara. Its surface runs up into veritable mountains some 8000 feet high, which, incredible as it may seem, are covered with snow for three months in the year. On the south it apparently falls again towards the basins of the Niger and Lake Chad; nevertheless there are mountain-ranges along the eastern side reaching 11,200 feet in Enni Kussi, an extinct volcano, and 10,700 feet in Tusside, both in the Tibesti Mountains, and 9800 feet in Jebel Marra, in Darfur, and a mountain-knot in the oasis of Air (or Asben) reaches up to 6500 feet. Mountainous tracts occur also in the west, between Morocco and Timbuktu, but of inferior elevation (2000 feet). These mountainous parts embrace many deep valleys, most of them seamed with the dry beds of ancient rivers, as the Igharghar and the Mya, both going some hundreds of miles northwards towards the 'shats' (see below) of Algeria and Tunis. These valleys always yield an abundance of water, if not on the surface in the watercourses, then a short distance below it, and are mostly inhabited, and grazed by the cattle and sheep and camels of the natives. Another characteristic type of Saharan landscape is a low plateau strewn with rough blocks of granite and other rocks, and perfectly barren. These elevated stone-fields, called 'hammada'—the best known is the Hammada el-Homra, south-east of Ghadames and on the border of Tripoli—alternate with tracts of bare flat sand, with broad marshes, where water has stood and evaporated, leaving salt behind it, and with extensive tracts of small, polished, smoothly-rounded stones. In very many parts of the Sahara, especially in the valleys of the mountainous parts, in the recesses or bays at the foot of the hills, alongside the watercourses, and in the hollows of the sand-dunes, in all which localities water is wont to exist, there are oases—habitable, cultivable spots, islands of verdure in the midst of the ocean of desert. These oases occur in greatest number along the southern face of the Atlas and the Algerian moun-

tains, on the northern side of the Ahaggar plateau, and along certain definite lines, the chief of which extend between Murzuk in Fezzan and Lake Chad, the Igharghar and Sokoto by way of Air, the Igharghar and the bend of the Niger by way of Timissao, Morocco and Cairo by way of Tafilet, Tnat (Ain-salah), and Ghadames, and Morocco and Timbuktu by way of Tenduf and Taudeni. These lines of oases mark the great caravan-routes between the central Sudan and the Mediterranean.

A large portion of the Sahara, though not the whole, was undoubtedly under water at one time, probably in the Cretaceous period and earlier. Then the surface seems to have been in great part elevated, so that the water remained only in some lakes and in gulfs near the Mediterranean coast. The physical features that at present characterise the Sahara are undoubtedly due in their broad essentials to atmospheric, chemical, and even mechanical causes, and only in a very small degree to the action of water. Water has exercised scarcely any influence on a large scale here since the Tertiary period; and there can be no doubt that a process of desiccation, similar to that which is now going on in the Turkestan deserts, has been in operation throughout the whole of this region from the earliest historic time. The Romans had colonies or military posts a long way southwards, in what are now desert regions; and both Herodotus and Pliny tell us that the elephant, the rhinoceros, and the crocodile, all animals that only live near abundant supplies of water, were common throughout North Africa in their day. None of the Egyptian inscriptions or animal-sculptures represent the camel, nor do the Greek and Roman historians mention it either as being a denizen of North Africa. The camel is now the principal carrier across the Sahara, and must have been introduced since the beginning of the Christian era. The inference from these and other facts is that the process of desiccation has gone on more rapidly during the last 2000 years. The position of the sand-dunes is determined by the unchangeable configuration of the surface; the wind and chemical action do all the rest. The sand itself is simply the Saharan rocks (granite, gneiss, mica-schists, and cretaceous rocks) ground to dust. The great heat by day causes the rocks to expand; the great fall of the temperature at night, combined with the enormous evaporation that then takes place, makes them split and crack, and break into pieces; and the strong, often violent, winds use these fragments like files, or even sand-blasts, with which to grind to pieces other rocky fragments. The terrors of the desert sand-storm have been often described (see DESERT). Thick deposits of Saharan quartz sand-dust were discovered by the *Challenger* on the floor of the Atlantic a long way west of the African coast. The sand in the dunes is so dry that in several places the tread of a camel or a man will make the hill hum, or even thunder, as a vast quantity of it slips down to a lower level. The range of temperature is exceedingly great: often the thermometer falls from considerably more than 100° F. during the day to just below freezing-point at night. In the west of the Sahara the daily average is 85° in the shade in the month of May. Rain does fall in certain parts of the Sahara with more or less frequency; but in most districts on the average after intervals of two to five years. After a fall of rain it is not unusual to see the riverbeds in the mountainous regions filled with foaming torrents. But the atmosphere is so dry and clear that objects can be seen and sounds heard at a vast distance. The Mirage (q.v.) is no uncommon feature. Owing to this extreme dryness of the air, the Sahara, especially where it is reached by the prevailing west and north-west winds, is very healthy.

The plant-life is very rich in the oases, the date-palm, which has its home in these regions, being the principal ornament as well as the most valuable possession of these fertile spots. But fruit trees, as oranges, lemons, peaches, figs, pomegranates, &c., are also grown, with cereals, rice, durra, millet, and such-like food crops. In the desert regions the plant-life is confined principally to tamarisks, prickly acacias and similar thorny shrubs and trees, salicaceae, and coarse grasses. The animals most commonly met with include the giraffe, two or three kinds of antelope, wild cattle, the wild ass, desert fox, jackal, hare, lion (only on the borders of the desert), ostrich, desert lark, crow, viper, python, locusts, flies. The people keep as domestic animals the camel, horse, ox, sheep, and goat. The Sahara separates the Ethiopian region from the Palaearctic. See GEOGRAPHICAL DISTRIBUTION.

Now a barrier, the Sahara was once a bridge. In Europe's Ice Age its climate was rainy. Before it became a desert it was a vast park-country, a high-road of migrations, human and other. Abundant traces of ancient human habitation have been found, some dating back to Neolithic times, others comparable in culture (whatever be their age) with the Palaeolithic of Europe—Acheulean, Mousterian, Aurignacian, &c. Rock-sculptures are widespread of animals not now to be found in the Sahara. Their age and artists unknown. To-day the human inhabitants, who are estimated altogether at between 1,400,000 and 2,500,000, consist of Moors, Tuareg, Tibbu, Negroes, Arabs, and Jews. The Moors and Tuareg are both Berbers (q.v.); the former live between Morocco and Senegal, the latter in the middle, south of Algeria and Tunis. The Tuareg are great traders, and control the principal caravan-routes. The Tibbu, who number about 200,000, and are regarded as being ethnically intermediate between the Berbers and the Negroes, occupy the oases between Fezzan and Lake Chad. The Arabs of pure stock are very few; they have become mixed with the Berbers and the Negroes. With the exception of some tribes on the borderland of the Sudan, all the dwellers in the Sahara are Mohammedans. In 1890 Cardinal Lavigerie, Archbishop of Carthage (Tunis), founded a Christian missionary order, called the Armed Brothers of the Sahara.

Within the Sahara are included parts of Tripoli, Tunis, Algeria, Morocco, Mauritania, Senegal, and French Sudan. Politically France is easily the predominant power, her aim of uniting her possessions on the Senegal and on the Niger with Algeria and Tunis having been accomplished by the agreement of 1890 between Great Britain and France, and others by which it has been modified, whereby the whole of the Sahara, except parts of the west coast and the extreme east (the Libyan Desert and the Nile basin), was acknowledged to be within the French sphere of influence. On the west coast Río de Oro belongs to Spain, and in 1912 Ifni was recognised as Spanish. By the conquest of Tripoli in 1911-12 Italy gained a footing in the north-east.

The most valuable products of the Sahara are dates and salt, the latter collected on the salt-pans, and made from the rock-salt of Taudeni in the west, and of Kawar (Bilma) in the east; the remaining products are horses, soda, and a little saltpetre. For many long years a very active trade was carried on by caravans, between the central Sudan and Niger countries and the Mediterranean states, the ivory, ostrich-feathers, gums, spices, musk, hides, gold dust, indigo, cotton, palm-oil, shea-butter, kola-nuts, ground-nuts, silver, dates, salt, and alum of the interior lands being exchanged for the manufactured wares (textiles, weapons, gunpowder, &c.) of European countries; but with the opening up of

means of communication to the Gulf of Guinea the flow of commerce has suffered grievous deflection from the arduous and venturesome trans-Saharan oasis routes. The opening up of the Sahara, however, by the construction of a trans-Saharan railway has long been a project of the French, and many schemes have been advanced. The possibility of a railroad from the Atlantic to the Red Sea has even been conceived, but generally it has been proposed to link the coast-lands of northern Africa, first with the central Sahara to the west of the Ahaggar Mountains, and then with central Africa in the direction of Lake Chad, and with western Africa in the direction of Timbuktu and the Niger. At present, from Philippeville to Tuggurt, and from Oran to Colomb Bechar, short lines capable of extension into trans-Saharan railways run into the desert from the Mediterranean coast. From the town of Tripoli to Gharian a line has been built by the Italians, part of a railway which it is proposed to construct as far as Murzuk. In the south-west Kayes, at the head of navigation on the Senegal, has been connected with the Niger.

The possibility of reclaiming the Sahara from the arid desolation to which such a vast proportion of its surface is now abandoned has been subject of much speculation. That no amelioration can be effected in the great bulk of its area is pretty well agreed; and if the desiccation is principally due, as has been maintained, to continental changes of elevation, it is pretty certain that nothing can be done. But the destruction of forests on the northern mountain-slopes is believed to be a co-operating cause. If so—for the fact is doubtful—this could be remedied. Two other methods of reclamation have, however, been proposed, the first that of flooding from the sea, the second that of irrigation by means of Artesian Wells (q.v.); effect has only been given to the second, but then with admirable success. (1) Westward from the Gulf of Gabes stretches for 250 miles a chain of salt lakes (*shats*) right along the south of Tunis and Algeria to the meridian of Biskra. Into these Captain Roudaire proposed (1874) to let the waters of the Gulf of Gabes by cutting through a ridge, 13 miles wide and 150 feet high, and so making an inland sea of some 3100 sq. m. in area with an average depth of close upon 80 feet. The scheme is, in point of engineering, practicable; but it is questionable whether it would accomplish the desired effect of modifying the climate and soil of the surrounding regions any more than the Sea of Aral or the Caspian does. At all events the proposal has been allowed to drop. In 1877 Donald Mackenzie propounded the idea of flooding the western Sahara, the district called El Juf, by letting in the waters of the Atlantic; but the German traveller Leuz ascertained that El Juf was not a vast depression, but only a small valley. (2) The method of reclaiming the desert by means of artesian wells was apparently known to the ancients. Since 1856 it has been prosecuted by the French with great energy. By 1890 they had made a string of these wells from the cultivated districts of Algeria as far as Tuggurt, on the edge of the desert, south of Biskra. Water is generally found at depths varying from 10 to 300 feet, and in great abundance. Wherever these wells have been bored the date-palm groves and the orchards have increased greatly in extent, and the population has become much denser.

Saharanpur, a town of British India, United Provinces, is situated 125 miles by rail N. of Delhi. It has an old Rohilla fort, a handsome new mosque. St Thomas's Church (1858), numerous administrative offices, and government botanical gardens (1817). It was formerly notorious for its malaria, but has vastly improved in this respect since a marsh to the east of the town has been drained. Pop. (1872) 43,844; (1881) 59,194; (1901) 66,254; (1921) 62,261.—The district has an area of 2133 sq. m. and a pop. (1921) of 937,471.

Sahib (Arab., 'master', 'lord'), the usual title in India and Persia of a respectable European, equivalent to Mr, Sir, &c. *Sahibah* is the correct feminine form, but the hybrids mem- and madam-sahib are used.

Sa'id Pasha. See EGYPT.

Saiga. See ANTELOPES.

Saigon, capital of French Cochinchina, stands on the river Saigon, a branch of the delta of the Mekhong, about 60 miles from the sea by river. The present town has grown up under French influences since 1861, and with its fine streets and squares and boulevards, is one of the handsomest cities of the East. It has a magnificent government house, a governor's palace, a cathedral (1877), a fine town hall, a municipal theatre, barracks, military hospital, arsenal, institutions of higher learning, administrative offices, and a botanical and zoological garden. Its population, consisting principally of Chinese, Annamese, and French, amounts to 109,000. But the business suburb of Cholon, 4 miles south-west, has grown from a town of 27,600 in 1885 to one of some 234,000 inhabitants, over one-half Chinese. Saigon (properly *Gia-dinh*) has fine docking accommodation, being accessible to the largest vessels, and is the most important port between Singapore and Hong-kong. It exports enormous quantities of rice, chiefly to China, the Philippines, Japan, and the Straits Settlements. The remaining exports include fish, salt, cotton, wood, beans, and hides. Previous to the French occupation (1861) Saigon, although only a collection of common Siamese huts, was the capital of the province of Lower Cochinchina.

Sail, a sheet made of canvas or other suitable material, which is spread to the wind to cause a boat or ship to move through the water. Flax and cotton are the materials of which sail-cloth is generally made; and mixtures of these with other materials are also used. Amongst primitive peoples matting and tissues of various vegetable fibres are used. Sail canvas is woven in 'cloths' from 12 to 36 inches in width, each piece, called a 'bolt,' being 40 yards in length. There are many different qualities and weights. The sail is built up of these 'cloths' sewn together with a flat-lapped seam. Certain parts are doubled for strength, and the sail is bound round the edges with a bolt rope. Sails are spread by masts, yards, booms, gaffs, ropes, and combinations of these. They may be of various shapes and sizes, according to the carrying power of the vessel. A sail acts with the greatest power

when the wind is well aft of the beam. The action of the wind on a sail set at an angle to it is a good example of what is known in mechanics as 'the resolution of forces.' Let TD be a ship, PAS its sail, WA the direction of the wind, and let the length of WA represent the pressure of the wind on the sail. WA can be resolved into AB perpendicular to the sail, and BW parallel to it. The latter has no effect in pressing on the sail; AB is the effective pressure on the sail. Let BA be resolved into CA and BC, the former, CA, acting in the direction of the length of the vessel, and the latter perpendicular to it, or in the direction of the breadth. CA is the pressure that moves the vessel forward, the other, BC, tends to make it move sideways. From the form of the vessel, however, this force, BC, produces comparatively little lateral motion; any that it does is called *leeway*.

Sails, according as they are set parallel to the keel, or across the ship, are *fore-and-aft* sails, or *square* sails. But those which are set across the ship are not exactly square in shape; and many fore-and-aft sails are four-sided; *stay-sails* are triangular, and are suspended on the stays which support the masts upon the fore-side—from the jib-

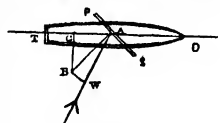

Fig. 1.

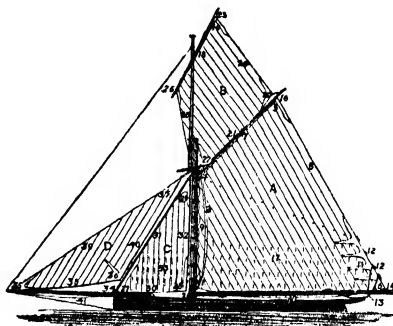

Fig. 2.—Sails of a Cutter, with the names of the different parts:

MAINSAIL, A.—1, main-tack; 2, main-tack tackle; 3, main-tack tricing-line; 4, throat; 5, peak; 6, clew; 7, head; 8, leach; 9, luff; 10, foot; 11, strengthening piece; 12, cringles; 13, reef pennants rove; 14, main clew lashing; 15, mast hoops and seizings; 16, peak earing; 17, reef points.

GAFF-TOPSAIL, B.—18, head; 19, peak; 20, clew; 21, foot; 22, tack; 23, luff; 24, leach; 25, peak earing; 26, head earing.

FORESAIL, C.—27, fore-tack; 28, clew; 29, head; 30, foot; 31, luff; 32, leach; 33, reef points; 34, fore-tack tackle.

TRAVELLER, D.—35, tack, hooked on to the traveller; 36, clew; 37, head; 38, foot; 39, luff; 40, leach; 41, inhaul of the traveller.

boom, bowsprit, and deck in the case of the foremast, and from the deck in the case of the mainmast.

Large sailing-vessels are usually propelled by a combination of fore-and-aft and square sails; the names and positions of these are illustrated at the article SHIPBUILDING. The Schooner (q.v.) has fore-and-aft sails on both masts, though many schooners carry square topsails. The two-masted Brig (q.v.) is mainly square-rigged; and the Brigantine is a cross between brig and schooner. The Cutter (q.v.) is the typical fore-and-aft one-masted vessel, and the names of the several sails, and the technical terms for the parts of the sails, will be gathered from the accompanying illustration (fig. 2).

A Sloop is supposed to have a fixed bowsprit, with the jib set on a stay, whereas that of the cutter has a running one, with the jib set flying. A Yawl has a foremast rigged exactly like a cutter, but has a small mizzen-mast carrying a *spanker* or *driver*.

Some other types of small sails may be noted. The *tug-sail* is four-sided, hung from a yard fastened obliquely to the mast. Luggers may be

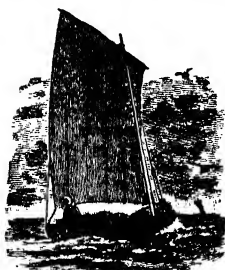

Fig. 3.—Tug-sail.

one, two, or three-masted, and vary much in size. The *shoulder-of-mutton sail* is triangular, set on the aft side of a boat's mast. The *sprit-sail* is quadrangular, stretched from the mast, not by a gaff along its top, but by a sprit extending from near the foot of the mast diagonally to the peak of the sail. The London barge has its heavy mainsail partly supported by a sprit, and there is a spanker on a small

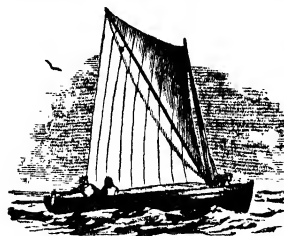

Fig. 4.—Sprit-sail.

mizzen-mast. The *spinnaker* is a large triangular racing sail carried by yachts when running before the wind, and extended by a boom on the side opposite the mainsail. The *lateen* sail, much used in the Mediterranean, is a triangular sail stretched from a long yard attached to a short mast, as shown in fig. 5. The Felucca is a two-masted lateen-sailed boat; the sails of the Egyptian Dahabiyah and of the Arab Dhow are of the same type. A Xebec has three masts, and carries a combination of lateen and square sails. The South

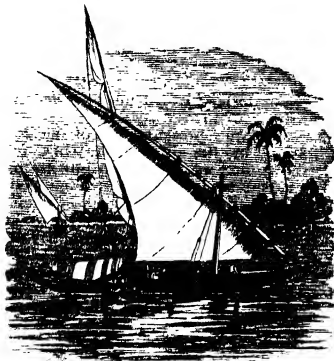

Fig. 5.—Dahabiyah.

Sea Proa, the Chinese Junk, and other local rigs have many peculiarities in their sails. Naval rigs are illustrated at NAVY. See also SHIPBUILDING,

YACHT; and for Sailing or Navigation, see GREAT CIRCLE SAILING, LATITUDE AND LONGITUDE, MERIDIAN, SEXTANT, STEERING, &c.

Saima, LAKE. See FINLAND.

Sainfoin (*Onobrychis sativa*), a plant of the family Leguminosae, sub-family Papilionaceae, of a genus nearly allied to *Hedysarum* (see FRENCH HONEYSUCKLE), but having one-seeded pods which are marked with wrinkles or pits, and are more

Sainfoin (*Onobrychis sativa*).
(Stebler and Schroter, Best Forage Plants.)

or less prickly toothed at the margin. It is a spreading perennial, about two or three feet high, with leaves of nine to fifteen smooth acute leaflets, and spikes of beautiful flesh-coloured flowers, striated with rose-red, on long stalks. It is a native of the continent of Europe and of the south of England, and is much cultivated as a fodder-plant in dry, and particularly in calcareous soils, to which it is admirably adapted. Its cultivation was introduced into England in 1651; and before the introduction of turnip-husbandry the sheep-farmers of the chalk districts depended almost entirely upon it, as they still do to a large degree. It is, however, a very local crop, being scarcely cultivated on any but the most calcareous soils, where scarcely anything else is equal to it, although it has been found to succeed well on any soil sufficiently dry. There is no more nutritious fodder than sainfoin, whether for sheep, oxen, or horses. Even the dry stems of a crop which has produced seed are readily consumed by cattle, if cut into small pieces. Sainfoin is a deep-rooted plant and sometimes endures for ten, or even fifteen years on the same land—more generally only for four to seven years; and in the eastern counties of England it is often sown instead of clover on light and somewhat calcareous sands and sandy loams, and the ground is ploughed again in two or three years.—The name *sain-foin* probably means 'wholesome hay' (from Lat. *sanus*), and not, as is often assumed, a shortened form for *saint-foin* ('holy hay').

Saint, a name applied in the New Testament to the members of the Christian community generally, but restricted by ecclesiastical usage from very early times to those who have been specially remarkable for their personal virtues and their eminent services to the cause of religion. In the ages of persecution the quality which most of all challenged the admiration and reverence of the faithful was naturally constancy in the profession and the defence of the Christian faith; and the honours of the martyrs, even before the age of persecution had passed, were extended to confessors, and eventually to all who died in the odour of sanctity, and especially to those who also obtained the reputation of performing miracles. In general, however, the saints of the Catholic Church are distributed into several classes, chiefly in relation to the special character of the ecclesiastical offices

appropriated to their honour. Thus we find enumerated (1) Apostles and Evangelists; (2) Martyrs; (3) Confessors, a name applied primitively to those who had courageously undergone imprisonment or pains for the faith without gaining the final crown of martyrdom, but in later times understood of all who, not being martyrs, were eminent for sanctity of life; (4) Doctors or saints eminent for sacred learning; (5) Virgins; (6) Matrons and Widows. Anciently the title of Saint was bestowed upon an individual by the members of the particular Christian community to which he belonged, or to which his merits were most familiar. In the earliest times, however, the letters of St Cyprian show that caution was observed by the bishops to guard against the recognition of undeserving persons. It was not, however, till the 12th century that the pope reserved to himself the exclusive right to add to the roll of saints, or that a regular form of procedure was established in the Roman courts for the purpose of testing and of solemnly pronouncing upon the title of persons, who had died with a reputation for sanctity, to the public *cultus* of the church. A saint, according to the received interpretation, is one who has exercised the three theological virtues of faith, hope, and charity, and the cardinal virtues, prudence, justice, fortitude, in a heroic degree, and has persevered in this exercise until death. Sanctity may exist without miracles, as, according to the commonly alleged instance, there is no record of John the Baptist having wrought miracles; and, on the other hand, miracles may be performed by heretics or sinners. Nevertheless, by the existing discipline of the Roman Church, before a decree of Canonisation (q.v.) can be obtained, the rule requires evidence of such miracles as an expected fruit of heroic faith and as a confirmatory sign of sanctity after proof has been given of the heroic virtues.

It is difficult to estimate with anything approaching to exactness the number of saints who have received *cultus* as such in the various churches of Christendom from the earliest times. Of many almost all record has perished, except their names commemorated in some ancient calendar or preserved in the dedication of some church or sacred locality. The fullest list is that to be found in the index or general table in the sixty-first volume of the colossal work of the Bollandists (see ACTA SANCTORUM). From these tables it appears that by 1883 biographies or notices had been given of about 17,000 saints in the preceding sixty volumes—that is, up to the end of October; and further, that biographies or notices of some 3500 more remained to be given in the concluding volumes of the work then, as still, in process of completion. But the authority, however great, which is due to these researches is no more than the authority of learned men. The catalogue which possesses the highest ecclesiastical authority, and which has the character of a liturgical or church service-book, is that of the *Martyrologium Romanum*, revised by order of Gregory XIII. in 1586 by Baronius (q.v.), and frequently supplemented since. The breviary prescribes that the 'Martyrology' be read as part of the office of Prime wherever the office is solemnly sung in choir; and it is the custom, moreover, in religious communities to read the 'Martyrology' for the day publicly in the refectory. The 'Martyrology' is not, as its name might suggest, confined to the commemoration of martyrs only. It comprises the saints of every class to whom the Roman Church gives authentic recognition, and names some 2700 in all, including about twenty saints of the Old Testament, arranged as in a calendar according to the days of their celebration; while the recital for each day terminates with the clause, 'And in

other places of very many other holy martyrs, confessors, and holy virgins.' It is plain that of this multitude only a select few can have festivals assigned to them in the ecclesiastical year, or proper offices in the breviary or missal.

About two-thirds of every month in the Roman calendar is occupied with special saints' days, though, on some of these, minor saints are commemorated by a collect or prayer. But the Roman calendar is modified or supplemented in a greater or less measure in every national church, every diocese, and every religious order or community. Thus to the Roman breviary in England is added a supplement containing the offices of the English saints who sometimes displace or transfer to another day the saints of the Roman calendar. The fixed calendar of saints' days in use in various Catholic countries or communities thus varies considerably. At the end of the 1860 edition of Canon Hensenbeth's *The Emblems of Saints* will be found printed in parallel columns for purposes of convenient comparison eight such calendars—the Roman calendar, two old English calendars, the Scottish, the French, the Spanish, the German, and the Greek. It should further be noted that the actual calendar of saints' days in use in any given year can never quite correspond with the fixed calendar of this or that diocese or community. The great movable feasts determined by the annually varying date of Easter constantly disturb the order of the calendar, and lead to transferring the observance of a saint's day to some proximate *feria* or vacant day, and in some cases to extinguishing it altogether. The complicated rules which regulate these changes are based upon the different ranks accorded to the feasts—doubles of the first class, doubles of the second class, greater doubles, doubles, semi-doubles, and simples—in their relations to one another and to the Sundays and movable feasts which also have their various ranks.

Thus, to take an example of these variations at random, the 26th of May is the festival of St Philip Neri in the Roman calendar, but in England his place is taken by St Augustine of Canterbury, while St Philip is regularly transferred to the following day. On the other hand, in the churches of the Congregation of the Oratory the feast of their founder keeps his own day even in England, and St Augustine is postponed to 6th September. Again, the 26th of May is specially liable to be invaded by the occurrence of movable festivals. Thus, in 1877 the English churches had to transfer St Augustine to the 30th of the month, and St Philip Neri to the 23d of June. The result is that a special local 'ordo' is annually printed for the use of the clergy, and beyond the fixed calendar there is the ecclesiastical calendar corresponding to the clerical 'ordo' for the year.

In Christian art representations of the saints are often marked by the nimbus, aureole, or glory (see NIMBUS), and many of the saints are pictured as accompanied by emblems, by which they could readily be recognised. Apart from symbols which only typified the person indicated (as a shepherd for Christ, a gourd or a whale for Jonah), the figure of the saint is given with an added emblem. Thus the four evangelists were symbolised by four rivers, the four rivers of paradise. The adoption of the four living creatures (Rev. iv. 6) for the same purpose does not appear to have taken place till the 5th century; but soon it became a constant practice to represent St Matthew by or with the man, Mark with the lion, Luke with the ox, John with the eagle. The twelve apostles are depicted as twelve men, twelve sheep, or twelve doves. St Peter, for obvious reasons, is represented with the keys or with a fish; many of the saints with

the instruments by which they were martyred—St Paul with a sword; St Andrew with a Cross (q.v.); St Simon with a saw; St James the Less with a club; St Matthew with a lance; St Catharine with a wheel; St Lawrence with a grid-iron; others with objects connected with their history or in some other way—St George with a dragon; St Matthew with a purse. St James the Elder is figured as a pilgrim. Between 4000 and 5000 such emblems are given in Maurice and Wilfred Drake's *Saints and their Emblems* (1916). A martyr who had a special interest in a place was called its patron (See PATRON) as early as the 4th century; the possession of a relic was enough to constitute the saint a patron of its possessors. His being born in a place or having died there was a good reason for choosing the patron saint. The angels Michael, Gabriel, and Raphael were chosen patrons of churches as early as the 6th century. Trades and professions had their patrons, and every disease a saint gifted for its cure. The patron saint defended his votary, heard his prayer, helped him in difficulty, and even protected him at the day of judgment from the consequences of his sin. Husebeth's work, already mentioned, gives a list of patron saints of trades, professions, countries, and cities. Among well-known patron saints were St George of England, St Andrew of Scotland, St Patrick of Ireland, St David of Wales, St Denis of France, St James of Spain, St Nicholas of Russia, St Stephen of Hungary, St Mark of Venice. There are curious instances, especially in the 15th century, of armoial bearings assigned to certain English and other saints. The Catholic doctrine of invocation of the saints is treated at PRAYER; at RELICS the honour paid to relics of saints and martyrs is dealt with. See also ROMAN CATHOLIC CHURCH, and SYMBOL.

Besides the *Acta Sanctorum* of the Bollandists and *Antiqua Britannica* (1882, et seq.) their annual review, see Anna Jameson's *Sacred and Legendary Art* (1848, new ed. 1896); Alban Butler, *Lives of the Fathers, Martyrs, and other Saints* (1756-59), and later editions, including the corrected and amplified edition begun in 1926 by H. Thurston, S.J.; Baring-Gould, *Lives of the Saints* (15 vols. 1872-77, and later enlarged editions), and with Fisher, *Lives of the British (Celtic) Saints* (4 vols. 1907-13); *Lives of the English Saints* (1844-45), edited by Cardinal Newman; C. A. Jones, *Saints of the Prayer-book* (1885); R. Owen, *Sanctorale Catholicum* (1880); R. M. Stanton, *A Menology of England and Wales* (1888), which includes the English martyrs of the 16th and 17th centuries beatified by Pope Leo XIII.; for Irish saints, O'Hanlon (1877) and Whitely Stokes (1888); for Scottish, Forbes (1872) and Pinkerton (1789, new ed. 1889, translated from the Latin by W. M. Metcalfe, 1895); for Welsh, Rees (1853).

St Affrique, a town of the French department of Aveyron, 56 miles NW. of Montpellier, stands in a beautiful valley in the midst of meadows, orchards, and vineyards. There is a considerable trade in wool and in the celebrated Roquefort cheese (see ROQUEFORT). Pop. 6000.

St Albans, a city of Hertfordshire, 20 miles NNW. of London, on the top and northern slope of an eminence washed by the Ver, one of the chief feeders of the Colne, across which stood Verulamium. That important Roman station is perhaps identical with the fortress of Cassivellannus, destroyed in 54 B.C. by Caesar, and was taken by Boadicea in 61 A.D. In honour of the protomartyr Alban, said to have been beheaded here about 303 for sheltering the Christian priest Amphibalus, Offa, king of Mercia, in 793 founded a great Benedictine abbey, which from Pope Adrian IV. (q.v., born in the neighbourhood) obtained precedence over all other abbeys in England. Rebuilt after 1077 with flat Roman tiles from Verulam by Abbot Paul of Caen, and dedicated in 1115 in the presence of

Henry I., the abbey church, in spite of successive alterations (Early English, Decorated, Perpendicular), is still 'the vastest and sternest' of early Norman structures, its external length (543 feet) being second only to Winchester's, whilst the transepts measure 189 feet across, and the massive central tower is 144 feet high. It was made the cathedral of a new diocese in 1877, and in 1871-85 was very thoroughly (much too thoroughly, many think) 'restored' by Sir Gilbert Scott and Lord Grimthorpe (then Sir Edmund Beckett). Special features of interest are the substructure of the shrine of St Alban (its 2000 shattered fragments pieced together), the tombs of Duke Humphrey of Gloucester and 'Sir John Mandeville,' the superb presbytery reredos, and Abbot Ramirye's chantry. Of the forty abbots down to the Dissolution in 1539 the greatest was Cardinal Wolsey; Richard of Wallingford, called the 'father of trigonometry in England,' was abbot in 1326-35; and among the monks were Matthew Paris, Roger Wendover, Rishanger, and the other compilers of the *Chronica Monasterii S. Albani*, which, like the *Treatise of Dame Juliana Berners* (q.v.), was printed here during Abbot Wallingford's abbacy, and which has been edited for the Rolls series (25 vols. 1863-91). The third printing-press in England was established here in 1480 by an unknown printer called 'The Schoolmaster Printer.' The abbey gatehouse was in 1869 converted from a gaol to the purposes of King Edward VI.'s grammar-school, which till then had occupied the Lady Chapel; else, nothing remains of the monastic buildings. In St Michael's Church is Francis Bacon's monument; the 15th-century clock-tower was restored in 1864; and a drinking-fountain marks the site of an Eleanor cross, demolished in 1702. There are almshouses founded by the famous Duchess of Marlborough, a town-hall (1832), a cattle market (new premises 1926), and a public library (1880). The industries include straw-plaiting, brewing, boot and brush making, printing, and silk-manufacture. St Albans, which was disfranchised for bribery in 1852, was incorporated by Edward VI. in 1553, and had its municipal boundary extended in 1879 and again in 1913. It was the scene of two battles in the Wars of the Roses (q.v.)—the first, on 22d May 1455, a victory for the Yorkists; the second, on 17th February 1461, for the Lancastrians. Pop. (1851) 7000; (1901) 16,019; (1921) 25,593. Area of city, 2695 acres.

See Ashdown, *St Albans, Historical and Picturesque* (1894); Page, *St Albans* ('Story of the English towns') (1920); and works on the cathedral by Newcome (1793), Conyns Carr (1877), Neale (1878), Perkins (1903), Galbraith (1911), Williams (1917).

St Amand-les-Eaux, a town of France, dept. Nord, 8 miles NW. of Valenciennes, with hot sulphur-springs and a ruined abbey. Iron-founding, porcelain, and hosiery are the industries. Pop. 14,000.

St Amand Mont Rond, a town of France, dept. Cher, on the river Cher, 25 miles SSE. of Bourges. Important fairs are held here. Pop. 9000.

St Andrews, one of the smaller towns of Scotland, but no mean city in age, importance, or historical interest, stands on a rocky plateau at the edge of St Andrews Bay, Fife, and is 31 miles NNE. of Edinburgh. From the number and nature of the remains of ancient burial found in and around the city there can be no doubt that there was a settlement here in early prehistoric times. The monkish legend, long discredited, assigned its ecclesiastical origin to St Regulus (q.v.) or Rule, who, warned in a dream, brought certain bones of St Andrew from Patras in the 4th century, and was

wrecked at Muckros, afterwards called Kilrimont, now St Andrews. There is, however, reason for believing not only that those relics were brought in the 8th century, but that, before the end of the 6th, Cainnech or Kenneth, the patron saint of Kilkenney, had founded a monastery at Rig-Monadh, the Royal Mount, and that thus arose the name of Kilrimont. Early in the 10th century it seemingly became the seat of the 'Ardepscop Albain,' the high bishop of Alban; and in Malcolm Canmore's time he was known as 'the Bishop of the Scots,' a title which was retained until at least 1309. By a bull of Sixtus IV., St Andrews was erected into an archiepiscopal and metropolitan see in 1472. The Augustinian Priory, founded in 1144, was the richest and greatest of all the religious houses of Scotland. The Cathedral, founded in or about 1160 in presence of Malcolm IV., and consecrated in 1318 in presence of Robert the Bruce, was stripped of its images and ornaments in 1559, and afterwards fell into ruin. The extreme length inside is 355 feet, but at one time it had been several bays longer. The Bishop's Palace or Castle, first built in 1200, was frequently demolished and rebuilt, and is now a ruin. George Wishart and other martyrs were confined in its 'bottle-dungeon,' and Cardinal Beaton was slain within its massive walls. None of the ruins is less imposing but few are more interesting than the foundations on the Kirkhill—the site of the Celtic Church. St Rule's Tower has probably occasioned more discussion and perplexed more archaeologists than any other building in Scotland. Its arches, as well as that of its roofless chapel, approach the horseshoe in form. Most competent judges now assign it to the second quarter of the 12th century. The Parish Church, which was almost entirely rebuilt in 1798, and beautifully restored 1907-1909, was founded in 1412. Its predecessor, which stood near the cathedral, was built three centuries earlier. Of the Black Friars Monastery a portion of the church remains; but of the Grey Friars nothing save the well and part of the enclosing wall. The schools of St Andrews were noted in 1120; but the University, the first in Scotland, only dates from 1411. St Salvator's College was founded in 1455, St Leonard's in 1512, and St Mary's in 1537. St Salvator's and St Leonard's were united in 1747. The College of Dundee was affiliated in 1897. The average attendance of students, including those at Dundee, is about 680, and of these many are women, who have been admitted since 1892. The library contains over 150,000 volumes, and there is a good museum. The Parish Church of St Leonard's was deserted in 1760, and the congregation, after worshipping in St Salvator's Chapel until 1904, occupied their new church at the West End. Of Celtic stones the largest local collection in Scotland is housed in the Cathedral Museum, which was opened in 1909. The Madras College, founded and endowed by Dr Bell, has been remodelled, and in 1888 was placed under a new governing body. The town was erected into a free burgh between 1144 and 1153. In those days the inhabitants were described as Scottish, French, Flemish, and English. In 1526 it was reckoned one of the six 'principale townis of merchandice of this realm'; but it has now almost no trade. The small harbour is little used. For a number of years the fishers were increasing rapidly, but the steam-trawlers have proved too much for them. The manufacture of golf-clubs and balls is naturally a thriving industry, St Andrews being known all over the world as the headquarters of golf. There are four long courses and six short ones. It is a popular watering-place and summer-resort. The St Andrews group of burghs is now merged in East Fife. Pop. (1801) 3263; (1891) 6853; (1921) 9336.

Soc., 1889-90); Hay Fleming's *Martyrs and Confessors of St Andrews* (1887) and *Cathedral Museum* (1927); Maitland Anderson's *Historical Sketch of the University* (1878), *Matriculation Roll of the University: 1747-1897* (1905), and *Early Records of the University* (Scot. Hist. Soc., 1926); Herkless and Hannay's *College of St Leonard* (1905) and *The Archbishops of St Andrews* (5 vols. 1907-15); works by Martine (*Reliquie*, 1797), Grierson (1807), Lyon (1843), Roger (1849), A. Lang (1894), and Eric S. Robertson (1923).

Saint Arnaud, JACQUES LEROY DE, a French marshal, was born at Bordeaux, 20th August 1796, and became a soldier. He fought for the Greeks in 1822-26, but made his reputation in Algeria. In 1847 he was made a general of brigade; and in the early part of 1851 he carried on a bloody but successful warfare with the Kabyles. Louis Napoleon, plotting the overthrow of the republic, was at this time on the lookout for resolute and unscrupulous accomplices; and he recalled General Saint Arnaud and appointed him to the command of the second division of the city forces. On 26th October Saint Arnaud became war minister, and took an active part in the arrangements for the *coup d'état* of 2d December, and in the subsequent massacres at the barricades. For these services he was rewarded with the marshal's baton. On the breaking out of the Crimean war in 1854 he was entrusted with the command of the French forces, and co-operated with Lord Raglan in the battle of the Alma, 20th September. But nine days afterwards he died on board ship, on his way home to France. See his *Lettres* (ed. by his brother, 2 vols. 1864).

St Asaph, a little cathedral city of Flintshire, North Wales, on an eminence between the rivers Elwy and Clwyd, 6 miles SSE. of Rhyl. The cathedral, rebuilt after 1284, is a plain, cruciform, red sandstone structure, mainly Decorated in style, 182 feet long, with a massive central tower 93 feet high, and five oak stalls. It has a collection of early Bibles and Prayer-books, and was restored by Scott in 1867-75. St Kentigern (q.v.) is said to have founded about 560 a bishopric at Llanelwy, renamed St Asaph after his favourite disciple. Among bishops have been Reginald Pecock; W. Morgan, the first translator of the Bible into Welsh; Isaac Barrow the elder, on whose monument is a request for prayers for his soul; W. Lloyd, one of the Seven Bishops; Thomas Tanner; and S. Horsley. In 1920 Dr Edwards, Bishop of St Asaph, was enthroned as the first archbishop of the newly constituted Church in Wales. St Asaph has a grammar-school, founded about 1600, and rebuilt in 1882. Pop. 1800.

St Augustine, an ancient Spanish town on the east coast of Florida, now the capital of St John's county, stands on Matanzas Sound, 2 miles from the Atlantic and 37 miles by rail SSE. of Jacksonville. It was founded in 1565, and is the oldest town in the United States. Its mild and equable climate renders it a favourite winter-resort for invalids. It is a Roman Catholic bishop's see. Pop. 6000.

St Austell, a town of Cornwall, 14 miles NE. of Truro and 1½ NW. of the head of St Austell Bay. It is the centre of the kaolin or china-clay industry, and has a church (13th to 16th century), restored in 1870. Pop. 3000.

St Bartholomew, or ST BARTHELEMY, a French West Indian island, 190 miles E. of Porto Rico. Area, 8 sq. m.; pop. 3000. The treeless surface rises to 1003 feet; the climate is very dry. French from 1648 till 1784, the island then was Swedish till 1877, when it was bought back by France for £16,000.

St Bees, a coast village of Cumberland, 4½ miles S. of Whitehaven by rail and 3 S.E. of St Bees Head (300 feet). A nunnery founded about 656 A.D. by an Irish princess, St Begha, appears to have been destroyed by the Danes, and to have been reconstituted as a Benedictine priory in the reign of Henry I. St Bees Theological College, established in 1816 by Dr Law, then Bishop of Chester, was closed in 1896. Near the church is a grammar-school founded by Archbishop Grindal in 1587, and reconstituted in 1881.

St Benoit, a town on the east coast of the island of Réunion; pop. 11,000.

St Bernard, the name of two mountain-passes in the Alps. (1) **GREAT ST BERNARD** is on the road between Aosta in Piedmont and Martigny in the Swiss canton of Valais, and is 8120 feet above sea-level. The pass was used by the Celts and Romans, and in the Middle Ages was much frequented by pilgrims and clerics journeying to Rome. In 1800 Napoleon entered Italy with 40,000 troops by the St Bernard. Almost on the crest of the pass stands the celebrated hospice founded in the 10th century by St Bernard de Menthon for the benefit of pilgrims. The hospice is connected with a station in the valley below, from which the Augustinian monks above are warned by telephone when travellers are on their way up the mountain. The monks are assisted by lay-brothers; their work is, with the aid of large dogs, to rescue travellers who are in danger of perishing from the snow and cold. The dogs used are the short-coated variety of the 'St Bernard dog' (see next article). The rigorous cold and the difficulty of breathing the rarefied air frequently do permanent injury to the health of the monks in charge. (2) **LITTLE ST BERNARD**, S.W. of the above in the Graian Alps, connects the valley of Aosta with that of Tarentaise in Savoy. By this pass Hannibal is thought by some to have led his forces into Italy. (See ALPS.) It too has a hospice, 7143 feet above the sea.

St Bernard, a breed of dogs which derives its name from the hospice of St Bernard, where it was first introduced for the purpose of finding the pass across the mountain in snow. Every morning during the winter two dogs, one old and one young, accompanied by one or more of the monks or attendants, started from the monastery for the shelter at the foot of the mountain on the Italian side; a similar party of men and dogs also descended to the shelter at the Swiss end of the pass. If any travellers were found there they were helped on their way to the hospice, the dogs going on before to show the road. Possibly, on rare occasions, the dogs were allowed to go down to the valley by themselves, but as a rule they only acted as guides to the monks. Pictures and stories of the dogs laden with food and clothes, and sometimes actually carrying a benumbed traveller, are plainly due to the exaggeration of their admirers.

The St Bernard, according to the traditions of the monastery, is the result of a cross between a Danish bull-bitch and a mastiff, a native hill dog, though at what time effected it is impossible to say. After the breed was once established it was kept pure until 1812, when owing to the severity of the winter the monks were obliged, contrary to their usual custom, to send out the brood-bitches as well as the dogs, with the result that all the females succumbed to the cold, and the monks found themselves without the means of continuing the true breed. In this extremity a cross with the Newfoundland was tried, but at first failed, owing to the excessive coat of the Newfoundland, which hampered the dogs in snow; however, by breeding back to their own short-coated dogs, the monks

obtained the desired shortness of coat, though occasional specimens were born with rough coats. These rough-coated specimens were sold or given away to the inhabitants of the surrounding valleys, who continued to breed them, so that St Bernard dogs soon became general in Switzerland. About 1860 these dogs first attracted the attention of English travellers, who imported them to Britain, where they were exhibited and at once excited much notice on account of their size and beauty. Others were introduced, and the St Bernard was soon established as the most popular big dog. The St Bernard, as bred to modern English ideas, is an immense red or orange coloured dog, marked with white on muzzle, neck, chest, feet, and tip of tail. The head should be massive and imposing, with a strong square muzzle, a point of great importance. Legs should be straight, with large feet, and double or, at least, single dew claws. Hind-feet should turn out, though not sufficiently to hinder the dog's movements. The coat of the rough variety is of medium length; it should not be too curly. In the smooth variety the coat should be short and wiry. Many of the finest St Bernards measure over 30 inches high at the shoulder, and weigh over 150 lb. On account of his great size and weight the St Bernard often moves in an awkward manner, a defect which should be avoided. St Bernards, as a rule, are good tempered, though many are not to be trusted.

St Brieuc, a town of Brittany, the capital of the department of Côtes du Nord, on the Gouet, 2 miles from its mouth in the English Channel, and 93 E. of Brest. It has a port, Le Légué, at the river's mouth; a cathedral, dating from the 13th century; and a quaint old quarter with picturesque houses. In 1689 James II. assembled his French forces here for the invasion of Ireland, and in 1840 it was the birthplace of Villiers de l'Isle Adam. There is a trade in coal, bricks, iron-work, and agricultural produce. Pop. 25,000.

St Catherine's, a city of Ontario, chief town of Lincoln county, on the Welland Canal by rail 32 miles E. by S. of Hamilton and 5 S. of Port Dalhousie on Lake Ontario. It has large manufactures of machinery and agricultural implements, with saw-mills and weaving. Its mineral springs are noted. Pop. 20,000.

St Chamond, a town of France, dept. Loire, 7 miles N.E. of St Étienne by rail, has manufactures of ribbons, silk, and iron, with naval and military workshops, and important dyeing industries. Pop. 16,000.

St Charles, capital of St Charles county, Missouri, on the high north bank of the Missouri River, 23 miles by rail (44 by river) N.W. of St Louis. It has steel-die works and a railroad-car factory. Pop. 8000.

St Christopher, popularly **St Kitts**, one of the Leeward group, British West Indies, lies 45 miles N.W. of Guadeloupe. It is long (22 miles) and narrow (6 miles), and is traversed by a chain of rugged mountains (Mount Misery, 3700 feet); area, 65 sq. m. The capital is Basseterre (q.v.), with a population of about 7700. Sugar culture is the chief industry; sugar, rum, and syrups are exported. Cotton-growing has developed rapidly, and other products are tobacco, salt, and coconuts. Administratively St Kitts forms a presidency along with Nevis (q.v.) and Anguilla (q.v.). The government rests with an administrator, nominated executive council, and a legislative council of seven official and seven nominated unofficial members. Pop. (1921) 38,214, about five-eighths in St Kitts. This island, whose native Carib name meant the 'fertile island,' was discovered in 1493

by Christopher Columbus, who named it from a fanciful resemblance of its outline to statues of his patron saint, St Christopher. Colonised by French and British settlers simultaneously in 1623, it passed wholly into the possession of Britain in 1713. The French both before and after that date held it for short periods. A terrible hurricane swept the island in 1899. See Mrs Burdon's *Handbook of St Kitts-Nevis*.

St Clair, a navigable river of North America, in the line of the Great Lakes, and carrying (225,000 cubic feet per second) into Lake St Clair the waters of Lake Huron. It is over 40 miles long, and half a mile broad. In 1891 a railway tunnel under its bed was completed between Port Huron, Michigan, and Sarnia, Ontario, 20 feet in diameter, and 6026 (including excavated approaches, 11,553) feet long. Lake St Clair is 26 miles long and 25 wide, has an area of 410 sq. m., and from its south-west end passes the volume of water it has received into Lake Erie by means of the Detroit.

St Claude, a town in a valley surrounded by hills, in the French department of Jura, with a pop. of 13,000, largely occupied with turner's work (briar pipes, chess-men, yard measures, &c.), gem-cutting, and cabinet-making. The monastery dates from 430 A.D.

St Cloud, a town of France, dept. Seine-et-Oise, situated on an eminence on the left bank of the Seine, in the western outskirts of Paris. Henry III. was assassinated here in 1589. St Cloud was long famous on account of its magnificent château, built by Louis XIV.'s brother, the Duke of Orleans. Napoleon planned and carried out here the *coup* of 18th Brumaire, and after he became emperor made this château his favourite place of residence. It was destroyed, and its magnificent park (in which stands the Sèvres porcelain-factory) greatly injured, during the siege of Paris in 1870. Pop. 12,000.

St Croix, an American river, called also the Passamaquoddy and the Schoodic, which, flowing out of Grand Lake, on the eastern border of Maine, runs south-east 75 miles to Passamaquoddy Bay, and forms a portion of the boundary between the United States and New Brunswick.

St Cyr, a village of France, dept. Seine-et-Oise, about 2 miles by rail W. of Versailles. It owes its origin to an educational institution for poor girls of good birth, founded by Louis XIV., at the suggestion of Madame de Maintenon. It was for its 250 pupils that Racine wrote his tragedies of *Esther* and *Athalie*. Madame de Maintenon died here, and was buried in the choir of the church. The institution was suppressed at the Revolution; and in 1806 the buildings were converted by Napoleon into a military school, which still exists. Pop. 6000.

St Davids, a 'city' of Pembrokeshire, South Wales, in the westernmost corner of the Principality, on the rivulet Alan, within 1½ mile of St Brides Bay and 16 miles WNW. of Haverfordwest station. The ancient *Meneria*, it is now a mere village; but in the middle ages its cathedral, with the shrine of its founder, St David (q.v.), the patron saint of Wales, attracted many pilgrims, among them the Conqueror, Henry II., and Edward I. and Queen Eleanor. Rebuilt between 1180 and 1522, that cathedral still is mainly Transition Norman in character, a cruciform pile, measuring 298 feet by 131 across the transepts, with a central tower 125 feet high. It is the largest, finest, and most interesting church in Wales. Special features are the reddish-hued stone, the richly ornamented nave with oak ceiling, the rood screen (c. 1338), the lantern, the base of St David's shrine, the tomb of Edmund Tudor, Henry VII.'s father, the mosaics by

Salviati, and Bishop Vaughan's chapel. The west front was rebuilt by Nash in 1793; and the whole was restored by Scott in 1862-78. Little is known of the British bishops after St David's death in 601; of bishops since 1115 may be mentioned Gower, Houghton, Chichele, Ferrar the Marian martyr, Davies, Archbishop Laud, Bnll, Horsley, and Thirlwall. North of the cathedral is the ruined college of St Mary (1377), with a slender tower 70 feet high; and across the Alan are the magnificent remains of Bishop Gower's palace (1342). A restored cross, the shattered Close wall, and the imposing Tower Gate deserve notice, and also St Davids Head, rising 100 feet above the sea.

St Denis, a town in the French department of Seine, 4 miles N. of Paris, has manufactures of printed calicoes, flour, chemicals, machinery, white-lead, and other commodities. A famous sheep and parchment fair, founded in the 7th century, was held up to 1552. The town is supposed to date from the foundation of a chapel raised above the tomb of St Denis (q.v.). This chapel was replaced in the 7th century by an abbey, built by Dagobert I., who was buried in its church, which thereafter became the mausoleum of the kings of France. The existing abbey church was begun by Abbot Suger in 1137, more or less finished during the next century, much damaged at the French Revolution, and skillfully restored by Viollet-le-Duc from 1848 onwards, though it suffered again in the bombardment of the town by the Germans in 1871. Monuments were erected above each of the royal tombs by St Louis, and the series was continued in after ages, but there are no tombs later than Henry II., the Bourbon coffins being placed in the crypt without monument in the church, which contains a magnificent stone altar. The most magnificent of these memorials are the tombs of Louis XII. and his queen, Anne of Brittany, of Francis I. and Claude, and of Henry II. and Catharine de' Medici. The abbey was plundered by the English in 1430. Napoleon converted it into a school for the daughters of officers of the legion of honour. During the Revolution, in 1793, the royal tombs were rifled and demolished, and the bodies cast indiscriminately into ditches prepared for them. Pop. (1872) 31,850; (1920) 76,358.

St Denis, the capital of Réunion (q.v.).

St-Dié, a town of the French department of Vosges, stands on the Meurthe, 50 miles by rail SE. of Nancy, possesses a Romanesque-Gothic cathedral, a large seminary, and a museum, and carries on energetically the weaving of cottons, woollens, and silks, embroidery, dyeing, the making of lace, machinery, and metal goods. It is a convenient starting-point for excursions into the Vosges. Pop. 20,000.

St Dizier, a town of France (dept. Haute-Marne), 38 miles by rail SE. of Châlons, is situated on the Marne, which here begins to be navigable. In 1544 it resisted for some weeks the army of Charles V., and in 1814 the French twice defeated and were twice defeated by the invading allies. There are iron forges and foundries, engineering yards, and copper and bronze works. Pop. 16,000.

St Domingo. See HAYTI, SAN DOMINGO.—St Domingo Bark is one of the names for Caribbean Bark (q.v.).

Ste Anne de Beaupré, a Canadian village at the junction of the river Ste Anne with the St Lawrence, 22 miles NE. of Quebec. From the 17th century it has been celebrated as a Catholic place of pilgrimage, and miraculous cures are still alleged. The basilica was burned down in 1922. Pop. 1600.

Sainte-Beuve, CHARLES-AUGUSTIN, critic, was born at Boulogne-sur-Mer in 1804. His father, commissioner of taxes in the town, a man of literary tastes, died three months before the birth of his son, but it was from him that Sainte-Beuve deduced the leading bent of his own character and talent. His mother was the daughter of an Englishwoman who had married a Boulogne sailor. She was a woman of character and practical sense, but with so little regard for any ideal interests of life that she was never reconciled to her son's choice of a literary career till his election as a member of the Academy in his forty-first year. Her husband had left her in straitened circumstances, and it was only by considerable sacrifice on her part that her son received the advantage of a liberal education.

Till his fourteenth year Sainte-Beuve attended the school of a M. Blériot in Boulogne, where he received a thorough grounding in Latin, and where he gave unmistakable proofs of unusual gifts. By his own desire he was then sent to Paris, where, boarding with a freethinking professor, M. Landry, he attended the Collège Charlemagne. At this school also he gave further promise of future distinction. Though he had thus shown such special aptitudes in the direction of literature, for the next three years (1824-27) he followed a course of medical study, and for another year even walked the hospitals—apparently out of deference to his mother's wishes.

It was in 1824, when Sainte-Beuve was in his twentieth year, and while he was still a medical student, that he began that career as a man of letters which he was to follow with such assiduity and devotion to the end. In that year M. Dubois, who had been one of his teachers at the Collège Charlemagne, founded a literary and political paper called the *Globe*. Supported by such writers as Jouffroy, Kérusat, Ampère, and Mérimée, the *Globe* became one of the leading organs of the day, and was hailed by Goethe as heralding a new departure in the intellectual life of France. On the invitation of Dubois, who had recognised the promise of his pupil, Sainte-Beuve took his place on the regular staff of contributors. For three years he wrote short articles on various subjects, which were collected after his death, and published under the title of *Premiers Lundis*. With the doctrinaire attitude of the chief contributors of the *Globe* Sainte-Beuve was never in complete sympathy, and in 1827 he came under a new influence, which forms one of the turning-points in his life. In that year he wrote a eulogistic review of the *Odes et Ballades* of Victor Hugo, which led to the closest relations between the poet and his critic. Under the influence of Hugo, Sainte-Beuve became for a time the zealous advocate of that romantic movement of which Hugo was the acknowledged leader, and of which Sainte-Beuve himself was eventually the most judicious critic. As a member of the romantic *cénacle* which counted in its number Hugo, Lamartine, De Musset, and Alfred de Vigny, Sainte-Beuve embodied his new ideals and his new experiences both in poetry and prose. In 1828 he published his *Tableau de la Poésie Française au Seizième Siècle*, with the double object of justifying the romantic movement and of directing attention to what was of real value in the French poetry of the 16th century. In 1829 and 1830 successively appeared *Vie et Poésies de Joseph Delorme* and *Les Consolations*, poems which, while they show intellectual subtlety and ingenious fancy, are fraught with morbid feeling strangely dissonant from the buoyancy and serenity of the writer's later years. In 1829, also, in the pages of the *Revue de Paris*, the predecessor of the *Revue des Deux Mondes*, he began the first of those longer critical articles on French literature which, under

the name of *Causeries*, he was afterwards to carry to such perfection.

The revolution of July 1830 brought Sainte-Beuve under a new set of influences. The *Globe* now passed into the hands of the Saint-Simoniens, and for a year he became one of its contributors under the new direction. All his life Sainte-Beuve had a keen interest in questions relating to the well-being of the people; but his new colleagues soon passed the limits of his sympathy, and we find him for the next three years on the staff of the *National*, then edited by Armand Carrel. An article by Sainte-Beuve in that journal, which was the organ of extreme republicanism, led to a rupture with the editor, and he discontinued his contributions. It was during this period (1830-36), also, that Sainte-Beuve became a sympathetic listener of one of the most interesting men of the century, the famous Lamennais. In his later years Sainte-Beuve insisted that the foundation of his intellectual life was the French materialism of the 18th century; yet both his relations with Lamennais and his private correspondence prove that at this period of his life, at least, religious questions seriously engaged his attention. With the extreme democratic opinions of Lamennais after his breach with Rome Sainte-Beuve could have no sympathy, and by 1836 their intimate relations ceased. Later in life he expressed himself very frankly regarding Lamennais' career, but his final judgment is virtually that of all judicious critics. His solitary novel, *Volupté* (1834), also belongs to this period of his life, a period apparently of mental and spiritual unrest. In 1837 he proceeded to Lausanne, where he delivered a series of lectures on the history of Port-Royal. Subsequently, as the result of the intermittent labour of twenty years, these lectures took the shape of a book of five volumes, which contain some of Sainte-Beuve's finest work. Whereas in the first two volumes, however, he is to a certain extent in sympathy with Jansenism, in the last three his point of view is that of the purely disinterested critic. At Lausanne Sainte-Beuve was deeply impressed by the character and views of Alexandre Vinet, and, though he eventually diverged far from Vinet's teaching, he treasured his memory as one of the noblest hearts and minds it had been his fortune to know. During his stay at Lausanne Sainte-Beuve produced his last volume of poetry, *Pensées d'Avril*.

From 1840, according to Sainte-Beuve himself, dates a new departure in his criticism. Thenceforward he claims to have been master of himself, and in his own words to be the disinterested 'naturalist of minds.' In that year he was again in Paris, where an appointment as keeper of the Mazarin Library brought him a modest competence, which saved him from the necessity of hasty production. During the next eight years he wrote mainly for the *Revue des Deux Mondes*, to which he had been an intermittent contributor since its foundation in 1831. As one of the most distinguished literary workers of the day, he was in 1844 elected member of the French Academy, his eulogium being pronounced by Victor Hugo. The political confusions of 1848 led Sainte-Beuve to accept the professorship of French literature at Liège, where he delivered a course of lectures afterwards published under the title of *Chateaubriand et son Groupe Littéraire sous l'Empire*. In 1849 he returned to Paris, when he entered on an engagement which was to afford him the precise sphere he needed for the adequate display of his powers and attainments as a literary critic. This was to write for the *Constitutionnel* an article on some literary subject to appear on the Monday of every week. For the next twenty years Sainte-Beuve,

with little intermission, carried on this task. On Monday he settled down to his task, and on five successive days worked for twelve hours at the preparation of his materials and the composition of his article. Saturday he devoted to a careful revision of proofs, and on Sunday he allowed himself a holiday. In 1861 these *Causeries du Lundi*, as they were called, were transferred to the *Moniteur*, an official organ of Napoleon III.; in 1867 back to the *Constitutionnel*, and finally in 1869 to the *Temps*. The papers thus written make up in all twenty-eight volumes, of which the first fifteen are entitled *Causeries du Lundi*, and the succeeding volumes *Nouveaux Lundis*.

By his acceptance of the government of Napoleon III. Sainte-Beuve gave offence to many of his former friends; but his justification was that forms of government were indifferent to him provided he might pursue his own objects in peace. In 1854, on the occasion of his appointment as professor of Latin Poetry at the Collège de France, the students refused to listen to his lectures, and he was forced to demit both the office and its emoluments. The lectures he intended to deliver, a critical estimate of Virgil, were subsequently published as a separate volume. Nominated a senator in 1865, he regained popularity by his spirited speeches in favour of that liberty of thought which the government was doing its utmost to suppress. In his last years Sainte-Beuve lived the life of a hermit in his modest house in the Rue Moutparnasse though he counted among his friends and admirers the first men of letters in France. He died on 13th October 1869 of a malady from which he had long suffered. It was his special instruction that he should be buried without religious ceremony and without the customary eulogium. His funeral, however, was attended by a multitude estimated at ten thousand, but the only words pronounced at his grave were—'Adieu, Sainte-Beuve; adieu, our friend.'

It is by the amount and variety of his work, and the range of qualities it displays, that Sainte-Beuve holds the first place among literary critics. Others have equalled or surpassed him in individual effects; where he is unapproachable is in his faculty of educing the interest and significance of the most various types of human character, and the most various forms of creative effort. To his marvellous insight, range of sympathy, and knowledge of detail he added an experience of men and things exceptionally rich and varied for one whose main function was literary criticism. But, besides their value as criticism, the works of Sainte-Beuve are an inexhaustible mine of facts and reflections bearing on every interest of human life. Regarded in its totality, his work is in its essential tendency identical with that of Montaigne. In both we have the point of view of the uncommitted observer, the same many-sided presentment of life, the same inconclusive philosophy; and in both a personal character equally void of every heroic element. Supreme as he is in his own department, however, Sainte-Beuve is not a European man of letters like Erasmus, or Voltaire, or Renan. The subjects he treated were not of universal interest, and his literary methods are as far as possible from the simplicity and directness which are the crowning qualities of these three writers. Nevertheless, the work of Sainte-Beuve marks an epoch in the intellectual history of Europe. By its delicacy, subtlety, and precision it extended the limits of the study of human character and of the products of human intelligence.

The chief authorities for the life of Sainte-Beuve are the Lives by Levallois (1872) and D'Haussonville (1875). See also Sainte-Beuve's own 'Ma Biographie' in *Nouveaux*

Lundis, vol. xiii.; the *Souvenirs* by Troubat (Sainte-Beuve's last secretary; 1890); and studies by Vathier (1892), Faguet (1900), Spoelberch de Lovenjoul (1901), and Michaut (1906). The works of Sainte-Beuve are: *Tableau Historique et Critique de la Poésie Française et du Théâtre Français au XVI^e Siècle*; *Poésies Complètes* (2 vols.); *Volupté*; *Port-Royal* (7 vols. 1860); *Chateaubriand et son Groupe Littéraire sous l'Empire* (2 vols. 1860); *Critiques et Portraits Littéraires* (5 vols.); *Portraits Contemporains* (5 vols.); *Portraits de Femmes*; *Causeries du Lundi* (15 vols.); *Nouveaux Lundis* (13 vols.); *Souvenirs et Indiscrétions*; *Premiers Lundis* (3 vols.); *Les Cahiers de M. Sainte-Beuve*; *Chroniques Parisiennes*; *Lettres à la Princesse*; *Étude sur Virgile*; *Le Général Jomini*; *Monsieur de Talleyrand*; *P. J. Proudhon, sa Vie et sa Correspondance*; *Correspondance de C. A. Sainte-Beuve* (2 vols.).

Sainte-Claire Deville, HENRI ÉTIENNE, French chemist, was born on 11th March 1818, in St Thomas, West Indies, and was educated in Paris. In 1844 he was commissioned to organise the Faculty of Sciences at Besançon, and in 1851 obtained the chair of Chemistry in the Normal School at Paris, and shortly afterwards the similar chair to the Sorbonne. He died in Paris on 1st July 1881. He began his work as a chemical investigator by inquiring into the composition of certain resins, but soon transferred his energies to the investigation of metallurgic substances. It was Sainte-Claire Deville who first produced aluminium (1855) and platinum in commercial quantities, and demonstrated the general theory of the dissociation of chemical compounds at a high temperature. Amongst other results that were due to his skill and ingenuity, he discovered (1849) anhydrous nitric acid; examined the forms of boron and silicon; devised methods for fusing platinum, iridium, cobalt, &c.; determined the density of metallic vapours at exceedingly high temperatures; produced artificially sapphire, aluminium, and similar substances; and invented a way of getting crystallised oxides. His labours for producing globules of aluminium, which he exhibited at the Paris Exhibition of 1855, were in continuation of Wöhler's, dating from 1827. The platinum metals he studied along with Debray. His papers were published in *Comptes Rendus* of the Academy of Sciences, and in *Annales de Chimie*. He also published *De l'Aluminium* (Paris, 1859), and *Métallurgie du Platine* (2 vols. 1863).

Sainte Croix. See SANTA CRUZ.

St Elias, MOUNT, a great volcanic mountain close to the border between Canada and Alaska, 8,024 feet high. Long believed to be the highest mountain in North America, it is exceeded by Mount Logan, inside the Canadian line, 19,539 feet, and by Mount McKinley in Alaska (400 miles to the NW.), 20,464 feet. Mount St Elias is clothed almost from base to summit with eternal snow. There are huge glaciers and utterly impassable precipices and yawning chasms; but in 1897 the ascent to the summit was successfully made by Prince Luigi of Savoy, and the feat has been repeated more than once since. The forest covering the greater part of the lowlands near the Malaspina glacier at the base of St Elias extends over a moraine, and thence for four or five miles over the surface of the glacier.

Sainte Marie-aux-Mines. See MARKIRCH.

Saintes, an old town of France, dept. Charente-inférieure, on the left bank of the Charente, 28 miles by rail SE. of Rochefort, has manufactures of earthenware, pottery, bricks, and tiles. In ancient times this town, under the name of *Mediolanum*, was the capital of the Santones, from whom the subsequent province derived the name of Saintonge (see ROLAND). Its interesting Roman remains include a triumphal arch and the

ruins of an amphitheatre. It was a bishop's seat down to 1790; the cathedral still stands. Palissy's home was at Saintes during the first fifty years or so of his life. Pop. 19,000.

St Étienne, one of the most important industrial towns in France, capital of the department of Loire, stands on the Furens, a tributary of the Loire, 36 miles by rail SW. of Lyons and 312 SSE. of Paris. It is built in the midst of the second largest coalfield of France. The town, which looks thoroughly grimy, has few buildings of interest; but a school of mines (1816), a national small-arms factory (1764), a gallery of art, an artillery and a commercial museum may be mentioned. The chief industries are in iron and steel and in ribbons. Its workshops turn out steel and iron plates, gun-armour, dynamos, bicycles, iron masts, large castings for machinery, firearms, locks, cutlery, files, nails, tools, &c. Large numbers of craftsmen, mostly hand-workers in their own homes, or operatives in small factories with looms driven by electricity, are engaged in the town and its vicinity in making ribbons, laces, fringes, and similar ornamental work. Besides these branches of industry pottery and glass are manufactured. Pop. (1800) 16,000; (1851) 53,741; (1891) 133,443; (1921) 107,967. The coal-mines were worked in the 14th century, but extensively only in the end of the 18th. The town was twice captured by the Huguenots, in 1563 and 1570, and between this last date and 1629 it suffered terribly on three occasions from the plague. The first railways in France were built from St Étienne, one in 1828 to Andrézieux, the other in 1831 to Lyons.

St Eustatius (commonly called *Statia*), a Dutch West Indian island, 10 miles NW. of St Christopher. Area, 8 sq. m.; pop. 1300. See CURAÇAO.

Saint-Évremond, CHARLES MARGUETEL DE SAINT-DENIS, SEIGNEUR DE, a famous French writer and wit, was born at St Denis near Coutances in Normandy, 1st April 1613. He was educated by the Jesuits at the Collège de Clermont, at Caen, and at the Collège d'Harcourt, next entered the service, and fought with distinction at Rocroi, Freiburg, and Nördlingen. He gave steady support to the throne throughout the Fronde, but in 1661 had to flee first to Holland, finally to England, on the discovery of his witty and sarcastic Letter to Créqui on the Peace of the Pyrenees. He was warmly received by Charles II., and here he spent the rest of his days, delighting the world with his wit, a fast friend of the beautiful Hortense, Duchesse de Mazarin, whose strange death sorely troubled his old age. Here he died, 29th September 1703, and was buried in Westminster. His writings were famous long before they were made public, and in his own day he enjoyed an equal reputation on either side of the Channel for polished satire, Attic irony, and brilliant style. Distinctively a man of fashion, a complete Epicurean in philosophy and life, a brilliant conversationalist in an age when conversation ranked among the fine arts, he has written his name high amongst the masters of French prose, although he lacked enthusiasm, ambition, motive, to produce anything adequate to his gifts. Still, it is a sovereign distinction to have created a style so delicate, yet so effective and so individual. His one mannerism is antithesis, yet the art is so exquisite as never to offend. His satire, *La Comédie des Académistes* (1644), is a masterpiece in its kind, and his dissertation on Racine's *Alexandre* reveals the true critic's insight. But so little was his curiosity that though he lived nearly forty years in England he never learned English and never knew Shakespeare. The letters betwixt him

and his dear friend Niwon de Lenclos are charming. His writings, including essays, comedies, &c., were first collected by Des Maizeaux with a Life (Lond. 1705). There are good volumes of selections by C. Girard (1865) and Lescure (1881).

See the studies by Gilbert and Gidel (1866), Merlet (1870), Pastorello (Trieste, 1875), Maodé (1894); also Sainte-Beuve's *Nouveaux Lundis*, vol. xiii., and *Ciceroes du Lundi*, vol. iv.

St Flour, a town in the French department of Cantal, finely situated on a steep basaltic plateau (3000 feet) 50 miles S. of Clermont-Ferrand, has a cathedral (Gothic; 1375-1466), and manufactures gloves and cloth. Pop. 5000.

St Gall. See SANKT GALLEN.

Saint-Gaudens, AUGUSTUS (1848-1907), American sculptor, was born in Dublin of French and Irish stock, but was carried to New York in infancy with his family, and trained a cameo-cutter. In 1867-73 he studied sculpture in Paris and Rome, being the first American sculptor who had enjoyed a complete artistic training in European schools. His monuments to Farragut and Sherman at New York, to Lincoln and General Logan at Chicago, to Colonel Shaw at Boston, to R. L. Stevenson at Edinburgh are famous; as also his 'Puritan,' 'The Peace of God,' and his 'Diana.' See his *Reminiscences* (1913), books on him by Cortissoz (1907) and Hind (1908), and works on American sculpture by Cadin (1903) and Taft (1904).

St Germain-des-Prés, named from Germanus (q.v.), was a famous Benedictine monastery near Paris (see MAURISTS). Its church (1001-1163) ranks as the oldest in Paris.

St-Germain-en-Laye (in English books often ST GERMAINS), dept. Seine-et-Oise, stands on an eminence above the Seine, with a royal forest (10,000 acres) behind it, the river before it, and Paris 13 miles to the E. Above the river runs the famous terrace (2625 yards long by 115 feet wide), made by Lenôtre in 1672. The historic associations cluster round the old royal castle, which, until Louis XIV. removed the court to Versailles, was the favourite residence of the kings of France. Here were born Henry II., Charles IX., Louis XIII., and Louis XIV., and here died Louis XIII. King James II. of England lived in this castle from 1689 to his death in 1701. After that it was turned into barracks, then into a military prison, and finally by Napoleon III. into a museum of Gallo-Roman antiquities. Peace was signed within its walls between Charles IX. and the Huguenots in 1570, between France and Brandenburg in 1679, and between Austria and the Allied Powers in 1919. The Fête des Loges, one of the most popular of popular festivals, is held annually at a chapel in the forest. The people (20,000 in all) manufacture woollens and cottons.

St Germans, formerly the seat of the ancient diocese of Cornwall, now a small village, stands on the slope of a hill, on a branch of the river Lynher, 9½ miles W. by N. of Plymouth. Its fine parish church has an excellent Norman west front.

St Gilles, a town of France, dept. Gard, is situated on the Canal de Beaucaire, 12 miles SSE. of Nîmes. Its abbey church, the west front of which is a masterpiece of Romanesque architecture, and is covered with the richest decoration, dates from 1116. Pope Clement IV. was born here. Pop. 6000.

St Gotthard, a mountain-knot of the Alps, has its feet planted in the Swiss cantons of Uri, Grisons, Ticino, and Valais, and lifts its head, 9850 feet high, to the eternal snows. In its arms it holds the sources of the rivers Rhine and Rhone, Ticino and Reuss, and so sends the water from its melted snows to the German Ocean, the Mediter-

anean, and the Adriatic. On its shoulder it bears one of the most celebrated of the Alpine passes from Switzerland to Italy. The road that crosses this pass (6936 feet) leads from the shores of Lake Lucerne to the shores of Lago Maggiore. This route was first used by the Longobardi in the 6th century. The name is taken from St Gotthard, bishop of Hildesheim (d. 1038). In the days of Charlemagne the path was made practicable for pack-animals; but down to 1820 it was not wider than 13 feet. In 1820-30 it was widened to 18 feet and smoothed for carriages. Near the summit of the pass stand two hotels and a hospice, the latter for poor wayfarers, of whom some 12,000 used to travel this way every year. Since 1882, however, a railway has climbed up the lower slopes of the St Gotthard, and then burrowed through it in a tunnel. The making of this tunnel was begun in 1872 and finished in 1880; it extends from Göschenen (at a height of 3639 feet) in Uri to Airolo (3757 feet) in Ticino, measures 9½ miles in length, is 26 feet wide and 21 high, rises with a gradient that reaches on an average 26 in 100 feet. A mountain railway crosses the pass at right angles, running from Chur (Coire) to Brigue by way of the Oberalp and Furka passes and the Rhone valley.

St Helena (pronounced St Eléna), a lonely British island in the Atlantic, 1200 miles from the west coast of Africa, 1700 NW. of Capetown, measures 10 miles by 8, and has an area of 47 sq. m. It is part of an old volcano, and reaches 2823 feet in High Hill. Its shores face the ocean as perpendicular cliffs 600 to 2000 feet high, and are in many places cleft by deep, narrow valleys. The climate is pretty constant and generally healthy. Previous to the cutting of the Suez Canal St Helena was a favourite port of call for vessels bound to and from India by the Cape of Good Hope, and the inhabitants did a large trade in furnishing these vessels with supplies. But the Suez route greatly lessened its importance. The internment of Boer prisoners (1899-1902) gave a temporary fillip to trade, and in 1908, as a relief measure, the New Zealand flax industry was established by government and took root. A lace-making industry has also been started. The exports consist almost entirely of fibre and tow. Cattle-rearing is carried on, and there is a certain amount of fish-curing. St Helena is an important cable station, is a naval coaling station with a detachment of marine artillery, and has a noted observatory. Pop. (1921) 3747. The capital and port of the island is Jamestown (pop. 1400). St Helena was discovered by the Portuguese in 1502, and taken possession of by the British East India Company in 1651, who remained masters of the island down to 1834; since that time it has been administered by a governor and an executive council. The island was the place of Napoleon's imprisonment from 1815 to his death in 1821, at Longwood, three miles inland from Jamestown; and near Longwood he was first buried.

St Helens, (1) a town of Lancashire, on the Sankey brook, flowing to the Mersey, 12 miles ENE. of Liverpool and 21 W. by S. of Manchester. With good railway and canal facilities, and situated in the immediate neighbourhood of coal, it has become one of the chief centres of the glass industry of the world, being especially noted for its plate-glass, and also possesses extensive glass-bottle, copper-smelting, and chemical works. It was constituted a municipal borough in 1868; a parliamentary borough, returning one member, in 1885; and a county borough by the Local Government Act, 1888. Pop. (1871) 45,134; (1901) 84,410; (1921) 102,640.—(2) A small town in the Isle of Wight, 4 miles SE. of Ryde; pop. 6000.

St Heller, St Hélier, or St Helier's, the

capital of Jersey, is on the south coast on the east side of St Aubin's Bay. It is defended by Elizabeth Castle (1551-86), on a rocky island off the shore, approached by a causeway at low-water. Royal Square, the scene of the battle of Jersey in 1781 (the last attempt of the French to regain possession of the islands), contains the Salle des États, the meeting place of the local parliament, the public library (1736), and the court-house (1647). Victoria College (1852) is finely situated, and the parish church dates from the 11th to the 14th century. Pop. (1851) 29,153; (1871) 30,756; (1921) 27,866. See JERSEY, and CHANNEL ISLANDS.

St-Hilaire. See BARTHÉLEMY, GEOFFROY.

St Ignatius' Bean. See IGNATIUS' BEANS.

St Ives, (1) a fishing-town of Cornwall, beautifully situated on the west shore of St Ives Bay, 8 miles NNE. of Penzance. It has a 15th-century granite church, with an ancient cross, in the picturesque old parts of the town. St Ives is the chief seat of the Pilchard (q.v.) fishery, and from its mild climate and good bathing is a favourite resort. It is said to take name from St Ia, an Irish princess, martyred here in 450 A.D. Incorporated by Charles I. in 1639, it returned two members till 1832, and then one till 1885. Pop. 7000.—(2) A picturesque old monastic town of Huntingdonshire, on the left bank of the Ouse, 5 miles E. of Huntingdon. Almost destroyed by fire (1689), and inundated by the river (1823), it has a 15th-century parish church and a six-arch stone bridge of singular beauty, built by the abbots of Ramsey, with an old chapel or lighthouse in the middle. Cromwell lived at Slepe Hall, now built over, in 1631-36, and T. Watts-Dunton was born here. This place is said to be named after Ivo, a Persian bishop, who died here about 590, and it became in 1017 the seat of a Benedictine priory. A large weekly cattle-market was chartered in 1290, and the town was incorporated in 1874. Pop. 3000.

St James's Palace, a large inelegant brick structure in London, fronting towards Pall Mall. Originally a hospital dedicated to St James, it was reconstructed and made a manor by Henry VIII. The Chapel Royal, much altered since the time of Henry VIII., has been the scene of several royal marriages. Here Queen Mary died (1558); Charles I. slept here the night before his execution; and here Charles II., the Old Pretender, and George IV. were born. When Whitehall was burned in 1697, St James's became the London residence of the British sovereigns till Queen Victoria's time.—*The Court of St James's* is a designation of the British Court.—St James's Park, southward from the Palace, extends over 58 acres.

St Jean, chief town of the St Jean and Iberville district of Quebec, on the Richelieu, opposite the town of Iberville, with which it is connected, 22 miles SE. of Montreal. There are miscellaneous manufactures and a trade in lumber and agricultural produce. The railroad name is St John. Pop. 8000.

St Jean d'Acree. See ACRE.

St John, the largest river of New Brunswick, rises in the highlands in the north of Maine, flows north-east and then south-east 450 miles (the last 225 in British territory), and falls into the Bay of Fundy by an estuary 5 miles in width. It is navigable for about half its course. Its middle course separates Maine from Canada. At its mouth are the famous 'reversing falls' occasioned by the great range and rapidity of tidal ebb and flow in the Bay of Fundy.

St John, (1) commercial capital and largest city of New Brunswick, and principal Atlantic winter port of Canada, stands on the north bank

of the estuary of the St John River, by rail 277 miles NW. of Halifax and 481 from Montreal. It is an important railway town, being the terminus of the Canadian Pacific and Canadian National systems. The harbour is exceptionally fine, and accessible to the largest vessels at all seasons of the year. The timber-trade and fishing are great industries, and the manufactures include lumber, cotton, flour, engines, nails, wooden ware, &c. It has a custom-house, post-office, city building, insane asylum, hospital, public library, Y.M.C.A. building, and numerous churches and banks. Pop. (1881) 26,127; (1921) 47,166. The Micmac Indian settlement here was first entered by Champlain in 1604, and a permanent French settlement was established in 1635, and was recognised as British in 1713. In 1783 10,000 United Empire Loyalists settled here, and gave the place its importance. Its charter of incorporation (1835) is the oldest in Canada. In 1877 the place was mostly destroyed by fire. Portland, an adjoining town, was absorbed in 1889.—(2) A town in Quebec. See ST JEAN.

St John, HENRY. See BOLINGBROKE.

St John, KNIGHTS OF. See HOSPITALIERS.

St John's, (1) the capital of Newfoundland, stands on the extreme east coast of the island, on Avalon Peninsula, 1076 miles ENE. of Montreal and 1730 W. by S. of Cork in Ireland. It is thus the nearest port in America to Europe; and it possesses a small but excellent harbour, landlocked but accessible to ships of largest tonnage. It is the seat of Government House, Parliament Buildings, Anglican and R.C. cathedrals, and a public museum. The industries include fishing, oil-refineries, iron-foundries, machine shops, engine works, breweries, tanneries, and manufactures of shoes and furniture. Pop. 37,000.—(2) Capital of Porto Rico, see SAN JUAN.

St John's Bread. See CAROB.

St Johnstoun. See PERTH.

St John's Wort (*Hypericum*), the typical genus of plants of the family Hypericaceae. It is a numerous genus of herbs and shrubs widely distributed both in the New and the Old World, particularly abundant in western Asia, southern Europe, and in North America; it occurs also within the tropics. The leaves are opposite entire, without stipules, often marked with glandular dots of two kinds, pellucid ones which are very apparent when the leaves are held against the light, and black ones which are usually on the under side of the leaves round the edge, or sometimes on the flowers. The flowers are regular, with five sepals, and five petals, usually yellow. They abound

Large-flowered St John's Wort
(*Hypericum calycinum*).

in a yellow resinous juice which is more or less purgative and anthelmintic. The common St John's Wort, an abundant native of Britain,

even when slightly bruised yields copiously a yellow resinous juice, which, when rubbed between the fingers, emits a scent like lemons, and stains the skin dark purple. The plant has long been credited with powerful medicinal properties, but finds no place in the pharmacopœias, nor is it recognised by regular practitioners. In France and Germany the plant is ceremoniously gathered on St John's Day as a charm against evil spirits, storms, and thunder; in North Wales a similar custom still exists, and in Scotland it was formerly worn as a charm on the person against all malignant influences. The leaves of *H. Androsæmum* are called by the French *toute saine*, hence the English name *Tutsan*; in both countries they were formerly used to dress fresh wounds. Other species of *Hypericum* have similar properties. There are several species, such as *H. calycinum* (also called Aaron's Beard), frequently cultivated in British gardens.

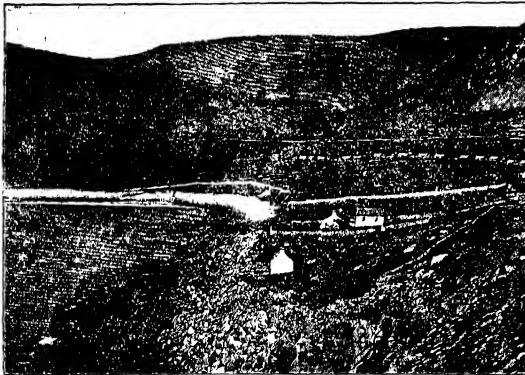

St Joseph, a city of Missouri, capital of Buchanan county, is on the left bank of the Missouri River, 110 miles (68 by rail) above Kansas City. It is an important railway centre, and a busy commercial town. Here are the state asylum for the insane and St Joseph College and other Roman Catholic institutions; the city was formerly a bishop's see. St Joseph has large packing establishments and manufactories of ornamental and other ironwork, clothing, furniture, machinery, marble, confectionery, &c. It is also the centre of a great fruit and grain district. The first settler, an Indian trader, laid out the town in 1843, and by 1851, when incorporated as a city, it was famous as the starting-point for the long journey in wagons across the plains. It suffered from a great fire in 1893. Pop. (1870) 19,565; (1890) 52,324; (1920) 77,939.

Saint-Just, LOUIS ANTOINE LÉON FLORELLE DE, French Revolutionist, was born at Decize near Nevers, 25th August 1767, and was educated by the Oratorians at Soissons. He began the study of law at Reims, but early gave himself to letters, and found his gospel in the writings of Rousseau. At nineteen he set off for Paris, perhaps to avoid taking orders, with some of his mother's plate and other valuables, and was, at her request, imprisoned for six months for selling these. Like most young men of his age he was fired by the revolutionary fever, which, added to the native enthusiasm of his temperament, was yet to carry him far. He published in 1789 a poor poem, *L'Organt*, a mere boyish imitation of Voltaire's *Pucelle*, and in 1791 an essay of a different promise, *L'Esprit de la Révolution*. Next year he was returned fifth deputy for Aisne to the Convention. He first attracted notice by his fierce tirades against the king, and he opened the memorable debate on the verdict in his trial. 'Royalty,' said he, 'is in itself a crime. Every king is a rebel and a usurper. We must judge Louis, not as a citizen, but as an enemy; that is to say, put him to death without forms of process.' He soon became a devoted follower of Robespierre, and by his influence was sent on missions to the armies of the Rhine and the Moselle, which his energy and enthusiasm, as well as administrative ability, urged on to victory. He made bombastic rhetorical speeches before the Convention, but his slight youthful figure, mild voice, large blue eyes, long black hair, and singular beauty gave no promise of the intensity and relentlessness of the fire that burned within him. 'He carries his head like a Saint Sacrament,' said Camille Desmoulins. 'And I,' retorted Saint-Just, 'will make him carry his like a Saint Denis'—a ferocious prophecy soon to be fulfilled. Saint-Just began the attacks on Hébert which

sent him to his doom, quickly followed by the fall of Danton and his friends. Early in 1794 he laid before the Convention a comprehensive report on the police, and soon after proposed Robespierre's famous civil institutions—a ludicrous scheme for a new organisation of society. Boys were to be taken from their parents at seven and brought up for the state, not the family; marriages were not to be proclaimed till after the birth of the first child; friendship was to be no longer a domestic tie, but a public obligation, every citizen being required on reaching twenty-one to declare in the temple who were his friends, he that had none to be banished. Until the citizens were sufficiently educated for this splendid programme a strong dictatorship was necessary, and the faithful follower and his chief alike saw the one man in Robespierre. Saint-Just fell with Robespierre, but unlike him carried his head high on the tumbril, and died without a word, 28th July 1794.

See S. Fleury, *Saint-Just et la Terreur* (1851), and the *Life* by Ernest Hamel (1879), the latter as eulogistic as the former is the opposite; vol. ii. of Aulard's work, *Les Orateurs de la Législative et de la Convention*; also, the *Œuvres Complètes*, with introduction by Vellay (1908).

St Kilda, a lonely island in the Atlantic, belonging to Harris in Inverness-shire, and 40 miles W. of North Uist. With an extreme length and breadth of $3\frac{1}{2}$ and $1\frac{1}{4}$ miles, it is only 1.9 sq. m.

The Town and Bay, St Kilda.

in area; has lofty precipitous cliffs almost everywhere except at the south-eastern landing-place; and attains a maximum altitude of 1220 feet. The rocks are igneous, incumbent on sandstone; the climate is mild; and the soil is black loam, with very fine pasture, but little arable land. The live-stock includes some sheep (which graze also on four neighbouring islets) and Highland cattle, and some mongrel collies; but a principal source of wealth is the sea-birds—fulmar petrels, gannets, puffins, &c.—which supply feathers, oil, and meat. The fisheries, though productive, are neglected. The crofters are practical communists; but their advantages are well-nigh counterbalanced by the destructive tempests and consequent famines, by the practical inaccessibility of the island for eight months of the year, by poverty, and by an absolute lack of amusements. Crime is unknown. The native name of the island is Hirta, and the name St Kilda is probably of Columban origin. The island, which had been in the hands of the Macleods from time immemorial, was sold in 1779,

ST LAWRENCE

but was repurchased in 1871. Events in its history have been the reduction of the population by small-pox to four adults and twenty-six children (1724); the imprisonment of Lady Grange by her husband (1734-42); the emigration of thirty-six islanders to Australia (1856); the drowning of six (1864); and the founding of a regular school (1884); the establishment of wireless communication with the mainland (1913); a submarine attack (1918). There are less than 100 inhabitants.

See works by Dean Munro of the Isles (1585); Martin (1698-1703), Kenneth Macaulay (1764), L. MacLean (1838), J. Sands (1877), G. Seton (1878), R. Connell (1887), and N. Heathcote (1900).

St Kilda, a coast suburb of Melbourne (q.v.), on the east side of Hobson's Bay.

St Kitts. See ST CHRISTOPHER.

St Lawrence, a great river of North America, which, issuing from Lake Ontario, flows north-east for some 750 miles—part of the way forming the boundary between Canada and the United States—and falls into the Gulf of St Lawrence by a broad estuary. But in its widest acceptance the name includes the whole system of the Great Lakes and their connecting streams, with a total length from source to mouth of 2200 miles, and a drainage basin of 297,600 sq. m. (These lakes, which are of comparatively modern date, are nothing more than a great system of river-valleys, whose old outlets

have been blocked, but many of whose former channels have been traced.) The area of water-surface in the five lakes alone is 94,650 sq. m., and their aggregate basin 259,950 sq. m. The St Lawrence system, or that of which the great river is the outlet, thus constitutes by far the largest body of fresh water in the world. This mighty artery of North-east America rises, under the name of the St Louis, on the spacious plateau which sends forth also the Mississippi towards the Gulf of Mexico, and the Red River of the North towards Hudson Bay. Lake Superior (602 feet above sea-level), the next link in the chain, finds its way to Lake Huron through St Mary's River, whose rapids have a fall of 20½ feet. Below Lake Huron, which receives Lake Michigan from the south, St Clair River, Lake St Clair, Detroit River, and Lake Erie maintain pretty nearly the same level (there

is a fall of some 8 feet, however, in Detroit River) till the river Niagara descends 326 feet to Lake Ontario, which is itself still 247 feet above the sea-level. The St Lawrence proper, with a number of lake-like expansions (such as the Lake of the Thousand Isles, of St Francis, St Peter, &c.), presents the character first of a river, and then of an estuary, down to the gulf. Prior to 1858 only vessels drawing not more than 11 feet of water could pass up the river above Quebec; but now vast extensions have been made, and the channel has been cleared for transatlantic steamers as far as Montreal, which has become Canada's principal maritime port. There is, further, an important lake, river, and coast traffic, which is increasing every year. Between Lake Ontario and Montreal there are several rapids, which, however, may be all avoided by means of canals that have been constructed at a very great expense. The 'Great Lakes Waterway Scheme' proposes the deepening of the channel of the upper St Lawrence, the enlargement of the Welland Canal, and the construction of new

canals, whereby Chicago, Toronto, and the other lake ports should be brought into direct communication with the Atlantic without transshipment at Montreal. A joint engineering board for Canada and the United States took up the problem in 1924. At about two-thirds of the distance from Lake Ontario to the city of Montreal the intersection of the parallel of 45° determines the point where the St Lawrence, after having been an international boundary from the head, or nearly so, of Lake Superior, becomes exclusively Canadian. Immediately above the island of Montreal the St Lawrence is joined by its principal auxiliary, the Ottawa (800 miles), from the north-west; and a little more than half-way between this confluence and Three Rivers, the highest point of tidal influence, the Richelieu from the south brings in the tribute of Lake Champlain. Other principal tributaries are the St Maurice (400 miles), the Saguenay (100), and the Batiscan (50). The width of the St Lawrence varies from less than 1 to 4 miles; the estuary at its mouth is above 100 miles across. During winter the river is frozen over and navigation closed. For map, see CANADA.

THE GULF OF ST LAWRENCE, a western inlet of the North Atlantic, washes Newfoundland, Quebec, New Brunswick, and Nova Scotia. It has three communications with the ocean—the Strait of Belle Isle, between Newfoundland and Labrador; the Gut of Canso, between the island of Cape Breton and the peninsula of Nova Scotia; and a far wider passage than either, with the island of St Paul in the middle, between Cape Breton and Newfoundland: while in the opposite direction it narrows, at the west end of Anticosti, into the estuary of the St Lawrence River. Besides the islands of Anticosti, St Paul's, and Prince Edward, this arm of the sea contains very many clusters of islands, which are rendered more dangerous to shipping by the thickness of the fogs and the uncertainty of the currents. Both the Gulf and River of St Lawrence are celebrated for the productiveness of their fisheries. See QUEBEC.

St Leger, one of the five classic races of Horse-racing (q.v.) in England. It is named after Colonel St Leger, who instituted the race in 1776, and is run on the round course at Doncaster in September; the distance is 1 mile, 6 furlongs, 132 yards.

St Leger, SIR ANTHONY, born about 1496, became a courtier of Henry VIII., and in 1540 was appointed lord deputy of Ireland. He filled the office under Edward VI. and again under Mary, and throughout distinguished himself for moderate yet firm treatment of the fractious Irish clans. He was, however, accused of fraud, and died 16th March 1559.

St Leonards. See HASTINGS.

St Lô, a town of Normandy, dept. Manche, is built on a rocky elevation on the right bank of the Vire, 60 miles by rail SE. of Cherbourg. A St Lô, Bishop of Contances, built a church here in the 6th century; but the place was destroyed by the Normans in 888, and, having been rebuilt, taken by the English in 1346 and 1417. The Gothic church of Notre-Dame is very handsome. St Lô is an important agricultural centre, and horse-breeding is carried on in the country round. The astronomer Leverrier was born here in 1811, and the novelist Fenillet in 1812. Pop. 10,000.

St Louis, ranking as sixth city of the United States in respect of population, is the commercial metropolis of the Mississippi valley and principal city of the state of Missouri. Situated on the west bank of the Mississippi River, 21 miles S. of the mouth of the Missouri, it is by rail 1108 miles WSW. of New York, 2434 E. of San Francisco,

and 1170 N. of New Orleans. In 1764 Pierre Liguette Laclède, head of the Louisiana Fur Company, established a trading-post on the present site of St Louis, giving it the name which it still bears in honour of Louis IX. of France. In 1768 the Spaniards took formal possession of Upper Louisiana, but the settlement was governed by a French captain, St Ange de Bellefève, until 1770, when Don Pedro Piaras was made lieutenant-governor and military commandant, with headquarters at St Louis. In 1801 the village again became a part of the French possessions, and in 1803 passed into the hands of the United States. The population of the settlement in 1799 was 795; in 1810, one year after the town was incorporated, it had increased to 1400, in 1820 to 4923, and in 1840 to 16,469. Then began a rapid growth. In 1844 the population was 34,140; in 1850, 74,439; in 1870, 310,864; in 1900, 575,238; and in 1920, 772,897.

St Louis is built upon three gently sloping terraces, the summit of the third being 200 feet above and 4 miles W. of the river; beyond this point for miles the country is almost perfectly level. The city has a river frontage of nearly 20 miles; its greatest width is 7 miles, and its area nearly 65 sq. m. The streets in the old part of the city are narrow, but all those west of Third Street, three blocks from the river, are broad and straight. The water-supply is taken from the Mississippi River at Bissell's Point, north of the city, and is virtually inexhaustible. The fearful cyclone of 27th May 1896 caused some three hundred deaths, damaged property extensively, and wrenched off the east end of the Eads Bridge.

The largest of about a score of parks—amongst the finest in the United States—is Forest Park, in the western part of the city. Tower Grove Park was, with the botanical garden, given to the city by the philanthropist Henry Shaw. The principal public buildings are the Four Courts, court-house, city hospital, insane asylum, and women's hospital, the custom-house and post-office (which cost over \$5,000,000), the Merchants' Exchange, the Cotton Exchange, the Crow Museum of Fine Arts, city hall (1891-95), the Mercantile Library, and the Public Library.

The city has a well-developed system of education. There are two universities, the Washington (non-sectarian), with over 2000 students, and the St Louis (Roman Catholic), with over 3000 students, and a Lutheran Theological Seminary, with 350 students; but there are numerous academies and colleges of lower grade, besides two law schools, several medical colleges, a school for nurses, a school of midwifery, and a college of pharmacy. St Louis contains over 300 churches, representing almost every Christian denomination. Several of the newspapers are wholly in German.

At the annual Fall Festivities in October there are, besides a popular fair, an exposition and a great 'Procession of the Veiled Prophet,' somewhat like the Mardi Gras celebration at New Orleans. The exhibition of 1904, a world's fair on a great scale, was timed to commemorate the Louisiana Purchase, by which the United States acquired from France—President Jefferson and Napoleon being representatives—1,000,000 square miles of the Mississippi basin (see UNITED STATES).

Some twenty railroads enter St Louis, the terminus of all being the new Union Depot (1874-92). The Mississippi at St Louis is spanned by three bridges. The oldest of these, the Eads, was opened for traffic 4th July 1874. It consists of three spans, the central being 520 feet in the clear; and the two side spans 502 feet each. It is a railroad, foot, and wagon bridge, and connects with the Union Depot by a tunnel one mile long under the city. There are in addition the Merchants' steel railroad bridge

(1890), 2420 feet long, and the McKinley Bridge (1907) for electric railways.

In 1875 St Louis was separated from the county of St Louis and given an independent government of its own. The mayor and municipal assembly constitute the governing power. The position of the city in the midst of the Mississippi valley gives it a commanding place as a trading centre, with an immense distributing and manufacturing business. Amongst its staples are cotton, bread-stuffs, packed meats and foods, tobacco, live-stock, timber, furniture, machinery, grain, wool, and furs; and in respect of manufactures St Louis holds the fourth place amongst American cities. It is the chief tobacco-manufacturing place in the world, and its annual product of flour, boots and shoes, enamel ware, hardware, railway cars, stoves, bricks, wooden wares, drugs, is enormous. It has a fur-market, and a large commerce in grain, live-stock, &c.

St Louis, the capital of the French colony of Senegal in West Africa, is situated on a small low island near the mouth of the Senegal River. Bridges connect it with N'dar Toute, a summer watering-place, on the right bank, and with the suburb of Bouetville, the terminus of the railway, on the left bank. The mouth of the river is rendered dangerous by a shifting bar of sand. The great ocean steamers land goods and passengers at Dakar, on Cape Verde, 100 miles to the south-west, and thence they are conveyed by rail. Nevertheless, the place has a trade of considerable importance, gums and earthnuts being exported. The climate is not healthy; water is supplied by an aqueduct 7½ miles long. There are a cathedral, governor's palace, &c., and a public garden. Pop. 18,000.

St Louis, a town of the French island of Réunion (q.v.), 28 miles from St Denis; pop. 15,000.

St Louis. See MAURITIUS.

St Lucia, the largest of the Windward Islands, in the West Indies, 42 miles long and 15 to 20 wide, with an area of 233 sq. m. Pop. (1924) 54,304. The chief products are sugar, cocoa, logwood, lime-juice, honey, rum, and coconuts. Sugar and cocoa are the principal exports. Much of the island is high and rocky land, covered with well-high impenetrable forest, and it contains extensive deposits of sulphur. The climate is in the main healthy, a fresh trade-wind blowing almost continually. The island, discovered in 1502, was colonised by the French in 1563; up to 1803, when it definitively became a British possession, it frequently changed hands between France and Britain. The capital is Castries (pop. 6000), a cooling and shipping centre. St Lucia suffered severely from the great hurricane, with deluge of rain, of 1898.

St Lucia Bay, a lagoon at the mouth of the Umfulosi River in Zululand, surrounded by uninhabitable swamps. Cape St Lucia is a promontory to the south of the channel which connects the lagoon with the sea.

St Malo, a fortified seaport of Brittany, dept. Ille-et-Vilaine, stands 51 miles NNW. of Rennes, by rail, on the estuary of the Rance. The old town clusters all over a rocky islet that is surrounded with walls and connected with the mainland by a single narrow causeway (*Sillon*). Forts and batteries crown several rocks lying off the town, and the defences are completed by an old castle next the causeway. The harbour is safe, but difficult of approach; the tides sometimes rise 50 feet, and storms dash over the top of the battlements. About the end of the 17th century the people of St Malo reaped large fortunes by privateering in the English Channel, and the port was the headquarters of the French East India Company. The harbour, which lies between St Malo and St

Servan, is common to both places. The trade is mainly with Britain. Regular services connect Southampton and the Channel Islands with St Malo, which exports potatoes, vegetables, dairy produce, chestnuts, apples, slate, and imports wood, coal, iron, &c. The people, 12,000 in number, are engaged in fisheries, the coasting-trade, shipbuilding (launches and small craft), and tanneries. The former cathedral, now the Church of St Vincent, has a gloomy nave and a beautiful choir dating from the 12th and 14th centuries respectively. The see was established in the 12th century, but suppressed in 1790. Among eminent natives of St Malo are Chateaubriand, Maupertuis, Lamennais, and the sailors Cartier and Labourdonnais. The English bombarded the town in 1693 and 1695, and in 1758 an expedition led by the third Duke of Marlborough burned numerous vessels lying in the harbour. Suburbs connect St Malo with Paramé and St Servan, while Dinard, across the Rance, is a fashionable watering-place.

Saint-Marc Girardin. See GIRARDIN.

St Martin, one of the Lesser Antilles, in the West Indies, has since 1648 been divided between France and the Netherlands. It exports sugar, cotton, tobacco, maize, &c., and large quantities of salt. The French portion, a dependency of Guadeloupe, has an area of 20 sq. m. and a pop. of 4000. The Dutch portion, a dependency of Curaçao, has an area of 18 sq. m. and a pop. of 2000.

Saint-Martin, LOUIS CLAUDE (1743-1803), a French philosopher ('le Philosophe inconnu'), was born at Amboise, and died at Aurai near Châtillon. Influenced by Böhme and Mystrasin, he was a vigorous opponent of sensationalism and materialism. Of his numerous works among the best known are *Des Erreurs et de la Vérité* (1775); *De l'Esprit des Choses* (1800); and *L'Homme de Désir* (1790). See the *Essai* on him by Caro (1852), and the Life by Waite (1901).

St Mary Church, now part of Torquay (q.v.).

St Marylebone. See MARYLEBONE.

St Marys, a city of Ohio, on the St Mary's River. Natural gas and oil are abundant in the district, while the town has woollen, paper, and flour mills, &c. Pop. 5700.

St Mary's Loch, a Scottish freshwater lake in the west of Selkirkshire, 16 miles WSW. of Selkirk, 10 S. of Peebles, is picturesquely situated like a mirror among the hills, and is aptly described by Scott as 'lone St Mary's silent lake.' Lying 814 feet above sea-level, it is crescentic in shape; its length is 3 miles, its maximum breadth 1 mile, and maximum depth 153 feet. The river Yarrow issues from its north-eastern end, while at the other extreme it is connected with the smaller Loch of the Lowes; Meggat Water is the chief of the tributary streams. To the north are traces of the ancient St Mary's Kirk, whence comes the name of the loch. The district has many associations with James Hogg (q.v.), the 'Ettrick Shepherd.' His cottage at Altrive stands some distance to the east; a monument erected to his memory in 1860 stands on the south-west, as does also the inn of Tibbie Shiel (d. 1878), a former servant of Hogg's father. At this famous inn Hogg, Aytoun, and many other worthies used to frolic.

St Mary's River, the strait connecting Lakes Huron and Superior, with a 'sault' of 20½ feet.

St Maur. See MAURISTS.

St Mawes, a village of Cornwall, on an offshoot of Falmouth Harbour, 3 miles E. of Falmouth. It has a castle (1542), and from 1562 to 1832 returned two members.

St Michael's, or SÃO MIGUEL. See AZORES.

St Michael's Mount, a conical and isolated granite rock in Mount's Bay, Cornwall, 3 miles E. of Penzance. It communicates with the shore by a causeway 560 yards long, which, however, is covered with water eight hours out of the twelve, and sometimes is impassable for two or three days together. The Mount is 267 feet high, and is crowned by an old and picturesque castle—now used as a manorial residence—surmounted by a tower, on one angle of which there is a projecting stone lantern, popularly called 'St Michael's Chair.' At the base of the north or landward side of the Mount is a fishing-village. The 'guarded mount' is said to have received its name from an apparition of St Michael to some hermits; and Edward the Confessor founded upon it a Benedictine priory, which in 1088 was annexed to the abbey of Mont St Michel in Normandy.

St Michel, MONT, an extraordinary rocky islet of the Norman department of Manche, in the bay of St Michel, 18 miles WSW. of Avranches. It is a solitary cone of granite, a thousand yards in circumference and 260 feet high. It rises sheer out of a level expanse of sand, and, though its elevation is not great, the perfectly flat environment and its pointed crest render it a most striking feature in the landscape. Till 1880–81 it was only accessible by crossing the sands at low-water, there being a firm track across them, with quicksands to right and left; but a good road was then formed along a causeway a mile in length. A Druid stronghold once, the islet, as the scene of an apparition of St Michael in 708, became in 966 the seat of a great Benedictine monastery, which, 'half church of God, half fortress,' has memories of Henry I., II., and V. of England, resisting the last successfully in two sieges. The Revolution transformed this celebrated place of pilgrimage into a prison, and such it remained until 1863; in 1874 it was declared a 'monument historique,' and large sums were spent on its restoration by Viollet-le-Duc and his successor. The buildings include the church (c. 1020–1521), with Norman nave and Flamboyant choir; the exquisite cloisters (1228); the Hulle des Chevaliers (1220), where Louis XI. in 1469 founded the order of St Michel; 'La Merveille,' the monastery proper, so called from its huge north wall of the 13th century, 246 feet long and 108 high; and numerous crypts dating variously from the 10th to the 12th centuries. Beneath is a little fortified town with 200 inhabitants.

St Mihiel, a fortified town on the right bank of the Meuse, in Meuse department, France, 20 miles SE. of Verdun. There are iron-works and manufactures of hosiery and of paper. The Benedictine abbey, founded in 709, is famous. During the Great War St Mihiel was the apex of an important salient in the lines held by the Germans attacking Verdun, and was the scene of a famous American victory in September 1918. Pop. 10,000.

St Moritz, a favourite watering-place in the upper Engadine (q.v.), with chalybeate, sulphurous and other mineral waters, and a pop. of 1600.

St Nazaire, a seaport of France, dept. Loire-Inférieure, is situated on the north side of the estuary of the Loire, 40 miles by rail W. by N. of Nantes. During the 19th century large sums were spent on harbour improvements, and extensive docks were built to accommodate the larger vessels, that were unable to get up the Loire to Nantes (q.v.). The shipping increased rapidly, and St Nazaire became one of the leading ports of France, served by numerous lines of passenger steamers. It has busy metallurgical works and great shipbuilding yards, where battleships and large mail and cargo steamers are constructed.

The most important of the imports are timber, coffee, sugar, rice, and of the exports, agricultural produce, cloth, wine, spirits. Pop. (1851) £400; (1891) 26,461; (1921) 41,631.

St Neots, a market-town of Huntingdonshire, on the Ouse, 8 miles SSW. of Huntingdon. It takes name from the ninth-century hermit St Neot, whose relics were translated from St Neot (close to Liskeard) in Cornwall to a Benedictine monastery founded at Eynesbury, close by, in 974; and it has a fine parish church, Perpendicular in style. Pop. 4000.

St Nicolas, a town of Belgium, in East Flanders, 12 miles by rail W. by S. of Antwerp, stands in the midst of the district of Waes, a densely-peopled and productive agricultural region. It has a large flax-market, and manufactures cotton and woollen stuffs, lace, needles, bricks, and pottery. A flourishing trade is carried on in linens, flax, corn, &c. Pop. 35,000.

St Omer, a town of France (till 1892 a second-class fortress) dept. Pas-de-Calais, stands in a marshy site, on the Aa, 26 miles SE. of Calais by rail. The chief objects of interest are the Gothic cathedral (13th–15th century), with remarkable sculptures, the ruined tower and arches of the Benedictine abbey church of St Bertin, an arsenal, a museum, and a library. A college for the education of English and Irish Catholics was opened at St Omer in 1592. It was closed during the Revolution, but still exists as a seminary. Alban Butler was a president, and O'Connell a student. The people carry on active manufactures of tobacco-pipes, linen, shoes, sugar, with brewing, distilling, and tanning. Pop. 19,000.

Saintonge, a former French maritime province, now forming mainly the department of Charente-Inférieure. The capital was Saintes (q.v.).

St Paul, capital of the state of Minnesota, occupies a commanding situation on both banks of the Mississippi, near the mouth of the Minnesota River, one of its great tributaries. With Minneapolis it ranks as one of the 'twin cities of Minnesota.' It is the outgrowth of a small hamlet of voyageurs, chiefly Canadian, employed in the fur trade and in selling whisky to the soldiers at Fort Snelling in the vicinity. The first log-huts were erected on the site of the city in 1840, and in 1841, at the suggestion of a Roman Catholic priest who made occasional visits, a small log-chapel was erected and dedicated to St Paul, which has given the name to the city. In 1842 the first family of American ancestry arrived, and in 1846 the hamlet had become of sufficient importance to have a post-office. In the act of the United States congress passed in 1849 authorising the organisation of Minnesota Territory, St Paul was designated as the capital, and from that time has occupied an important position. At that period the town did not contain a brick or stone building, and the number of inhabitants was about 500. Upon the lower plateau of limestone rock are the capitol, post-office, city hall, and large stores; the best private residences are on the upper plateau, overlooking the Mississippi. The Summit Avenue is noted for its width and the beauty and costliness of the houses. The sanitation of the city is excellent, and there are some thirty public parks. Ample provision is made for education. There are several colleges, not under the control of the city or state; Macalester College, the oldest of these was chartered in 1853, and that year opened its preparatory department, known as the Baldwin School; Hamline University, chartered in 1854, is under the control of the Methodist Church; and St Paul's College and Seminary are Roman Catholic. There are also the Agricul-

tural College of the State-University, the State Historical Library, and an Academy of Natural Sciences. There are churches of all denominations. All parts of the city are reached by electric street-railways. St Paul is a great railway centre, is the centre of the wholesale grocery and dry goods business in Minnesota, and has the largest manufactures in the west of boots and shoes and of clothing. It has also large railroad and machine shops, and manufactories of agricultural implements. Pop. (1860) 10,701; (1880) 41,473; (1890) 133,156; (1920) 234,698.

St Paul, a bare volcanic islet, 860 feet high, in the Indian Ocean, midway between Africa and Australia, in 38° 42' S. lat. and 77° 32' E. long.; area, 3 sq. m. Both it and the densely vegetated New Amsterdam (26 sq. m.), 50 miles to the north, were taken possession of by France in 1843.

St Paul's Rocks, a group of small islets 1° N. of the equator and 540 miles from the South American Atlantic coast.

St Paul's School was founded in 1509-12 by John Collet (q.v.), dean of St Paul's, for 153 children 'of every nation, country, and class,' with William Lilye as the first headmaster. The original schoolhouse in St Paul's Churchyard was burned in the Great Fire of 1666; the second by Wren (1674) gave place in 1824 to a third; and a fourth, at West Kensington, near Addison Road station, was opened in 1884. The boys' school is now one of the largest secondary day-schools in England, with some 600 boys. Famous Paulines have been Camden, Milton, Halley, Pepys, the Duke of Marlborough, Sir P. Francis, Judge Jeffreys, Major André, and Jowett. St Paul's School for Girls, a modern development of Collet's foundation, is near.

St Peter Port, the town of Guernsey (q.v.).

St Petersburg, now **LENINGRAD**, from 1713 to 1918 the capital of Russia, stands at the head of the Gulf of Finland, in 59° 56' N. lat. and 30° 19' E. long., at the mouth of the Neva. The flat and low marshy ground upon which the city is built only recently emerged from the sea, and even in historical times the hills of Pulkova and Duderhof, which are now at a distance of 9 miles from the shore, stood close by the sea. Before entering the sea the mighty Neva, which flows 36 miles from Lake Ladoga, divides into many branches, thus giving origin to no less than 100 islands of various sizes, the surfaces of which rapidly increase. The average area added in this way to St Petersburg in a century and a half was 4 acres in a year. When a strong wind is blowing from the sea its level rises by several feet, and the poorer parts of the city are inundated every year; but when the overflow exceeds 10 feet nearly the whole is inundated. Such was the case in 1777 and 1824, when the Neva rose 13·8 feet above its average level. In August 1891 it rose again for a few hours full 10 feet above the average. The country round St Petersburg being covered with morainic deposits, peat bog, and marshes, is so thinly peopled that the government of St Petersburg (without the city) has only 90 inhabitants per square mile. The almost uninhabited wildernesses of Karelia, Olonetz, and Vologda, beginning at the very gates of Leningrad, stretch towards the north and east, while the lake-depression (see **RUSSIA**) and the very thinly peopled tracts of the Valdai plateau separate from the Russian cities of Tver, Yaroslavl, and Moscow (400 miles). Within a radius of 120 miles there is not one single town worth naming, the towns nearest to the former Russian capital being the now decaying Novgorod, the Finnish cities of Viborg and Helsingfors (263 miles), and the Estonian and Lettish cities of Reval and Riga (449 miles). Nevertheless the

mouth of the Neva was from an early period coveted by the Novgorod merchants. In the 16th century they already had their factories at the head of the delta of the Neva; so that Peter I. only followed the tradition of the Novgorodians when he took possession of the Swedish forts at the head and at the mouth of the Neva, laid the first foundations of his capital (in 1702) on one of the islands of the delta, and dreamed to make of it a new Amsterdam. His dream was realised to some extent, but St Petersburg still remains somewhat isolated from the rest of Russia. Connection was established through the Neva, which, connected by canals with the upper Volga, became the virtual mouth of the immense basin of the chief river of Russia and its numberless tributaries. Owing to this connection St Petersburg became, and has remained almost since its founding, the chief port of Russia for the export of raw produce and the import of manufactured goods. Foreign trade and the centralisation of all administration in the residence of the emperor made of St Petersburg a populous city with more than a million inhabitants and covering 42 sq. m., on the banks of the Neva and the islands formed by its branches—the Great Neva, the Little Neva, the Great Nevka, the Little Nevka, and scores of others. The removal of the government to Moscow, with civil war, blockade, and other troubles, reduced the population from 1,907,708 in 1910 to 1,071,103 in 1920. On the other hand, Leningrad (including Cronstadt) is now Russia's only port on the Baltic.

The Great Neva, the chief branch, which has within the city itself a width of from 400 to 700 yards, and carries every second 1,750,000 cubic feet of very pure water, is a most beautiful river. It is so deep that large ships can lie alongside its granite embankments. But it is rather shallow at the mouth, with a narrow and sinuous channel across the bar, so that Cronstadt, built on an island 16 miles to the west of St Petersburg, was not only its fortress but also its port, till 1885, when a ship-canal, 20 miles long and 22 feet (now 28) deep, was constructed to admit ships to the Gálernaya Harbour in the south-west corner of St Petersburg. A shallower channel admits lighter ships. The main body of the city, containing all the chief streets, stands on the mainland, on the left bank of the Neva; and a beautiful granite quay, with a long series of palaces and mansions, stretches for 2½ miles from the timber-yards in the east to the New Admiralty in the west. Three permanent bridges cross the Neva; another, built on boats, is removed in autumn and spring, as well as when the ice of Lake Ladoga comes down the Neva in the beginning of May. Vasilievsky Island, between the Great and Little Nevas, has at its head the Stock Exchange, surrounded by spacious storehouses, and a row of scientific institutions, all facing the Neva—the Academy of Sciences, the University, the Philological Institute, the Academy of Arts, and various schools and colleges. On Peterburgskiy Island, between the Little Neva and the Great Nevka, stands the old fortress of St Peter and St Paul, facing the Winter Palace, and containing the Mint and the cathedral wherein the members of the imperial family are buried. Farther up the mainland on the right bank of the Neva is covered by the poorer parts of the city, but contains some public buildings and a great number of factories. Numerous islands, separated from each other by the small branches into which both Nevas subdivide, and connected together by a great number of wooden bridges, are covered with beautiful parks and summer-houses. The main part of Leningrad has for its centre the Old Admiralty; its lofty gilded spire and the gilded dome of St Isaac's

Cathedral are among the first sights caught on approaching by sea. Three streets radiate from it, east-south-east, south-east, and south; the first of them the famous Nevsky Prospekt; while four canals describe irregular half-circles which intersect these three streets at right angles. The street architecture, with its huge brick houses covered with stucco and mostly painted gray, is rigid and military in aspect. But the canals and the bridges which span them, the width of the chief streets, and an occasional glimpse of the Neva or of some broad square break the monotony.

A spacious square, planted with trees, encloses the Old Admiralty on three sides. To the east of it rise the huge and magnificent mass of the Winter Palace, the Hermitage Gallery of Art, and the semicircular buildings of the general staff, which surround a square facing the palace, and adorned by the Alexandra column, a shaft of red granite 84 feet high. To the west of the Admiralty is the Petrovskiy Square, where prances the well-known statue of Peter I.—the work of Falconet—on an immense block of granite brought from Finland. The cathedral of St Isaac of Dalmatia, in the south of it, is an almost cubic building (330 feet long, 290 broad, and 310 high), surmounted by one large and lofty and four small gilded domes. This church, erected by Nicholas I., is devoid of architectural beauty, but its peristyles of immense red granite monoliths give it a character of rude majesty. Its interior decorations are very rich, and it contains pictures painted by the best representatives of Russian art of its period. A somewhat stiff monument to Nicholas I. by Baron Clodt stands on a large square to the south of the cathedral.

The Nevsky Prospekt is one of the finest streets of the world, not so much for its houses—they are of a very mixed and mostly vulgar architecture—as for its immense width and length, the crowds which overflow its broad *trotoirs*, and the vehicles which glide over its wooden pavement. It runs for 3200 yards, with a width of 130 feet, from the Admiralty to the Moscow railway station, and thence with a slow bend towards the south for another 1650 yards, to reach again the Neva near the Smolnyi convent. About midway in its first part it passes by the Kazan cathedral, the Gostinoy Dvor—a two-storied building containing numerous shops—the public library, the square of Catharine II. adorned with a gorgeous but tasteless statue of the empress, and the Anitchkoff Palace. It crosses the Fontanka on a broad bridge adorned by four groups in bronze of wild horses with their tamers.

The climate is less severe than might be expected, but it is unhealthy and very changeable on the whole. The average temperatures are 15.4° F. in January, 64° in July, and 38.6° for the year. Still, the Neva remains frozen for an average of 147 days every year. A short but hot summer is followed by a damp autumn and very changeable winter, severe frosts being followed by rainy days in the midst of winter, and returning in April and May after the first warm days of the spring.

As a manufacturing centre, Leningrad has not the importance of Moscow. Its factories produce cottons and other textiles, metals, machinery, leather, sugar, guns, porcelain goods, &c. There are many large factories in the surrounding country, but the industrial establishments of the town itself are chiefly small.

The great number and variety of scientific, literary, artistic, and technical institutions, and of institutions for higher education, as well as the development of the press, rendered life at St Petersburg especially attractive, the more so as the provincial towns of Russia decidedly suffered from a lack of such. Even Moscow, which down to

1848 was the intellectual centre of Russia, had largely fallen from that position. Leningrad has a university, and numerous academies, medical, technological, engineering, naval, military, &c. The scientific societies are very numerous: the Academy of Sciences and its branches are well known in Europe, while the scientific museums enjoy a high repute. The Botanic Garden is famous. Great facilities for work in all branches of art are afforded by the Academy of Arts; and Leningrad is on the whole a very musical city, with an excellent conservatoire. The public libraries are numerous. Besides the Public (formerly Imperial) Library (see LIBRARY) there are the libraries of the Academy of Sciences, the University, the Council of State, as well as those of the scientific societies, some of which are very rich in their special branches. There are besides rich art collections in the Hermitage and Winter Palace (Flemish, Russian, and early Italian schools well represented, and priceless collections of Greek and Scythian antiquities). Many pictures from private collections confiscated at the Revolution have gone to the Winter Palace, as well as those which belonged to the Academy. Other private collections remain where they were, the old palaces of the nobility being retained as museums. It is noteworthy that there was little looting or destruction in the historic houses of Leningrad, even where there was actual fighting. On the other hand, depopulation and dearth of fuel have led to the demolition of many wooden buildings of no particular interest. Leningrad is the chief seat of the Russian publishing trade.

St Petersburg, a town of Florida, is situated on Pinellas Peninsula on the west coast, 20 miles SW. of Tampa. Much fruit is grown in the neighbourhood, and there are cigar and furniture factories. In 1924 a concrete bridge, some 6 miles long, across the Gulf of Tampa was completed, to provide direct communication between St Petersburg and Tampa, both of which are popular winter and summer resorts. The terrific hurricane which devastated Miami in 1926 also did some damage to St Petersburg. Pop. 27,000.

St Pierre, was the largest town, though not the capital, of the island of Martinique (q.v.) in the West Indies, with a good harbour (defended by a fort), a cathedral, a college, a botanical garden, and 30,000 inhabitants. Founded in 1665, it was the birthplace of Josephine, consort of Napoleon I. It was utterly destroyed in a few minutes on the 8th May 1902 by an appalling eruption of Mount Pelée, a volcano long supposed to be extinct.

St Pierre. See RÉUNION, and MIQUELON.

Saint-Pierre, JACQUES-HENRI BERNARDIN DE, the author of *Paul and Virginia*, was born at Havre, 19th January 1737. His parents were amiable but foolish people with absurd pretensions to family, and the education of the abnormally imaginative boy was ill regulated from the beginning. He found his ideals in the Lives of the Saints and *Robinson Crusoe*, made a voyage to Martinique in one of his uncle's ships, and returned to pursue irregular studies at Caen and Rouen. He dreamed of a missionary's life, but was sent to Paris to become an engineer, and found himself at twenty-three on his father's second marriage compelled to shift for himself. He served some time in the Engineers, but quarrelled with his chiefs and was dismissed, and next year was sent to Malta only to suffer the same experience. His head was turned by the writings of Rousseau, and he made public employment impossible for him by the innumerable utopian memoirs and criticisms on matters of administration with which he deluged the bureaux of the ministers. Buoyed up by

dreams of a new state to be founded on the shores of the Sea of Aral, he travelled on nothing to Russia, and returned in dejection to Warsaw, where in his three months' stay occurred the romance which grew into that legend of the love of a princess which he ended by believing in himself. Next followed further wanderings to Vienna, Dresden, and Berlin, and a government expedition to Madagascar, which he abandoned at the Ile de France, to spend there almost three years of melancholy and observation. In June 1771 he returned to Paris, his head full of ideas, yet he hesitated awhile before he recognised his true vocation. His *Voyage à l'Île de France* appeared early in 1773, and at first attracted little attention. Yet it gave a distinctly new element to literature in that close portraiture of nature—that apprehension of the mysterious correspondence between the spectacle and the spectator, which nowadays adds the personal accent to descriptions of landscape. As he himself said of the contemporary descriptions, 'la physionomie n'y est pas,' and indeed even Rousseau's *Confessions* and *Rêveries* (both later) give us sensations rather than images.

A close friend of Rousseau in his last years, Saint-Pierre became misanthropic and half-crazy through poverty and lack of sympathy, and wearied out his few friends with his importunities. His *Études de la Nature* (3 vols. 1784) showed the strong influence of Rousseau in its sentimentalism, its inspired folly, and the ridiculous length to which it carries the use of final causes. He proves the existence of God from poetic reasons; everything in nature points to Him, for God made nature for man, and man for Himself. Nature makes men good; society corrupts them—'plus la société est policée, plus les maux y sont multipliés et cruels.' Hence the value of ignorance—the mother of all mystery—especially to women. In his Elysium are no capitalists nor nobles, but monuments to the inventors of useful arts, and such especial benefactors of the race as Nicot, who introduced tobacco into Europe. Not to speak of more essential faults, the book contains much wild physical science, as his theories of the tides and elongation of the poles. The new work was received with immense applause, and a fourth volume followed in 1788, containing the immortal *Paul et Virginie*, its author's one work of genius. Humboldt owns the wonderful truth with which it realises the splendours of tropical vegetation, but it is as an exquisite idyll of love growing up unconsciously in two natural hearts that the book possesses a perennial charm even for such critics as Sainte-Beuve and Gautier. *Daphnis and Chloe* suggested the idea of the change from friendship into love, but individual genius alone wrought the peculiar spell which carried *Paul and Virginia* quickly across Europe in English, Italian, Dutch, Russian, Polish, and Spanish translations, and which made Napoleon take it with him in his Italian campaign, and re-read it at St Helena. Yet the story has many faults besides its overstrained sentimentality—it is sadly marred by its didactic passages, and indeed the whole is but an object-lesson to the *Études*. His next works were *Vœux d'un Solitaire* (1789) and the weaker novel, *La Chaumière Indienne* (1791).

At fifty-five Saint-Pierre married the daughter of his printer, a girl of twenty, and at sixty-three he married another young girl, who after his death became the wife of Aimé Martin, his enthusiastic biographer and editor. A member of the Institute from its foundation in 1795, he was admitted to the Academy on its revival in 1803, but he made himself ridiculous by childish quarrels with his fellow-members. Napoleon heaped favours upon him, and he lived comfortably amid his flowers till

his death in his country-house at Eragny, near Pontoise, 21st January 1814.

Saint-Pierre wrote down to the last, yet did not succeed in destroying his reputation. His *Harmonies de la Nature* (3 vols. 1796) was but a pale repetition of the *Études*. Besides these the *Le Café de Surate* and the *Essai sur J.-J. Rousseau* alone deserve to be named. His name survives only in his one masterpiece, but his influence remains entire in the greater Chateaubriand and Lamartine.

His *Œuvres Complètes* by Aimé Martin fill 12 volumes (1813-20); the *Correspondance*, 4 volumes (1826). His great Biography by the same editor appeared in 1820; its extravagances may be corrected by Arède Barine's clever study (1891) in *Les Grands Écrivains Français*. See also Mornet, *Le sentiment de la nature en France de Rousseau à Saint-Pierre* (1907).

St Pol de Léon, a decayed town in the Breton department of Finistère, near the English Channel, 13 miles NNW. of Morlaix. It has a beautiful cathedral (13th to 15th century), dedicated to St Pol, who came hither from Cornwall in the 6th century, and also the Kreizker church, with a famous open-work spire 283 feet high. Pop. 7000.

St Quentin, a town in the French department of Aisne, stands on the Somme, by rail 95 miles NE. of Paris and 33 S. of Cambrai. The church of St Quentin is a remarkably fine Gothic structure (damaged during the Great War), dating from the 12th to the 15th century, and containing a much more ancient crypt. The town-wall (16th and 16th centuries) is also a fine specimen of Gothic. The town suffered considerably during the Great War, but its trade soon recovered. The chief industries are manufactures of cotton and wool, embroideries, machinery, and commerce in grain. Pop. (1911) 55,571; (1921) 37,345. St Quentin and its vicinity have been the scene of many memorable battles. The Spaniards under the Duke of Savoy and Ferdinand Gonzaga, assisted by an English contingent under the Earl of Pembroke and Egmont in command of the Flemings, inflicted a crushing defeat upon the French under Constable Montmorency, on 10th August 1557 (St Lawrence's Day), a victory which Philip II. commemorated in the Escorial (q.v.). Shortly afterwards the town, after a brilliant defence by Coligny, capitulated to the Spanish army. On 19th January 1871 the Germans under von Goeben defeated the army of Faidherbe, capturing nearly 10,000 prisoners. The Germans occupied St Quentin from August 1914 to 1st October 1918, and for many months this front was the point of junction of the French and British armies. The battle of St Quentin (or second battle of the Somme) in March 1918 ended in the retreat of the British fifth army against overwhelming odds.

St Raphael, a popular health resort near Fréjus (q.v.).

Saint-Réal, CÉSAR VICHARD, ABBÉ DE, who has been, and not undeservedly, styled the French Sallust, was born in 1631 at Chambéry, and died there also in 1692. He went early to Paris, visited London and there lived awhile under the shelter of St Evremond and the Duchesse de Mazarin, but in 1679 settled at Chambéry as historiographer to the Duke of Savoy. He had been long a student of history when in 1674 he covered himself with distinction by his brilliant *Histoire de la Conjuración que les Espagnols formèrent en 1618 contre la République de Venise*, which to this day is counted among French classics. His style is vivid and vigorous, simple and pure, yet picturesque; and the story is unfolded with a skilful mastery of dramatic sense. It has been objected that the facts are not always reliable, the conclusions frequently unsound, but it should be remembered that Saint-Réal wrote history before the modern

conception of history awoke, and that his aim was to produce a good literary narrative, not a chronicle. A work of art should be estimated according as it corresponds to the ideal of the writer, rather than to the prepossessions of the individual reader, and, this test applied, the *Conjuración contre Venise* remains an exquisite masterpiece of historical painting in miniature.

Saints. See SAINT.

Saint Saëns, CHARLES CAMILLE, French composer, pianist and critic, was born in Paris 1835, and died on a visit to Algiers in 1921. At the age, it is said, of two and a half years he was taught the pianoforte by his great-aunt, and at seven he had further instruction from Stamaty, and subsequently learned harmony under Maleden. In 1847 he studied the organ under Benoist, and at the age of sixteen wrote his first symphony. He became organist, first of the church of St Méry, and in 1858 of the Madeleine, where he continued till 1877. One of the greatest exponents of his time on the pianoforte and organ, he displayed remarkable powers of improvisation. He repeatedly made professional tours abroad in all the principal countries of Europe, including Great Britain, also visiting Africa, the United States twice, and South America once. Of his thirteen operas, by far the most successful has been *Sansouet* and *Dalila*, first produced at Weimar in 1877, and sometimes given as a cantata; but *Henri VIII.* (1883) and *Asernio* (1890) had some popularity. His four symphonic poems (in which he follows the lead of Liszt), *Le Roi et l'Omphale*, *Phaéton*, *Danse Macabre*, *La Jeunesse d'Hercule*, are also well known. His other works include five symphonies; five piano, three violin, and two cello concertos; besides a large amount of chamber music, organ music, songs, &c. Saint Saëns laid stress on form as the essential part of music, advocating 'art for art's sake' and putting reason before sentiment. Though his very numerous compositions reveal an excellent technique and are distinguished for their clarity and vivacity, yet they always seem to be superficial, and to be lacking in depth of feeling and in a sense of realities. The same precise, clear-cut style is to be found in his literary productions (on a variety of subjects)—*Harmonie et Mélodie* (1885), *Problèmes et Mystères* (1894), *Portraits et Souvenirs* (1899), *Au Courant de la Vie* (1914), &c.

See studies by Neitzel (1899), Baumann (1905), and Hervey (1921).

Saintsbury, GEORGE EDWARD BATEMAN, was born at Southampton, 23d October 1845, and was educated at King's College School, London, and Merton College, Oxford. From 1868 till 1876 he filled scholastic appointments at Manchester, Guernsey, and Elgin, but soon after established himself firmly in the literary world of London as one of the most active and influential critics of the day. From 1895 to 1915 he occupied the chair of English Literature in Edinburgh University. All his work is characterised by clearness of thought, fullness of knowledge, and force, if not always grace of style; and he has been invaluable to his generation as a guide to French literature old and new. He has been an active contributor to the greater magazines (of *Macmillan's* he was for some time editor) and to encyclopedias, including the present work. Among his books are a *Primer* (1880) and a *Short History* (1882) of French literature; *Dryden* in 'English Men of Letters' (1881), and *Marlborough* in 'English Worthies' (1885); *Minor Poets of the Caroline Period* (3 vols. 1905-21); a *History of Elizabethan Literature* (1887); *Essays in English Literature, 1780-1860* (1891); *Essays on French Novelists* (1891), *Miscellaneous Essays* (1892 and 1895); *English Literature in the*

19th Century (1896); *The Flourishing of Romance and Rise of Allegory* (1897), a book on Scott (1897), a *Short History of English Literature* (1898), *Matthew Arnold* (1899), a great *History of Criticism* (1900-4), *The Earlier Renaissance* (1901), *Specimens of English Prose Style* (1885), the standard *History of English Prosody* (3 vols. 1906-10), *A History of English Prose Rhythm* (1912), books on the English (1912) and the French (1917-19) novel, *Notes on a Cellar-book* (1920), and a succession of *Scrap Books*.

St Servan, a French seaport, department Ille-et-Vilaine, on the Rance estuary, now practically a suburb of St Malo (q.v.), with fishing and ship-building; pop. 12,500.

Saint-Simon, CLAUDE HENRI, COMTE DE, founder of French socialism, was born at Paris, 17th October 1760, and belonged to the same stock as the dual author of the memoirs. When D'Alembert was his tutor, he ordered his valet to rouse him every morning with the words, 'Rise, Monsieur le Comte, you have great things to do.' Like other French nobles, he showed his youthful enthusiasm for liberty by serving as a volunteer in the American war of independence against England. He did not, however, take any prominent part in the Revolution in his own country; his birth as an aristocrat brought him into suspicion with the extreme party, and he was imprisoned for a time. But he made a little fortune by speculating in confiscated lands; not from love of money, as we are assured, but that he might have leisure to promote the grand projects which he was now contemplating.

His ancestor Charlemagne had appeared to him in a dream, and encouraged him to devote his life to philosophy, by promising that his successes as philosopher would equal those of the emperor as warrior and statesman. Accordingly Saint-Simon now went through a long course of study and experiment to fit himself for his new career. Pleasure and science were alike welcome to him, provided they enlarged the circle of his knowledge and experience. One of his experiments was matrimony (1801); it proved a failure, and was soon terminated by a divorce. The lavish expenditure incurred during his experiments also reduced him to utter poverty, in which he passed the rest of his life. It was at this time that he made his characteristic proposal of marriage to Madame de Staël: 'Madame, vous êtes la femme la plus extraordinaire du monde, comme j'en suis l'homme le plus extraordinaire; à nous deux nous aurions, sans doute, un enfant plus extraordinaire encore.' Madame de Staël, however, declined to honour the philosopher, and Saint-Simon, now beginning to be in straits, published his first work, *Lettres d'un Habitant de Genève à ses Contemporains* (1803). His early writings were scientific and speculative. The first distinct approach to an enunciation of socialism occurred in a work *L'Industrie*, which appeared in 1817, and similar views were set forth in *L'Organisateur* (1819), *Du Système Industriel* (1821), *Catholicisme des Industriels* (1823). The last, and by far the most important, work of Saint-Simon was the *Nouveau Christianisme*, published in 1825. While writing these works the philosopher lived in utter penury, being often destitute of decent food and clothing, and hardly able to scrape together the means of publishing them. But for the kindness of friends and a small pension allowed him by his family in 1812 he would have died of starvation. In 1823 he had so exhausted his funds that he tried to shoot himself with a pistol, and lost an eye in the attempt. He died May 19, 1825.

It will be seen that the most prominent feature

of Saint-Simon's life was the originality with which he ordered it for himself. The heroic fortitude which he showed in enduring extreme poverty and neglect cannot be too highly commended. That his originality degenerated into eccentricity and vanity is evident enough. The like qualities and defects are found in his works. They are wanting in sober-mindedness, judgment, and system; they are loose, diffuse, and full of repetitions. Yet there must have been a great charm both in the personality and in the theories that attracted so many of the brightest and ablest young men of France, including Comte and Augustine Thierry. Notwithstanding all his vagaries and eccentricities, the man who originated Comtism and French socialism must be regarded as a seminal thinker of high rank. He sowed the seed which afterwards grew into important systems. In opposition to the destructive spirit of the Revolution, he sought after a positive reorganisation of society. He desired that the feudal and military system should be superseded by an industrial order controlled by industrial chiefs, and that the spiritual direction of society should pass from the church to the men of science. In the *Nouveau Christianisme* the cause of the poor is laid down as the groundwork of religion. Proceeding from the grand precept, 'Love one another,' Saint-Simon thus enunciated the fundamental principle of the new Christianity: 'The whole of society ought to strive towards the amelioration of the moral and physical existence of the poorest class; society ought to organise itself in the way best adapted for attaining this end.' According to Saint-Simon, the essence of religion and the transforming principle of the new society are alike contained in these words.

After his death the vague ideas of Saint-Simon were developed by his disciples into an elaborate system of socialism. During the excitement produced by the revolution of 1830 the school attracted great attention both in France and Europe. The *Globe* became its organ, and many of the most promising youth of France joined it. An association living out of a common purse was established. But dissensions connected with the marriage question arose between the two leaders, Bazard and Enfantin. Bazard, with many important members, seceded, and Enfantin, who had advocated lax ideas on the relations of the sexes, led the association into the lower depths of extravagance and absurdity till the courts of law interfered, and the society was broken up in 1832. Many members of the school afterwards played a leading part in various departments of French life. The first systematic presentation of socialism may be regarded as due to the Saint-Simon school, and it will be most convenient to give an account of their views under the article SOCIALISM.

An admirable edition of the works of Saint-Simon and Enfantin was issued by survivors of the school (47 vols. Paris, 1895-78). See the study by Booth in English (1871); the study by Janet (1878); two books by G. Weill (1894, 1896); and the monograph on Saint-Simon and Comte by G. Dumas (1905), all in French.

Saint-Simon, LOUIS DE ROUVROY, DUC DE, a great French writer, was born at Paris, 16th January 1675. His father, who was sixty-eight at his birth, had been a page and favourite of Louis XIII., and had risen rapidly at court, becoming First Equerry in 1627, and finally duke and peer in 1636, but soon after fell into disgrace, and passed much of his time thereafter at the castle of Blaye on the Gironde, which as governor he kept for the crown throughout the Fronde. The boy was given the title of Vidame of Chartres, as those of marquis and count had become too common. He received a careful education at home and at the academy of Rochefort, entered the service in the king's

household troops in 1691, and behaved with spirit at Neerwinden (1693) under the eye of Luxembourg. He succeeded his father in the title, as well as in all his appointments, in 1693, married in 1695, and served in the army of the Rhine under his father-in-law, the Marshal de Lorges, from 1694 till the peace of Ryswick, having offended Luxembourg by championing the action of the dukes in Parlement against his claim in a question of privilege. Dissatisfied with his promotion, he left the service in 1702, and repaired to Versailles, where he studied the 'insects of the court,' and conformed to all the tedious etiquette of Louis XIV., without for some years enjoying any measure of the royal favour. He embroiled himself in an endless series of disputes with members of the peerage about points of precedence and privilege, made a bitter enemy of the powerful Marquis d'Antin, as well as of the Duc de Maine, the eldest of the king's bastards by Madame de Montespan, who had been, to his great displeasure, given in 1694 a special rank below the princes but above the other peers; and he was disliked by the Dauphin and the whole 'cabal of Mendon' which surrounded him. Indeed, he left Versailles for a time, and passed most of the year 1709 in the country at La Ferté. But he recovered the king's favour by his efforts to bring his friend Orléans to a more reputable life, and by his successful intriguing in the project to marry the Dauphin's favourite son, the Duc de Berry, to the daughter of Orléans. The marriage took place in July 1710, and the Duchesse de Saint-Simon was, to his great regret, made lady-in-waiting to the young Duchesse de Berry, and passed nine uncomfortable years of attendance upon her half-mad mistress. The death of the Dauphin (April 1711) relieved him of all anxiety for the future, for his son, the Duke of Burgundy, Fénelon's pupil, was his warm friend. But his joy was short-lived, for the virtuous young Dauphin and Dauphiness were both carried off by fever in February 1712. Another mortification was the elevation of the two bastards in 1714 to be princes of the blood. The king's death on 1st September 1714 opened up a bitter struggle between Orléans and Maine, in which Saint-Simon supported his friend with equal warmth and boldness. It ended in the complete triumph of Orléans; but though Saint-Simon had a seat on the council of the regency, he found Orléans indifferent to his schemes of financial reform, and the restoration to the peers of a paramount position in the work of government, but he had at least the gratification of seeing 'the bastards' degraded from the princely rank. His influence decreased as that of Dubois rose; but he was sent to Spain in 1721 on a splendid special embassy to demand the hand of the Infanta for the young king, Louis XV. The death of Orléans in December 1723 closed his public career, and he spent the next thirty years in calm retirement at his château of La Ferté Vidame near Chartres, 77 miles distant from Paris. Saint-Simon died in his house at Paris, 2d March 1755. He had struggled all his days with colossal debts, and he sank at last into sheer insolvency.

Saint-Simon amused himself, between the years 1734 and 1738, in making notes in an interleaved copy of Dangeau's dry and servile *Journal* (written 1684-1720); but he seems to have begun his own journal before 1699. Finally, about 1739, he began to prepare the *Mémoires* in their final form, and this task he completed about 1752. This precious MS. was claimed by his cousin, the Bishop of Metz, but it was finally impounded in 1761 by the Duc de Choiseul for the Foreign Office. It was read to furnish amusement for Madame de Pompadour; Madame du Deffand speaks of it in a letter to

Horace Walpole; and it had undoubtedly been seen by Duclos, Marmontel, and Voltaire. A volume of garbled extracts appeared at Brussels in 1780, but it was not till 1830 that the first authentic edition appeared, the MS. having been given to General de Saint-Simon by Louis XVIII.

Saint-Simon's Memorials on Precedent and Privilege are not interesting, nor yet his Letters, but his *Mémoires* remains a consummate masterpiece of literary art, in its kind absolutely alone. His knowledge of military affairs was inadequate; his fondness for a striking story was a standing snare to him; and other inaccuracies are plentiful enough; while his narrative is constantly marred by defective information and by prejudice, but never by deliberate falsehood. He was an honest hater—"all my life," he says, "I have known only too well how to love and how to hate"—but if he heaps his hatred upon Vendôme, Villars, Madame de Maintenon, Maine, Noailles, and DuBois, he has no less intense a love for Beauvilliers, for his spiritual adviser, the Abbot Rancé of La Trappe, and for his young hero the Duke of Burgundy. His life was pure in an impure age; he had an un-French dislike to all such frivolities as cards and frequenting playhouses; there is but one instance even of his taking part in a hunt. He describes with pity the horrors of hunger among the peasantry during the winter of 1709; and his heart was hot within him at the inhuman persecutions of the Jansenists and the Huguenots, which he ascribes directly to Madame de Maintenon, herself "the dupe of her own hypocrisy"—a mere tool in the hands of the Jesuits. He loved the old Gallicanism of the French Church, and abhorred the infamy of the Revocation; he describes the military disasters and humiliation of the king's later years with a remorseless truth, but does ample justice to the dignity and kingly deportment of Louis, who "never considered that any one but himself had been king of France." He was an admirable observer, and he has left us an inimitable gallery of the portraits of a whole court, all distinct and individual, vivid and real. His aim was to make his reader think 'not that he is reading a history or memoirs, but rather that he is himself in the secret of all that is represented to him, and spectator of all that is related,' and in his aim he succeeded as no other has done before or since. Yet his style is unstudied, slap-dash, full of confusions of construction—"il écrit à la diable pour l'immortalité," said Chateaubriand. Sainte Beuve with these words smugs up his judgment: "Thanks to him—un Tacite au naturel et à bride abattue—we have nothing to envy in the earlier writer. And what is more, the vein of comedy, which he has so boldly scattered through his *Mémoires*, has given us in him truly a Tacitus à la Shakespeare."

Editions of Saint-Simon's *Mémoires* were published in 1840 (40 vols.), 1856 (20 vols., ed. by Bédollière), and in 1873-86 (20 vols., ed. by Clémel), but the final complete edition of the *Mémoires*, with the additions to Dangeau's *Journal*, is that of Boislisle (30 vols., 1879 et seq.). Faugère published the *Écrits Inédits* in 1880-92 (8 vols.). The *Projets de Gouvernement du Duc de Bourgogne* were published in 1860 and the *Lettres et Dépêches of the Spanish Embassy* in 1880. Volumes of extracts from the *Mémoires* appeared (in French) in 1891 and 1911 (ed. by Lannéau), while abridged English translations were made by Wormeley (4 vols., 1899) and Arkwright (6 vols., 1915-18). See Sainte-Beuve, *Causeries du Lundi* (vols. iii. and xv.), and *Nouveaux Lundis* (vol. x.); Taine, in *Essais de Critique et d'Histoire*; Chéruel, *Saint-Simon considéré comme Historien de Louis XIV.* (1865); studies by Collins (1880), Cannan (1885), and Boissier (1892); books by Pilastré (1905, 1909); Meyrac, *Louis XIV., sa cour, ses maîtresses d'après Saint-Simon* (1911); and Doumic, *Saint-Simon et la France de Louis XIV.* (1919).

St Stephen's. See WESTMINSTER.

St Sulpice, the famous diocesan seminary for priests in Paris, close by the large and wealthy church of St Sulpice, on the south side of the Seine, near the Luxembourg.

St Thomas. See SÃO THOMÉ.

St Thomas, one of the Virgin Islands in the West Indies, sold in 1916, together with Santa Cruz (q.v.) and the less important St John, by Denmark to the United States, lies 36 miles E. of Puerto Rico. Area, 28 sq. m.; pop. 10,000, mostly negroes. English is the language of the educated classes. The surface is hilly (1555 feet) and the soil poor. The port, Charlotte Amalie or St Thomas (pop. 8000), was formerly a busy emporium for the European trade and the principal port of call in the West Indies. Geographically it is favourably situated, and the Panamá Canal may restore some of its old importance. Much imported coal is sold to passing steamers. The harbour is landlocked. Before the abolition of slavery St Thomas was covered with prosperous sugar-plantations. The island is often visited by earthquakes. It was first colonised by the Dutch in 1657, and became Danish in 1666. The British held it in 1667-71, 1801, 1807-15.

St Thomas, a town of Ontario, 15 miles S. of London by rail, with sawmills, foundries, railway works, and various factories. It is an important railway centre. Pop. 16,000.

St Thomas's, one of the great London hospitals, founded as a hospice in the 13th century, was moved from Southwark in 1868, and is now housed in seven four-storied red-brick pavilions, a spacious but ugly building standing opposite the Houses of Parliament, on the south side of the Thames. The revenue of the hospital is about £70,000. It has over 630 beds, and treats annually 8000 in-patients and over 60,000 out-patients.

St Victor, HUGO OF, a mediæval theologian, a Fleming, born near Ypres in 1097, died in 1141 as prior of the Augustinian monastery of St Victor at Paris, was a man of the school of Bernard of Clairvaux, and a mystic, his favourite teaching being that the intellect or its exercise, reasoning, will never enable man to discover the 'uncorrupted truth of things.' His writings were very popular in the monastic schools and in pietistic circles during the middle ages. His pupil, RICHARD OF ST VICTOR, prior of his monastery from 1162 to 1173, and a Scot by birth, went even further than Hugo in that he proclaimed mystic contemplation to be above reason.

Saint-Victor, PAUL DE, a superfine French writer, was born at Paris in 1827, the son of a poet who translated Anacreon and became a fine connoisseur in painting. He had his education at Freiburg in Switzerland and at the Collegio Romano at Rome, and made his début in 1851 as a dramatic critic in the *Pays*, under the protection of Lamartine, whom he had already served as secretary. In 1855 he carried his pen to the *Presse*, later to *La Liberté*, and last to the *Moniteur Universel*. He quickly made himself famous by his knowledge and insight, and by a brilliant style, marred only by its affectedness and over-elaboration. Sense of colour, imagination, a quick eye for the picturesque in everything, and the sovereign gift of the artist—the intuition of individuality—made him a word-painter of the first rank, while his severity of taste and his sense of form saved him from extravagance. Yet his style is splendid, Oriental or at least Italian rather than French—even in his appearance he was a Venetian who had stepped out of his canvas. 'When I read Saint-Victor, I put on blue spectacles,' said Lamartine, and Victor

Hugo wrote to him, after reading his review of the *Travailleurs de la Mer*, 'One would write a book merely to make you write a page.' His first book was *Rommes et Dieux* (1867), a series of historico-æsthetic studies on the Venus of Milo, Diana, Ceres, Helen, Nero, Marcus Aurelius, Cæsar Borgia, and Henry III. Later books were *Les Deux Masques*, *tragédie-comédie* (3 vols. 1879-83); *Anciens et Modernes* (1886); *Les Femmes de Goethe* (1869); *Victor Hugo* (1885); and *Barbares et Baudits*. Saint-Victor was reserved in temperament, and indeed, to speak truly, was something of a coxcomb. He lived an uneventful life, was for some years General Inspector of Fine Arts, and died at Paris, 9th July 1881. See the study by Alidor Delzant (1886), which reveals to us the strangely mechanical method in which he wrote. He first selected certain words, spread them about his page like colours on a palette, next grouped round them other euphonious terms, and lastly strung the whole together in a proposition.

St Vincent, one of the British islands in the West Indies, Windward Group, 105 miles W. of Barbados. Area, 150 sq. m.; pop. 46,744. The chief town is Kingstown (pop. 4000), at the head of a bay on the south-west coast. The island is traversed from north to south by a chain of volcanic mountains, which rise in the volcano called the Soufrière (in eruption in 1812 and 1902) to 3000 feet. Many of the valleys are fertile, and the shores are rich and productive. One-fourth of the area is under cultivation, a peasant proprietary being established under government auspices. The climate is healthy. Sugar, rum, cocoa, spices, and arrowroot are products; the sugar industry has steadily declined, and the total trade of the island fell in twenty years to about half, but cotton since 1903 has largely restored prosperity. The island has an administrator and a legislative council, since 1926 partly elected. St Vincent was discovered by Columbus in 1498, and was then inhabited by Caribs. These people were left in possession down to 1783, although Charles I. gave the island to the Earl of Carlisle in 1027. In 1797 the Caribs, rebelling with French aid, were transferred to the island of Rattan in the Bay of Honduras. St Vincent, with the other Windward Islands, suffered greatly from a hurricane of almost unparalleled violence in 1898; and in 1902, almost at the same time with the eruption of Mont Pelée on Martinique, the Soufrière burst into activity, vomiting lava and ashes, and causing 1600 deaths.

St Vincent, CAPE, a commanding promontory forming the south-western corner of Portugal. On June 16, 1693, Admiral Rooke was here attacked by a superior French fleet, and defeated with the loss of twelve men-of-war and eighty merchantmen which were sailing under his convoy; on January 16, 1780, Admiral Rodney destroyed here several Spanish ships of Langara's fleet; on February 14, 1797, the great battle of Cape St Vincent (see following article) resulted in the total defeat of the Spaniards and capture of some of their largest ships. This victory frustrated the formidable Spanish-French scheme of invading England. The fourth naval fight off Cape St Vincent took place between the fleet of Queen Maria of Portugal, commanded by Sir Charles Napier (q.v.), and that of Dom Miguel, in which a portion of the latter was destroyed and the rest captured, 5th July 1833.

St Vincent, EARL, Admiral. John Jervis was born at Meaford Hall, Staffordshire, January 9, 1735. Running away to sea as a boy, he rose to be a naval lieutenant in 1755, and so distinguished himself in the Quebec expedition in 1759 as to receive the rank of commander. As captain of the *Foudroyant* in 1778 he fought in the action off Brest, and in

1782 captured the *Pégase* of 74 guns, whereupon he was made K.C.B. In 1793 he commanded the naval part of the successful expedition against the French West India Islands. In 1795, now a full admiral, he received the command of the Mediterranean fleet. On the 14th February 1797, with only fifteen sail of the line and seven frigates, he fell in, off Cape St Vincent, with the Spanish fleet of twenty-seven sail. Jervis determined to engage the enemy, and the battle of St Vincent was fought; but it should be remembered that the genius of Nelson contributed greatly to the success of the day (see NELSON). For this victory the king created Jervis Earl St Vincent, and parliament settled upon him a pension of £3000 a year. After having, by great firmness, repressed a mutiny off Cádiz, which threatened the loss of the whole fleet, he was compelled by ill-health to return home. He was soon applied to by government to subdue the spirit of sedition which had openly manifested itself in the Channel fleet; and his endeavours were eminently successful. He held the appointment of First Lord of the Admiralty for the three years 1801-4, and reformed innumerable crying abuses; and having for a second time commanded the Channel fleet, he retired. He died 13th March 1823, and was buried at Stone, Staffordshire, with a monument in St Paul's Cathedral.

See his *Life and Correspondence*, by Captain Brenton (reprinted, 1838); the standard *Memoirs of the Earl of St Vincent*, by J. S. Tucker (1844); the *Life*, by Anson (1913, based on Tucker); and the naval histories.

St Vitus' Dance. See CHOREA.

Sais, an ancient Egyptian city, called in the hieroglyphs *Sa*, was situated on the right bank of the Canopic branch of the Nile. It gave its name to two Egyptian dynasties, the 24th and 26th, founded by natives of the city. Sais was important as a religious capital, and had a famous temple of the goddess Neith and a tomb of Osiris. Towards the decline of the monarchy it rose to great splendour. The 26th dynasty transferred thither the capital of the kingdom. It was also a renowned seat of learning, and was frequently visited by the sages of Greece. The legend of the mysterious statue in the temple at Sais (which formed the subject of Schiller's ballad and of Novalis's romance) is the issue of Greek invention.

Saith. See COAL-FISH.

Saivas is the name of one of the three great divisions of Hindu sects. See INDIA, Vol. VI. s. 106. The word designates the votaries of Siva, and comprises different special sects, which varied in number at different periods of mediæval Hindunism. See SIVA.

Sakai, a town of Japan, situated on the south-west of the island of Nippon, 7 miles S. of Osaka. Before the rise of that town Sakai was the chief commercial port of Japan; its trade is now absorbed in that of Osaka. Pop. 85,000.

Sakni, a dwarfish jungle people of the south of the Malay Peninsula, with dark skin, black wavy hair, and broadish nose. They are classed as pre-Dravidian.

Sakhalin, or SAGHALIEN (Japanese *Karafuto*), is a long and narrow island (670 by 20 to 150 miles), running north and south, and lying close off the east coast of Siberia. The northern portion is Russian, and the southern Japanese, the parallel 50° N. lat. being the dividing line. The Strait (or Gulf) of Mamia Kinso (or Tartary) separates it from the mainland; the Strait of La Pérouse parts its southern extremity from Hokkaido (Yezo); and the misty, shilly sea of Okhotsk washes its eastern and northern shores. Owing to the vicinity of this sea, to the presence of ice-floes off the east coast, and to the dense forests, chiefly of coniferous trees, which clothe the

mountains (5000 feet) that run from end to end of the island, the rainfall is heavy and mists very prevalent, so that the climate is on the whole extremely raw and cold. Large areas, however, are fit for agriculture and pasturage, which the Japanese have been developing. The rivers are navigable for very short distances; but they, as well as the adjoining seas, teem with fish, the rivers especially with salmon; and herring, sturgeon, and salmon fisheries are very important. Coal is mined, and the rich petroleum supplies of the north-east were exploited after the Russo-Japanese war. The people are Gilyaks in the north, Ainu in the south. Soon after the Russians became masters of the whole island (1875) they made an attempt to colonise it by means of convicts, but the scheme proved a failure. Bears, sables, wild reindeer, tigers, and other wild animals occur. The vegetation is chiefly Siberian in character. Sakhalin, inhabited since the stone age, belonged to China until the beginning of the 19th century. The Japanese then held the southern part down to 1875, when they ceded it to Russia, certain of the Kurile Islands being granted in return. But after the war in 1904-5 the Japanese demanded the restitution of the whole island; ultimately, by the treaty, the Russians, who long refused to make any concession, restored the southern part (with its fisheries) to Japan. After the Russian Revolution the Japanese occupied Northern Sakhalin till 1922. Of the Japanese portion, the area is about 13,926 sq. m., and the population 105,900; of the Russian portion, the area is about 42,610 sq. m., and the population 52,600. See a French work by Labbé (1903), and *The Uttermost East* by C. Hawes (1903).

Saki (*Pithecia*), a genus of long-tailed American monkeys of the family Cebidae. Some species (e.g. *P. hirsuta*) are covered with long hair, and are sometimes called Fur-tailed Monkeys. The Black Saki (*P. satanas*), from the Amazons, is the best-known species.

Saki, a kind of beer which the Japanese make from rice. It is the common alcoholic liquor of Japan. It is clear, and has a peculiar taste, which Europeans generally reckon unpleasant. The Japanese usually heat it before drinking, and pour it into flat cups or saucers of lacquered wood. It produces a very speedy and transient intoxication.

Sakjageuzi, a site 62 miles WNW. of Carchemish, excavated by Professor J. Garstang, has yielded important Syro-Hittite and Aramean sculptures.

Sakkara, a village 10 miles S. of Cairo, near the ruins of Memphis (q.v.), and famous for its eleven Pyramids (q.v.).

Saktas is the name of one of the great divisions of Hindu sects. See INDIA, Vol. VI. p. 106.

Sakuntalā is one of the most pleasing female characters of Hindu mythology. She is mentioned as a water-nymph in the *Yajurveda* (see VEDA); she is the subject of an interesting episode of the *Mahābhārata* (q.v.), and is spoken of in the *Purānas*; but her name has become especially familiar in Europe through the celebrated drama of Kālidāsa (q.v.), which, introduced to us by Sir William Jones in 1789, became the starting-point of Sanskrit philology in Europe, and excited the warm admiration of Goethe.

Sakurashima, an island volcano in the Bay of Kagoshima, did much injury to the town of Kagoshima in 1914.

Sākya-muni, or the 'Saint Śākya,' is a name of the founder of the Buddhist religion. See BUDDHISM, Vol. II. p. 526.

Sāl (*Shorea robusta*), a tree of Northern India, whose wood—hard, dark brown, rather coarse

grained, but very durable—is next in value to teak. It is carefully cherished by government. See SHOREA, DAMMAR, DIPTEROCARPACEÆ.

Sala, GEORGE AUGUSTUS HENRY (1828-95), journalist and novelist, and a man of much out-of-the-way learning, was born in London, the son of an Italian and an Englishwoman, and, forsaking art for literature, became a contributor to *Household Words*, the *Welcome Guest*, *Temple Bar* (which he founded and edited), the *Illustrated London News* (to which from 1860 to 1864 he contributed the 'Echoes of the Week'), and *Cornhill*. As special correspondent of the *Daily Telegraph* he was in the United States during the civil war, in France during the war of 1870-71, in Russia in 1876, and in Australia in 1885. *Twice Round the Clock* was published in 1859. Among his best-known novels are *The Buddington Peerage* (1860), *Captain Dangerous* (1863), *Quite Alone* (1864). *Wat Tyler*, M.P. is a burlesque; and among the popular books of travel are *A Journey due North* (1859), *Dutch Pictures* (1861), *A Trip to Barbary* (1865), *From Waterloo to the Peninsula* (1866), *Rome and Venice* (1869), *Under the Sun* (1872), *Paris Herself Again* (1881), *America Revisited* (1882), *A Journey due South* (1885), *Things I have Seen* (1894), and his autobiographical *Life and Adventures* (1895). His last book was on cookery.

Salaam (*Salam*, Arab. = Heb. *Shalom*, 'peace'), the general term of salutation among the Moham-medans; 'Es-selāmu aleikum' ('Peace be with you') (addressed only to the faithful) being answered by 'With you be peace, and the mercy of God, and his blessings!'

Salad, a preparation of raw herbs for food, derives its name from the fact that salt is one of the chief ingredients used in dressing it. The principal salad herbs are lettuce, endive, cichory, celery, mustard and cress, water-cress, onions, radishes, tomatoes, chervil, and a few savoury herbs used to give flavour. They are usually cut up, and mixed with salt, vinegar, oil, and other condiments, according to taste, often with sugar. The great value of salads is in the fact that they are uncooked, and consequently contain more mineral matter, such as potash, soda, &c., than if boiled. Potato salad is made with boiled potatoes. Salads are often prepared with animal food, such as lobsters, crabs, eggs, &c. See MAYONNAISE.

Salādin, the name given by western writers to SALAH-ED-DIN YUSUF IBN AYUB, the sultan of Egypt and Syria, and the founder of the Ayubite dynasty in those countries. He lives in the works of historians as the Moslem hero of the third crusade and the paragon of Moslem chivalry. He was born in 1137 at the castle of Tekrit, on the Tigris, of which his father Ayub, a Kurd, was governor under the Seljuks. Following the example of his father and uncle, he entered the service of Nur ed-din (q.v.), emir of Syria, and accompanied his uncle Shirkoh in his expeditions to Egypt (1167-68) in command of Nur ed-din's army. On the death of Shirkoh, Salādin succeeded as vizier of the Fatimite khalif, and in 1171 he deposed him and became virtual king of Egypt, though nominally subject to Nur ed-din. But on Nur ed-din's death (1174) Salādin proclaimed himself sultan of Egypt and Syria, and the title was confirmed to him by the khalif of Bagdad. He next reduced Mesopotamia to his rule, and received the homage of the Seljuk princes of Asia Minor. The remaining years of his life were occupied in wars with the Christians and in the consolidation of his extensive dominions. On 4th July 1187 the Christian army suffered a terrible defeat near Tiberias; the king of Jerusalem, the two grand-masters, and many other warriors of high rank were taken captive; then

Jerusalem was stormed (3d October), and almost every fortified place on the Syrian coast (Acre, Saida, Beyrout, &c., though not Tyre) was taken by the victorious Saladin. The news of this great success being brought to western Europe aroused the religious enthusiasm of the Christians to its highest pitch, and a powerful army of crusaders, headed by the kings of France and England, eventually made their appearance on the scene of strife. They captured Acre in 1191, and Richard Cœur-de-Lion defeated Saladin in the battle of Arsuf, 7th September, took Caesarea and Jaffa, and finally obtained a treaty for three years (2d September 1192), by which the coast from Jaffa to Tyre was yielded to the Christians. In the following year Saladin died at Damascus on 3d March. Saladin was not a mere soldier; his wise administration left traces which endured for centuries, in the citadel of Cairo, and in forts, canals, dikes, and roads. His opponents frankly attribute to him the noble qualities of chivalry, invincible courage, inviolable fidelity to treaties, greatness of soul, piety, justice, and moderation. The chivalrous side of his character has been well caught by Scott in *The Talisman*. The Ayubite dynasty ruled over Syria till 1259, when it was dispossessed by the Perso-Mongols, and over Egypt till the rise of the first Mameluke kingdom in 1250. See S. Lane-Poole, *Life of Saladin* (1899, re-issue 1926).

Salamanca, a city of Spain, stands on and between four low hills beside the river Tormes, 110 miles NW. of Madrid. From the middle of the 13th to the close of the 17th century it was the seat of one of the most celebrated universities in Europe. Founded in 1243, this great school won renown at first for the teaching of civil and canon law; later theology became an important faculty. In the 16th century there were here from 6000 to 8000 students, amongst them the members of an Irish College. The university buildings date chiefly from the 15th century, and are Gothic in style. In Salamanca's palmy days her population reached 50,000, and the university counted more than a score of colleges. The library was founded in 1254. The city is still surrounded with walls, pierced by ten gates, and preserves very much of its medieval appearance, its houses, convents, and churches, its streets and squares having altered but little since the university began to decline. The river is crossed by a bridge of twenty-seven arches, in part of Roman construction. The great square is the largest perhaps in Spain; it is surrounded by an arcade, and has on one side the municipal buildings. It was used for bull-fights, and can hold 20,000 spectators. The city possesses two cathedrals; the old cathedral, cruciform in shape, late Romanesque in style, and dating from the 12th century, is richly decorated with paintings and monuments; the new cathedral (1513-1734) is a florid Gothic pile, also richly decorated. Amongst the remaining noteworthy buildings are the Jesuit College (1614), Renaissance in style; the Old College, now the governor's palace; the convents of the Dominicans and the Augustinians, the churches of which are both elaborately ornamented. In the middle ages Salamanca was famous for its leather-work; at the present day it has not much industry, save a little manufacture of cloth, linen, leather, and pottery. Population, 32,000. The town was captured by Hannibal in 222 B.C. The Moors were expelled from its walls in 1055. During the Peninsular war it was taken by the French (1812), who committed great destruction in one of its quarters, and in the vicinity Wellington defeated Marmont on 22d July 1812.—The province, which produces a good deal of wool, has an area of 4830 sq. m. and a population of 320,000.

Salamander (*Salamandra*), a genus of tailed Amphibians, nearly related to the newts (Molge, &c.). The Salamanders are born in the water, but in adult life mostly live on land. In early life they breathe by gills, but these disappear, the adults breathing entirely by lungs. They feed on worms, slugs, snails, insects, and other small animals. In habit they are somewhat sluggish, shy, and stupid. The Spotted or Fire Salamander (*S. maculosa*) is common in Europe and extends to Algiers and through Asia Minor to Syria. It is usually 5-6 inches in length, but giants of eight inches are recorded. The colour is conspicuous, bright yellow patches on a blackish background. The very glandular skin exudes a milky poisonous secretion. The Black Salamander (*S. atra*) is restricted to the Alps of Europe. It is viviparous with only two young ones at a time. There are no British species. The four genera included

The Spotted Salamander (*Salamandra maculosa*).

in the family Salamandridæ—of which the salamander is type—are confined to the Old World. Though the salamanders are quite harmless, they have long had, and still retain, a popular reputation of extreme venomousness, and are therefore much dreaded. Strange fables have been current concerning them from remote ages, particularly concerning the icy cold (a reference perhaps to the moist secretion) which envelops their body, and enables them not only to endure fire without burning, but to extinguish fire. Pliny refers to this belief, but very dubiously (*Nat. Hist.* x. 86 and xxix. 23); and so recently as 1716 the *Philosophical Transactions* recorded how a salamander, being cast 'into the fire, thereupon swelled presently, and then vomited store of thick slimy matter, which did put out the neighbouring coals.' Cellini relates that as a boy he was beaten by his father to make him remember he had seen a salamander in the fire. See SYLPHIS.

Salamis, or KOLURI, an irregularly-shaped, mountainous island of Greece, forming with Attica the Bay of Eleusis. Close to the southern promontory lies the long narrow island of Psytalia. Its area is about 35 sq. m., the chief town being the port of Salamis (pop. 12,000), on the west coast. In ancient times it was the site of two principal towns, Old and New Salamis, lay, the former on the south, the latter on the north-east coast. Salamis was an independent state till about 620 B.C., when it fell, first to Megara, next to Athens through the policy of Solon. Its name is ever memorable from the great naval battle between the Greeks and Persians, fought (480 B.C.) a few days after the battle of Thermopylæ, in the narrow strait between the east coast of Salamis and the west coast of Attica. The Greek fleet of 386 triremes was drawn up at the entrance of the bay forming the harbour of New Salamis, the Athenian contingent under Themistocles, the Corinthians under Adimantus, while the Spartan Eurybiades commanded the whole. Great dissensions prevailed among the Greek leaders, which would probably have led to a general break-up had not Themistocles by a stratagem induced Xerxes, king of the Persians, to bring up his fleet, and give immediate battle to the Greeks. Xerxes drew up his ships, numbering

1200 triremes and 3000 smaller vessels, during the night previous to the battle, opposite the Greek fleet, along the coast of Attica, almost completely blocking up both entrances to the straits; and confident of victory he took his seat on a throne erected on a lofty height on the Attic coast, almost opposite New Salamis. Both Greeks and Persians fought with great bravery, but the latter were entirely defeated, their unwieldy fleet losing all advantage of numbers in the narrow space. Both the order and incidents of the battle are obscure, but the issue is clear enough. The loss of the Greeks is said to have been 40, and that of the Persians 200 ships, exclusive of those which were captured. See Kromayer and Veith, *Antike Schlachtfelder* (vol. iv. 1924).

Sal Ammoniac, known also as Ammonium Chloride, and sometimes as Hydrochlorate of Ammonia, is used in medicine and in chemistry to a considerable extent. It is obtained from the ammoniacal liquor of the gas-works by adding hydrochloric acid and then subliming it in iron pots; on a small scale it may be made by adding hydrochloric acid to solution of ammonia. It occurs in colourless, odourless, translucent fibrous masses, with an acrid saline taste, and soluble in water. It is used as an expectorant in chronic bronchitis, in catarrhal conditions of the gastrointestinal tract, and in various hepatic diseases. While being dissolved in water it greatly lowers the temperature, and hence in solution can be used as a refrigerant. The dose is 3 to 12 decigrams given in solution. In chemistry it is largely used as a test. See AMMONIA.

Salangane, the Swiftlet that builds edible nests. See NESTS.

Salaria Via, one of the oldest of the Roman roads, left the city at the Porta Salaria, and ran *ad Keate*, *Asclum Picenum*, to *Castrum Truentinum* and *Ancona* on the Adriatic. A traffic in salt from the salt-marshes of the Tiber was carried on by the Sabines along this highway. The ancient Porta Salaria has not survived.

Salband, name given by miners to the band of altered rock or other material which often separates the contents of a mineral vein or lode from the rock-mass which the vein traverses. *Selva* and *Flucon* are terms used in the same sense.

Saldanha Bay. See CAPE OF GOOD HOPE.

Saldanha Oliveira e Daun, JOÃO CARLOS, DUKE OF, Portuguese statesman and marshal, was born on 17th November 1790, a grandson of the 'Great Marquis,' Pombal, and great-grandson of the Austrian Marshal Daun. He was educated at Lisbon and entered the army. When the French invaded Portugal he took the patriotic side, and fought with distinction at Busaco, San Sebastián, Nive, &c. From 1817 to 1822 he was in South America, and took a leading part in the struggle between Brazil and Montevideo, after the capture of which last town he was nominated viceroy of the province. When, however, Brazil declared herself independent of Portugal, Saldanha returned to Lisbon, and in 1825 was appointed governor of Oporto. A moderate constitutionalist, he took the part of Dom Pedro against Dom Miguel (see PORTUGAL), helping to defend Oporto in 1833, beating off repeated attacks upon Lisbon (for which he was created marshal), gaining the victories of Pernes and Almoester, taking Leiria and Santarém, and finally forcing Miguel to sign the convention of Évora Monte (26th May 1834) and leave Portugal. During 1836-46 the extreme democratic party were in power and Saldanha lived partly in exile, partly in retirement, partly employed on diplomatic and other public business

abroad. Meanwhile Portugal was in a most unsettled and disorderly state. Saldanha returned home in 1846; and from that time down to 1856 was alternately at the head of the government (1847-49, 1851-56), being supported chiefly by England, and in armed opposition to his political opponents. During the reign of Pedro II. he held no great office of state, and under King Louis was kept abroad as ambassador at Rome and London, except that he was prime-minister for some months in 1870. He died in London, 28th November 1876. He had been created a duke in 1846. The highly enlogistic *Memoirs*, by Count da Carnota (Lond. 1880), must be read with caution.

Sale is an exchange of land or goods for money. *Sale of Land*.—The Law of Property Act, 1925 (15 and 16 Geo. V., chap. 20, sec. 40 (1)), enacts that no action may be brought upon any contract for the sale or other disposition of land, or any interest in land, unless the agreement upon which such action shall be brought, or such memorandum or note thereof, is in writing, and signed by the party to be charged therewith. The rule applies to contracts whether made before or after the end of 1925. Such a contract, even when those conditions are not complied with, will be specifically enforced, when it has been part performed by the party seeking relief. Such part performance, according to the phrase, takes the case out of the statute. Certain conditions of sale are usually put forth on the part of the vendor, and under them the sale is conducted. The purchaser is supplied with an abstract of title going back for thirty years. Then the deeds conveying the estate are prepared and signed, the money is handed over, and the purchase completed. Before this, however, the purchaser is entitled to the estate and the vendor to the purchase-money, but the vendor has a lien for the unpaid price. The Real Property Limitation Act, 1874, gives, in the absence of fraud, a person who has held real property undisturbed for twelve years an indefeasible title thereto. The method of sale is somewhat different according as the land is freehold or leasehold. If the property is in Middlesex, or Yorkshire, or Kingston-upon-Hull, a memorial of the deed of conveyance must be duly registered in the county register; but it is not necessary so to register a memorial of any instrument made after 1925, unless it operates to transfer or create a legal estate, or to create a charge thereon by way of legal mortgage; and the registration of a memorial of any instrument not required to be registered will not effect any priority. Recent acts give power to limited owners (as tenants for life, &c.) to sell the land they occupy; but they must act under the sanction of the court, and apply the purchase-money as directed. In Scotland no contract for the sale of land is binding without writing. There is no copyhold, and leasehold is rare. There is a very perfect system of registration.

Sale of Goods.—By the 17th section of the Statute of Frauds no contract for sale of goods of the price of £10 or upward is valid unless the buyer receive and accept part of the goods sold, or pay part of the price, or the agreement be reduced to writing and signed by the parties. The title of buyer is no better than that of a seller, so that, e.g., if you purchase a watch from a man not its owner, the true owner can make you deliver it up without compensation. But there are some exceptions: thus, an agent under the Factors Acts, who may sometimes give a buyer a better title than he has himself; also goods bought in market overt become the absolute property of the purchaser, with the undernoted exception. By the custom of the City of London every shop on a week-day is a market overt;

elsewhere, only a market held at a regular time and place. The sale of horses is regulated by certain special provisions, chiefly contained in a statute of Philip and Mary. Even if goods be sold in market overt, on the subsequent conviction of the thief the property will revert to the true owner. On sale the duty of the seller is to deliver the goods, but not to send or convey them. The buyer is bound to accept and pay for what he has ordered. *Caveat emptor*, by which words is meant that the buyer takes an article at his own risk, is the rule, but a good many exceptions are admitted. The seller has a lien on the goods as long as the purchase-money is unpaid, and in case of the buyer's insolvency he may stop them in transit. In Scotland the chief theoretical point of difference is that, whilst in England the completion of the contract of sale vests the property of the goods in the buyer, in Scotland he has only a right to demand their delivery; but owing to various statutory provisions the difference is not of much practical importance. Also, the contract may be entirely verbal, and the doctrine of sales in market overt is not recognised. Among many books on the subject of sale that of Benjamin (6th ed. 1920) is the most complete. The law on the subject was codified in the Sale of Goods Act, 1893. See also BILL, CONTRACT, WARRANTY.

In the United States the sale of land is simplified by registration, but the law is based on that of England. So also with the sale of goods; only the law as to market overt is not recognised in the States, nor is warranty of title carried so far as in England.

Sale, GEORGE, an eminent oriental scholar, was born in Kent about 1690, educated at the King's School, Canterbury, and bred to the law. He assisted in getting up the *Universal History*—together with Swinton, Shelvocke, Campbell, George Psalmanazar, and A. Bower—for which he wrote the cosmogony and several portions of oriental history. He was also one of the authors of the *General Dictionary*; but he is best known by his unrivalled translation of the Koran, 'with explanatory notes taken from the most approved commentators, to which is prefixed a preliminary discourse' (1734). This translation, with its learned preliminary discourse, formed a new epoch in the study of Islam and its literature (see KOHAN; and Wherry's *Comprehensive Commentary on the Qur'an, comprising Sale's Translation*, 1882-86). That his contemporaries fastened the charge of heresy upon one who spoke philosophically and humanely of other creeds is not to be wondered at. He died 14th November 1736. After his death a catalogue of his oriental MSS. was published, and they are now in the Bodleian Library, Oxford.

Sale, SIR ROBERT HENRY, British soldier, was born in 1782, the son of an officer in the army of the East India Company, and himself in 1795 joined the colours as ensign. He saw a great deal of fighting; he was present at the storming of Seringapatam (1799) and of Trivancore (1809), assisted at the capture of Mauritius (1810), and fought throughout the Burmese war of 1824-25. When war was declared against Afghanistan in 1838 'Fighting Bob,' as Sale was called, was given the command of the first brigade in the Bengal division of the invading army. He greatly distinguished himself at the assault and capture of Ghazni. In the autumn of 1840 he was despatched to punish certain hostile chiefs in Kohistan and to keep a close watch upon the restless movements of Dost Mohammed. When the evacuation of Afghanistan was decided upon Sale's was the first brigade to set off back to India; but it had to fight its way through all the passes—the Khurd Kabul, Tezen,

Jagdalak—that lie between Kabul and Jalalabad. In this last fortress he was closely invested from 12th November 1841 to 7th April 1842; but in numerous sorties, and even in a general engagement (Tezen), he defeated the forces of Akhtar Khan (son of Dost Mohammed). He was at length relieved by General Pollock, and with him took part in the recapture of Kabul and the events that followed it. Sale was killed, his thigh being shattered by grape-shot, at the battle of Mudki, fighting against the Sikhs, on 18th December 1845. His wife, Lady Sale, who was captured by the Afghans during Elphinstone's retreat, and kept prisoner by them until the arrival of Pollock's army, wrote a *Journal of the Disasters in Afghanistan* (1843).

Salem, a town in the south of India, 120 miles by rail SW. of Madras, stands in a pretty position in a valley backed by hills, and is a clean though straggling place, with extensive manufactures of cotton and cutlery and carpet-weaving; there are much iron and lime near. Pop. (1921) 52,244.

Salem, (1) a city and port of entry of Massachusetts, on a peninsula in Massachusetts Bay, 16 miles by rail N. by E. of Boston. It has a good harbour, from which was formerly carried on a large foreign commerce, but now there only remains a coast trade, chiefly in coal. Principal institutions of Salem are the East India Marine Society, its collections now united with those of the Peabody Academy of Science, the Essex Institute, and the Salem Athenaeum, the last two housed in Plummer Hall. The manufactures include cottons, leather, shoes, and lumber products. Salem was settled in 1626. In 1692 the great witchcraft delusion broke out, during which nineteen persons were hanged (including one clergyman) and one pressed to death. Nathaniel Hawthorne and Prescott the historian were born here. There was a great fire in 1914. Pop. 42,500.—(2) Capital of Salem county, New Jersey, on Salem Creek, 34 miles from its entrance into the Delaware and 36 miles by rail SSW. of Camden. It has dye-works, and various factories. It was founded in 1675. Pop. 7000.—(3) Capital of Oregon, on the east bank of the Willamette River (navigable for most of the year), 52 miles by rail S. by W. of Portland. Settled in 1834 and incorporated in 1853, it became state capital in 1860. The streets are wide and regular. Here are the state capitol, prison, and insane asylum, and schools for the blind and deaf and dumb, besides the Willamette University (Methodist Episcopal, 1851), and mills, foundries, factories, and machine shops. Pop. 18,000.

Salemi, a town in the west of Sicily, 39 miles SW. of Palermo; pop. (1921) 19,374.

Salep. See ORCHIDS.

Salerno (anc. *Salernum*), a city of southern Italy, on the gulf of the same name, 33 miles by rail SE. of Naples, with a pop. (1921) of 51,980. A hill behind the town is crowned by an old Norman castle. The beautiful Gothic cathedral of St Matthew (whose bones were brought from Pestum in 954) was erected by the Normans (1076-84), and has in front of it a quadrangular court, the arcades of which are supported by porphyry and granite columns. The fine bronze doors of the central entrance are of 11th-century Byzantine work. Within are the tombs of Pope Gregory VII. and Margaret of Durazzo, mother of King Ladislaus of Naples; also two magnificent 12th-century amboes, a fine 11th-century altar frontal, and 13th-century mosaics (in the apse). The city was celebrated in the middle ages for its university (founded in 1150, closed in 1811), but especially for its school of medicine (*Schola Salernitana*), which was long the first in Europe (see MEDICINE, Vol. VII. p. 113).

In the neighbourhood are the ruins of Pæstum (q.v.). There is a small harbour. Silk and cotton are spun. Originally a Roman colony (194 B.C.), Salerno figures little in history until after it was taken by Robert Guiscard, who made it his capital. But the removal of the Norman court to Palermo and the sack of the city by the Emperor Henry VI. struck serious blows at its prosperity, and a third came from the decay of the medical school in the 14th century.

The *Gulf of Salerno* is a nearly semicircular indentation, separated from the Bay of Naples by the promontory ending in the Punta Campanella. On its shores stand Amalfi and Salerno.

Sales, FRANCIS DE. See FRANCIS OF SALES.

Salette, LA, an Alpine village of France, dept. Isère, 28 miles SSE. of Grenoble. Here on 19th September 1846 the Virgin is alleged to have appeared to two peasant children; from that time the spot was visited annually by thousands of pilgrims. In 1852-61 a pilgrimage church was built, in the Romanesque style, at an elevation of 5920 feet. The alleged appearance of the Virgin was, however, discredited by Pope Leo XIII. in 1879.

Saley, a group of islands lying off the south-west extremity of Celebes, in the East Indies, consists of the principal island (area, 170 sq. m.; pop. 37,000) and several small ones (their united area 130 sq. m. and pop. 21,000), and is governed by native chiefs who pay tribute to the Netherlands East India government. Principal exports, cotton, teapung, coconuts, tortoise-shell, salt, and tobacco. The people are Malay Mohammedans.

Salford. See MANCHESTER.

Sali, SALLIE, or SLA, a seaport of Morocco, stands on the Atlantic, at the mouth of the Bu-Raguel, on the northern side of the river, opposite to Rabat (q.v.). It was for centuries notorious as a haunt of pirates (see COBSAIR), and gave its name to the Sallee Rovers, who carried the terror of their name into the English Channel, and are known to every reader of *Robinson Crusoe*. It was only within the 19th century that Britain ceased to pay an annual subsidy to the sultan of Morocco to secure safety from their attacks. The streets are mean and poor, and the houses small. A wall surrounds the town, the chief features of which are forts and the prison. Excellent carpets are made, as well as shoes.

Salicacea. See POPLAR, WILLOW

Salicin, $C_{13}H_{18}O_7$, is a crystalline glucoside obtained from the bark of the *Salix alba* and other species of *Salix* (Willows), and also from the bark of several species of *Populus* (Poplars). It occurs in small white crystals, without smell, but having a very bitter taste; is soluble in 28 parts of cold water, in 1 part of boiling water, and in 80 parts of rectified spirit. When treated with strong sulphuric acid it dissolves with a bright red colour; being a glucoside it is readily decomposed by suitable chemical agencies into glucose (grape-sugar) and saligenin. Saligenin can be easily oxidised to form salicylic acid. Its action and uses when given internally are much the same as those of Salicylic Acid (q.v.), into which it is converted in the body; but it is less powerful, is not so depressant, and does not disturb digestion so much. Being a bitter, it promotes appetite and digestion. Its dose is 3 to 12 decigrams.

Salic Law, a collection of the popular laws of the Salic or Sallian Franks (see FRANKS), purporting to have been committed to writing in the 5th century, while the people were yet heathens. There exists several Latin texts of this code, and considerable obscurity rests over its history. It relates

principally to the compensation and punishment of crimes, and there is a chapter containing provisions regarding the succession to what are called Salic Lands, which seems to have been inserted at a later date. Although the Frankish law did not in general exclude females, the succession to these salic lands, whatever they were, was confined to males, probably from the importance of securing the military service of the chief proprietors. It was but a doubtful analogy that led the rule of succession to Salic lands to be extended to the succession to the French crown, and it seems to have been only in the 14th century that the exclusion of females from the throne became an established principle. The accession of Philip the Long was probably the first occasion on which it received public sanction, and the fact that Edward III. rested his claim on female succession doubtless led to that instance being regarded as an unquestionable precedent. See *Lex Sallia*, the *Ten Texts with the Glosses*, edited by Hessels (1880).

Salicornia. See GLASSWORT.

Salicylic Acid, $C_7H_6O_3$, was originally obtained from Salicin (q.v.), but is now made on a large scale from carbolic acid; it may also be obtained from oil of wintergreen or oil of sweet birch. It occurs in small white crystals, slightly soluble in cold water; it has no smell, but is very irritating to the nostrils, and causes sneezing; its taste is sweetish and acid. It is used externally as an antiseptic, and in some skin diseases. For internal use the SALICYLATE OF SODIUM is preferred, as it is much less irritating to the stomach. It occurs in small white crystals, has a sweetish taste, and is highly soluble in water. It controls acute rheumatism much more speedily and thoroughly than any other drug, though of less value in chronic rheumatism. It is also employed as an antipyretic. It given in too large doses it may induce marked disturbance of the central nervous system, characterised by buzzing in the ears, deafness, and disturbances of vision. More severe results have been noted, but they are very rare. The dose is 3 to 12 decigrams (5 to 20 grains).

Salieri, ANTONIO (1750-1825), born at Legnano in north Italy, was for fifty years court musician at Vienna. He composed thirty-seven Italian, four German, and two French operas, and five masses. The friend of Haydn and teacher of Beethoven and Schubert, he was hostile to Mozart. Gluck heartily admired him.

Salii, two colleges of dancing priests in ancient Rome. The Salii Palatini who served Mars were believed to have been founded by Numa Pompilius, who entrusted to their charge a shield that had fallen from heaven, and eleven exact copies made to prevent theft. The priests were twelve in number, all patricians. Almost the whole of March, the month named in honour of Mars, in which campaigning began, was devoted to observances in honour of the god. The Salii, in ancient military garb, carried the shields in procession through the city, dancing war-dances and chanting Saturnian verses at the temples and altars of Mars. A similar festival, the Armilustrum, or purification of arms, brought the fighting season to an end in October. The Salii Collini or Agonales, priests of Quirinus, in many respects resembling the Palatini, claimed Tullus Hostilius as their founder.

Salimbene, FRA, chronicler, was born at Parma on the 9th of October 1221, the son of Guido di Adamo, a crusader, and his wife Imelda. Known at first as Ognibene, or sometimes as Balian of Sidon, he ran away from home and joined the Franciscan order in 1238, receiving the name of Salimbene. His early years as a Minorite were spent in travel through many parts of Italy, Bur-

gundy, and France, often on political errands on behalf of Innocent IV. against Frederick II. From 1249, when he took priest's orders, to 1281, he lived a more retired life in Ferrara, Ravenna, Imola, Faenza, and elsewhere, copying manuscripts and writing chronicles and theological works now lost. In 1281-88, in various convents of Emilia, he wrote his *Chronicon*. He probably died soon after. The *Chronicon*, covering the period 1167-1287, was composed for the use of his niece Agnes, a nun of the order of St Clare. Salimbene in his wanderings saw much of Italian and French life in peace and war, and met many of the most notable men of his time. Neither very virtuous nor very wicked, he observed keenly, and wrote with vivacity and remarkable candour, even of his own order. He has been compared with Peypus. See Professor Holder-Egger's edition (1905) in *Monumenta Germaniae (Scriptores)*, and the boiling-down in G. G. Coulton's *From St Francis to Dante* (1906).

Salina, capital of Saline county, Kansas, 186 miles by rail W. by S. of Kansas City. It has a Wesleyan university and a military school. Salt and gypsum are obtained near by, and the city has flour-mills, carriage works and ice factories. Pop. 15,000.

Salina Cruz, a seaport of the Mexican state of Oaxaca, 12 miles S. of Tehuantepec, is the Pacific terminus of the Tehuantepec Railway. The construction of its capacious artificial harbour (1907), and of the railway to Coahuacuilcos or Puerto Méjico on the Atlantic, changed it from a small Indian village to an important commercial town.

Salina Formation, name given in North America to one of the subdivisions of the Silurian system, which appears to be equivalent to the lower portion of the Ludlow rocks of the British series. See SILURIAN SYSTEM.

Salinas are parts of inland drainage-basins forming natural salt-pans. They may be the beds of old salt-lakes and salt-marshes, or they may still in seasons of flooding contain marshes and shallow lakes which give place to salt-desert on evaporation. Many notable examples occur in South America. In the Argentine provinces of Santiago del Estero and Córdoba are Las Salinas Grandes, some 200 miles by about 50. The rainfall is scanty, but as it has no run-off, the water soaks into the ground and the subsoil becomes water-logged. The great heat scorches the surfaces, leaving a deposit of salt, but water can generally be found about two metres below. This of course is salt, and such inhabitants as are to be found in the Salinas, besides suffering from heat and the glare of the white surface, have to depend upon the railway for water-supply. Salinas, however, are a great difficulty to railway engineers, as the salt blown over the track eats away the rails, which must be protected by a coating of tar, and must not be allowed to touch the earth. The salt of many salinas is exploited. In some cases borax takes the place of common salt.

Saline is a very popular effervescent powder used as a gentle aperient. Sold under fancy titles, it essentially consists of a mixture of bicarbonate of soda, sugar, and tartaric acid, with a trace of Epsom salts or chlorate of potash.

Saline Plants, or HALOPHYTES, are plants which grow on or near the seashore, in salt water or salt-marshes, or on salt-steppes. Few of them are strictly aquatic plants, except the marine Algae. Grasswack (q.v.) and Glasswort (q.v.) are flowering plants living immersed in salt water. Others grow chiefly or only on the seashore and in salt-marshes. Some of these, as the sea-kale, may be cultivated far from the sea, but succeed best when

liberally supplied with salt. Asparagus derives benefit from similar treatment. Some of the Salt-worts and other saline plants yield much soda when collected and burned, and the produce was at one time largely imported into Britain from Spain and other countries under the name of Barilla (q.v.). The dry steppes of Russia and Tartary, having in many places a strongly saline soil, are covered with a very peculiar vegetation. Among the ornaments of these steppes is *Halimodendron argenteum*, a shrub of the family Leguminosae, often cultivated in gardens for its beautiful rose-coloured flowers and silvery gray leaves. For the swamps of tropical coasts, see MANGROVE. Saline plants have their whole tissues impregnated with salt. The presence of salt in the assimilating cells seems to check, or if greatly concentrated altogether stop, assimilation. The presence of salt in the soil renders the osmotic absorption of water by the roots so difficult and slow that plants living in a salt-marsh or on the sea-margin are exposed to the same danger of drying up as those which grow in deserts. The soil, though it may be physically wet, is physiologically dry: 'a halophyte, in fact,' as Warming says, 'is one form of xerophyte.' Halophytes therefore adopt the same means of storing water and reducing assimilation that are seen in plants that have to contend with drought. The stem may become fleshy, leaves being suppressed, as in the Glasswort, which resembles a desert dwelling cactus; or the leaves themselves may become fleshy, and may be leathery or covered with mealy hairs or wax. Typically halophytic families are the Chenopodiaceae, Plumbaginaceae, and Rizophoraceae or Mangroves.

Salinometer (sometimes SALIMETER, SALOMETER), an instrument of the nature of a hydrometer, for ascertaining the salinity of water; especially one for indicating the density of brine in marine boilers.

Salins (anc. *Salinae*), a town of the French dept. of Jura, 22 miles S. by W. of Besançon, has some interesting churches, and valuable salt-springs, which supply baths and yield salt. Pop. 5000.

Salisbury. See GINKGO.

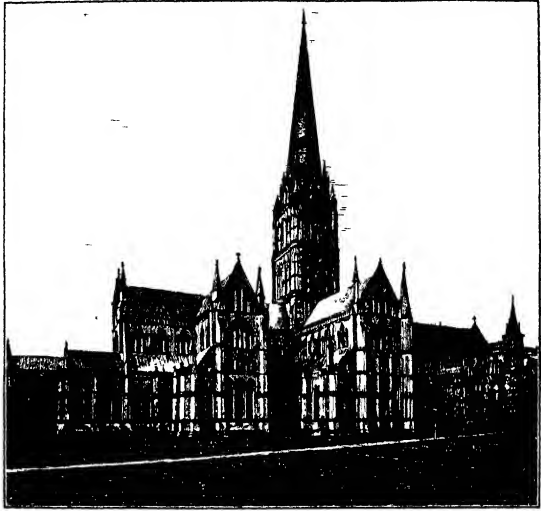

Salisbury (New Sarum) and **Old Sarum**. Old Sarum (*Sorbiadunum*) stood about a mile north of the present city of Salisbury. It now consists of a bare conical hill encircled with entrenchments, with a central mound—from Roman times a castle and a place of much importance. Here William the Conqueror assembled the barons to renew their oath of fealty. About 1075 Bishop Herman removed the bishopric of the united sees of Ramsbury and Sherborne to Old Sarum, and began a cathedral. It was finished by his successor St Osmund, who established a chapter of secular canons and compiled the *Use of Sarum*, which was adopted throughout the greater part of England. It was rebuilt and enlarged in the 12th century. The foundations of Old Sarum Cathedral and Castle have been excavated by the Society of Antiquaries. Old Sarum returned two members to parliament until the passing of the Reform Bill, although at that time there had for many years been no inhabitants. Service was daily performed in a chapel until the Reformation, after which the place was entirely deserted. The desertion of Old Sarum and the foundation of Salisbury or New Sarum were due to the removal of the cathedral from the former place to the latter. The reasons for the change were the frequent disputes and collisions between the authorities of the castle and the cathedral, the exposed position of Old Sarum (the noise of the winds often drowning the voices of the officiating priests), and the want of water.

Salisbury or New Sarum is a cathedral city, the capital of Wiltshire, a municipal, and till 1918 a parliamentary borough. It stands in a valley near the confluence of the rivers Avon, Bourne, Willy, and Nadder, 84 miles WSW. of London. The plan of the city is very regular, it having been laid out as a whole at its foundation in rectangular plots. Water originally ran through most of the streets, but the streams were covered over after the visitation of cholera in 1849. The removal from Old Sarum began in 1220, when the foundations of the new cathedral (B.V.M.) were laid. The Lady Chapel was consecrated in 1225, and the whole building, after being rehallowed in 1238, was finally dedicated in 1260. The cathedral consists of a nave of ten bays, choir, and Lady Chapel, with two aisles, and two transepts, each having a single aisle towards the east, the ground-plan being in the form of a double cross. The whole building is a perfect example of pure Early English style. The cloisters and the chapter-house were built about 1270, and the tower (Decorated) and the spire added about 1330. The spire is the highest in England (400 feet). It formed no part of the original design, and the effect of the addition became apparent in a dangerous settlement which took place within 100 years of its erection. Owing to this the spire leans 2 feet towards the south. The cathedral suffered from a disastrous 'restoration' at the hands of James Wyatt (1782-91), when two 15th century chapels, built by Bishop Beauchamp and Lord Hungerford, and two porches were destroyed, much painted glass removed, the tombs rearranged, and a lofty campanile standing apart from the cathedral pulled down. Much of the damage then done was repaired in the restoration begun in 1863 under Sir Gilbert Scott. There is a curious muniment room over the vestry containing a copy of the Magna Carta of King John, said to be that handed to Longespée, Earl of Salisbury, who was one of his witnesses. The library, built about 1450, is over the east side of the cloisters, and contains many valuable MSS. The outside measurements of the cathedral are: length 473 feet, width 111 feet; the height of the nave and choir inside is 81 feet. The cathedral stands apart from any other building in the midst of a beautiful close of about half a square mile in extent, encircled by a wall, within which stand the Bishop's Palace, an irregular building begun by Bishop Richard Poore (*circa* 1220) and added to by many of his successors, the deanery and canons' houses, and many other picturesque buildings. In 1227 King Henry III. granted a royal charter constituting New Sarum a free city, and conferred on the citizens all the liberties and immunities throughout the realm which the citizens of Winchester enjoyed. These rights and privileges were confirmed, varied, and extended by ten subsequent charters from 1270 to 1707.

The ancient parish churches are St Martin's, St Thomas of Canterbury, a handsome Perpendicular building of the 15th century, and St Edmund of Canterbury, formerly a collegiate church of secular canons. Other parishes with churches are Fisherton (St Paul's) and St Mark's.

The other most notable buildings are the council-

house, where the assizes are held, containing a fine collection of pictures; the infirmary; the 'Hall of John Hall' and Audley House, now the church-house of the diocese, two fine examples of 15th-century domestic architecture; the Old George Inn, a 15th-century hostel where Pepys stayed; Joiners' Hall; St Nicholas' Hospital, established by Bishop Bingham about 1240; the Trinity Hospital, founded in 1379 for twelve inmates and hospitality to poor travellers; the market-house; the poultry-cross; and the Blackmore Museum, which contains one

Salisbury Cathedral, from the north-east.

of the finest collections of prehistoric antiquities in England, the collection from America being probably unrivalled anywhere.

The market-place is spacious and planted with trees, and contains statues of Lord Herbert of Lea (Sidney Herbert) and Professor Fawcett, who was a native of the city. Here the Duke of Buckingham was beheaded in 1483 when Salisbury was the headquarters of Richard III. There are many charities and almshouses, and an endowed school for the choristers of the cathedral. Other endowed schools of importance are the Godolphin school for girls, Salisbury Chafyn-Grove school for boys, and Bishop Wordsworth's school for boys. The city chiefly depends upon its agricultural trade, the former manufactures of cutlery and woollens being extinct. Pop. (1851) 11,657; (1921) 22,867.

The most notable bishops of Old Sarum were St Osmund and Bishop Roger; of New Sarum, Hallam (whose death at the Council of Constance, 1417, is regarded by Dean Milman as fatal to many really effective reforms in the church), Cardinal Campeggio, Jewell, Seth Ward (a founder of the Royal Society), Burnet, Hoadley, Sherlock, Douglas, Burgess, Denison, Hamilton, Moberly, and Wordsworth. Fox the martyrologist, Hooker, Fuller, Pearson, Isaac Barrow, Joseph Butler, and Liddon have been canons of the cathedral, where George Herbert was a frequent worshipper. Among distinguished natives and residents have been Massinger, William and Henry Lawes, Chiffinch (the chief agent in the intrigues of Charles II.), Harris the philologist,

Chubb 'the Deist,' and Henry Fawcett. Fielding resided at one time in the Close, and Joseph Addison was educated at the grammar-school.

For plan of Cathedral, see GOTHIC ARCHITECTURE. For the Use of Sarum, see LITURGY, and books on it by Frere (1895-1901).

SALISBURY PLAIN is an undulating tract of chalky down affording splendid pasture for sheep, with rich and well-timbered valleys. The high-lying land is too poor to repay cultivation. Of its many ancient mounds, barrows, and other antiquities, the most notable is Stonehenge (q.v.). Salisbury Plain was acquired by government for a military training ground.

Salisbury, in North Carolina, 118 miles W. of Raleigh, had a Confederate prison during the Civil War, and in its national cemetery repose upwards of 12,000 unknown dead, victims of the war; it has a notable negro college and schools, and cotton mills, wood-working plants and granite quarries. Pop. 14,000.—**SALISBURY**, Maryland, 100 miles SE of Baltimore, trades mainly in timber; pop. 8000.

Salisbury, the capital of Southern Rhodesia, founded in 1890 in the province of Mashonaland, 225 miles NE of Bulawayo, is connected by railway with Beira and, through Bulawayo, with other parts of South Africa. It is situated at an altitude of almost 5000 feet. An agricultural and commercial centre, it has the cathedral of the Anglican bishopric of Mashonaland. White pop. 5000.

Salisbury, EARLS OF. Salisbury gave an earl's title in the 12th century; the first eminent holder being William, called Longespée (or Longsword), natural son of King Henry II., who in 1198 married the daughter of the second Earl of Salisbury, and with her hand received the earldom. He was Lieutenant of Gascony, Warden of the Welsh Marches and of the Cinque Ports, and faithfully served his nephew Henry III. till his death in 1226.—His son, also called Earl of Salisbury and Longespée, twice went crusading, and was killed at Mousourah in 1250. Later the Montagues held the earldom (see MONTAGU); later still the Nevilles (see WARWICK); last the Cecils (see below). For Margaret, Countess of Salisbury, see POLE (REGINALD).

Salisbury, THIRD MARQUIS OF (ROBERT ARTHUR TALBOT GASCOYNE-CECIL), son of the second marquis, was born at Hatfield House, 2nd February 1830, ninth in descent from Lord Burghley's second son, Robert Cecil (c. 1563-1612), who by James I. was made Viscount Cranborne (1604) and Earl of Salisbury (1605); the seventh earl received the marquise in 1789. As Lord Robert Cecil the third marquis passed in 1847 from Eton to Christ Church, Oxford, where he graduated in 1849. He next went on a round of travel, extending to Australasia; on his return he was elected a fellow of All Souls (1853), and entered parliament at twenty-three as Conservative M.P. for Stamford. In 1858 he opposed the abolition of church-rates; in 1859 supported Disraeli's Reform Bill by arguments which he had set forth in the 'Oxford Essays' for 1858. From this time he became a frequent speaker—staunch, pugnacious, vigorous, sarcastic, often brilliant; he never spoke more warmly than in defence of the church or on education. Foreign affairs engaged his attention hardly less. In June 1865 he became Viscount Cranborne and heir to the marquise by the death of his elder brother; and he was one of the most effective opponents of Gladstone's Reform Bill of that year. In the Derby ministry (1866) Lord Cranborne became Indian Secretary; but Lord Derby and Disraeli proceeding to concoct a Reform Bill, Lord Cranborne (like others) resigned, and fought against the measure with extreme pertinacity. In 1868 he succeeded his father as third marquis, and was the strongest

opponent of the disestablishment of the Irish Church. In 1869 he was elected Chancellor of the University of Oxford. In 1870 he supported the Peace Preservation Bill, but disapproved the Irish Land Act. The bill for abolishing religious tests in the universities gave him arduous employment. In January 1874 parliament was dissolved, and the Conservatives came in with a great majority. Lord Salisbury again became Secretary for India; but before the end of the year he had again come into collision with his chief on the Public Worship Regulation Act, being described by Disraeli as 'a great master of gibes and flouts and jeers.' As envoy to the Constantinople Conference (1876-77) Lord Salisbury, by acting against the spirit of his instructions, came into direct collision with Lord Derby (then Foreign Secretary); when in 1878 Lord Derby resigned Lord Salisbury succeeded him. He signalled the change by publishing a circular despatch assertive of the British objections to the San Stefano Treaty; but soon after a famous secret agreement with Russia crept into the newspapers. In the Berlin Congress both Disraeli (now Lord Beaconsfield) and Lord Salisbury took part. The 'Millothian campaign' (1879) was followed by a dissolution in March 1880, and that by a heavy defeat for the Conservatives. On the death of Beaconsfield (1881), Lord Salisbury succeeded to the leadership of the Conservative Opposition; in June 1885 he became Prime-minister and Secretary of State for Foreign Affairs, and settled the 'Peyghel incident.' This was but a short-lived administration, for Gladstone (q.v.) returned to power, only, however, to be wrecked by his Home Rule Bill, and after a general election Lord Salisbury again took office (August 1886). The general election of July 1892 returned a Gladstonian majority; but in opposition Lord Salisbury and the Conservatives maintained their alliance with the Liberal Unionists, and the Home Rule Bill of 1893 was defeated in the Lords. In June 1895 the Rosebery administration fell; and in the ensuing general election, fought mainly on Irish Home Rule, the Unionists were returned with a crushing majority of 152. Lord Salisbury became for the third time Prime-minister, with a Liberal-Unionist and Conservative Cabinet. Within the next two years a succession of foreign complications brought the country several times to the verge of war, only averted by the firm, and at the same time conciliatory, attitude of the British government. Turkish massacres in Armenia led to the reopening of the Eastern Question in an acute form, nearly resulting in a European conflagration. Hostilities with the United States seemed imminent owing to the interference of the latter country in a boundary dispute between British Guiana and Venezuela. Dr Jameson's filibustering expedition into the Transvaal at New Year 1896 led to critical relations with the republic, and revealed antagonism on the part of Germany. The jealousy of France at the British occupation of Egypt was actively aroused by Lord Salisbury in April 1896 entering upon the reconquest of the Soudan. And the Cretan insurrection, with the consequent crushing defeat of Greece by Turkey (1897), severely tested the Concert of the Powers. He resigned the Foreign Secretaryship in 1900; and having remained at the head of the government during the Boer war of 1899-1902, retired from public life in July 1902, receiving the Victorian Order. He died 22nd August 1903. He was naturally a student and a scientist; a masterly and most impressive orator, he yet neglected the art of persuasion; and even in apparently well-weighed speeches some startlingly injudicious sentence often broke loose. His contributions to the *Quarterly Review* from 1860 to 1883 were numerous and important.

See *Lives* by Traill (1891), MacCarthy (1903); the article by Algernon Cecil in the 2d supplement to *Diet. Nat. Biog.* (1912), and the official *Life* by his daughter, Lady Gwendolen Cecil (1921).

The FOURTH MARQUIS (b. 1861) succeeded his father in 1903, and was between 1900 and 1905 Under-Secretary for Foreign Affairs, Lord Privy Seal, and President of the Board of Trade, in 1922-23 Lord President of the Council, in 1924 Lord Privy Seal, and in 1925 Leader of the House of Lords. His brothers, Lord Robert, who held various cabinet posts during the war, including Assistant Foreign Minister in 1918, and who was created a viscount in 1923, and Lord Hugh both won reputations as Conservatives in the House of Commons, and interested themselves greatly in the League of Nations.

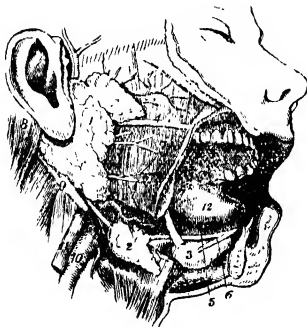

Salisbury. JOHN OF, born at Salisbury, studied at Paris, and was the confidential adviser of Becket, and, sharing his exile, became (1176) bishop of Chartres. He wrote a *Life* of Becket, and one of Anselm; the *Polycraticus*, in which he lashes the vices of the court (edited by Webb in 2 vols. in 1909); the *Metaphisics*; the *Entheticus*; and many letters. One of the most learned classical writers of the middle ages, he died 1180. See Dr H. L. Poole's *Illustrations of Medieval Thought* (1884).

Saliva, one of the digestive fluids, mainly the product of the SALIVARY GLANDS, of which there are three pairs—the parotid, the submaxillary, and the sublingual, with efferent ducts which convey the glandular secretions into the mouth. These, when mixed with the mucus secreted by the follicles of the mucous membrane lining the mouth, constitute the ordinary or mixed saliva. The *Parotid Gland*, so called from the Greek

its duct is about two inches in length, and opens by a narrow orifice on the top of a papilla, at the side of the *frænum* of the tongue. The *Sublingual Gland* is situated, as its name implies, under the tongue, each gland forming a ridge on the floor of the mouth, between the tongue and the lower gums. It has a number of excretory ducts, which open separately into the mouth. The salivary glands are racemose, or of the compound acinous type (see GLANDS). The recesses which open into the fine terminal branches of the ducts are 'lined and almost filled' by the epithelial cells which secrete the saliva. True salivary glands exist in all mammals, except the cetacea, in birds, in reptiles, and in amphibians, but not in fishes; and glands discharging a similar function occur in insects, many molluscs, &c. Saliva contains about one-half per cent. of solids, chiefly salts and mucus. The proportion of its active constituent, ptyalin, is extremely small; and it has never been satisfactorily isolated (see DIGESTION).

The most common disease of the parotid gland is a specific inflammation, which has been already described in the article MUMPS. Tumours of various kinds sometimes occur in front of the ear and over the parotid gland. Their removal is often difficult. Calculi are occasionally formed in connection with the ducts of the salivary glands. *Deficient Secretion* is indicated by clamminess or dryness of the mouth, and is common in low forms of fever. It is important as indicating the condition of the system, and seldom requires treatment. If it should occur as an original affection it must be treated by local Sialogogues (q.v.), such as liquorice, horse-radish, pellitory, &c. *Alteration of the Saliva* is not infrequent in disease. For example, it sometimes loses its alkaline character, and becomes acid, as in acute rheumatism, diabetes, &c.; whilst in other cases it becomes so fetid as to be a source of annoyance both to the patient and his friends, as, for example, in scurvy, various forms of dyspepsia, salivation, &c. The undue acidity may be corrected by rinsing the mouth with bicarbonate of soda, while the factor may be relieved by attention to diet and by antiseptic mouth-washes. *Ordinary Inflammation* of these glands (distinct from mumps) may proceed from cold, local injury, or decayed teeth. *Ramula* is a small, clear swelling on the floor of the mouth, caused by temporary blockage of one of the sublingual ducts.

SALIVATION, or PTYALISM (from the Gr. *ptyalon*, 'the saliva'), is the term employed to designate an abnormally abundant flow of saliva. It most commonly arises from a specific form of inflammation of the parotid glands, induced by the action of mercury, in which case it is termed mercurial salivation; but it occasionally appears under the action of other drugs, especially iodide of potassium; and sometimes it occurs without any apparent cause, in which case it is said to be *idiopathic* or spontaneous. When mercury is given in such a way as to excite salivation a metallic taste in the mouth is soon recognised by the patient, and a remarkable but indescribable smell, known as the mercurial factor, may be detected in his breath; the gums become swollen and spongy at their edges, and usually present a few slight ulcers; and an increased flow of saliva takes place, accompanied by pain in the teeth on pressure. If these symptoms be not checked (and *a fortiori* if more mercury be given) the tongue, cheeks, and throat swell and ulcerate, and the saliva that flows away amounts to several pints in the course of the day. Until a comparatively recent period profuse salivation was deemed the only certain indication that the system was duly under the influence of mercury (and, indeed, it was believed that the cause of the disease

The Salivary Glands:

- 1, the parotid gland; 2, the submaxillary gland; 3, the sublingual gland; 4, Steno's duct; 5, Wharton's duct; 6, Bartholin's duct; 7, masseter muscle; 8, mastoid process; 9, digastric muscle; 10, internal jugular vein; 11, external carotid artery; 12, the tongue.

words *para*, 'near,' and *ous*, 'the ear,' is the largest of the three glands occurring on each side. It lies upon the side of the face immediately in front of the external ear, and weighs from half an ounce to an ounce. Its duct is about two inches and a half in length, and opens into the mouth by a small orifice opposite the second molar tooth of the upper jaw. The walls of the duct are dense and somewhat thick, and the calibre is about that of a crow-quill. It is called, after its discoverer, Steno's duct.

The *Submaxillary Gland* is situated, as its name implies, below the jawbone (part of which is cut away in the figure), and is placed at nearly equal distances from the parotid and sublingual glands.

was carried out of the body with the saliva); but it is now recognised that salivation is harmful, and in administering mercury the object aimed at is not to allow its effect at farthest to go beyond the production of slight tenderness of the gums and slight mercurial tætor. Mercurial salivation is therefore very rarely to be seen at the present day. Moreover, there is a more or less marked tendency to salivation in scurvy, smallpox, hysteria, hydrophobia, some forms of mania, and not infrequently in pregnancy.

Sallust. CAIUS SALLUSTIUS CRISPUS, a Roman historian, was born of plebeian family at Amiternum in the Sabine country, 86 B.C. He had risen to be tribune of the people in 52, when he helped to avenge the murder of Clodius upon Milo and his party. An intrigue with Milo's wife may have given a spur to his love of justice; indeed, such was said to be the licentiousness of his life that he was expelled in 50 from the senate. It is true, however, that his attachment to Caesar's party may well suggest a plausible reason for his expulsion. In 47, when Caesar's fortune was in the ascendant, he was made prætor, and was consequently restored to his forfeited senatorial rank. Soon after this he nearly lost his life in Campania, in a mutiny of some of Caesar's troops about to be shipped to Africa. Next year he carried off the enemy's stores from the island of Cereina, and at the close of the African campaign he was left as governor of the annexed kingdom of Numidia, formed into the province of Nova Africa. Charges of oppression and extortion brought against him by the provincials failed before the partial tribunal of Caesar. With his spoils he laid out those famous gardens on the Quirinal which bore his name for centuries, the splendid mansion on which became an imperial residence of Nerva, Vespasian, and Aurelian. Here he lived apart from public cares, devoted to literary labours; and here he died, 34 B.C. In his retirement he wrote his famous histories, the *Catiline*, or *Bellum Catilinarianum*, a brief account of Catiline's conspiracy in 63, during the consulship of Cicero; the *Jugurtha*, or *Bellum Jugurthinum*, a history just twice as long of the five years' war between the Romans and Jugurtha, the king of Numidia; and the *Historiarum Libri Quinque*, commencing with the year of Sulla's death (78 B.C.) and coming down to 67 B.C., of which, unhappily, but a few fragments have come down to us. The two letters *Ad Cæsarem senem de Republica* and the *Invektive Sallusti in Ciceronem* are not authentic.

As a historian Sallust is not accurate in details of fact and chronological sequence—a defect caused, no doubt, by his love for broad effects and unity of treatment. He was one of the first Roman writers to treat a subject rather than a period of time, and to look directly for a model to Greek literature. He brought to his task strong prepossessions and a fatal readiness to sacrifice anything to his antithesis or epigram; but we need not suppose with Mommsen that his main object was to discredit the old regime and vindicate the memory of Caesar. He loves to explore in philosophic fashion into the tone of the age and the hidden motives of men, and he falls a victim to his own subtlety and confidently presents his inferences as facts. The high morality which he inculcates harmonises but ill with what is reported of his life, although it may be it was a legitimate enough fruit of after reflection and repentance which supplied its characteristic tinge of pessimism to his tone. In his labour to be

brief and concise like his great model Thucydides he is not seldom merely obscure and involved, and his historical style is overlaid too thickly with rhetorical ornament, the narrative overloaded with general reflections that are often little better than pretentious commonplaces. The speeches are dramatically effective though not authentic, the structure of the sentences simple, the repetition of favourite words and rapid changes of construction to secure vivacity being characteristic marks. The Grecisms are mostly close echoes of Thucydides, and even his favourite arrangement of short contrasted phrases is imitated from the same master. Moreover, he makes use of many words and phrases in an archaic sense, and is supposed especially to have drawn much from the elder Cato; while in other ancient critics, again, we read of the innovations of his style. The influence of Sallust is plainly marked on the greater Tacitus, who styles him (*Ann.* iii. 30) "rerum Romanarum florentissimus auctor." Martial also places him first in Roman history, and Quintilian does not fear to match him with Thucydides and sets him above Livy, although admitting that the latter is a safer model for boys. His diction and rhetorical colour found him many imitators from the time of Fronto down to the Christian writers of the 5th century.

There are English translations by Thomas Heywood (ed. Whibley in "Tudor Translations"), Watson (1852), A. W. Pollard (1882), and Rolfe (Loeb Library, 1921).

Sallustius, 'the philosopher,' wrote in Greek a Neoplatonist treatise, *Concerning the Gods and the Universe* (ed. Nock, 1926). He was perhaps a friend of Julian the Apostate.

Sally-port, a gate or passage by which the garrison of a fortress may make a sally or sudden attack on the besiegers.

Salmagundi, a word of uncertain origin, unless it be derived from the Countess Salmagondi, lady of honour to Marie de' Medici and the inventor of the dish; for salmagundi is a dish of minced meat, seasoned with pickled cabbage, eggs, anchovies, olive-oil, vinegar, pepper, and similar ingredients. In an applied sense the word means a pot-pourri, a medley, a miscellany.

Salmasius, CLAUDIUS, the Latinised name of a celebrated French scholar, CLAUDE SAUMAISE, who was born at Semur in Burgundy, 15th April 1588. His father, Benigne de Saumaise, a man of superior erudition, was his first teacher. At the age of ten young Salmasius translated Pindar and composed Greek and Latin verses. He studied philosophy at Paris, under Casanbon; and at Heidelberg (1606) he devoted himself to the science of jurisprudence, and publicly professed Protestantism. So insatiable at this time was his thirst for book-knowledge that he was wont to devote two whole nights out of three to hard reading, in consequence of which he brought himself to within an inch of the grave. In 1608 he published from MSS. two treatises against the primacy of the pope, one by Nilus Calabrian, Archbishop of Thessalonica, and one by the monk Barlaam. In 1620 he greatly expanded Casanbon's notes on the Augustan History. In 1629 appeared his chief work, his commentary on the *Polyhistor* of the 3rd century compiler Solinus—practically on Pliny, on whom Solinus based. Next he set himself, without the help of a master, to acquire a knowledge of Hebrew, Arabic, Coptic, and other oriental tongues. In 1631 he was called to Leyden, to occupy the chair that Joseph Scaliger had held there, and it is from this period that his European reputation as a scholar and critic dates. Various efforts were made (1635-40) to induce Salmasius to return to France, but he declined them on the ground that his spirit was too 'liberal' for his native land. He was in vain invited

to Oxford, Padua, and Bologna. Queen Christina of Sweden, however, managed to bring him to Stockholm, and fix him there for a year (1650-51), after which he returned to Holland. Among his later works were treatises on the primacy of the pope, on the Hellenistic dialect, on usury, and on the military art of the Romans. He died of an illness due to imprudent draughts of the waters at Spa, 6th September 1653. In the scholastic world Salmasius was probably the most famous personage of his day in Europe: 'the miracle of the world, the most learned of mortals.' The most exalted personages courted his friendship. Christina of Sweden declared that 'she could not live without him.' When Mazarin failed to induce him to return to France, he nevertheless sent him the order of knighthood, as a proof of Louis XIV.'s desire to honour him as a Frenchman. Though his attainments were prodigious, Salmasius does not rank with scholars like Casaubon or the younger Scaliger; he had neither Casaubon's balanced judgment nor Scaliger's grasp or insight. Hence, though his industry and learning could not have been inferior to theirs, his work has no distinctive value in the history of scholarship. In England Salmasius is best known in connection with his controversy with Milton regarding the execution of Charles I. At the request of Charles II., Salmasius, as the highest scholastic authority in Europe, published (1649) his *Defensio Regia pro Cerofo I.*, which was answered in 1651 by Milton in his *Pro Populo Anglicano Defensio*. The preparation of his pamphlet cost Milton his eyesight, but, as Salmasius died shortly after writing a rejoinder, the English poet boasted that his adversary had the worst of the encounter. The brutal consciousness of both disputants seems now the main feature of their controversy.

For the life of Salmasius, see the *Éloge* by Clément Jexyded to the collection of his letters published at Leyden in 1656; Papillon's *Auteurs de Bourgogne* (1745); Haag's *La France Protestante* (1883). For his controversy with Milton, see Masson, *Life of Milton*, vol. iv.

Salmon (*Salmo salar*). This fish occupies a somewhat distinctive position on account both of its famous sporting qualities and the excellent flavour of its flesh. No form of sport is now more sought after than salmon-angling, and in the market no fish commands so high a price. The nutritive value of the salmon as a food is also very high.

The majority of the family to which the salmon belongs are marine fishes with a very wide distribution. They are also regarded systematically as comparatively recent fishes, and are subject to considerable variations under the influence of local conditions. This is especially true, perhaps, in the trouts. *Salmo salar* is found on the coasts and in the rivers of western Europe from Spain to the Arctic. It is absent from the Mediterranean, but is found in northern rivers of the Eastern States and Canada, and is reported to be also found in northern rivers of Asia. In contradistinction to the group of allied species which inhabit the Pacific coast of North America, it is frequently referred to as the Atlantic salmon. In Europe, other species of large size inhabit fresh waters only in the Danube and the great rivers of northern Russia. A land-locked salmon is found in Lake Wener in Sweden and in certain lakes of North America, but this fish is commonly of no great weight, and of inferior quality.

Amongst all the Salmones, *Salmo salar* is the most elegant in form, and this fact accounts for the particular distinguishing feature by which, amongst others, the salmon can be most surely distinguished from allied European species. The tapering of the body towards the 'small' of the

tail, or caudal peduncle, results in a smaller number of scales being found in a transverse series. If, in the salmon, the scales be counted from the

Fig. 1.—Salmon (*Salmo salar*).

back of the adipose fin downwards and forwards to the lateral line, either eleven or twelve will be found. In the sea-trout or common brown trout the corresponding series will be found to number fourteen to sixteen, and commonly the latter.

The life history of the fish has ever been a source of great interest and much discussion. Not till 1837 was the parr of our streams discovered to be the young of the salmon. All writers up to that time described *Salmo salmulus*, as it was then called, as a distinct species, and even went the length of pointing out the distinctions between this little fish and the young of the salmon. The modern angler has more difficulty in satisfying himself as to the distinctions between the salmon parr and the trout of similar size. The parr has a very small mouth; the brown trout has a considerable gape; hence, if the two be compared, it will be found that in the parr the posterior border of the maxillary bone forming the angle of the mouth reaches only to a line vertically below the middle of the eye; while in the trout the posterior border of this bone reaches to a line vertically below the back of the eye. This is considered the surest test in these early stages, but as the salmon advances in size after its migration to the sea the test does not hold good, as the maxillary bone gradually extends backwards. Other features of the parr are the dark colour of the fins, including the adipose fin, and the very forked appearance of the tail fin. Again, as the fish grows the appearance of the fins changes, and especially the tail fin becomes less and less forked, till it is 'straight' or not forked at all in old fish.

The great majority of salmon spawn, in British rivers, during the months of November and December, but spawning is not infrequent later in the winter; while fish full of spawn, which have apparently failed to find mates, sometimes occur even in May. These fish are in some localities termed 'ranners,' and by decision of the courts they must be regarded as foul or unclean fish which cannot legally be taken. Salmon in the kelt or spent condition have been noticed as late as July. Fish which have entered fresh waters in spring, as clean, fresh-run salmon, usually push on to the highest possible tributaries the following autumn, and, much discoloured through their long continuance in fresh waters, secure the purest streams and cleanest gravel for the deposition of their eggs. Late-running fish, although they frequently also ascend considerable distances, are the fish which commonly occupy the middle and lower reaches. The female fish scoops out a trough or 'redd' in the gravel, and deposits a proportion of her eggs therein, where they are immediately fertilised by an attendant male fish. At intervals during, it may be, a week or ten days the process is repeated till all the eggs of the female are shed. In small rivers, where the protection to large fish is scanty and the water-flow liable to fall away in frosty weather, the spawning-out of a female salmon seems to occupy a much shorter time. Considerable disproportion of the sexes occurs in some rivers, an excess of males being noticeable in

Scottish rivers north of the Moray Firth. After spawning, and before good condition is restored by feeding in the sea, the salmon, whether male or female, is termed a kelt; in Ireland, a slat. The eggs of the salmon die if subjected to salt water, or to more than about a third salt water. The fish entering our rivers are therefore the breeding stock from which all salmon, whether caught for commercial purposes in the sea, or for sport in rivers, must necessarily spring.

The eggs, having been fertilised in the redd, are covered with gravel by the spawning fish, and are then left alone. The temperature of the water influences the time of hatching, but with a usual temperature of 40° to 45° F., hatching may be expected in from 90 to 100 days. On hatching, the little creature has gradually to wriggle its way through the interstices of the stones; it is still incapable of feeding, but has a yolk-sac attached to it from which nourishment is drawn. This is described as the alevin stage. By the time the yolk-sac is absorbed the little fish is able to feed by the month.

The early river life of the salmon parr is exactly similar to that of a young trout, and in Scottish rivers usually continues for rather more than two years. Towards the conclusion of this period a gradual descent of the river has been made, and a silvery coat has been assumed. In this silvery condition, when great numbers of the young fish congregate just above tide reach, the young salmon is called a smolt. By law, the breeding fish and the parr and smolts are protected from capture.

Recent investigations in Norway have shown that in that country the very different conditions of river life cause a diversity of habit in smolt migration. In the southern rivers, it would appear that the smolts leave the river for the sea when only one year old, and that as investigations have been pursued northwards into colder and colder waters, so the period of the smolt's river life has been found to be prolonged, till in the extreme north of Norway smolts are ascertained as living three, four, and even at times five years in the fresh water before they migrate to the sea. There is evidence to show that in British rivers the same wide range of ages can be found, though to a less degree. The great majority leave, however, when fully two years old.

After entering the tidal estuary of the river, the salmon smolt, unlike the sea-trout smolt, seems at once to make for the sea. Experimental fishing in the Tay estuary resulted in salmon smolts being caught only in the run of the main channel and during ebb-tide. Fishing by small-meshed sweep-net on the shores of the estuary, or by an anchored net during flood-tide, produced sea-trout only.

Grilse are adolescent salmon, usually three years old. They are the fish which, after leaving as smolts, have spent one year in the sea. A smolt is about 6 inches long, and weighs about 2 ounces. It commonly goes to the sea in May or June, although migrations at other times also occur. After a summer, winter, and spring in the sea, the grilse, if it returns to fresh water in this stage, appears commonly in June and July as a fish of 2 to 6 lb. Grilse, intent on entering fresh water, continue to arrive in our rivers through summer and autumn, and according to the length of time spent in the sea, so the weights are greater—up to about 8 lb. In the months already named as those in which salmon most frequently spawn, the grilse spawn, and thereafter return to the sea; and it has been observed that their return to the sea is usually more prompt than the return of adult female salmon, which, as kelts, may spend four or five months in the quiet pools of our largest rivers. In all small rivers the fish go to the sea more quickly

after spawning, and, in whatever locality, males descend more quickly than females. The latter become 'mended' or restored in condition, and in many cases take on a very bright, silvery, metallic lustre before leaving large rivers; but several instances have occurred of kelts descending one river, and being afterwards caught, not yet fully mended, in other rivers. Kelts which descend rapidly from small rivers commonly remain in brackish water till 'well mended.'

An important fact to notice in the life of the salmon is that the ascent from sea to river is usually made only once or twice in the fish's life. The fish is not an annual spawner, as many people even still suppose. The mere reflection that clean-run fish, with reproductive organs quite undeveloped, ascend our rivers in the winter and spring, when the spawning fish are either on the redds or already returning to the sea as kelts, should in itself be sufficient to show this. A long series of experiments in the marking of salmon by the attachment of numbered silver labels, conducted by the Fishery Board for Scotland, has clearly shown that after descent to the sea, some fish return towards the end of the same year, while others may spend one, two, or three years continuously in the sea before returning to fresh water. This has been referred to as the divided migration of the salmon. Marking of fish in the smolt stage has further clearly shown that the first possible return is in the grilse stage, one year after the first descent, but that numbers of grilse do not then return to fresh water, but pass through this stage in the sea, and make their first return after a second winter in the sea, being then representatives of the small class of spring fish, 8 to 10 lb. in weight. These are the fish caught in spring in the Aberdeenshire Dee, Beaulie, Conon, Biora, Helmsdale, Naver, &c. As summer advances the usual summer fish of 12, 14, or 16 lb. appear, and are simply fish of the same class which have remained longer in the sea to continue feeding; for the sea, not the river, is the feeding place of the salmon. A proportion still further delay their return to fresh water. When we reach fish of 20 lb. in weight, in rivers where such fish are common, we have reached a stage in which representatives of different classes of salmon may be mixed up. The large spring fish common in the Tay, for instance, are in most cases fish of nearly five years old—fish which, after descending as smolts of two years old, have passed the grilse stage and the small spring-fish stage in the sea, and have remained a further year before returning to fresh water for the first time. Such fish, however, may have amongst them a few fish which were previously in the river as grilse, and which have spawned, descended, and are now reascending fresh water. In many of our smaller rivers, fish caught at this weight may have remained longer than three years in the sea before returning to fresh water.

The actual history of the migrations of such fish can also be ascertained by a study of their scales, for the scale of the salmon has imprinted upon it a record of the successive summers and winters of growth. As the fish rapidly grow under the rich feeding in the sea, the scales increase in size by the addition, at their edges, of layers of scale-forming material. These, when the scale is examined under the low power of the microscope, appear as lines or rings not dissimilar to the rings showing the growth of a tree. Since, however, food is much more abundant in summer than in winter, summer lines are more numerous and more strongly marked than winter lines. A broad belt of numerous well-marked lines indicates summer growth; a narrow belt of about six lines placed close together indicates winter growth. In all

ordinary cases, therefore, it is not difficult to tell the age of a salmon. The central portion of the scale contains the miniature scale of the smolt, after which the rapid growth of the fish in the sea is indicated by the summer and winter rings. One portion of the scale is, however, destitute of lines. This is the portion exposed on the surface of the fish's body. The larger area of the scale lies in a skin pocket, and it is upon this covered portion of the scale that the lines are shown. When a salmon approaches the spawning condition, a considerable amount of absorption from various tissues of the body takes place. The fish has already ceased feeding, and has entered fresh water. The genitalia receive nutriment at the expense of other tissues, and even the scales are affected, absorption occurring at the edges. Both males and females are affected in this way. When, after they re-enter the sea, feeding and rapid growth again obtain, the frayed edges are made up as a wound is healed, and lines are again added to the periphery of each scale. This healed place remains evident, as does a cicatrice, and indicates that the fish has spawned. It is termed the 'spawning-mark.' It persists throughout life, but varies very much in appearance, and sometimes shows on the plain exposed portion of the scale. In very large and old salmon the possibility of reading the age and history of the fish is more difficult than in younger fish, since in these the lines often have become blurred, and the various divisions showing years of growth more or less coalesced.

Certain variations undoubtedly occur in scales taken from the same fish. Some observers have placed much importance upon the number of rings in each area or belt or zone of the scale. A detailed study of groups of scales taken from different parts of the same fish has shown, however, that the number of the rings increases as the examination moves from the head along the body as far as the adipose fin, and then decreases from this point towards the tail. On the caudal peduncle or 'small' of the tail, moreover, it is difficult to find scales sufficiently perfect for comparison. Also the scales above the lateral line have, as a rule, rather more lines than those below the lateral line. It is essential, therefore, if comparisons of scales from different fish are to be made, that the scales be taken from the same places on the different fishes. As a rule, it is found satisfactory and preferable to take scales from the 'shoulder' of a fish.

Great support to the correctness of scale-study data has been secured by the taking of scales from salmon when marked, and afterwards when recaptured. It is found that the known intervals of time exactly correspond with the deductions drawn from scale-study alone. It is always essential to remember, however, that a salmon entering fresh water and remaining there till it spawns is not nourished by any food, and therefore does not show any addition of lines for this period. In judging age, therefore, it is necessary to notice when the salmon left off feeding before the spawning-mark (if present) was formed.

An important discovery in the economy of our salmon-fisheries, largely brought to light by scale-study, is the infrequency of spawning of the salmon. The great majority of fish appear to spawn only once. It is rare to find a salmon in the river for a third time, and five times is the maximum in Britain.

It is found that the salmon of certain districts increase more rapidly than do fish in others. From

actual fish which have been marked when in the kelt state, and recaptured in the river after a single season's feeding, it appears that in a district famous for large fish, such as the Tay, a 9-lb. kelt has on an average increased to a clean-fish weight of 17 lb. Similar fish in the Helmsdale, where salmon do not run so heavy, show kelts of 7 lb. increasing on an average to 12½ lb. When we deal with fish from these two rivers which have spent two consecutive seasons in the sea, the Tay kelt has become a fish of 26 lb., and the Helmsdale

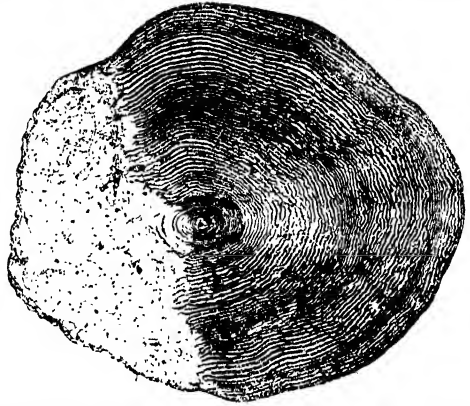

Fig. 2.—The Scale of a salmon marked when a Smolt, and recaptured in third manner after entering the sea; a fish of 12½ lb.

kelt a fish of 15½ lb. Instances of remarkably rapid growth and increase of weight are at times noticed, some fishes doubling their kelt weight in six months. The commonly accepted belief that salmon return to their own rivers is pretty generally borne out by records of marking and recapture. Only about 8 per cent. of the fish recaptured can be definitely regarded as having gone to other rivers. A few clean fish have been recaptured in coast nets fully 100 miles from where the fish were marked; but although marking has been simultaneously carried on in Ireland and England, only one recapture in Scotland of an Irish fish has yet been recorded. The maximum distance travelled by a marked fish is instanced by a fish marked in the Spey in November found in the Eden near Carlisle the following June.

The food of the salmon is chiefly herring, small and great, but sand-eels, the young of other fishes, and various crustacea are also found in the stomachs of sea-caught fish. Salmon caught in estuaries and rivers have no food or remains of food in them, and an examination of the cells lining the digestive tract shows that no food is then passing into the system. The tissues are usually richly stored with fats when the fish leaves the sea, and the development of the reproductive organs as the spawning season is approached has been very clearly shown to be at the expense of the stored nourishment.

Anglers are very commonly sceptical about the non-feeding of salmon in fresh water. That the fish take artificial flies, natural worms, and spinning baits of various kinds (frequently smelling strongly of the formaline in which they are preserved) is undoubtedly true. In this limited and erroneous sense the fish feed; but in the truer sense of taking nourishment the salmon does not feed in fresh water, and steadily loses weight and condition.

The reproductive period in the female seems to be over when the fish is eight years old, and no older females are found in Britain. The male appears to remain fertile for a slightly longer period, and hence old males of large size are more common than large females. Hen fish of over 35 lb. are extremely unusual, but males of 40 and 50 lb. are taken every year in some of the largest rivers. A male of 61½ lb. was caught by rod and

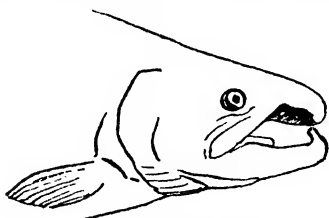

Fig. 3.—Head of Old Male Salmon.

line in the tidal waters of the Tay in 1907; in the Deveron in 1924 a 61 lb. fish was caught. Both those heavy fish were taken by ladies. The record Scottish fish appears to be a male of 84 lb. which was caught in the Tay estuary, in a sparling-net, in the winter of 1869. The heaviest Scottish rod-caught fish is, it is believed, a Tay fish of 71 lb. caught in June 1870. It measured 4 feet 4 inches in length, and was 32 inches in girth. The record rod-caught fish of the Tweed is a fish of 57½ lb., 53 inches by 28½ inches, taken at Floors. The Shannon in Ireland, and the Severn, Wye, and Tyne in England, have also yielded very heavy salmon.

It has frequently been noticed that certain rivers hold early fish, the so-called spring fish, while other rivers do not contain salmon till late summer and autumn. Various theories have been advanced to account for this, and the temperatures of rivers in different localities have been commonly brought prominently into the arguments. When actual thermometric readings are taken both in sea and river, it is found that the spring salmon leaves a cold sea for a much colder river, and that in the spring months the temperatures of our rivers do not materially differ, although the North Sea shows a lower mean temperature than the Atlantic on our western coasts. Till April the sea is warmer than our rivers; thereafter, till September, our rivers are warmer than the sea. In all probability the absence of a spring run of salmon in any river of good volume is to be laid to man's account in over-netting. There is strong presumptive evidence, but as yet no proof, that early runs and late runs are separate races of fish, and that either may be influenced independently of the other. It is the case, however, that most western rivers, in Scotland at least, do not contain salmon at so early a date as do the large rivers of the east coast. From the study of temperatures, however, it has been shown that when salmon are ascending a main river, they do not enter a cold tributary till such time as it has approximated to the temperature of the main river. At the same time, this has to be read together with the observation that early fish habitually pass the tributaries which enter the main river near its mouth.

In their attempts to ascend waterfalls and rapids, also, salmon are considerably influenced by the temperature of the water. A fall which offers little difficulty to a salmon in summer or autumn will not be attempted when the river is running cold in winter and spring. In Norway, however, salmon ascend very rough falls in glacier-fed water.

In Scotland many rivers have low falls which stop the spring fish. In the Helmsdale, for instance, all spring angling is below Kildonan Falls; but whenever the wintry conditions have left the water, the fish leap the falls and may be fished for above. In the Inverness-shire Garry the same obtains. Other instances are at the Falls of Orclay, Falls of Mincomer, Falls of Rogie, &c.

If a deep pool exists at the foot of a fall—and the water erosion usually secures this condition—the salmon is capable of leaping a considerable height. The fish swims with utmost speed from the depths of the pool, and projects itself into the air. Probably the highest perpendicular leap accomplished in this country is about 8 or 9 feet, but where falls are broken up into series of cascades and rapids, considerable heights can be ascended by combined leaps and rapid swims.

Artificial obstructions, such as weirs, in salmon rivers are required by statute to be provided with salmon-ladders or passes. In the case of natural waterfalls, passes can be secured by the consent of the proprietors. The conception of what constitutes an efficient pass has undergone considerable modification since these structures first came into use. A gradient of about 1 in 20 is now sought; the entrance for fish at the lower end should be placed where the run of water gives a natural lead-in close to the obstruction, and the pass should be adjusted to a level of water at which salmon will naturally attempt the ascent. It is well, also, to have the outlet at the upper end suitably protected from flooding and violent current. Many passes in former days have proved to be inefficient, and where circumstances permit, it is still true that the best method to allow of the ascent of fish is to remove the obstruction altogether.

SEA-TROUT (*Salmo trutta*).—In the adult state this fish is known also as the Salmon-trout and, chiefly in Ireland, as the White Trout. In the early grilse stage it is known as the Plincoe, Whiting, or Heeling, the two former names being common in the north of Scotland, the last in the Solway. In systematic natural history it is an open question whether, in the trout family, the sea-trout or the brown trout should be regarded as the type. Reference to this point, and to the modern tendency to disregard the separation of the family into many distinct species, is made under **TROUT**. Certain varieties of trout are so closely allied as to make any definite separation impossible. The brown trout commonly associated with fresh waters assumes an estuarial habit in many localities, and under certain conditions takes on even pure sea-water, so that it cannot be distinguished from *S. trutta*. Nevertheless there is great convenience in regarding sea-trout separately, since the variety is well marked as a rule, and has habits quite distinct from those of the great majority of brown trout. The Sewin of Wales and south England, commonly called *Salmo cambricus*, is, further, a well-marked local race of sea-trout, and the Bull Trout (q.v.) of the Tweed and Coquet represent another such race.

The sea-trout spawns in fresh water in the same manner and at much the same time as the fresh-water trout. The early stages are spent in the river as in the case of salmon, and a gradual migration takes place with the assumption of silvery scales. The smolts of the sea-trout are very commonly called Yellow Fins or Orange Fins, since the pectoral and pelvic fins and the tip of the adipose fin are almost invariably yellow or orange. In the salmon smolt these fins are gray-coloured. For the further distinguishing of the salmon smolt from the sea-trout smolt, the test of the relation of the maxillary bone to the centre of the eye is most valuable. This test applies also to salmon parr

and the young of common fresh-water trout. In the salmon the gape of the mouth is small, and when the mouth is closed the hind-border of the maxillary bone reaches only to a point vertically beneath the centre of the eye. In either the orange fin or the young brown trout, the hind-border of the maxillary bone reaches to a point vertically beneath the posterior border of the eye.

A marked difference in habit has also been noticed. The salmon smolt when it leaves fresh water makes straight to the sea, whereas the sea-trout smolt likes to linger in the estuary. This tendency persists throughout life. The sea-trout has at all times a fondness for estuarial life. This is the most distinctive feature in its habit. If a number of salmon and sea-trout smolts are caught as they are congregating before leaving fresh water, it is noticeable that the sea-trout smolts are commonly larger than the salmon smolts. This seems to be explained partly on account of the sea trout being rather older than the salmon, since the spawning is earlier, and also by the tendency of sea-trout to drop down to the estuary and return again. This habit is more strongly noticed in the whiting or phinoc stage. These beautiful little fish are found ascending from the estuary in the summer months. They may be only about $\frac{1}{2}$ lb. in weight in July, and by November, when they are dropping back again to the estuary, a few of them may have reached almost a pound weight in our largest rivers. In rivers where there is a wide extent of estuary, these little fishes are frequently caught in great numbers. They never ascend fresh waters very far, as fish intent on spawning do, and when dropping back to the estuaries in autumn and winter and in early spring, they are frequently in very poor condition. This is especially the case after cold winters, since at such seasons the food is much more limited. It has been ascertained that some of them spawn, and are actual kelts, so that they harmonise with the adult sea-trout kelts which are dropping down at the same time.

This habit of ascending fresh water from the estuary and dropping back again in the first season of migration is peculiar to the sea-trout. The salmon does not do so. Also, the whiting or phinoc feed freely in fresh water. The salmon, after leaving fresh water as a smolt, remains in the sea for a whole year before making a first ascent of the river, which ascent culminates in the spawning of the grilse. Further, as described above, very many do not return to fresh water as grilse, but pass through this stage in the sea.

Sea-trout frequent small streams which hold but few salmon. In the Orkney and Shetland Islands, where sea-trout are very plentiful, they may be said to have the streams almost to themselves at spawning-time, although at rare intervals grilse have been caught in these islands. In all such small streams sea-trout ascend late. In the Shetlands they ascend very late. Yet, contrary to the belief of some, sea-trout in not a few localities ascend fresh water in spring. Even on the west side of the Outer Hebrides, where the rivers are small, this is the case; while netsmen in large rivers like the Tay catch them regularly, and send them to market in February, March, and April.

The average sea-trout known to sportsmen is probably the fish of about $1\frac{1}{2}$ to 2 lb. In the small rivers of the west coast sea-trout of 4 to 6 lb. are considered large. The same is true of English and Irish rivers. In larger rivers, however, specimens of 8, 10, to 13 lb. are obtained. The largest sea-trout known to the writer was taken in the Tay in 1900, and weighed 18 $\frac{1}{2}$ lb. The bull trout of the Tweed, already referred to

as a local race of sea-trout, has been taken up to 22 lb. in weight.

Sea-trout, also, do not usually ascend fresh waters for any very great distance. They are very commonly found in small rivers and streams, and in lochs from which such streams flow. In large rivers they usually ascend some tributary not very far up. As a rule they favour small waters for spawning purposes. They are wonderfully energetic in ascending obstacles, and will frequently manage to overcome falls almost impassable to salmon, through their smaller size enabling them to swim and leap in comparatively shallow water. Their great energy and dash make them most excellent sporting fish for the angler, and on light tackle their capture is by some preferred to the capture of the salmon.

SALMON DISEASE.—When salmon disease is spoken of, the particular ailment meant is that which for many years has been associated with the presence of the fungus *Saprolegnia ferax*. The fungus is, however, a secondary product. The disease is caused by a microbe which has been named *Bacillus salmonis pestis*. Only after the tissue has been attacked by this bacillus does the fungus grow. The fungus is killed when the fish succeeds in entering salt water, but great numbers of salmon die in certain rivers each year. Kelts are for the most part affected. The fungus arises in circular spots of a dull-white colour, giving the appearance of wet blotting-paper. These patches coalesce as the disease spreads, and the fish meanwhile becomes lethargic. The fungus spreads more rapidly on dead tissue than on living, so there is every reason to have badly diseased and dead fish removed from the river and destroyed.

SALMON-FISHERY LAWS.—The salmon is protected by special laws in the United Kingdom. (1) In England the right to fish salmon in the sea and navigable rivers belongs to the public as a general rule; and the right to fish salmon in rivers not navigable belongs to the riparian owner on each bank, the right of each extending up to the centre line of the stream. But though the public have, as a rule, the right to fish in the sea and navigable rivers, there are various exceptions, which arose in this way. Previously to Magna Carta the crown, whether rightly or wrongly, assumed power to make grants to individuals—generally the large proprietors of lands adjacent—whereby an exclusive right was given to such individuals to fish for the salmon within certain limits. This right, when conferred, at times applied to the shores of the sea, but more generally applied to navigable rivers and the mouths of such rivers. The frequency of such grants was one of the grievances redressed by Magna Carta, which prohibited the crown thenceforth from making such grants. But the then existing grants remained, and hence every person who at the present day claims a several or exclusive fishery in navigable rivers should show that his grant is from the crown, and is as old as Magna Carta. It is not, however, necessary that he be able to produce a grant or chain of grants of such antiquity; for if he has been in undisturbed possession for a long time—say sixty years and upwards—it is presumed that such title is as old as Magna Carta, and had a legal origin. When a person is entitled to a salmon-fishery (and if he is entitled to a salmon-fishery he is entitled also to the trout and other fish frequenting the same place), he is nevertheless subjected to certain restrictions as to the mode of fishing salmon. These restrictions were imposed by a series of acts from 1861 to 1921. In 1903 the care of the fisheries was transferred from the Board of Trade to the Board of Agriculture and Fisheries, which body subsequently was raised to the position of a ministry.

All the earlier acts may now be disregarded, however, since, by the Salmon and Fresh-water Fisheries Act, 1923, their provisions have been consolidated. By this important act, nineteen statutes were affected, eighteen being entirely repealed. Of the remaining act, that of 1891, only one section remains, so that in the 1923 act we have a code of statutory law on this subject.

The term salmon used in this act no longer includes migratory trout, a provision which affects the marketing of the trout. Local fishery boards are reconstituted, and have upon them representatives of net-fishers in public waters, as well as rod-fishers who angle for fish other than salmon. There are clauses for the prevention of the destruction of fish and their ova, and the food of fry, by pollutions; and also to enable the amount of netting to be restricted. Fishery boards are given additional powers to enable them to raise adequate funds for the administration of their local affairs, and for the regulation of the fisheries by bylaws. The weekly close time may be extended by bylaw to seventy-two hours, forty-eight being otherwise the period, and fishermen may be required to furnish a return of salmon and trout caught. The act has ninety-four clauses and five schedules. A first part deals with the salmon and fresh-water fisheries; and a second with pollutions and the Rivers Pollution Acts, 1876 and 1893.

(2) In Scotland the conditions under which salmon-fisheries are held are fundamentally distinct from those which obtain in England. Scottish salmon-fishing was originally the private patrimony of the sovereign, and the right of catching salmon has only been obtained legally by charter from the crown. To the present time the right of salmon-fishing is vested in the crown—now in this matter represented by the Office of Crown Lands—or is held by subjects, or successors to subjects, to whom such rights have been alienated. The right is a separate heritable estate, and has, at law, no connection with rights in land: although as a matter of fact the two commonly go together where rights have been granted. There are, however, not a few instances where the right of salmon-fishing in rivers is held by those who do not own the banks of the rivers. The great majority of river-fisheries have been alienated from the crown to individuals, but the coast salmon-fisheries are still held to a very considerable extent by the crown, and are let on lease or otherwise by the Office of Crown Lands. The public have no right anywhere in Scotland to fish for salmon either with net or rod. By virtue of many old statutes all fixed engines for catching salmon in rivers and estuaries are illegal, and it is settled that everything is in the nature of a fixed engine unless it is held in the hand of the fisherman and is in motion while he is fishing; but a mechanical contrivance which enables the fisherman to go a little farther into the river with his coble or boat which is to drag the net is not illegal. Even drift-nets worked in estuaries have, by House of Lords decision, been found to be fixed engines, and therefore illegal. A very limited number of crivies or fishing weirs still, however, exist in rivers by virtue of special charters. Fixed nets proper—i.e. stake-nets, bag-nets, and fly-nets—are largely fished on the open coast, but may not be used within the limits of estuaries, which limits are scheduled in a bylaw of the Salmon Fisheries (Scotland) Act, 1868. In 1862 and 1868 statutes were passed for regulating the Scottish salmon-fisheries. By these acts fishery districts are authorised to be managed by boards. These boards consist of qualified proprietors of fisheries. The boards appoint constables, water-bailiffs, and watchers, forming a kind of river-police. The board has power to assess the various proprietors

so as to raise funds for purposes of protection, &c.—similar funds being raised in England chiefly by license-duties. The general superintendence of the salmon-fisheries is vested in the Fishery Board for Scotland, and is conducted by the Inspector of Salmon fisheries. Annual reports are made to the Secretary for Scotland and presented to parliament. Trout-fishing in Scotland is a pertinent of the land, and is not held by separate charter. In 1902 the Fresh-water Fisheries (Scotland) Act was passed, which for the first time instituted a close time for trout. This close time is from 15th October to 28th February, both days inclusive. This act also made it illegal to expose trout for sale, or to have trout in possession between those dates. It also, by incorporating the penalties of the Fisheries (Dynamite) Act, 1877, made it illegal to employ any explosive for the capture of trout.

(3) In Ireland the salmon-fisheries are, as regards title, somewhat similar to those in England. There is a public right of fishing, and several private fisheries also exist.

See *British and Irish Salmonidæ*, by Francis Day (1887); *Salmon and Sea-trout*, by Sir Herbert Maxwell (1898); *The Life of the Salmon*, by W. L. Calderwood (1907); *The Law relating to the Salmon Fisheries of England and Wales*, by J. W. Willis Bund (1876); *The Law of Scotland relating to Rights of Fishing*, by Charles Stewart (2nd ed. by J. C. Shairp, 1892); *The Law of Scotland as applied to the Game Laws, Trout and Salmon-fishing*, by J. Hunter Tait (1901); *The Fishery Laws of Ireland*, by H. D. Conner (1892; 2nd ed. 1907); *Bibliotheca Piscatoria*, by T. Westwood and T. Satchell (1883, 1901). Also the articles ANGLING, FISHES, POACHING, PISCICULTURE, TROUT, and works there named.

Salmon, GEORGE (1819-1904), a great mathematician and divine, was born in Dublin, and had his education at Cork, and at Trinity College, Dublin, where he graduated as senior moderator in mathematics in 1839. He was appointed to a fellowship in 1841, took orders in 1844, became regius professor of Divinity in 1866, and provost of the college in 1888. His contributions to mathematical learning include many papers in the special journals, and admirable treatises on *Analytic Geometry*, *The Modern Higher Geometry*, *Conic Sections*, *The Higher Plane Curves*, and *Geometry of Three Dimensions*. In the department of theology his writings comprise four volumes of strong and thoughtful sermons, *College Sermons* (1861), *The Reign of Law* (1873), *Non-miraculous Christianity* (1881), *Gnosticism and Agnosticism* (1887), and two collections of his lectures, the first forming an excellent *Introduction to the New Testament* (4th ed. 1890), the other on the *Infallibility of the Church* (1888), a vigorous and unusually readable controversial work.

Salmonidæ, a large and important family of Teleostean fishes in the order *Pisces*. The family includes salmon and trout (*Salmo*), smelt (*Osmerus*), grayling (*Thymallus*), vendace, pollan, and 'white fish' (*Coregonus*), and about a dozen other genera—about eighty species in all. They inhabit both salt and fresh water, and many migrate from the one to the other. With one exception (in New Zealand), the fresh-water forms are restricted to the temperate and arctic zones of the northern hemisphere. The body is generally covered with cycloid scales, the head is naked, there are no barbules, there is an adipose or fatty fin behind the dorsal, the pelvic fins are situated about the middle of the ventral surface, the outline of the belly is rounded, the air-bladder is large and open, and with the stomach numerous pyloric creta are associated. The eggs are large, and are shed into the abdominal cavity before they are spawned. In beauty, activity, and also in palatability, the Salmonidæ rank high among fishes.

See SALMON, SMELT, TROUT, &c.; Day's *British and Irish Salmonidae* (1887); and for the acclimatisation of Salmonidae since 1864 at the antipodes, the book by Nicols (1882), and articles by Allport in *Proc. Zool. Soc.* (1870), by Arthur in *Tr. N. Z. Inst.* (1881), and by Seager and Johnston in *Proc. R. Soc. Tasm.* (1888).

Salò, GASPARO DI BERTOLOTTI DA (c. 1542-1609), a celebrated maker of double basses, and of other instruments of the viol and violin families, was a son of the painter Francesco di Bertolotti, and worked in Brescia.—His son FRANCESCO, born in Brescia in 1565, succeeded him; and died after 1614.

Salome, the daughter of Herodias (see JOHN THE BAPTIST), with an associated love-story, was made the subject of a play (in French) by Oscar Wilde; and on this Richard Strauss based his opera (1905).

Salomon, JOHANN PETER, violin-player and musical composer, born at Bonn in 1745. When young he was attached to the service of Prince Henry of Prussia, for whom he composed several operas. He settled in London, and his series of Philharmonic Concerts there in 1790, for the first of which he arranged to have Haydn present, form an era in the history of music, in that they led to the production of Haydn's twelve greatest symphonies. After his retirement in 1800, he continued to compose songs, glees, and violin solos and concertos. He died on 25th November 1815, and was interred in Westminster Abbey.

Salon, the French word for a large and lofty hall of reception in a palace—later, for an ordinary drawing-room—appears in English in the 18th century either in the same spelling or, in Richardson and Horace Walpole, as *saloon*, now used in another and a less dignified sense both here and in the United States. The Salon of ordinary parlance, the *Salon par excellence*, is the French or Parisian Salon, the annual exhibition at Paris of paintings and sculptures by contemporary artists, originally held in the Palais Royal (1667), later in the Salon Carré of the Louvre (whence the name), and now in the Palais de l'Industrie. The Paris Salon was the precursor and model of like exhibitions in London and elsewhere.

In the history of French culture and French society 'the salon' has also quite another and specific meaning, and refers to a characteristic French institution which originated in Paris, and in its fullest developments was peculiar to the French capital—the reception-room of the Parisian society queen for the time being transformed into a meeting-place of notabilities in society, literature, art, and politics, the focus of fashion and the parliament of taste and social usage. We may say that Aspasia had her salon, in which Pericles and Socrates were almost equally conspicuous; in the first half of the sixteenth century many of the courtesans of Venice, learnedly educated and highly accomplished in poetry and the arts, enjoyed the friendship of the foremost poets and painters, and their salons were crowded by philosophers and great scholars as well as noble courtiers. Vittoria Colonna, Margaret of Navarre, and brilliant and accomplished women in all ages have attracted to their houses and to their society the most distinguished men of their time and country. Chivalric devotion to women's service is said to have been first specially cherished in Provence. But in its most characteristic shape and highest influence the salon is a Parisian phenomenon; this particular homage to women's fascination and women's influence—women's rights is one special department—dates from the opening of the Hôtel de Rambouillet in 1617. At the shrine of the marquise—young, beautiful, refined, witty—Richelieu, Malherbe,

Balzac, Corneille, and Voiture worshipped; and later Bossuet, Scarron, St Evremont, and La Rochefoucauld. The original members of the French Academy were perhaps the most distinguished guests. There too Madame de la Fayette, Mademoiselle de Scudéry, the Duchesse de Longueville, Madame de Sévigné, the Duchesse de Montpensier, trained themselves in the arts they practised so skilfully when they in turn opened salons for themselves, and were, some of them at least, satirised in Molière's *Précieuses Ridicules*. Then came the salons of Madame de Sablé, Ninon de l'Enclos, and Madame de Scarron (afterwards De Maintenon). The Marquise de Lambert, learned but vivacious, had the most noteworthy salon in the first half of the 18th century, said to be 'the ante-chamber of the Academy.' Madame de Tencin was one of the cleverest but least estimable queens of the salon. Madame du Deffand—aristocratic, beautiful, most accomplished in conversation and as a letter-writer—had a long reign, and when blind and frail was not wholly deserted after her *protégée*, Julie de Lespinasse, poor, plain, nobly but not honourably born, set up her rival salon, to which D'Alembert brought the notable encyclopedists with him. Madame de Geoffrin, *bourgeoise* by birth and a manufacturer's wife, devoid of beauty or literary accomplishment, had yet the *esprit* and personal charm which attracted to her salon the chief men of letters and the most aristocratic women of France. Her salon, like those of Madame Necker and Madame Roland, was a centre of the new doctrines that prepared the French Revolution; and Madame d'Épinay, who gave scope to the genius of Rousseau, had a high reputation in philosophical, literary, and political circles. In the 19th century the tradition was revived or maintained by Madame de Staël, Madame de Récamier, Madame Vigée le Brun, Madame de Girardin, and Madame Mohl.

According to M. Arthur Meyer, the last salon that influenced elections to the Academy was that of the Comtesse de Loyne (Amaray Duval's 'Lady of the Violets'), frequented by the younger Dumas, Sardon, Flaubert, Gautier, Mistral, Coppée, Lavendun, Sarah Bernhardt, and Anatole France.

In no typical salon were the claims of birth paramount; in some wit or political, literary, or artistic eminence was a sufficient passport. Madame du Deffand was not content with genius, but demanded elegant manners, tact, gaiety, and good sense; she admired Voltaire, disliked Diderot, held Rousseau in contempt, despised Marmontel, and would not admit Grimm at all. But possessed of the required qualifications, representatives of all ranks, and often of diametrically opposed schools, sects, and coteries, met on the same footing. The salon was a centre where pleasant people were to be met, good conversation to be enjoyed, and a liberal interchange of ideas promoted. The salon might have its special tone—literary, philosophical, artistic, political, philanthropic, religious even; but it was always the home of good talking, and of intellectual companionship between cultivated men and women. The parties were small and select, and did not break up into groups; the conversations were general and not *tête-à-tête*; and the hostess was understood to direct the discussion, tossing the ball from one to another, so that vanity had no room to display itself in monologues. The interchange of ideas in the salon diffused new thought and new light throughout society generally. The salons governed opinions; opinions governed the French world. A standard of conduct was maintained, not the highest perhaps, but higher than generally obtained at court in a licentious age; a pattern of manners was set which tended to become universal. Bunnetière has maintained that if literary refinement and elegance was promoted by the salon, spontaneity, freedom,

and originality were correspondingly checked and dominated by formality.

In England the 'matchless Orinda,' Mrs Katherine Philips (q.v.), was early in the field. Later, the select assemblies of Mrs Montagu and other 'Blue Stockings'—Mrs Delany, Hannah More, Mrs Chappone, Elizabeth Carter, Mrs Vesey—were but pale reflections of the glory of the French salons, and neither socially, politically, nor in respect of their influence on art or literature took the same pre-eminent place; nor did those of Mrs Piozzi (Thrale) and the Della Crusceans (q.v.), of Lady Anna Millar and the Bathaston coterie, or of Lady Blessington. Hohand House at its best, when its rooms were haunted by Sydney Smith, Macaulay, all the living magnates and political stars, the social and literary lions of the time, most nearly rivalled the Parisian prototype. The 'society-leader' aims at a salon of a kind. The women of the American colonies imitated their French sisters to some purpose; and in Germany Henriette Herz, Bettina von Arnim, Rahel, Carolina von Schlegel, and Queen Louisa were pre-eminent.

See Bassanville, *Les Salons d'Aufrefois* (1862-70); Miss Clergue, *The Salon* (1907); Arthur Meyer, *Forty Years of Parisian Society* (trans. 1912); Miss Wheeler, *Famous Blue Stockings* (1910); Huchon, *Mrs Montagu and her Friends* (1907); Lloyd Sanders, *The Holland House Circle* (1908); Miss Hargrave, *Some German Women and their Salons* (1912); Wharton, *Salons Colonial and Republican* (1900); Boulting, *Woman in Italy* (1910); C. B. Tinker, *The Salon and English Literature* (1915); L. Daudet, *Salons et Journaux* (1912); and the articles on the several founders of salons in this work.

Salona, an ancient ruined city of Dalmatia, at the head of a gulf, about 3 miles N.E. of the spot on which Diocletian afterwards built his palace of Spalato (q.v.). It was made a Roman colony in 78 B.C., and later became the capital of Dalmatia and one of the most important cities and seaports of provincial Rome. But it was frequently captured by the Goths and other barbarians, and in 639 was completely destroyed by the Avars. The inhabitants who escaped took refuge in Diocletian's palace. The ruins having been excavated during the 19th century, there are now to be seen remains of the city walls, the shell of the ancient Christian cathedral, remains of other churches, traces of an amphitheatre, and other structures. The city was early made the seat of a bishop, who was soon advanced to the dignity of archbishop of all Dalmatia. After the destruction of the city the archbishop converted the temple of Jupiter at Spalato into his cathedral.

Salonika, or SALONIKI (Turk. *Selanik*), a great commercial city of Greece, second city of the republic, and chief European port of the Aegean, stands at the head of the Gulf of Salonika. The city climbs up the rocky heights that stretch back from the shore, and is overlooked by a citadel, the ancient acropolis. From the sea it has a fine appearance, being surrounded with white walls, 5 miles in circumference, and having its houses and churches enfolded in trees of dark foliage. The streets previous to 1889 were narrow, rough, and dirty; since that year they have been widened and excellently paved and drained. The principal buildings of interest are the churches (used as mosques during the Turkish occupation), which preserve on their walls many valuable evidences of Byzantine art. St Sophia, supposed now to date from about 500 A.D., and therefore older than its namesake at Constantinople, is shaped like a Greek cross surmounted by a dome, and contains beautiful mosaics and capitals. In the great fire of September 1890, which did enormous damage to the town, it was a good deal injured, but not irreparably, though the archives were burned. St George,

dating probably from the time of Constantine, is circular in form, with a dome also covered with fine mosaics. St Demetrios (7th century), one of the most beautiful of all Byzantine churches, lined with marbles and mosaics, was damaged so much in the great fire of August 1917 (which destroyed the commercial quarter) that only the bare walls remained. Eski Djumra (5th century) is a superb basilica with marble columns and mosaics. Salonika is an important railway centre, lines running to Constantinople, Belgrade, Monastir, and Athens (the extension to the Thessalian border, linking up the Greek capital with the European railroads, was only completed in 1916). A new harbour was opened in 1901, and the commerce is very considerable, the principal imports being metal wares, cereals, and textiles, and the exports silk cocoons, skins and hides, wine and olives. Cotton, rice, tobacco, and vines are grown locally. A university began work in 1925. Pop. (1900) estimated at 100,000; (1923) at 263,000 (of whom 75,000 may be Jews of Spanish descent), but it is doubtful whether this figure includes the Armenian and other refugees from Asia Minor, that poured into Greece after the Great War.

Thessalonika, as the town was anciently called, was built by Cassander about 315 B.C., on the site of an older city named Therme, and was called after his wife, sister of Alexander the Great. It soon became a place of importance as the principal harbour of Macedonia, and later was the chief station on the Via Egnatia, the great high road from the Adriatic coast (and so Rome) to Byzantium. To the Christian community here St Paul addressed the two Epistles to the Thessalonians. In 390 A.D. there took place the notorious massacre of 7000 citizens by the Emperor Theodosius. Under Byzantine rule, the town successfully withstood the Goths and Bulgarians, but was captured by Moslems from Africa in 904 and by the Normans of South Italy in 1185. The Turks took it in 1430 from the Venetians, and it became the headquarters of the Young Turk movement (1908). The Greeks invested it in the First Balkan War (1912) and kept it, in spite of Bulgarian opposition. In 1915 an Anglo-French force under General Sarraill landed here, but King Constantine adopted a policy of neutrality. The next year, Venizelos formed a provisional government at Salonika in opposition to the court at Athens. After the evacuation of Gallipoli, the Serbian debacle, and the abdication of Constantine, a huge allied force collected here in 1917, and finally in 1918 completely crushed the Bulgarians. See GREECE (*History*). The fire of 1917 was followed by very active rebuilding with spacious if pretentious avenues, and the wiping out of traces of Turkish tenancy.

Saloop. See SASSAFRAS.

Salop. See SHROPSHIRE.

Salpa, a remarkable genus of free-swimming Tunicates, included along with Didolium and Anchinia in the order Thaliacea. Several species occur in the warmer seas, transparent pelagic animals, complex in structure and in life-history. The body is somewhat barrel-shaped, open at both ends, ringed round by several distinct but incomplete hoops of muscle, controlled by a complex nervous system, possessed of eyes and other less definite sense-organs, with compressed lateral viscera. In the life-history there is an alternation of generations. There are asexual forms or 'unreses,' from which there grows out a long ventral 'stolon.' This stolon is segmented into a chain of sexual buds, and the whole chain is set free. As the individuals become mature they separate from one another, the chain breaks into its links. Each of these produces an ovum, which after fertilisation

develops into an embryo and into the asexual 'nurse' form with which we began. The sexual forms are hermaphrodite, like all Tunicata, but cross-fertilisation seems to occur.

Sal Prunelle, purified nitre in mass, or fused and rolled into small balls. See NITRE.

Saltes. See VOLCANO.

Salsette, an island lying N. of Bombay, with which it is connected by a bridge and a causeway. It is a beautiful island, diversified by mountain and hill, studded with the ruins of Portuguese churches, convents, and villas, and rich in extensive rice-fields, coconut groves, and palm-trees. Area, 246 sq. m.; population, 150,000; chief towns, Bandra (22,000) and Thana (q.v.), the headquarters of the district. Nearly one hundred caves and cave-temples exist at Kánhari or Keneri, in the middle of the island, five miles west of Thana. They are excavated in the face of a single hill, and contain elaborate carving, chiefly representations of Buddha, many of colossal size. Salsette was occupied by the Portuguese early in the 16th century, and was captured by the Mahrattas in 1739 and by the British in 1774.

Salsify, or **SALSIFY** (*Tragopogon porrifolius*), a compositous biennial growing in meadows

Salsify (*Tragopogon pratensis*), a native of Britain, (*porrifolius*).

was formerly cultivated in England for its roots, which are similar in quality to salsify. Scorzonera is sometimes called Black Salsify.

Salt, or **CHLORIDE OF SODIUM** (sym. NaCl; sp. gr. 2.15). This substance is called by chemists common salt to distinguish it from a great number of other bodies termed Salts (q.v.) in scientific language. Rock-salt or halite crystallises in cubes, colourless and usually transparent when pure, and sometimes measuring an inch on the side. It is, however, generally coloured by the presence of some foreign body, and occurs of yellow, red, blue, and purple tints. When decidedly impure it is often of a dull-gray colour. Salt is one of the few substances which are nearly as soluble in cold as in hot water. A saturated solution has a specific gravity of 1.205. Sea-water, which contains salt to the extent of from 2.5 to 2.7 per cent., has a mean specific gravity of 1.027. Salt has a saline but not a bitter taste, and is inodorous. Some of the physical properties of rock-salt are remarkable (see HEAT). Salt is of great importance as a condiment and antiseptic, and equally so in some chemical manufactures.

As rock-salt it is found in most countries, and in some extensively; but salt from any source is scarce and costly in some places—certain parts of the interior of Africa, for example. It can, of course, be obtained by evaporating sea-water. Some beds or deposits of rock-salt have no doubt been formed by the slow evaporation of large bodies of salt water, which by one means or another—by a sandbank, for example—have been cut off from communication with the sea. This process would sometimes be repeated by sea-water again getting in through a breach in the bank, and this again being filled up. There are instances where it has certainly been formed in this way on a limited scale. But geologists seem to be of opinion that beds of rock-salt have more generally arisen from the long-continued evaporation of large inland lakes without outlets; these had long been fed by rivers or streams which dissolved salt out of the soil or strata over which they flowed. The Dead Sea and the Great Salt Lake of Utah are examples of lakes without outlets at the bottoms of which rock-salt is forming. All salt, wherever found, has probably come originally in some way or other from the sea. Rock-salt beds are usually associated with deposits of sulphate of lime (calcium sulphate), and are more common in the Tias than in other geological formations.

Valuable beds of rock-salt, usually accompanied with brine, occur in England. The Cheshire deposits, which are in the basin of the river Weaver, have been long worked and are still productive. At Northwich in that county rock-salt is found at from 200 to 250 feet below the surface. There are four beds of an aggregate thickness of 240 feet, but the two lower ones are mixed with marls. The two upper beds each average about 90 feet in thickness, with some brine just above the top bed. At Winsford and Wheelock in the same county thick beds of rock-salt also occur at moderate depths. In Worcestershire, at Stoke Prior and at Droitwich, rock-salt occurs, 154 feet thick including marls in the former locality, and brine is likewise found at both places. At Stafford (common in Staffordshire the salt is 78 feet thick; and in these two counties the deposits are not far below the surface. In the west of England, most of the salt is obtained from brine naturally overlying the rock-salt or from inundated salt-mines. In 1889 an important discovery of rock-salt was made at Walney Island and at Fleetwood (Preesall), in Lancashire, where the deposits are roundly from 100 to 500 feet in thickness, and at the former place from 270 to 360 feet below the surface. This Lancashire salt was first worked (as Preesall brine) in 1890. On the east side of England, between Middlesbrough and Hartlepool, there is an extensive deposit of rock-salt, which was accidentally discovered in boring for water in 1862. Its proved area is between 30 and 40 sq. m., the salt is from 50 to 115 feet thick, and its depth below the surface varies from 800 to 1600 feet. This is greatly deeper than the beds in the west of England. A bore-hole is made, into which a double iron pipe—one within the other—is inserted, and in the jacket or annulus thus formed fresh water is let down to form brine, which is pumped up through the inner tube by a steam-engine.

Rock-salt is found in Galicia, the mines at Wieliczka, which have been worked since the 13th century, being the most famous in the world. The system of mines extends over an area of about 6 miles from east to west, and 2 miles from north to south, with underground streets, squares, &c., and about 30 miles of tramway; the greatest depth reached being about 1000 feet. In Wallachia, Transylvania, Hungary, Upper Austria, Styria, Salzburg, and Tyrol important salt-mines are

worked. Rock-salt is also found in Russia, Italy, and largely at Stassfurt in Germany and Córdoba in Spain. Of eastern countries Persia is perhaps the best supplied with salt; India has productive mines in the Salt Range (q.v.), but salt is also largely imported; and both rock-salt and salt lakes occur in Asiatic Russia. The Wieliczka rock-salt is of Tertiary age; that of Cheshire, Bavaria, and the Austrian Alps Triassic; in Permian deposits near Berlin borings have gone down in rock-salt for nearly 4000 feet. Deposits of the same age occur also in Holstein, and in eastern Russia. Brine-springs rise from many other geological systems: thus, in Northumberland and Leicestershire they issue from Carboniferous strata, while in some parts of the Alps they come from rocks of Jurassic age. Similarly in North America saliferous formations occur on several geological horizons. Thus, the salt-works at Syracuse, New York, and in the neighbourhood of Golerich on the Canadian side of Lake Huron, are in the well-named 'Salina group' of the Upper Silurian. Brine-springs also rise from the Carboniferous strata of Michigan, Ohio, and Virginia, while a thick bed of rock-salt of apparently Cretaceous age occurs in southern Louisiana.

Not infrequently rock-salt occurs in considerable abundance at the surface; some of these accumulations are of quite recent formation, while others are of great geological age. Thus, at Cardona (Montserrat) in Spain rock-salt forms hills some 400 and 500 feet in height the deposits being probably of Cretaceous age; and similar masses occur near Orenburg in Russia, and in the Punjab. Superficial saline deposits are met with covering extensive areas in many more or less desert regions, where they evidently indicate the sites of dried-up lakes and inland seas of comparatively recent age. As examples may be cited the rock-salt deposits of the Kirghiz Steppes, those near Lake Urmiah, and in various parts of South America. Salt lakes from the bottoms and shores of which rock-salt is obtained are met with in many regions, both in the Old and New Worlds. Thus, it is collected in Cyprus, Melos, the Crimea, and the Aral-Caspian area; and many saline lakes, pools, and marshes occur in the great western region of North America. Even in dry warm regions where no salinas may happen to exist, an efflorescence of salt not infrequently covers the ground after rains—the salt having doubtless been derived by capillary attraction from the underlying subsoils and rocks. Rock-salt also occurs as a product of sublimation in volcanic regions, from which it has been inferred that much of the steam emitted by volcanoes has come from water introduced by underground fissures from the sea.

When brine is pumped up to the surface it is run into cisterns or reservoirs situated at a higher level than the evaporating pans, into which it descends through pipes. These pans are large shallow iron vessels, heated either by coal-fires placed beneath them or by other means, such as wastesteam. With a high heat and a short time in the pan a fine salt is produced; with a comparatively low heat and a longer time in the pan a coarse salt forms. Agitation of the brine tends also to produce a fine salt. Brine boils at 226° F., and it is at this temperature that ordinary table-salt, called also 'lump' or 'lumped' salt, is produced. At about 165° F. what is called 'common' salt is obtained; large grained salt forms at between 130° and 140° F.; and fishery-salt, also large grained, at from 100° to 110° F. The salt crystallises on the surface of the brine in the pan, floats about a little, and then falls to the bottom, leaving the surface free for a fresh crop of crystals. Twice or thrice in twenty-four hours fine salt is drawn from the pans, which are kept nearly full of

brine, by raking it to the side and lifting it out with perforated scoops. It is then put into moulds called 'tubs,' and left for about half an hour to let the water drain off, after which the shaped lumps are put into a stove, where they remain till they are quite dry. Sometimes even fine salt is not stove-d, and it is then called butter salt or chesse salt. To make salt of the largest grain the brine is left for nearly a fortnight before removing the crystals. In this process the 'bittern' or magnesium chloride remains in solution after the common salt separates.

At different places around the British coasts salt was formerly obtained by evaporating seawater, and to such salt the name bay-salt (often used for coarse salt) properly belongs. In Spain, Italy, and southern France the manufacture of salt in this way is practised on a large scale. Besides common salt sea-water contains much smaller quantities of potassium chloride, magnesium chloride and sulphate, calcium sulphate, and more minute quantities of other bodies. The water of the Mediterranean, which is slightly more salt than the open ocean, contains 2.72 per cent. of sodium chloride. As the evaporation goes on calcium carbonate separates first and then calcium sulphate. When the water reaches the density of between 1.22 and 1.31 sodium chloride separates along with small quantities of other salts; and when the specific gravity becomes 1.33 very little of anything but magnesium chloride remains. A series of shallow rectangular basins are usually so arranged that the water can flow from basin to basin, and when it has reached the lowest the partially concentrated sea-water is collected in a well. From this it is raised to the first of another series of basins, and finally into the series where the salt crystallises. The salt is then stacked in heaps, which are protected from rain and left for months to drain. This to a large extent gets rid of deliquescent and bitter impurities. It then contains about 95 per cent. of chloride of sodium, in which state much of it is sent into the market.

In some northern countries sea-water, suitably placed for the purpose, is frozen over in winter in order to increase the proportion of salt in what remains liquid, since the ice so formed is fresh. The water is then evaporated by artificial heat till the salt is obtained.

Besides its universal use as a condiment, salt is an all-important substance in the manufacture of soda, hydrochloric acid being obtained from it in large quantities in the process as a by-product. It is also employed in the manufacture of soap and for producing what is called a salt-glaze on stone ware. Agriculturists destroy slugs and grubs with salt, and it appears to improve the fertility of soils when mixed with certain manures. Brine is used in the pipes of freezing machines. Rock salt is carved into cups and vases in the Punjab, and it is said that houses are built of it in certain very dry regions, as in the Desert of Caramania, where this material is abundant.

The salt-tax was or is in some countries an important source of revenue, though it is recognised by economists as one that presses unfairly on the poor. The salt-tax of the ancient regime in France is referred to at GABELLE. In Britain salt duties were first exacted in 1702; the rate was 5s. per bushel in 1798, during the great French war, but was ultimately increased to 15s. per bushel, thirty or forty times the cost of the article! The duty was finally remitted in 1825. Salt-makers or salters used in some parts of Britain to be, like colliers, serfs (see SLAVERY). For the value of salt in preserving food, see ANTISEPTICS, PRESERVED PROVISIONS. For the varying saltiness of the

sea at various depths, see ATLANTIC, PACIFIC, SEA, &c.

Salt, SPIRITS OF, an old name for hydrochloric acid.

Salt, SIR TITUS (1803-76), a public-spirited English manufacturer, was born at Morley, near Leeds. He began business as a wool-stapler at Bradford, and being successful started wool-spinning in 1834, and was the first to introduce the manufacture of alpaca fabrics into England. He was responsible for the model village of Saltaire (q.v.). Titus Salt was mayor of Bradford in 1848, was returned as member of parliament in 1859, and was created a baronet in 1889. See *Life by Balgarnie* (1877).

Salta, a northern province of the Argentine Republic, touching Chile and Bolivia, and nearly enclosing the province of Jujuy. Minerals are abundant, but have been neglected for agriculture and cattle-raising. Salta is watered by the Salado, San Francisco, and Bermejo. Area, 48,302 sq. m.; pop. 154,000.—**SALTA**, the capital, on the Rio Arias, 535 miles by rail N. by W. of Córdoba, founded in 1582, is an important agricultural centre. Pop. 30,000.

Saltaire, a model village on the Aire, 3 miles from Bradford and 1½ miles by rail from Leeds, founded and built by Sir Titus Salt (q.v.), who opened his worsted and alpaca factory here in 1833. The place has a Byzantine church, hospital, school, park, workmen's club and institute, technical schools, &c. It forms part of Shipley urban district.

Saltash, a picturesque ancient municipal borough and seaport of Cornwall, on the west side of the estuary of the Tamar, and 4½ miles NW. of Plymouth by a railway that crosses the Tamar by Brunel's iron Royal Albert Viaduct (1857-59), 2240 feet long and 240 high. The church of St Nicholas dates from 1225. Pop. 3600.

Saltburn, a picturesque Yorkshire watering-place, on lofty cliffs facing the sea, 4 miles SE. of Redcar, dates only from the opening of the railway in 1861. Strong brine baths are provided from wells at Middlesbrough. Pop. 4600.

Saltbush. See CHENOPODIACEÆ.

Saltcoats, a watering-place and burgh of Ayrshire, on the Firth of Clyde, 1 mile ESE. of Ardrossan and 30 miles SW. of Glasgow. It was a great seat of salt manufacture from 1686 to 1827. Pop. (1921) 13,480.

Salters. See SLAVERY.

Saltillo, capital of the Mexican state of Coahuila, by rail 237 miles SW. of Laredo, Texas, and 603 N. by W. of Mexico City. Shawl-making is a local industry. Cattle farming, cotton, grain, and sugar-growing are carried on, and there is some mining of gold, silver, lead, &c. in the surrounding country. Pop. 35,000.—Near it is Buena Vista (q.v.).

Saltire. See HERALDRY.

Salt Lake City, the chief town and ecclesiastical capital of the state of Utah, is on the river Jordan, 12 miles from Great Salt Lake (q.v.), and 4300 feet above the level of the sea. By rail it is 36 miles S. of Ogden and 833 miles from San Francisco. It was settled by the Mormons (q.v.) in 1847, incorporated in 1851, and is beautifully laid out with parks and open spaces. The chief public buildings are the Mormon temple (dedicated in 1893, being forty years in building; the Tabernacle (1870), an immense elliptical building seated for 8000, with a dome-shaped ('dish-cover') roof resting on sandstone pillars, and a magnificent organ (en-

larged 1915); the Latter-day Saints office building; the state capitol (1916); the City and County building; the Catholic cathedral, the First Presbyterian church, together with churches of nearly every denomination; the High School (technical), the university (1850), and some fine hospitals. Manufactures are unimportant, but salt-refining is carried on, and there are very important large mining interests in the vicinity. In the neighbouring agricultural district irrigation is largely practised. Pop. (1870) 12,854; (1900) 53,531; (1910) 92,777; (1920) 118,110.

Salto, (1) a north-western department of Uruguay on the Uruguay River, is a picturesque hill-country, watered by the Arepey and its many tributaries, and devoted to cattle-rearing. Area, 4865 sq. m.; population, 88,000.—The chief town, Salto, the third city of the republic, stands on three hills almost at the head of navigation on the Uruguay, 306 miles from Buenos Aires, and 86 by rail N. of Paysandú, and 366 miles NNW. of Montevideo. It carries on an active frontier trade with Brazil, and is the centre of live-stock and agricultural interests. Pop. 30,000.—(2) **SALTO**, in Argentina, is 107 miles by rail W. of Buenos Aires. The surrounding district abounds in fossil remains of prehistoric animals.

Salt of Saturn, a name for acetate of lead.

Salt of Sorrel, the common name for binodate of potash. See OXALIC ACID.

Salt of Tartar, a commercial name for carbonate of potash in a very crude form.

Saltpetre. See NITRE.

Salt Range, a mountain-system in the Punjab, India, consists of two main chains running east and west, and embracing between them an elevated tableland. It begins on the south side of the Jhelum, runs west to the Indus, and varies from 3200 to 5000 feet in height. Its appearance is exceedingly bleak and barren, but not without much savage grandeur. The system gets its name from the beds of rock-salt that occur on the edges of the plateau, and form the largest known deposits in the world.

Salts constitute an extremely important class of substances in chemistry, of which common or sea salt (sodium chloride) may be mentioned as the most familiar example. Epsom salt (magnesium sulphate), Glauber's salt (sodium sulphate), saltpetre (potassium nitrate), Rochelle salt (sodium potassium tartrate) are other well-known salts. Common salt appears to have been known from the earliest times, and the fact that the same Greek word *hals* is used in the feminine, signifying the ocean, and in the masculine, signifying salt, would seem to indicate the sea as the source from which common salt was obtained in the first instance. The application of the name salt to substances other than common salt would follow from the more or less general similarity of these to common salt in appearance, and in the more easily observed properties, such as solubility, taste, &c.

By the term salt chemists now ordinarily understand a substance which may be looked upon as derived from an acid by the replacement of part or the whole of the hydrogen of the acid by means of a metal or of a Radical (q.v.) capable of playing the part of a metal; such as, for instance, the radical NH₄, which is called ammonium. The acids themselves are even looked upon as constituting the hydrogen terms in the various series of salts, and are sometimes called hydrogen salts.

There are several general modes of formation of salts. One of the most important of these depends upon the mutual action upon each other of an acid

and a Base (q.v.), when the typical characters of each of these substances disappear and a salt is produced, usually with the simultaneous production of water. For example, when nitric acid and the basic oxide of lead act upon each other, lead nitrate and water are produced, thus: $2\text{HNO}_3 + \text{PbO} = \text{Pb}(\text{NO}_3)_2 + \text{H}_2\text{O}$. Salts are also frequently produced when metals are dissolved in acids, the hydrogen of the acid being displaced by the metal. Thus, iron dissolves in dilute hydrochloric or sulphuric acid with the evolution of hydrogen and the formation of a ferrous salt: $\text{Fe} + \text{H}_2\text{SO}_4 = \text{H}_2 + \text{FeSO}_4$. Strictly analogous to the displacement of hydrogen from sulphuric acid by means of iron is the displacement of copper from cupric sulphate by the same metal—this action also giving rise to ferrous sulphate while copper is precipitated: $\text{Fe} + \text{CuSO}_4 = \text{Cu} + \text{FeSO}_4$. In the process called double decomposition (see the article CHEMISTRY) two new salts are frequently produced when the solutions of two salts are mixed together, as, for instance, when sodium chloride and silver nitrate act mutually upon each other, yielding silver chloride and sodium nitrate: $\text{NaCl} + \text{AgNO}_3 = \text{AgCl} + \text{NaNO}_3$. There are other modes of salt formation which are of minor importance.

Salts are frequently considered as consisting of metal and salt radical, the latter comprising all that portion of a salt which is not metal, as explained in the article RADICAL. In the cases of the so-called haloid salts (fluorides, chlorides, bromides, iodides) the salt radical consists of one element only, while in other salts the salt radical contains two or more different elements. The names given to certain classes of salts may be shortly explained. Normal salts are those resulting from the displacement of the whole of the displaceable hydrogen of an acid by means of a metal. Neutral salts are such as do not exhibit either the acid or the alkaline reaction when dissolved. Basic salts and acid salts, as contrasted with the normal salts, are respectively intermediate in composition between the normal salt and the base and between the normal salt and the acid. These salts still possess the respective characters of a base and of an acid. Double salts may contain two or more metals in combination with the same salt radical, or two or more salt radicals in combination with the same metal, or they may contain more than one metal and more than one salt radical.

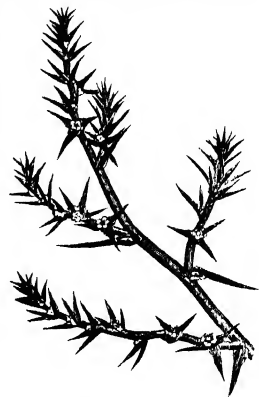

SMELLING-SALTS are a preparation of carbonate of ammonia with some of the sweet-scented volatile oils, used as a restorative by persons suffering from faintness. The pungency of the ammonia is all that is useful, and the oils are added to make it more agreeable. Oils of lavender, lemon, cloves, and bergamot are those chiefly used.

Saltus, EDGAR (1858–1921), an American author, born in New York City, studied at Paris and in Germany, and in 1880 graduated at Columbia College law-school. His writings include a good biography of Balzac (1884); a history of Pessimistic philosophy—*The Philosophy of Disenchantment* (1885), and *The Anatomy of Negation*—both treated with a curious whimsical briskness and humour; and a series of striking stories, full of an odd passionate materialism and biting cynicism, painful, but original and clever, though disfigured by a fantastic style and eccentric vocabulary—*Mr Incourt's Misadventure* (1887), *The Truth about Tristrem Varick* (1888), *Imperial Purple* (1893), *The Poms of Sultan* (1904), *The Lords of the Ghostland* (1907), *The Monster* (1913), &c.

Saltwort (*Salsola*), a genus of plants of the family Chenopodiaceæ, having hermaphrodite flowers, with 5-parted perianth and a transverse

appendage at the base of each of its segments, five stamens and two styles, the seed with a simple integument. The

species are numerous, mostly natives of salt marshes and sea-shores, widely diffused. One only, the Prickly Saltwort (*S. Kali*), is found in Britain. The plant is annual, with prostrate much-branched stems, awl-shaped spine-pointed leaves, and axillary solitary greenish flowers. It was formerly collected in considerable quantities on the western shores of Britain, to be

Prickly Saltwort (*Salsola Kali*)

burned for the sake of the soda which it thus yields. *Halogeton sativa* is the chief Barilla (q.v.) plant of the south of Spain. For Salicornia, see GLASSWORT.

Salutations are customary forms of address at meeting or at parting, or of ceremonial on religious or state occasions, including both forms of speech and gestures. Through the influence of heredity and habit many of these have become reflex irrepresible actions, their observance fortified with all the sanctity of moral or religious obligation. For although it is true that etiquette is entirely a matter of relative, and not absolute, obligation, and that such a feeling as modesty itself is mainly a question of latitude, yet the average modern European dreads the unfavourable judgment of society upon a solecism more than the condemnation of his own conscience on some breach of the weightier matters of the law. And it seems to be a general rule among races of men, not to speak of individuals, that extremes of ceremonious salutation stand in inverse ratio to their moral value. The ceremonious politeness of modern Europe has descended in great measure from the unworthy regime of the Lower Roman Empire, and its traditions, now as well as then, are incapable of being taken literally, its metaphors translated into fact. It is a complete mistake to suppose that savages are at all informal or extemporary in their salutations and ceremonies. Salutations tend to become less elaborate in progressive civilisation, the tendency being toward the preservation only of those which help to soften the asperities of social intercourse.

One of the most ancient and wide-spread, as well as natural, forms of salutation by gesture is the embrace in testimony of affection, as we find it in the Old Testament and in Homer. The kiss was at no time universal, being unknown among Fuegians, New Zealanders, Papuans, Australians, and Eskimos. It was used by the ancient Hebrews, Greeks, and Romans, and among the early Christians was adopted as a sign of fellowship, survivals of which are the Eastern kiss of peace at the Eucharist and the Western modified one of the *osculatorium* or *pax*. In England it was formerly the custom to kiss at the beginning and end of a dance, as well as on meeting a lady or taking leave of her; and the game of 'kiss-in-the-ring' is the last survivor of many similar old English pastimes.

As a general form of salutation, however, it appears to have been a custom peculiarly English; Æneas Sylvius describes the Scottish women of his day as 'giving their kisses more readily than Italian women their hands'; Erasmus, in a letter to a friend, describes it as a custom never sufficiently to be praised, and Balstrode Whitelocke describes his satisfaction in teaching the English mode to Queen Christina's ladies at the court of Sweden. The Puritans objected strongly to it, but its disuse was really the result of the French airs that came in with Charles II., and it lingered among honest country-folk till the times of the *Spectator*. It is still used ceremoniously between royal personages, and still on the Continent even between men at parting or meeting again after an absence, as well as in the more servile forms of kissing the hand of a royal personage or the foot of the pope. The custom of grasping or shaking hands is now widely spread over the world, either in the English method, with its many gradations of heartiness, or the Moslem variety of pressing the thumbs against one another as well; but it is not really a primitive custom everywhere, and as Tylor showed, is by no means to be explained with Herbert Spencer as a compromise between a simultaneous effort of two persons to kiss each other's hands in token of submission. Its real origin lies deeper in the universal gesture-language of mankind, the essential act being a joining of hands to express compact, union, peace, or friendship. The Roman *dextrarum junctio*, in making a contract of marriage, preserved by ourselves, and the early Christian 'right hand of fellowship,' point to the real origin of what has become a more salutation with us as with the Romans themselves. Other forms of salutation that recall the civilities observed among dogs, cats, and other animals are forms of bodily contact, as the rubbing of noses of the Laplanders and New Zealanders; the patting of each other's arms, breasts, or stomachs by North American Indians; the Polynesian stroking of one's own face with another's hand or foot; the clapping of hands and leaping backwards and forwards in Loango; the snapping the fingers in Dahomey; the Batongau rolling on the back along the ground, slapping the thighs the while; the blowing with the breath upon another in Africa; or the Abyssinian custom of holding another's hand and pretending to spit upon it. The Polynesians and Malays always sit down when speaking to a superior; on the Congo and elsewhere in Central Africa it shows respect to turn the back upon a superior in addressing him. The Tongans reserve the use of certain words for the king alone, and they employ the third person in token of respect. Still more marked is the difference between ceremonial and common speech in Samoa, and here also they use the plural in speaking to a superior. In Fiji if a great man slips or falls every one of inferior rank must at once do the same.

Other groups of ceremonial salutations are the prostrations before a superior of ancient Egypt and Assyria, as well as of modern Dahomey, and of regular Moslem divine worship; the lying with the face in the dust of China and Siam; the ancient Malagasy custom of a wife crawling on all fours before a husband and licking his feet; the Arab refinement of putting the hand upon the ground and then lifting it to the lips and forehead; the kneeling on one knee to express homage to a European sovereign, as on both in divine worship; the turning towards the east, the genuflection before the host, or bowing at the pronouncing of the name of Jesus in Christian churches. These are all originally signs of submission or of inability to resist, meant to deprecate the majesty or the wrath of

superior power. We find falling on the face before a potentate in the Old Testament, and in China until modern times among the eight kinds of obeisances, increasing in humility, the first was putting the hands together and raising them before the breast; the second, bowing low with the hands joined; the third, bending the knee; the fourth, actual kneeling; the fifth was kneeling and striking the head on the ground; the sixth, kneeling and thrice knocking the head, which again doubled made the seventh, and trembled, the eighth—the famous *kotow* which Lord Amherst refused in 1816: this last being due to the emperor and to heaven. Among the Hebrews repetition had a kindred meaning—'Jacob bowed himself to the ground seven times, until he came near to his brother.' Survivals amongst ourselves of ancient more abject forms are the *courtesy* in the one sex, and in the other the *scrape* till lately accompanying the bow, made by a backward sweep of the right foot. From the profound bow, expressive of great respect, our usage shades away to the modern curt nod, in which respect has faded into mere recognition.

Uncovering, again, is a characteristic symbol of submission in presence of a superior (Isa. xx. 2-4), whether to the waist, as in Tahiti, or of the entire clothes, as in the case of the female attendants upon the king of Uganda. In Europe we only uncover the head, and this in many cases is minimised to a mere touching of the hat. In the Coptic and Abyssinian churches the Semitic custom of uncovering not the head but the feet is still preserved. We find the same ceremonial uncovering of the feet in ancient Peru and Mexico; and in Burma it was long a point of dispute whether foreigners should comply with the native custom on approaching the king.

Again, as for the words and phrases which accompany the gestures of salutation, we find the widest variety in form and nature. The oriental forms, both scriptural and modern, are full of grave dignity and religious character. Mohammed took advantage of this characteristic, and made the use of certain forms rigorous as religious passwords; exactly like the once common Spanish form, 'Ave Maria purissima,' which had to be answered by 'Sin pecado concebida.' The Eastern phrases, 'The Lord be with thee,' 'Be under the guard of God,' 'Blessed be thou of the Lord,' have degenerated into the Spanish 'Vaya con Dios, Señor,' the French 'Adieu,' and our own 'Good-bye,' abridged from 'God be with ye.' The Basque verb has distinct inflectional forms for use in addressing a man, a woman, a superior, or an equal. Our familiar abridged forms, 'Bless you,' 'Mercy me,' 'Save you, sir,' show an English reticence in a light and familiar use of sacred names which is not seen in the familiar French 'Mon Dieu,' the German 'Mein Gott' or 'Herr Je.' The *citoyen* and *citoyenne* of the French revolution, an attempt to obliterate the natural growth of ages, never lasted, and it is not a little striking that 'Merci, monsieur,' was the phrase that came to the lips of the wretched Robespierre a moment before his end. The familiar *sir*, *signor*, *señor*, *mon-sieur* are of course ultimately referable to the Latin *senior* expressive of the reverence due to age; *madame*, *mademoiselle* lead up to Latin *dominus*, 'the master of a house.' The use of 'sir' may convey a sense of scorn, just as the archaic *sirrah* always implied anger or contempt. And even 'madam' and 'mistress' are not without an odious sense. The Greek phrase, both at meeting and parting was χαίρε ('be joyful'); the Romans usually said 'Salve' at the one and 'Vale' at the other. These words express wishes for cheerfulness, peace,

health; specialised forms of the same are the Pauline *χάρις καὶ εἰρήνη* ('grace and peace') and the ecclesiastical 'Pax vobiscum' and 'Benedicite.' A special salutation is due, as everybody knows, to any one who has just sneezed, perhaps as a tribute of respect to a sign of mortality. The English 'How do you do?' the French 'Comment vous portez-vous?' the German 'Wie geht's?' are mere forms that one uses without waiting for or thinking of the answer, just as the Spanish custom of offering to a visitor anything he happens to admire in one's house is expected to be answered by a ceremonious form of refusal. Many phrases are used which may have once expressed inferiority, but are now mere forms without meaning. The Chinese in particular have an elaborate vocabulary of complimentary epithets for the person addressed, and deprecatory terms for themselves. A wife calls herself 'a mean concubine'; the speaker's opinion is 'the stupid opinion'; his house 'the tattered shed'; 'your father is 'the honourable grey-beard,' 'the honourable severity'; 'your mother, 'the good gentleness.' Even a simple question takes a ceremonious and complimentary form, as, for example, 'To what sublime religion do you in your wisdom belong?' An interesting chapter in the study of salutations is the history of the pronouns of address in the modern European languages, singular or plural, second or third person—in German, Italian, Rumanian, and Spanish. In English the use of the plural for the singular form was established as early as the beginning of the 14th century. In old English *ye* was always used as a nominative, and *you* as a dative or accusative—a distinction carefully observed in the Authorised Version of 1611. In Shakespeare's time, as Abbott points out, *thou* was proper from superiors to inferiors, and as expressing companionship, affection, permission, or contempt and anger towards strangers; *ye* and *you*, again, are proper from a servant to a master, and as expressing compliment, submission, or entreaty.

In the Navy and Army a salute is a compliment paid when a royal or other distinguished personage presents himself, when squadrons or armed bodies meet, when officers are buried, and on many other ceremonial occasions. There are several modes of saluting: firing great guns and small arms, dipping colours, flags, and topsails, presenting arms, manning yards, bugle-sounds, &c. A royal salute consists in the firing of twenty-one great guns, in the lowering by officers of their sword-points, and the dipping of the colours. A form of salute of more frequent occurrence is when a soldier 'presents arms' or touches his cap to an officer.

Saluzzo, a city of northern Italy, at the foot of the Alps, 42 miles S. by W. of Turin, with a semi-Gothic cathedral (1480), the Gothic church of S. Giovanni, and some silk and other manufactures. The famous printer Bodoni and Silvio Pellico were born here. Pop. 15,680.

Salvador, the smallest but most thickly populated of the Central American republics, consists of a strip of territory stretching along between Honduras and the Pacific, and bounded on the W. by Guatemala, and on the E. by Fonseca Bay, which separates it from Nicaragua. It has an area of 13,176 sq. m. with a coast-line 160 miles in length, and the population is estimated at about 1,600,000. The capital is San Salvador, with a population of 85,000. Other towns are Santa Ana and San Miguel, with 73,000 and 36,000

inhabitants respectively. Except for a rich, narrow sea-board of low alluvial plains, Salvador consists of a level plateau, some 2000 feet above the sea, furrowed by river valleys and broken by numerous volcanic cones, and bounded along the northern frontier by a portion of the Central American Cordillera. Of the volcanoes, which rise from 4900 to 6900 feet, many are extinct, but others break into eruptions at intervals. Earthquakes are of frequent occurrence (see SAN SALVADOR). Of the rivers, all of them flowing towards the Pacific, the most important are the Lempa (140 miles), which receives the surplus waters of the Laguna de Cuija—a large lake on the borders of Salvador and Guatemala—and the San Miguel, which drains the south-east portion of the republic. The climate varies according to the altitude, healthy in the interior, but in the low-lying country very hot, though less unwholesome than on the Atlantic side of Central America. The land is well watered, and the soil exceedingly fertile, the annual rainfall being about 100 inches. The principal product is coffee, 140,000 acres being under cultivation; others are tobacco, sugar, cocoa, rubber, balsam, and ornamental woods. The Balsam of Peru (see BALSAM) grows only in part of the sea-board known as the Balsam Coast. On the whole the flora and fauna resemble those of Guatemala (q.v.), but the forests present a less dense vegetation than on the Atlantic side, and beasts of prey, such as jaguars and pumas, are seldom seen. Heneguen is cultivated for fibre, and there is a certain amount of maize and fruit-growing. The minerals include both gold and silver. In 1922 there were 253 miles of railway open in the republic.

The bulk of the population is composed of Indians and mixed races. The Indians are of the Aztec (Pipil) race, and all speak the Spanish language and profess the Roman Catholic religion (the one established by statute), except on the Balsam Coast, where alone they retain their old habits and language. Education is free and compulsory, but there is an enormous amount of illiteracy. The government is carried on by a president (for four years) and four ministers. The legislature consists of a congress of forty-two deputies (three for each of the fourteen departments), elected by universal male suffrage for one year. The departments are controlled by governors appointed for four years. The capital, San Salvador, is the seat of an archbishopric, a national institute, and a national university. Salvador, originally called *Cuscatlan*, was conquered after a long and obstinate contest by Pedro de Alvarado in 1525-26. In 1821 it threw off the Spanish yoke, and from 1823 to 1839 it belonged to the Central American confederacy. Since 1859 it has been an independent republic, but various unsuccessful attempts to unite with one or more of the neighbouring republics were made in 1842, 1850, 1885, 1895, and 1921. Severe fighting took place in 1885 and 1898. In 1908, Salvador was represented at the Central American Court of Arbitration at Washington. During the Great War she was the only one out of the five isthmian states that remained neutral.

See Squier, *Central America* (1868); P. F. Martin, *Salvador in the Twentieth Century* (1912); Leiva, *Republic of El Salvador* (1913); and books in Spanish on topography by Guzman (1883), on history by Gavidia (1917), and on economics by Quinónez (1919).

Salvage is the remuneration due by the owner of a ship or cargo in respect of services rendered by persons, who are under no obligation to render such services, in preserving the ship or cargo from shipwreck, fire, or capture—the perils to which property at sea is peculiarly exposed. If nothing is saved no salvage is due, however meritorious may have been the services rendered at sea to a vessel in

danger or distress. By statute—Merchant Shipping Act, 1894, sec. 544—salvage is also due for the saving of the lives of persons on board a British vessel anywhere, or on board a foreign vessel in British waters. The word salvage is also used to denote the services rendered. In the earliest maritime codes, such as the laws of Rhodes, Oléron, and Wisby, salvage was recognised; and salvage reward is allowed by all modern maritime states. At common law the person who saves a ship or cargo from imminent peril may, if the property is in his possession, retain possession of it until the salvage is paid. The salvor, too, has a right, known as maritime lien, which may be enforced against the property salvaged even though that property is not in his possession. The Admiralty Division of the High Court or, in Scotland, the Court of Session, has jurisdiction to decide upon all claims relating to salvage. Where the value of the property salvaged does not exceed £1000, or where the amount claimed as salvage does not exceed £300, the claim is properly brought in a county court having Admiralty jurisdiction, and, in Scotland, in the sheriff court. An action to enforce a claim for salvage must be commenced within two years from the date when the services were rendered.—Maritime Conventions Act, 1911, sec. 8. In fixing the sum to be paid in name of salvage, the elements to be considered are—the value of the property salvaged, the peril of the salvaged ship and the risk encountered, the labour incurred and the skill shown by the salvors. The amount, if not fixed by agreement, is assessed by the court. The court, too, where there is no agreement for division of the salvage, may apportion the amount among the owners, master, and crew of the salvaging vessel, and, where salvage services have been performed by several independent sets of salvors, among these different sets. It is provided by statute that all goods saved from shipwreck are to be delivered to the Receiver of Wrecks appointed for each district by the Board of Trade (see WRECK). Where salvage is due to any person, the receiver must detain the goods until payment is made for salvage, or until security is given for its payment. In marine insurance the expression salvage is used to denote the thing saved. Thus the thing insured, when transferred by abandonment to the underwriter, is called the salvage, and the losses, which give the right of abandonment, are spoken of as 'salvage losses.' On abandonment the assured is entitled to the whole amount of the insurance, and the underwriter, on payment of such amount, is entitled to the 'salvage,' i.e. the property saved, after deducting the expenses of saving and recovering it.

Salvage. The methods employed in salvage directly depend upon position of ship, rise and fall of tide, probable state of weather, probable extent of damage sustained. A vessel to be salvaged may be stranded, i.e. lifted out of her floating draught, through running on a bank, shoal, or rock, or sunk either partly or entirely. In either of the above categories she has lost her buoyancy, and cannot be salvaged until this is restored. Water-ballast tanks being fitted to modern vessels reduce the chances of total loss when stranded, and it is now a rare thing to leave even a badly-damaged vessel to break up upon the most distant shore. Water-ballast tanks mean that there are two watertight bottoms to the vessel, and although the outer plating may be pierced, the filling of a tank thereby is a small matter as compared to the piercing of an open hold.

Simple Salvage.—In a case where a vessel is stranded on, say, a shoal it is often just a question of jettisoning the cargo, or pumping overboard water-ballast in order to get the desired buoyancy,

when, by simply putting engines astern, or by the use of tug-boats, she can be floated. If the sea-water is leaking into the vessel's hold through a considerable number of damaged places then recourse to pumping is necessary. Should tides at low-water leave the vessel quite dry, then ordinary carpenters may be able to patch or plug up the torn plating, and as the tide rises any leaks may be kept in hand by using salvage pumps on board with suction into the damaged compartments; on the other hand, the vessel may be partly submerged at low-water, then divers must be employed to plug up or patch the torn plating, and, of course, much more pumping power is required for the floating operations, i.e. enough to pump out the water before the high-tide moment is reached.

Air.—Where a vessel's bottom is considerably damaged and it is impossible to reach the fracture or to patch it, recourse to the 'air' method may be adopted. In this it is not at all necessary to patch or plug up any of the damaged plating on the bottom, but only so far down the vessel's side in order to leave a box form of compartment with the necessary buoyancy. This method calls for decks, hatchways, and bulkheads being made airtight in the damaged compartments, the fitting-up of air-compressors with the necessary piping from air-tank to damaged section. When this is attained the compressors force air into the sealed compartment; as the pressure increases the sea-water is blown out through the torn plating, and when the displacement equals the weight of the ship she starts lifting and continues until safely afloat. Care is necessary in this operation to see that decks, bulkheads, and hatchways are of sufficient strength to withstand the air-pressure required.

Variation of Air Methods.—There are several variations of the 'air' method, such as the placing of air-bags in the damaged compartments or filling the space with watertight barrels; in none of these is it required to have hatchways or decks made airtight, but, on the other hand, the compartments must be empty of all cargo.

Lifting.—In quiet waters, or in a river such as the Thames, when a vessel is sunk it is the custom to 'lift' her in towards the shore out of the traffic. This 'lifting' is carried out by means of barges properly fitted out for the purpose. Barges are ranged along each side of the sunken ship, and steel ropes are passed from one barge right under the vessel and connected to the barge directly opposite; sometimes as many as six steel ropes are thus connected to each barge. The barges are filled with sea-water to sink them as far as possible, and at about low-water the ropes are hove tight by means of specially designed winches, made fast, then the water in the barges pumped out (by means of either steam or motor pumps of great power). As the water is discharged the vessel in the cradle of ropes is lifted, and as the tide rises she comes well clear of the mud or sand, the whole mass then being towed ashore until the vessel again touches the bottom. The operations are resumed at low-water, and wires shortened to suit the new draught, and hence by a system of floating she is eventually taken where she may lie high and dry at low-tide, and be patched up and dry-docked when able to float without the barges' assistance. In this method the greater the rise and fall of tide the quicker the operations.

Cigar-shaped pontoons are much used on the Continent for lifting purposes. These are watertight, and connect up to the vessel in a similar manner to that described above, but the water within them is blown out by means of air in place of the pumping referred to.

Coffer-damming.—Coffer-damming is another method employed in salvage, and is resorted to

when it is not possible to obtain barges enough to give the necessary 'lift.' In this operation great skill is required, and, besides, salvors are a mercy of the elements more than in any other method. The work of months may be destroyed in a few moments. Suppose a vessel has been sunk with a minimum of constructional damage to her bottom, or with an easily temporarily repaired damage, and her decks are entirely submerged at any state of tide, then a coffer-dam must be erected. It may be only a continuing up of hatchways with wood, or it may be necessary to build up the ship's side with wood until at all states of the tide the inside of the vessel is contained in the one structure reaching above water. When this additional erection is duly fastened and shored strong enough to withstand the pressure (which is at a maximum just at the moment the vessel begins to float), pumps are started, and when sufficient discharge is made the vessel lifts. When she is safely afloat the added structure can be removed, and it then remains only a question of pumping until she is safely dry-docked. In the above operation all classes of skilled tradesmen are utilised, and generally it is the most expensive method employed.

Uprighting.—When a vessel is upset and lies on her side a combination of methods may be necessary to right and float her. Sometimes by erecting tripods on her upper side, over which ropes are placed and connected to tackles made fast to anchors or to places on shore, she may be pulled upright. In some cases where there is a considerable rise and fall of tide tripods may be dispensed with, and by a mechanical use of the compartments the necessary leverage to upright the vessel may be got.

Salvation Army, a religious and social organisation which had its birth in the year 1865, when the Rev. William Booth, encouraged by his wife, Mrs Catherine Booth, broke away from the Methodist New Connexion. Being an ardent mission preacher, he desired the adoption of less conventional methods for reaching the poor and neglected classes in great centres of population. Of strong individuality and magnetic force, William Booth gradually gathered together a number of workers and converts in the Christian Mission, with headquarters in the East End of London; and in 1878, acting upon inspiration, he changed the title of his mission to 'Salvation Army.' Gradually he evolved a religious organisation with military rules and characteristics, and on these lines it has extended to a remarkable degree in all parts of the world. The general of the army for the time being, according to deed, is in supreme command, and under certain conditions nominates his successor. This position was keenly criticised in the early days, but it has stood the test of time, and remains to-day as the pivot on which this great organisation works in all its numerous agencies, both in the United Kingdom and elsewhere. General Booth (q.v.) died 20th August 1912, the Salvation Army being the memorial of his forty-seven years' labour. By trust-deed he nominated as his successor his eldest son, who had served in the army since its commencement, and from 1880 as chief of the staff; and General Bramwell Booth took office with the support of all his father's staff. To the wisdom of that nomination remarkable developments bear ample testimony. Contrary to the predictions of critics and fears of friends that the army would fall into decay when its gifted founder was no longer at its head, in 1926, fourteen years after his death, every phase of the work then in operation was not only still in existence but was found to be in a healthier and more advanced position, and everywhere new departments have been opened. Soldiers and ad-

herents have increased in numbers, the work for young people has grown beyond all expectation, and twenty-six additional countries and colonies have been entered. During his period of generalship, Bramwell Booth has made a tour of inspection to nearly every country where the army is at work.

From the commencement the Salvation Army has maintained an independent attitude in relation to other churches. Informal approaches were made in 1882 by the Church of England through a committee of the Upper House of Canterbury Convocation, consisting of Dr Benson (then Bishop of Truro, and afterwards Archbishop of Canterbury), Canon Wilkinson (afterwards Bishop of Truro and Primus of Scotland), and the Rev. Randall Davidson (then chaplain to Archbishop Tait, afterwards Archbishop of Canterbury). They interviewed General Booth, between whom and the committee a considerable correspondence followed, and they also visited army institutions. On his side, General Booth was willing that the National Church and the Salvation Army should run side by side like two rivers, with bridges thrown across over which the members could mutually pass and repass. But the difficulties in the way of a working arrangement proved insurmountable, and finally some of the leaders of the Church of England established the Church Army as their contribution to the evangelisation of the masses.

In its principal 'Articles of War,' the Salvation Army accepts the essential doctrines approved by the Protestant churches. These may be defined as belief in the inspiration of the Bible, the deity of human nature through the Fall, atonement through the sufferings and death of the Lord Jesus Christ, salvation as a result of repentance towards God and faith in Jesus Christ, regeneration by the Holy Ghost, and justification through grace. Its soldiers and officers express their belief in the immortality of the soul, in the resurrection of the body, in the general judgment at the end of the world, in the eternal happiness of the righteous, and in the everlasting punishment of the wicked. In addition to these beliefs, the army preaches holiness, or entire sanctification by the Holy Spirit. Primarily, however, whether in the halls, meeting-places, or in the open air, its message is one of instant salvation and an entire change of life. Ardent revivalism characterises all the army's religious work.

Discipline and loyalty are demanded of every officer. Before candidates are accepted for appointment as officers, a searching cross-examination has to be faced in a series of more than eighty questions, and the replies thereto constitute the conditions of service. Officers must not drink intoxicating liquor, smoke tobacco, or use snuff; they must not marry until they have been at least four years in the service, including training, except in special cases; nor must any male officer be married before he is twenty-three years of age unless required for special work. Each candidate also agrees in writing not to enter into any engagement to marry without first informing his divisional or responsible officer or headquarters. Consent is not given to the engagement of any male officer unless the young woman is likely to make a suitable wife, and, if not already an officer, is prepared to enter a training college. Officers pledge themselves to spend at least nine hours every day in active work on behalf of the army, and to accept the allowances which are set forth in the list of questions, with the understanding that no salary or allowance is guaranteed.

If accepted, the candidate is trained at one of the army training garrisons. The training garrisons for the United Kingdom are situated at Hapton and Mildmay, London, and there are

usually 400 to 500 young men and women cadets in residence. The erection of a new and up-to-date Garrison—a memorial to the founder—was begun in 1926 at Denmark Hill. The nine months' course of training includes the study of the history and teachings of the Bible, the doctrines and discipline of the Salvation Army, first aid, home nursing and domestic hygiene, book-keeping, and a variety of minor subjects bearing directly upon the probationer's future work. Each probationer is asked to give or collect a small sum towards the initial expenses. In addition to the colleges already mentioned, a staff training institute has been established at Sunbury, Middlesex. Other training colleges are established in the United States, Canada, Australia, Denmark, Finland, Germany, Holland, Norway, Sweden, Switzerland, France, the West Indies, South Africa, Japan, India, and Java.

From the beginnings of the army the position of women has been clear and definite. Mrs Catherine Booth, to whom the army owed so much in its early days, was one of the most effective women preachers or speakers that ever addressed great audiences. She was a fearless upholder of her sex, and without the slightest hesitation her husband utilised the services of women in all departments of the work. The same rule obtains to-day, and East or West, in the Colonies, India, America, or Japan, the woman officer is welcomed and appreciated, and she is as eligible for the highest posts as the male officer. Mrs Bramwell Booth was in charge of the Women's Social Department in Great Britain and Ireland until the death of the first general; Miss Eva Booth is the commander of the work in the U.S.A.; Commissioner Lucy Booth-Hellburg commands the work in Norway; and Colonel Catherine Booth is in charge of the women's social work in Great Britain and Ireland.

In the first year (1878) the Salvation Army numbered 80 corps and 127 officers. In December 1925 the statistics were as follow:

INTERNATIONAL STATISTICS.

Countries and colonies occupied	82
Languages in which salvation is preached	59
Corps and outposts	14,719
Social institutions and agencies	1,612
Day-schools	1,028
Naval and military homes and hostels	27
Officers and cadets engaged on field work	18,635
Persons without rank wholly employed in the work	8,297
Officers and cadets engaged in social work	4,212
Local officers (senior and junior)	97,598
Songsters	54,323
Corps cadets	30,356
Bandmen (senior and junior)	48,471
Handmen { Number issued	108
Periodicals { Total copies sold per issue	1,881,827

SOCIAL STATISTICS.

This progress has been gained despite persecution, which in the years immediately following the army's establishment proved of a violent character. During the first decade 'Skeleton Armies' were organised in many towns in order to upset Salvation Army processions and intimidate the followers. Women as well as men were frequently treated with much cruelty, and female captains whilst leading their corps through the streets were stoned or otherwise maltreated by half-drunken roughs. One noted instance of such persecution took place at Basingstoke. In some cases police and magistrates 'winked at' these oppressive acts, until the late Sir William Harcourt, then Home Secretary, made it clear to civil authorities that their duties consisted in the protection of peaceable processions, and the punishment of disorder and assault against defenceless men and women. After a time the firmness of the Home Office induced a new spirit, and without open assault the army was allowed to proceed on its way.

The royal favour bestowed upon the army, especially the gracious honour extended to its founder by King Edward VII. and by Queen Alexandra, has influenced the popular mind. In 1904, on the eve of an International Congress of the army held in London, King Edward commanded William Booth's presence at Buckingham Palace, and during a long interview expressed his warm sympathy with the army's aims and objects; afterwards sending a hundred guineas as a further demonstration of his good wishes. King George and Queen Mary also acknowledged the work of the first General, who was likewise received by many of the rulers of Europe and the East, including the King and Queen of Denmark, the Queen of Sweden, the Emperor of Japan, as well as by presidents of the United States and governors of British dependencies.

One of the most important events in the history of the Salvation Army was the launching in 1891 of the 'Darkest England' scheme. Towards the close of 1890 General Booth issued his book, *In Darkest England and the Way Out*, in which he asked for £100,000 in order to attempt carefully devised plans on a large scale for the social and spiritual betterment of the 'submerged tenth' of society. The book caused a profound sensation throughout Great Britain, as well as in other parts of the world, by the skill with which its pleadings were made. By way of response, a sum of more than £100,000 was raised. Hostile criticism as to the expenditure of the money subscribed made a public inquiry advisable, and Lord James of Hereford, the Earl of Onslow, Mr Sydney Buxton, M.P., Mr Walter Long, M.P., Mr Edwin Waterhouse, C.A., and Mr Hobhouse, M.P. formed a committee for the purpose of investigation. Eighteen meetings were held and twenty-nine witnesses examined. Members of the committee

also visited and inspected the labour colonies then in operation, and Mr Waterhouse, with the aid of his office staff, instituted a careful investigation of the books and vouchers relating to the scheme. After a searching examination, the committee placed on record their verdict to the effect that 'it appears that the methods employed in the expenditure of such have been and are of a business-like, economical, and prudent character; that the accounts of such expenditure have been and are kept in a proper and clear manner.' Some few suggestions were made as to the management of the vast undertakings; but on the whole the findings endorsed the general management. The committee elicited the fact that General Booth did not draw a salary from either the spiritual or social wing of the army, but found that he had a small income partly settled on him by a personal friend, and partly derived from the sales of his literary works, 'which seemed to them commensurate with the maintenance of his personal establishment.'

The social work of the army in England has developed in many important respects. In addition to the farm colony there are cheap food and old clothes depôts for slum families, inebriate homes for men and women, labour bureaux and industrial labour homes, inquiry offices for the lost and missing, anti-suicide and reconciliation bureaux, prison visitation and assistance, and schemes for colonisation in British colonies. The latest developments in the latter connection include the assisting of widows, many hundreds of whom have been comfortably settled overseas, and the training and placing of workless lads. The women's department includes agencies and institutions for the relief of erring women, the rescue of children living in vicious surroundings, hostels for working-women, slum centres, and Eventide Homes for aged people. A hospital for mothers at Clapton was opened by Princess Louise, and has received the patronage and personal inspection of Queen Mary. This institution includes a training school for midwives.

Outside the British Isles the army possesses a network of agencies for dealing with religious and social problems. In India, for instance, the government has provided buildings and land in order that the army may deal with the difficult problem of the hereditary criminals of India, of whom there are three millions. As a beginning the army established several settlements in which these outlaws, who had not previously been trained in industrious habits, were encouraged to obtain their living by agriculture, weaving, and other handicrafts. The venture proved highly satisfactory, and several thousands of these criminals are now under the army's care. The government of Ceylon has sought the aid of the army in dealing with the beggar population. Here again remarkable success has been achieved in reforming apparently hopeless men, and making them into useful citizens. A hand-loom has been invented by an army officer, by means of which the village weavers of India have been taught to develop the weaving industry, which was threatened with extinction through the competition of the mills and the increase of imported goods. For the same purpose, silk-weaving and the culture of silkworms have also been commenced under the army's auspices. In South Africa the natives are instructed in agriculture, cattle-raising, lime-burning, building, and other branches of knowledge suitable to their circumstances. In Java, at the request of the Dutch government, the army has undertaken the control of the leper colony and several other social agencies, with marked success. In the United States army officers have access to all the principal prisons in the country, and valuable work is being accomplished among both long and short

sentence prisoners. In some of the jails there is now a regularly organised corps of Salvation Army soldiers. Similar work is carried on in nearly every country where the army operates, and accommodation is provided for prisoners on release. On the great prairies of South America, amidst the log cabins of Canada or Australia and throughout the British colonies the army is carrying on its work of mercy and salvation. Europe has also benefited in varying degrees by the advent of the army, especially in countries like Germany, Denmark, Holland, Norway, Sweden; and in some of these substantial progress is reported with regard both to the evangelistic and to the social agencies.

During the Great War (1914-18) the army lent its services to the nations. In England, France, and Belgium cheap food and recreation huts were established, and a system of hospital visitation instituted. A fleet of ambulances, manned by Salvationists, assisted in carrying the wounded from the firing-line to the base hospitals. Chaplains officiated, and religious services were held. Thousands of parcels of cheer were distributed to needy or lonely men. Since the conclusion of hostilities, more than 25,000 men and women have been conducted to France and Belgium to visit the graves of the fallen. In Germany army work was maintained, and since the war has developed in a surprising manner. Army work in China began during this period, while, with the cessation of war, Serbia, Czechoslovakia, and Hungary opened for its administrations.

Apart from the social departments of the army, its financial arrangements are planned upon two main principles. Each local corps must meet its own needs and contribute something to the cost of oversight, and also to the requirements of the world at large. Every soldier gives towards the support of his corps. Ten per cent. of the total income of the local corps is due to the divisional officer, while another quota is allotted to special funds. Each year the army organises a week of self-denial, when Salvationists save a proportion from their cost of living in order to contribute funds for the maintenance of the army's missionary, social, and training enterprises throughout the world. In 1926 the amount given or collected by the army members in Great Britain and Ireland totalled over £189,744, and since the establishment of the Self-denial Fund nearly £3,000,000 has been raised in the United Kingdom alone. Of the proceeds of the annual Harvest Festival celebrations three-fifths of the amount contributed is devoted to the slum, retirement, and building funds, the balance being retained for the assistance of the corps. In addition to local requirements the army collects central and missionary funds in order to maintain its world-wide evangelisation. Duly audited balance-sheets are issued every year, and can be obtained from the headquarters, 101 Queen Victoria Street, London, E.C. Apart from the certificate of chartered accountants, the army's organisation includes an auditor-general, who travels all over the world.

Monson, *The Salvation Army and the Public* (1906), was critical, and evoked replies.

Salvator Rosa. See ROSA.

Salve Regina, the first words of the antiphon, addressed to the Blessed Virgin Mary, said after Lands and Compline, in the Roman Catholic

Church, from Trinity to Advent. It dates from the 11th century, but first found a place in the Breviary of Cardinal Quignon (1536), and thence was adopted into that of Pope Pius V. (1568).

Salvi. See SAGE.

Salviati, ANTONIO. See MURANO.

Salvini, TOMMASO (1830-1915), tragedian, was born at Milan, his father and mother both being actors. In 1849 he fought with distinction in the revolutionary war. He made many tours abroad, visiting the United States twice (1874, 1881) and Britain twice (1875, 1884), after which he retired from the stage to enjoy a life of learned leisure in his villa near Florence. He scored his greatest successes in the plays of Shakespeare and Racine. See his *Autobiography* (1893) and *Ricordi* (1896).—His son Alexander adopted his father's career, and inherited much of his talent.

Salvinia, a genus of Water-ferns (q.v.), inhabitants of tropical and warm temperate regions.

Sal Volatile, a well-known remedy for faintness, consists essentially of a solution of carbonate of ammonia in alcohol. It contains in addition free ammonia and the volatile oils of lemon and nutmeg. As it is a strongly caustic liquid, it should never be taken unless well diluted with water. See SALTS, and AMMONIA.

Salwin, a river of Asia that flows south through the Shan country, then between Siam and Burma, and flows into the Gulf of Martaban a little below Maulmain. It is navigable for only about 80 miles up from its mouth; its bed is then interrupted by rapids and the dangerous ravines through which it passes. The Chinese call it the Lukiang; they also give the same name to the Tibetan Giana Nu-chu. It was long uncertain whether this last, which has a course of some 700 miles through Tibet, was the upper part of the Salwin or the upper part of the Irrawadi (q.v.); but the latter view is now abandoned. The valley of the Salwin (also spelt *Salween*, *Salween*, and *Silouin*) is little used for traffic by land or by water. Except at points where the river is ferried there is scarcely any population. The Salwin gives its name to a district of Lower Burma.

Salzbrunn, a group of three villages (New, Lower, and Upper Salzbrunn) in Lower Silesia, 40 miles by rail SW. of Breslau; they have eight mineral springs, which attract visitors. The water is alkali-saline; much of it is exported. There are glass and porcelain factories, yarn-spinning works, brick-works, and coal-mines.

Salzburg, a land of Austria, bounded by Bavaria, Tyrol, Carinthia, Styria, and Upper Austria. Area 2762 sq. m.; pop. (1880) 163,570; (1923) 223,023. It lies on the northern face of the eastern Alps, and is a mountainous region, reaching altitudes of 12,000 feet in the Hohe Tauern. Snow-fields and glaciers cover 115 sq. m. in the more elevated regions. The river Salzach (190 miles), a tributary of the Inn, flows east and then north through one of the most picturesque of the Alpine valleys, and drains the greater part of the land. The climate is variable but healthy. Two-fifths of the surface are covered with forests, and two-fifths consist of Alpine meadows. The rearing of cattle and horses is an important branch of industry. Salt is obtained in large quantities, especially at Hallein (q.v.). Iron, copper, gypsum, and marble are mined. The hot springs of Gastein (q.v.) are widely celebrated.

SALZBURG, the capital (1350 feet above sea-level), occupies a charming situation on the Salzach, by rail 195 miles W. by S. of Vienna and 80 miles E. by S. of Munich. At this point the river passes between two extensive but isolated

of rock, the Capuzinerberg (2130 feet) and the Mönchsberg (1645 feet), the latter crowned by the old fortress of Hohen-Salzburg, dating originally from the 11th century. These hills and those that close in the valley are picturesquely wooded. The river divides the city into two parts; on the west is the old city, with many dark, winding streets, getting access to the valley and plain on the north through a gallery 150 feet long, hewn (1767) in the solid rock of the Mönchsberg. This portion of the city contains the cathedral, with florid stucco ornamentation, built (1614-34) in imitation of St Peter's at Rome; the Romanesque abbey church of St Peter (1127), in the graveyard of which are old monastic cells and a couple of chapels hewn out of the Mönchsberg, besides the chapel of St Margaret (1485); the handsome fountain in the Residenz Platz; the Residenz, in the Italian style (1592-1725); the former grand statues of the archbishops, partly constructed of marble (1607); the Benedictine monastery, with a valuable library of incunabula and ancient MSS.; the Franciscan Church (13th century) and the archbishop's palace. On the opposite bank—both banks are laid out as tree-shaded drives and promenades—lies the modern town, with Italian-looking, flat-roofed houses; here is situated the Castle Mirabell (1607), the former summer residence of the archbishops. The city possesses also a theological faculty, all that remains of the former university (1623-1810); the Carolino-Augustineum museum of Celtic and Roman antiquities, &c.; a bronze monument (1842) to Mozart; a Mozart museum in his birthhouse; a conservatorium (the Mozarteum); the government buildings (1588); the town-house (1407), &c. Industry is not much developed, being confined chiefly to the manufacture of musical instruments, marble ornaments, &c. Pop. (1923) 37,856. The city stands on the site of the Roman settlement *Juvavum*, which was ruined by the Goths and Huns. The nucleus of a new city was made by St Rupert of Worms, who established a monastery here in the 6th century. Boniface made it a bishop's seat in the 8th century, and in 798 it was elevated to an archbishopric. The archbishops had a seat and vote in the German diet, and were perpetual legates of the pope, primates of Germany, and princes of the empire. They were generally noted for their ecclesiastical severity; in 1498 the Jews were expelled from the archbishopric; in 1525 the peasantry rose in revolt; in 1732, after five years' bitter persecution (in spite of all friendly efforts on the part of the Protestant princes of Germany), 30,000 Protestants left their homes (as illustrated in Goethe's *Hermann und Dorothea*) and settled, on the invitation of Frederick-William I., in Prussia, mainly in Lithuanian districts that had been desolated by plague. The archbishopric was secularised in 1803, and given to the Grand-duke of Tuscany, but restored in 1824. Save in 1810-14 the country has been Austrian, from 1849 a duchy and crown-land of the Austrian empire; from 1918 a land of the Austrian republic. It has been more than once declared by plebiscite for union with Germany.

Salzkammergut, called the *Austrian Switzerland*, one of the most picturesque districts of Europe, lies in Upper Austria and Austrian Styria. Area, about 250 sq. m. The scenery combines in rare beauty the features of valley, mountain, and lake. The highest peak, the Dachstein, reaches an altitude of 9830 feet. But the district derives its principal attraction from its lakes, the most famous of which are Hallstatt, Traun or Gmunden, Atter, St Wolfgang, Aber, Mond, and Zell. A domain (Kammergut), now of the republic, it derives its name from its salt springs and mines. The chief seats of the salt-works are Ischl (q.v.),

Hallstatt, and Ebensee. Little or no agriculture is carried on; the inhabitants not engaged in the salt industry are employed in cattle-breeding and in the timber trade.

Salzwedel, in Prussian Saxony, 72 miles by rail N.W. of Magdeburg, has manufactures of sugar, linens and woollens, chemicals, and pins; pop. 12,000.

Samara, a town of European Russia, stands on the left bank of the Volga, at the influx of the Samara, and on the railway from Moscow (656 miles to W.N.W.) to Orenburg (261 miles to S.E.). One of the principal river ports on the Volga, it carries on a large trade in corn, salt, tallow, timber, &c.; it has also tanneries, tobacco-factories, soap-boiling-works, iron foundries, and brick works. It is the seat of a university (1919) and of a bishop, and has three annual fairs. Pop. 150,000.

Samara, a dry indehiscent, usually one-seeded fruit, with a wing—as in Ash (q.v.), Elm (q.v.), and Maple (q.v.)—the last a *double samara*.

Samarang, a seaport on the north of Java, 255 miles E. of Batavia. The European quarters have all the appearance of a typical Dutch town. The more important buildings are a military hospital, the town-house (1854-64) and Christian churches and schools. The port is suitable as a haven only for large vessels, since the weather is often extremely rough, especially during the west monsoon. A harbour for lighters covering an area of 32 acres was built in 1910, and there are excellent warehouses. Pop. 100,000.

Samaria, the capital (which gave its name to the whole district) of the northern kingdom of Israel, after Israel (the ten tribes) and Judah became two independent states. The city was founded by Omri, on a commanding site, about 5 miles N.W. of Shechem, and near the middle of Palestine. It stood on the long flat summit of an isolated hill (1450 feet), that was reached by a succession of terraces, and itself commanded a magnificent view on all sides. Consequently it was easy to make it a place of considerable strength; the Syrians indeed laid siege to it unsuccessfully more than once during the following reigns. But in 722 B.C. it fell before the three years' persistency of the Assyrian monarchs, Shalmaneser and Sargon. The conqueror carried away 27,290 of the Hebrew inhabitants of Samaria and the country of the Israelites captive into Babylonia. In their place were sent Assyrian colonists, from Babylon, Hamath, Sepharvaim, and Cuthah; hence the Jews often called the Samaritans 'Cutheans.' The new settlers, whilst retaining for a time their heathen forms of worship, gradually adopted the characteristic religious practices and beliefs of the remnant of the Israelites amongst whom they dwelt. When the Jews returned from the Captivity and set about the rebuilding of the temple (Ezra iv. 3), the Samaritans came desiring to participate in the work. But the Jews rejected their assistance, and would not permit them to have any part or share in the worship of Jehovah, on the ground that they were unorthodox and condoners of idolatry. This of course caused an estrangement between the two sections of the nation, and the Samaritans tried to prevent the Jews from fortifying their new city. The breach seems to have grown suddenly wider after the expulsion about 430 B.C. from Jerusalem of a member of the high priest's family who had become a son-in-law of Sanballat, the civil governor of Samaria. Some years later the Samaritans, augmented from time to time by numbers of renegade Jews, built on Mount Gerizim above Shechem (Nablus) a sanctuary to Jehovah intended as a rival to the temple at Jerusalem. This converted them into bitter

enemies, so that henceforward, at all events for very many years, the 'Jews had no dealings with the Samaritans,' and the Samaritans none with the Jews. At some time during the growth of this enmity between the two peoples, the Samaritans introduced the revised Pentateuch of Ezra as their religious code-book, and became extremely strict and puritanical in the observance of its laws. The prophetic and historical books of the Old Testament they never received. They practised circumcision and the observance of the Sabbath, both very strictly, and, in later times at any rate, developed their own doctrine of a resurrection and a Messiah, of demons and angels. Yet their religious system has always remained much simpler and more primitive than that of the Jews. At the present day there do not survive more than 150 of them, all at Nablus, the ancient Shechem, where they have a synagogue. The Samaritan language proper is an Aramaic dialect. In it are written an early version (Targum) of the Pentateuch (see below), certain prayers, hymns, and a sort of commentary. Since the 11th century they have used Arabic as their vernacular.

Samaria was taken by Alexander the Great, colonised by Macedonians, and Hellenised. They fortified it, and it grew and prospered. Twice it was besieged and taken by the successors of Alexander—viz. by Ptolemy I. (312 B.C.), and by Demetrius Poliorcetes (circa 296). The Jewish captain John Hyrcanus laid siege to it, and his sons (circa 110) destroyed it utterly. Nevertheless the Samaritans joined the Jews in offering fierce resistance to the Romans; they entangled themselves on Mount Gerizim, and only submitted after a desperate and bloody siege. Their city was again destroyed; but the consul Gabinus ordered it to be rebuilt. Augustus gave it to Herod the Great, who refounded it under the name of Sebaste. The Samaritans seem to have been involved in the 'dispersal' of the Jews, as they were found at Byzantium, at Rome, in Egypt, and elsewhere. Yet some of them remained in the old city, and in 529 A.D. revolted against the rulers of the eastern empire. On the ruined site of the ancient place, now called Sebastiya, there still exist parts of a colonnade of the age of Herod, remains of a temple to Augustus, and an old crusading church (now a mosque) built over the tomb of John the Baptist. American excavators have also found there the ruins of a palace and other remains of the time of Ahab. The tombs of six or eight (Omri, Ahab, Jehu, &c.) of the kings of Israel and traditionally also those of the prophets Obadiah and Elisha were at Samaria. See J. A. Montgomery, *The Samaritans* (Philadelphia, 1907).

Samaritan Pentateuch, a recension of the Hebrew text of the Pentateuch, in use with the Samaritans, and accepted by them as canonical to the exclusion of the other Old Testament writings. That such a recension once existed had always been known from certain allusions in Origen, Jerome, and Eusebius, and also in the Talmud; but Julius Scaliger was the first modern scholar to suggest that it might still be recoverable, and to point out its possible importance if obtained. Early in the 17th century the famous traveller Pietro della Valle succeeded after much inquiry in procuring at Damascus a copy not only of the text of this Pentateuch of the Samaritans, but also of the translation, or Targum, in the Samaritan Aramaic dialect. Both documents passed in 1623 into the hands of the Oratorians in Paris, and were published in the Paris Polyglott (1628-45) by J. Morinus. In his *Exercitationes Ecclesiasticae*, with which Morinus accompanied the Pentateuch of the Samaritans, he placed it far above the received Hebrew text, a view which had a polemical

cal bearing on current theological discussions between Protestants and Catholics about the 'rule of faith,' and led accordingly to prolonged controversy, the principal disputant on the Protestant side being the Zurich theologian, J. H. Hottinger. Both the Samaritan Pentateuch and the Samaritan Targum (from the text of Morinus) were afterwards printed by Brian Walton in the London Polygot (1653-57) with a collation of the various readings of the Massoretic and Samaritan Hebrew texts. Through Ussher and others a number of additional Samaritan codices were brought to Europe in the course of the 17th century, so that Kennicott was able to use for his Hebrew Bible sixteen MSS. more or less complete. The first to arrange the variants in a systematic way, and to determine with any scientific accuracy the kind and amount of authority that can be claimed for the Samaritan recension of the Pentateuch was Gesenius (*De Pent. Sam. origine, indole, et autoritate*, 1815). Most of the variants do not materially affect the sense, representing merely a different fashion in spelling. Some, however, are more important, as in Exod. xviii. 25, xx. 18, 19; Num. xxi. 22; Deut. v. 18, x. 7, xxiii. 12, xxxiv. 1; the additions in Exod. xi. 3, xx. 17, 21; Lev. xvii. 4; Num. iv. 14, x. 10, xii. 16, xiii. 33, xx. 13, xxi. 11, 12, 20, xxvii. 23, xxxi. 20; Deut. ii. 7; the transposition of Exod. xxx. 1-10 after xxvi. 35, and the substitution of Gerizim for Ebal in Deut. xxvii. 4. As is well known, the Samaritan Pentateuch varies from the received text in the figures it gives in Gen. v. and xi. and also in Exod. xii. 40, thus presenting a scheme of chronology materially different both from the Massoretic and from that of the LXX. Moreover, its relation to the LXX in general still awaits investigation. Of the MSS. that have reached Europe none are known to be older than the 13th century. All are written in a peculiar modification of the old Semitic character (see ALPHABET). There is no ground, either external or internal, for assigning to the Samaritan recension a higher authority than that of the Jewish text, though, from its use in northern Palestine, it was formerly argued that it must have had an independent existence before the fall of the northern kingdom, or even before the revolt of Jeroboam. The text is printed (incorrectly) in the Paris and London Polyglots, and separately, in Hebrew characters, by Blayney (Oxford, 1790), and more critically by August von Gall (Giessen, 1914-18). The Samaritan Targum, a translation of the Samaritan Pentateuch into Samaritan Aramaic, is probably of the 4th Christian century. It was printed in a very corrupt form in the Paris and London Polyglots, but there is a more critical edition by Petermann and Vollers (*Pentateuchus Samaritanus, ad fidem librorum Manuscriptorum apud Nabulianos repertorum*, Berlin, 1872-91); see also Nutt, *Fragments of a Samaritan Targum* (1874). The Samaritan Targum of Genesis, in Hebrew characters, is given in Heidenheim's *Bibliotheca Samaritana* (1884) and the whole by A. Brüll (Frankfurt-a.-M., 1874-79). There is also an Arabic translation of the Samaritan Pentateuch, made in the 11th or 12th century, generally attributed to Abu Said, but probably by Abulhasan of Tyre, based on the work of Sandin.

Samarkand, or SAMARQAND, a city selected to be capital of Uzbekistan, about 4 miles S. of the Zarafshan, 130 miles E. by S. of Bokhara, and 2300 feet above sea-level. It is the ancient *Marcanda*, the capital of Sogdiana, destroyed by Alexander the Great. It was again captured in 712 A.D. by the Arabs, who supplanted the Greco-Bactrian civilisation, of which it was the centre. Ever since it has been a sacred city in the eyes of the Moslems,

especially after Timur made it his capital (1369). Genghis Khan took it (1219) and destroyed three-fourths of its half a million inhabitants. In Timur's time it had a population of 150,000. Its most remarkable buildings date from the 14th and 15th centuries; the Ulug-beg *Madrasa* (1388), which with two other colleges, the Tilla-Kari and Shir-dar (founded early in the 17th century), encloses the chief square, called the Rigistan; the Gur Emir (Timur's mausoleum), the tomb of Timur's wives, the shrine of Shah Zinde. These are magnificent structures, grandly decorated with arabesques, enamelled tiles of different colours, marble pavements, inscriptions in gold, and similar rich ornamentation. In the 15th century Samarkand was renowned as a school of astronomy and mathematics. The citadel, on a steep hill, contains Timur's audience-hall and the great stone from which he used to dispense justice. After the decay of Timur's empire the city had a chequered history, falling at last into the hands of the emirs of Bokhara, from whom it was taken by the Russians in 1868. They laid out a new town, with broad and handsome streets, to the west of it. On the other side of the citadel is the old city, walled, with dark and narrow streets and dirty houses. Since 1888 Samarkand has been connected by rail with the Caspian Sea, and since 1905 with Tashkent and so with Orenburg. Pop. 90,000, including some 25,000 Russians. The people carry on gardening and viticulture (their grounds being irrigated by water from the Zarafshan), distilling, and the manufacture of textiles, harness, gold and silver wares, leather, tea-boxes, lead, paper, pottery, boots, &c., and conduct a brisk trade in cotton, silk, raisins, fruits, wheat, rice, salt, and horses. See TURKESTAN.

Sāmaveda. See VEDA.

Sambhal, an Indian town in the United Provinces, 23 miles SW. of Moradabad; pop. (1921) 41,585.

Sambor, a town in Poland, in Galicia, on the Dniester, 41 miles SW. of Lemberg; pop. 20,000.

Sambourne, EDWARD LINLEY (1845-1910), cartoonist, born in London, was apprenticed at sixteen to marine engineer works at Greenwich, but in April 1867 began his connection with *Punch*. He also illustrated Kingsley's *Water-babies*, Andersen's *Fairy Tales*, &c.

Sambre, a tributary of the Meuse or Maas, rises in the French dept. of Aisne, flows 112 miles in a north-easterly direction, and at Namur in Belgium joins the Meuse from the left. It is navigable up to Landrecies, 90 miles, and is connected with the Oise by a canal 40 miles long. Valuable prehistoric remains have been discovered in caves in the Sambre valley, and are now preserved in the neighbouring museums of Charleroi, Floreffe, and Namur.

Sambul. See MUSK-PLANTS.

Sambur (*Cervus aristotelis*), a species of stag abundant in the forest-land of some parts of India, Burma, and China. It stands about five feet high, is a powerful animal, and is much hunted. The colour is dark brown; the antlers are rounded, and belong to a type known as Rusine.

Saphitā is the name of that portion of the Vedas which contains the Mantras or hymns. See VEDA.

Samland, a district of the province of East Prussia, stretching between the Frisches Haff and the Kurisches Haff. Its western coast is known as the Amber (*Bernstein*) coast. This district gave title to a bishopric from 1249 to 1525.

Samnites, an ancient Italian people of Sabine origin, who occupied an extensive and mountainous

region in the interior of Southern Italy. They were surrounded on the north by the Peligni, Marsi, and Marrucini; on the west and south-west by the Latins, Volscians, Sidicini, and Campanians; on the south by the Lucanians; and on the east by the Apulians and Frentani. It was not till after a long series of wars (of which the first began in 343 B.C., and the third did not conclude till 275 B.C.) that the Romans conquered the Samnites, ultimately making them allies; see *ROME*. It was in the second Samnite war that the Romans endured the humiliation of the *Caudine Forks* (q.v.). See *PYRRHUS*.

Samoa, or Navigators' Islands, a group of islands in the Western Pacific, lying in $13\frac{1}{2}^{\circ}$ to $14\frac{1}{2}^{\circ}$ S. lat. and 168° to 173° W. long. They are between 400 and 500 miles N.E. of Fiji. The group consists of nine islands, in addition to rocks and islets, some belonging to the United States, and the rest administered by New Zealand under a mandate from the League of Nations (see *History*). They are all, with the exception of Rose Island, of volcanic formation, and are for the most part surrounded with coral-reefs. They are very mountainous, but at the same time well wooded, for the decomposition of the volcanic rock has resulted in a very rich soil, which produces a most luxuriant vegetation. Four islands alone are of any size, Savaii, Upolu, Tutuila, and Manna (Manna really consisting of three islands, the largest of which bears the name of 'Tau Island'). These four lie in order of size from west and north-west to east and south-east. The climate of Samoa is very moist and variable; the pleasantest time of the year is from May to November, when the south-east trade-winds prevail; during the rest of the year heavy gales and rains are frequent, and occasionally, especially from January to the middle of April, the most disastrous hurricanes occur. The products of Samoa are almost entirely vegetable, consisting of tropical trees and plants. There are rich pastures, upon which imported live-stock thrives; almost the only indigenous mammal being a kind of bat. Among birds there is to be found on the island of Upolu a very rare species of ground pigeon, the didunculus or little dodo (a near relation of the dodo), which, nearly extinct, changed its habits to be out of the way of pigs, and took to nesting in trees.

Western Samoa, formerly the German Samoan Islands, comprises the islands of Savaii, Upolu, Apolima, and Manono. The areas of the two former are 660 and 600 sq. m. respectively, while the others are extremely small. The total population amounts to 38,230 (1925), mostly natives. The government, under New Zealand (1920), is in the hands of an administrator, with legislative and native councils. The chief products are copra and cocoa, but cotton, fruit (avocado pears and bananas), and Pará rubber are also grown. The plantations have been worked very efficiently, and there are some 60 miles of good roads. Most of the trade is done with the United Kingdom or the Dominions, as there is a regular steamship service between New Zealand and Apia (pop. 1400), the port of Upolu, on the northern side of the island, entered between coral-reefs. In 1889 R. L. Stevenson settled at Vaialima, near Apia, and there in 1894 he was buried.

American Samoa includes the island of Tutuila and the Manna group, with a total area of 58 sq. m. and a population (1922) of 8194. Nearly all the land is owned by the natives, and there is a considerable amount of native self-government. The land is fertile, and copra, coconuts, and fruit (oranges, bananas, &c.) are grown, but copra is the only article exported. Tutuila possesses a good harbour at Pago Pago, or Pango Pango, a deep

indentation in the southern coast, which nearly cuts the island in two. It is a United States naval station, and also a port of call for mail-steamers between the United States and Australia.

History.—The Samoans belong to the brown Polynesian race, and are therefore akin to the New Zealand Maoris. Samoa is by tradition the birth-place of the race, and the Samoans, a well-formed and prepossessing race, are perhaps the lightest in colour of all the Pacific islanders. The islands were visited by Bougainville in 1768, and from him received the name of *Isles des Navigateurs*, as a tribute to the skill of the native boatmen. In 1787 some members of a French exploring expedition under La Pérouse were killed in a quarrel with the natives at Massacre Bay in Tutuila. The Christian religion was first introduced in 1830, and the result of missionary enterprise is that the Samoans are now nearly all Christians (Protestants, Roman Catholics, and Mormons), while a considerable amount of attention is paid to education. For many years Samoa, like other groups of Pacific islands, suffered from the want of a stable government, able to control at once the native inhabitants and the European settlers. In 1889 a conference was held at Berlin between representatives of Britain, Germany, and the United States, who recognised the independence of the Samoan government, but at the same time made provision for a supreme court of justice and certain regulative restrictions. In 1892 and 1899 there was again civil war and foreign intervention, followed by the abolition of the native monarchy; and by a treaty between Britain and Germany, agreed to by the United States, it was settled that thenceforth Upolu and Savaii and the adjoining small islands should belong to Germany, Tutuila and its islets to the United States, the meridian of 171° W. being chosen as the dividing line. Dominion troops occupied German Samoa in 1914, and in 1919, by the Peace of Versailles, Germany surrendered her possession. The next year West Samoa was assigned to New Zealand under a mandate of the League of Nations, with the stipulation that the islands were not to be administered for any military or naval purposes.

See *POLYNESIA*, &c.; books by R. L. Stevenson (q.v.); Turner, *Samoa a Hundred Years Ago* (1884); Stair, *Old Samoa* (1897); H. J. Moore, *With R.L.S. in Samoa* (1910); R. M. Watson, *History of Samoa* (1919); and books in German by Reinecke (1901) and Krämer (1902).

Samogitia, a district of western Lithuania, inhabited by pure Lithuanians.

Samos (Turk. *Susan Adassi*), an island in the Aegean Sea, lying close to the coast of Asia Minor, about 45 miles S.W. of Smyrna. Its length is 30 miles, its mean breadth about 8, and its area 180 sq. m. A range of mountains, which may be regarded as a continuation of Mount Mycale on the mainland, runs through the island, whence its name—'Samos' being an old word for 'a height.' The highest peak, Mount Kerki (anc. *Cerectus*), reaches 4725 feet. Between its eastern extremity and the mainland is the narrow channel of Mycale (called by the Turks the Little Bosphorus), scarcely a mile wide, where in 479 B.C. the Persians were totally defeated by the Greeks under the Spartan Leotychides. Between Samos and Niearia (anc. *Icaria*) on the west is the Great Bosphorus, from 3 to 8 miles broad, the passage traversed by vessels sailing from the Dardanelles to Syria and Egypt. Samos is well watered and very fertile. Its principal product is wine, which, though little esteemed in ancient times, is now largely exported to France, Germany, Italy, and Austria. Besides wine, the exports embrace olive-oil, carob beans, raisins, and 'ides, and the imports are principally manufactured

goods, corn and flour, tobacco, spirits, groceries, hides. The chief industry is tanning. The capital of the island is Vathy (pop. 12,000), on the north coast. Previous to 1832 the capital was Chora, near the south coast. The site of the ancient city of Samos is occupied by Tigani. This ancient city was renowned for three architectural works of great magnitude, an aqueduct cut through the heart of a mountain nearly one mile long, a gigantic mole to protect the harbour, and a large temple to Hera, a rival to that of Diana of the Ephesians. All that now stands of this last is a solitary pillar; the mole survives; the aqueduct was rediscovered in 1882. The island was in ancient Greek times celebrated for its red glossy pottery, which was imitated by the Romans in their so-called Samian ware (see POTTERY). Pop. of island, 84,000, all Greeks.

Anciently Samos was one of the most famous isles of the *Ægean*. At a very remote period it was a powerful member of the Ionic Confederacy, and (according to Thucydides) its inhabitants were the first, after the Corinthians, who turned their attention to naval affairs; Coleus the Samian was the first Greek who sailed through the Pillars of Hercules into the Atlantic. The Samians founded numerous colonies in Thrace, Cilicia, Crete, Italy, and Sicily. But the celebrity of the island reached its acme under Polycrates (q.v., 532-522 B.C.), in whose time it was mistress of the archipelago. Subsequently it passed under the power of the Persians, became free again after the battle of Mycale, stood by Athens during the Peloponnesian war, and after several vicissitudes became a portion of the Roman province of Asia (84 B.C.). Being a Byzantine possession, it was conquered by the Turks. When the war of independence broke out in 1821 no Greeks were more ardent and devoted patriots than the Samians; and deep was their disappointment when, at the close of the struggle, European policy assigned them to their former masters. They were, however, governed by a Greek, with the title of Prince of Samos, and by a native council. Union with Greece was accomplished in 1912, and confirmed by the Treaty of Lausanne (1923).

See books on the islands of the *Ægean* by Tozer (1890), Marden (1907), and Volonakis (1922).

Samosata (mod. *Samsat*), the capital till 73 A.D. of the Syrian kingdom of Commagene, on the Euphrates, 130 miles NNE. of Aleppo. It was the birthplace of Lucian and of Paul of Samosata (q.v.).

Samothrace, an island of the *Ægean* Sea, lies in the north-east corner, nearly opposite the mouth of the river Maritza and 40 miles NW. of the Dardanelles. Next to Mount Athos it is the most conspicuous object in the northern *Ægean*, rising to 5248 feet in Mount Saece (Phengari), which occupies nearly the whole of its surface (68 sq. m.). It was from this peak that Poseidon watched the fights on Troy plain (*I.* xiii.). Bare and repellent, the island possesses no harbour and only one village, Chora, of 2000 inhabitants, and is the meeting-place of the *Ægean* storms. In ancient times it was celebrated for the worship of the Cabeiri (q.v.), mysterious divinities of (probably) Pelasgo-Phœnician origin, and was one of the most sacred sites in the *Ægean*. The temples and subsidiary buildings forming the sanctuary of these deities were excavated in 1873-75 by Professor Conze (see his *Archäologische Untersuchungen auf Samothrake* (1875 and 1880). Parts of the cyclopean walls of the ancient city still remain. For several centuries the island belonged to the Byzantine empire; but in 1355 it was given to the princely merchant family of the

Gatilusi. They kept it until it was conquered in 1457 by the Turks, who then, and again in 1821, nearly exterminated the population. The Greeks regained it in 1912.

Samoyeds, the name of a Ural-Altaic race widely spread over the extreme north of Europe and Asia, especially along the middle course of the Obi River and on the Arctic coast between Cheskaya and Khatanga bays. They seem formerly to have possessed nearly all the vast regions between the Altai Mountains and the Arctic Ocean. Numerous grave-mounds of the Bronze period that have been found in western Siberia are attributed to a semi-civilised nation of Ugro-Samoyeds. The Samoyeds were gradually driven northwards by the Turko-Tatar races (Huns, Ugrians, &c.). They are short in stature, somewhat broad-headed, with Mongolian eyes, but without epicanthic fold. They dress in skins, use bone and stone implements, keep reindeer, live by hunting and fishing, and are Shamans in religion (mixed with fetishism). See Fred. G. Jackson, *The Great Frozen Land* (1895).

Samphire (*Crithmum*), a genus of Umbelliferae, having compound umbels, and an oblong fruit, rather flattened at the back, with five winged ridges, and many vittæ spread all over the seed. Common Samphire (*C. maritimum*) is a perennial, a native of Europe, growing chiefly on rocky cliffs near the sea. It is rare in Scotland, but common in the south of England, and a fatal accident in 1922 proved the gathering of it still a 'dreadful trade' on Dover cliffs, as in Shakespeare's day (*King Lear*, IV. vi. 15). Its radical leaves are triennate; those of the stem have lanceolate and fleshy leaflets. The stem is about 1½ feet high, the flowers yellow. Samphire makes one of the best of pickles, and is also used in salads. It has a piquant, aromatic taste, and is considered very diuretic. It is generally gathered where it grows wild, but is sometimes very successfully cultivated in beds of sand, rich earth, and rubbish, occasionally supplied with a little salt. *Isula crithmoides*, a perennial plant, allied to *Elecampane* (q.v.), and of the family Compositae, a native of the sea-coasts of England, is used in the same way as samphire, and is often called Golden Samphire. The young shoots of *Salicornia herbacea* (see GLASSWORT) are also substituted for it as a pickle, and sold under the name of Marsh Samphire.

Common Samphire
(*Crithmum maritimum*).

Samsø, an island belonging to Denmark, lies in the entrance to the great Belt, between Zealand and Jutland. Area, 42 sq. m. The people are engaged in cultivating the fertile soil and in shipping.

Samson (Heb. *Shimshon*, LXX and Heb. Judges, xiii. 24 *Sampson*, Vulg. *Samson*; the name is derived from *Shemesh*, 'sun'—cf. 'Shimshai the scribe,' Ezra, iv. 8, 17—and the Greek transliteration represents an older pronunciation than that of the present Hebrew text) 'judged Israel twenty years' (Judges, xv. 20, xvi. 31), being the last of the series of twelve in the Book of Judges. The

narrative of his adventures, however (Judges, xiii.-xvi.), does not represent him in the capacity of ruler of Israel, or even as leader of his own tribe, either in war or in peace; his action is always that of a private individual and for his own hand, without co-operation. He was a native of Zorah, one of the ancient stations of the Danites before they removed to Laish at the roots of Mount Hermon; and the name of his father, Manoah, reappears in that of the Manahathites (1 Chron. ii. 52, 54; cf. Gen. xxxvi. 23). The circumstances of his birth were similar to those of Gideon's, with the addition that he came under the Nazarite vow, or something equivalent to it (for the unshorn head and abstinence from wine used to be observed by the Arabs also when they were engaged in war or pursuing revenge). His numerous exploits, variously reckoned as seven, or eight, or twelve, have suggested to modern interpreters the idea that possibly elements of solar mythology may have come into his story, and it is in any case obvious that it owes much to popular legend (e.g. in the etymology of Leli); but there is no reason to doubt that it also incorporates an authentic tradition of a strong, child like, patriotic hero who on various occasions in the days of Israel's oppression had wrought havoc among the Philistines.

See the full discussion of the mythical and other aspects in Burney's commentary on the Book of Judges (see also Judges).

Samsun (anc. *Amisus*), a port on the S. coast of the Black Sea, 35 miles SE. of the mouth of the Kizil Irmaak, is the great centre of the tobacco trade.

Samuel (Heb. *Shemū'el*, i.e., most probably, 'name of God'), next to Moses the greatest personality in the early history of Israel (Jer. xv. 1; Ps. xcix. 6), was, according to the narrative in 1 Sam. i.-iii., an Ephraimite, native of Ramathaim or Ramah in Mount Ephraim (probably the Arimatea of the New Testament, the modern Er-Ram, about five miles north of Jerusalem). As a child he was dedicated by his mother to the priesthood (not to the Nazirite, Num. vi. 1-21, as is sometimes supposed), and, clothed in priestly ephod and robe (1 Sam. ii. 18, 19), he became a temple attendant under Eli the high-priest at Shiloh. Later tradition represented him as a Levite (1 Chron. vi. 27, 28, 33, 34). While still a child he received the prophetic gift and foretold the fall of Eli and his house, a prediction soon fulfilled in the national disaster at Ebenezer. The story of Samuel contained in 1 Sam. vii.-xvi. combines two widely different accounts of the rest of his career. According to one of these, Israel lay for twenty years under the Philistine yoke; at the end of this period a national convocation was summoned to Mizpah by Samuel, who, for a still longer time, had been known and recognised from Dan to Beersheba as a prophet of the Lord. While prophet and people were engaged in religious exercises the Philistines came upon them, but only to sustain a decisive repulse which drove them within their own borders, where they remained during all the days of Samuel. The prophet thenceforward enjoyed a profoundly peaceful and prosperous rule as judge over all Israel, till his advancing years compelled him to associate his sons with him in the government. Dissatisfaction with their ways gave the elders of Israel a pretext for coming to Samuel and asking him to give them a king such as every other nation had. Although clearly seeing the folly of this and well aware that it was equivalent to a rejection of Jehovah, he, after some remonstrance, granted their prayer (1 Sam. viii.) and held a national convocation at Mizpah (x. 17-27), at which Saul, son of Kish, was chosen by lot to the sovereignty over Israel.

Saul's exploit against the Ammonites shortly afterwards led to another convocation at Gilgal, where the kingdom was 'renewed' (xi. 14) in what was, presumably, one of the last acts of the public life of Samuel. The other account, which is also the older, gives a wholly different impression of the prophet's career. There is quite another attitude to the institution of the monarchy; and, besides, the historical conditions are quite different. He comes before us as 'a man of God,' a man 'held in honour,' and a seer whose every word 'cometh surely to pass,' but occupying a position hardly so prominent as that of judge of all Israel. Saul is divinely made known to him as the instrument chosen by God in his mercy to deliver Israel out of the hands of the Philistines, under whose oppression they are (and long have been) groaning. The seer secretly anoints the young Benjaminite and gives him certain signs, with the injunction, 'let it be, when these signs are come unto thee, that thou do as occasion serve thee, for God is with thee' (ix. 1-x. 16). The 'occasion' arose about a month afterwards (x. 27; R.V. marg.), when the 'spirit of God came mightily upon Saul,' and his magnificent relief of Jabesh-Gilead resulted in his being immediately afterwards chosen and recognised as king. The accounts of Samuel's conduct during Saul's reign are also discrepant, and neither version of Saul's rejection by Samuel appears in the oldest narrative, which is also silent about the anointing of David.

Samuel, BOOKS OF. The Book of Samuel (for it is in reality but one) forms the third in the series of the four 'former prophets,' being preceded by Joshua and Judges, and followed by the (also undivided) Book of Kings. In the LXX. it appears as two books, entitled respectively A and B 'of kings,' or rather 'of kingdoms' (*basileion*); this, through the Vulgate (Jerome preferred 'Regum' to 'Regnorum'), is the source of the corresponding division in the authorised version, and of the alternative titles, 'otherwise called the first (or second) Book of Kings.' In Coverdale's version the title of 1 Sam. runs: 'the first booke of kynges, otherwise called the first booke of Samuel.' In the Revised Version the alternative title is dropped. In printed editions of the Hebrew Bible since Bomberg's time the Hebrew text has also shown the division of Samuel into two books, the first covering the period of Samuel and Saul, the second that of David. A more natural division would have been into three, the partitions being marked by 1 Sam. xiv. 52, 2 Sam. viii. 18, and 2 Sam. xxiv. 25, or rather by 1 Kings, ii. 46, respectively. Of the sections thus indicated the third is the most closely knit together. It is held to extend from 2 Sam. ix. 1 to 1 Kings, ii. 46, and—apart from 2 Sam. xxi.-xxiv., which constitutes an appendix to the main narrative, of miscellaneous contents—it is a quite continuous piece of history, showing in a singularly vivid way how it was that Amnon, Absalom, and Adonijah, failing in turn to secure the succession, cleared the way for Solomon. Its marked vividness and freshness have impressed nearly all critics who assign it a very early date; thus Thienius attributed it to a quite contemporary writer, and Klostermann even named Ahimaaz, the son of Zadok, as the probable author. The second section (1 Sam. xv. 1-2 Sam. viii. 18), containing the history of David from the time when he was first brought to court down to that of his elevation to the throne of all Israel, and his victory over all external foes, is somewhat more complex in its structure. A clue to its analysis is sought by most recent critics in the twofold account of the manner in which David was first brought into close personal relations with Saul. The first and earlier (xvi. 14-23) represents him

as already of mature age, a mighty man of valour, and practised in affairs, as well as a gifted musician, when, on account of his skill with the harp, he is introduced into Saul's service after his malady had begun to show itself; here he soon becomes the king's armour-bearer. In the second and later account (xvii. 1-xviii. 5), which appears in a considerably shorter form in the LXX (see R.V. marg.), he is a shepherd lad, inexperienced either in war or in affairs, who first attracts the king's attention by his heroic encounter with Goliath. The earlier of the two narratives—of Saul's growing fear and jealousy of David, the flight of the latter, his wanderings to Adullam, Keilah, the Negeb, and the Wilderness of Judah, Saul's last struggle with the Philistines, David's elevation to the throne, first of Judah and then of all Israel, the transference of his capital to Jerusalem, his victories over the Philistines, Moabites, Ammonites, and Edonites—finds its continuation (approximately) in xviii. 6-8, 12a-16, 20-29a, xix. 8-10, 11-17, xxi. 2-7, xxii. xxiii. 1-18, xxv., xxvii. 1-6, xxviii. 1-2, xxix., xxx.; 2 Sam. ii.-v., viii. The analysis of the first section (1 Sam. i. 1-xiv. 52) begins with the narration (again twofold) of the steps which led to Saul's accession to the throne (see SAMUEL). The earlier account is contained in ix. 1-x. 16, x. 27b (LXX), xi. 1-11, 15, xiii. 2-xiv. 51; the later (substantially) in 1 Sam. vii. 2-viii. 22, x. 17-27a, xi. 12-14, xii. 1-25. Closely related to the former (and in any case earlier than the latter) are 1 Sam. i.-iii. (with the exception of ii. 27-36 and Hannah's song) and 1 Sam. iv. 1-vii. 1.

According to the Talmud, 'Samuel wrote his own book'; Abrahanel attributes it to Jeremiah; but the Christian church has no definite tradition on the subject. The attempt systematically to analyse the composition of Samuel was first made by Gramberg (1830), who saw in it two parallel narratives editorially combined. Similar essays were afterwards made by Stähelin, Schrader, and Bruston. The criticism, both 'lower' or textual, and 'higher' or literary-historical, of the Book of Samuel was raised to a new level of scientific precision and accuracy by Wellhausen. He pointed out the literary unity of the narratives in 2 Sam. ix.—1 Kings ii. (apart from 2 Sam. xxi.-xxiv.) and its early date, and also disentangled the main thread of 1 Sam. xiv. 52—2 Sam. viii. 18, which represents a form of the tradition that must have been committed to writing comparatively soon. The older narrative in the first section he also regarded as early. In some early form, which almost certainly included some matters which have since been dropped, but of course did not contain the additions of a later age, these three sections were brought together into one great continuous historical work, corresponding to the present series, Judges, Samuel, Kings, before the reign of Josiah. The whole work afterwards underwent a Deuteronomistic redaction, which, however, from the nature of the material, was not so systematic and thorough in the case of Samuel as it was in those of Judges and Kings. The division into these three books was made by the Deuteronomist; and it was not till after this had taken place that the miscellaneous collection of passages (some of them very ancient) which now forms the last four chapters of Samuel, and breaks the original continuity, was introduced. Among the passages that help to fix the date of the final redaction of Samuel are 1 Sam. ii. 27-36, which Wellhausen considers to be pre-exilic, but not earlier than Josiah's reign, and the whole of the later form of the history of Saul's elevation to the throne (see SAMUEL), which in his opinion cannot have been written before the fall of the Judean monarchy. Budde's work on

the structure and sources of Judges and Samuel (1890) is in substantial agreement with the conclusions of Wellhausen; Budde, however, is inclined to assign an earlier date for the 'Mizpah' passages (1 Sam. vii. 2 *et seq.*, &c.), and to put them on a level with the E of the Pentateuch.

S. A. Cook (*Encyc. Brit.* vol. xxiv.) lays most emphasis upon internal historical difficulties and inconsistencies which point to late editing and bring the books much closer, as regards their date, to the books of Chronicles. For the literature see his article; also the commentaries of H. P. Smith (*Internat. Crit. Comm.* 1899); A. R. S. Kennedy (*Century Bible*; small but full), and Dlorne (French, 1910); and, especially for textual criticism, the very excellent work of Driver, *Notes on the Hebrew Text of the Books of Samuel* (1913). See also PENTATEUCH.

San. See TANIS.

Sanaa', or SAN'A, the capital of the Imámáte of Yemen, is situated 200 miles N. by W. of Aden, in a broad grassy valley, sheltered by hills 1200 and 1500 feet high, and is itself 4000 feet above the sea. The population of the city was estimated at 40,000, and of the valley at about 70,000, in 1836; the former is now probably about 20,000. The city and its suburbs are surrounded by walls, and overlooked by a couple of ruined fortresses. Few of the buildings are older than the 16th century, although the city has been in existence from the remotest ages. It was long the capital of the independent Imáms of Yemen, and during that period was noted for its handsome buildings, and gardens, its palaces, mosques, baths, &c. In 1872 it submitted to Turkish rule, and declined in importance. In 1905 it was taken by Arab rebels against the Turks and held for a time. The Great War restored the independence of Yemen.

San Antonio, capital of Bexar county, Texas, and after Dallas the largest city in the state, is on the San Antonio River, 210 miles by rail W. of Houston. It carries on a large trade in the produce—wool, hides, and live-stock—of the fertile country around. It contains a Roman Catholic cathedral, West Moreland College, an arsenal and a United States government building, and still retains some picturesque traces of its Spanish origin. Fort Alamo, just across the river, was the scene of a ruthless slaughter, by Santa Ana, of the American garrison of 188 men, including 'Jim' Bowie, in 1836. In 1921 a large part of the city was devastated by a flood-wave, while enormous damage was done to property and crops round about. Pop. (1880) 20,550; (1900) 53,231; (1920) 161,379.

Sanbenito. See AUTO DA FÉ.

San Carlos, a well-built inland town in the west of Venezuela, 125 miles SW. of Caracas. The town, founded in 1678, lies in a fertile plain, given up to agriculture and the rearing of cattle. Pop. 10,000.

San Cataldo, a town of Sicily, 10 miles W. of Caltanissetta. Pop. (1921) 21,540.

Sanchez, THOMAS, a Jesuit moralist and casuist, was born at Córdoba in 1550, and became director of the school at Granada, where he died 19th May 1610. His best-known work, in virtue of which he ranks as an *Auctor Classicus*, is the treatise *De Sacramento Matrimonii* (3 vols. Genoa, 1592). In this notorious work, parts of which Pascal and Voltaire treated with scathing sarcasm, the legal, moral, and religious questions that arise out of the sacrament of marriage, and the relations, regular and irregular, of the sexes, are treated in portentous detail. Yet the author was throughout his life esteemed a devout, pure-minded, and holy man.

Sanchi. See TOPE.

Sanchuniathon (SANCHONIATHON, SOUNIATHON), the supposed author of a Phœnician history of Phœnicia and Egypt, called *Phoinikika*. The name is a Greek form of a Phœnician compound and means 'Sakkun giveth' (*Sakkun yathon*). Somewhat similar theophorous names occur on inscriptions, and there is no possible reason for suspecting the genuineness of *Sanchuniathon*. Thus there are *Abd Sakkun* or *Servant of Sakkun* (M. Lidzbarski, *Handbuch d. nordsem. Epigr.*, 1898, I. 329), *Ger Sakkun*, i.e. Neighbour or Client of *Sakkun* (G. A. Cooke, *Text-book of N. Sem. Inscr.*, Oxf. 1903, p. 130), and *Askun Adar* or *Sakkun* is glorious (*ib.* p. 100). The name *Sakkun* alone originally denoted 'Governor' or 'Lord,' and it occurs twice in that sense on a Cypriote-Phœnician inscription of the 8th century B.C. (*ib.* p. 52) which refers to the *Sakkun* of *Qarth-hadasht* or governor of 'new town,' i.e. Carthage, in Cyprus. Thus *Sakkun* is akin in usage to Ba'al and means 'one who cares for' (cf. Assyrian *Sakānu*, Tell el Amarna, 179, 38), or 'friend,' just as the Hebrew root, which signifies 'to profit, be of use' (Numbers, xxii. 20, 30; Job, xxii. 21; Psalms, cxxxix. 3), designates a governor or official in Isaiah, xxii. 15. By a process of syncretism the god *Sakkun* became equated with Himeros.

Sanchuniathon is supposed to have been a native of Berytus; and the accounts which speak of him as born at Sidon or Tyre probably take these cities in their wider sense for Phœnicia itself. Our principal information about him is derived from Philo of Byblus, a Greek writer of the beginning of the 2d century A.D., who translated Sanchuniathon's history into his own tongue; but both the original and the translation are lost, save a few small portions of the latter, preserved by Eusebius, who uses them as arguments in a theological dispute against Porphyry. According to Philo, Sanchuniathon lived during the reign of Semiramis, queen of Assyria, and dedicated his book to Abibals, king of Berytus. Athenæus, Porphyry, and Suidas speak of him as an ancient Phœnician, who lived 'before the Trojan war.' There is also a discrepancy between the various ancient writers respecting the number of books contained in the *Phoinikika*. Orelli (1826), and after him C. Müller (1849), published the remaining fragments of Sanchuniathon, and the discussion raised on their genuineness and value can hardly be said to be yet at rest. Several critics went so far as to deny the fact of the existence of a Sanchuniathon point blank. According to some (Lobeck, *Aglaophamus*, &c.) it was Eusebius, according to others (Movers, Bandissin, &c.) Philo, who fathered his own speculations upon an ancient authority. The latter was accused, Movers thinks, partly by the desire of proving that the whole Hellenistic worship and religion was simply a faint imitation of the Phœnician; partly by the desire of lowering the value of the Old Testament, by showing the higher authority of the Phœnician writer; and partly, as was the fashion among the unbelieving philosophers of his age, to bring the popular creed into a bad reputation, by proclaiming his own views under the guise of an ancient sage. Yet even those who deny the authenticity of Sanchuniathon agree in allowing the fragments current under his name a certain intrinsic value, they being founded on real ancient myths. This, in fact, is now, with more or less modification on the part of the different investigators, Ewald, Bunsen, Renan, &c., the prevalent opinion. Ewald contends for the real existence of a Sanchuniathon, in which he is supported by Renan. But Ewald holds that Sanchuniathon is a translation of an early Phœnician text, while Renan would assign this to the Seleucid

era. Gruppe mainly supports Ewald. Lagrange goes furthest of all in denying the originality of a Phœnician source. In his view there may well have been an early epic dealing with Phœnician gods and cosmology, but probably this was not in the Phœnician language. Even if there never was a Sanchuniathon it was not Philo who forged him. There seems no doubt that we have but a very dim and confused reproduction of what, after many modifications, misunderstandings, and corruptions, finally passed the hands of Philo and Eusebius, and was by the Church Father, as has been said, quoted in a theological disputation. Yet, even assuming the person of a Sanchuniathon, his age—and Eusebius insists upon a very remote one indeed—must be placed much lower: into the last centuries before Christ, at the earliest. He would then, it seems, have endeavoured to stem the tide of Greek superiority in all things, by collecting, grouping, and remodelling the ancient and important traditions of his own country, and thus proving both to his countrymen and the Greeks their high importance, in comparison with the Greek productions, in the field of religion and philosophy.

The *Phoinikika* deals with the cosmogony of the Phœnicians, beginning from a dark *ἀρχή*, or *πρωή ἀρχή*, and Chaos, without measure or limit: hence came *μῶς*, spongy-watery matter, and, finally, *ζῆα*. From this developed culture, divine and human. We get the stories of Uranus and Chronos and a description of Phœnician antiquities. Therefore the work of Sanchuniathon was not only a cosmogony, it would appear, but a history of his own and the surrounding nations; and, like similar ancient histories, it probably began with the creation of the world, and contained an account of the Jews. All the historical parts, however, are lost, and nothing remains but a fragmentary cosmogony, or rather two or three different systems of cosmogony, or, according to Movers, merely an Egyptian and Phœnician patchwork. One of the chief difficulties for us consists in the Phœnician words of Sanchuniathon, which Philo either translated too freely or merely transcribed so faultily in Greek characters as to leave them a puzzle. Gruppe and Grimme uphold the theory of a translation from a Phœnician source. As evidence Grimme adduces the form in which certain proper names figure. This form must clearly imply a transcription in Greek characters of foreign words. Such examples are the mountains *Kassios*, *Libanos*, and *Brathy*, which would stand for *cassia* (*Qec'ah*, Job, xlii. 14; Psalms, xlv. 9), *Lebanah*, frankincense (Ex. xxx. 24, &c.), and *Beroth* (Heb. *Berosh*, Hosea, xiv. 9, &c.; Gr. *βράθυ*, Lat. *bratum*), cypress, these being articles of cult. Grimme's proposal to derive *Brathy* from Heb. *Borith* is unlikely, since *Borith* is lye or alkali and not aloes-salt, as Grimme suggests. Other equations are:

βααυ = *vūz* = Heb. *Bohu* (Gen. i. 2; Is. xli. 11).

Σαμυρρουνος = lofty heavens, *Shamayim ramim* or *ramim*.

Συδωκ = *dikaios* = *Qaddis*.

Τεως Μεδεχως = *Mallah* or sailor.

Eusebius further contains a fragment of a treatise by Sanchuniathon, *Peri Ioudaion*, but it is doubtful whether this is the work of Philo of Byblus or of Sanchuniathon; and if it be that of the latter, whether it is a separate work, or merely a separate chapter out of his larger work. A forgery, said to contain the whole nine books of Sanchuniathon, and to have been found by a Portuguese, Colonel Pereira, at the convent of St Maria de Merinhão, and to have been by him entrusted to a German corporal in Portuguese service, named Christoph Meyer, was published by Wagenfeld (Bremen, 1837), and translated into German (Lübeck, 1837),

but was very soon consigned to disgrace and oblivion by Mövers, K. O. Müller, and Grotefend, the last of whom at first believed and even wrote a preface to the *editio princeps*. There never was such a convent, nor such a colonel; but the facsimile taken by 'Pereira' in the convent in Portugal was found to have been written on paper showing the water-marks of an Osnabrück paper-mill.

San Cristóbal (1) a town of Chiapas state in Mexico, has a handsome capitol, a cathedral, a secondary school, and 12,000 inhabitants.—(2) A town of Venezuela founded in 1560 on a plateau near the Colombian frontier with an important trade (especially in coffee), mainly in the hands of Germans and Danes; deposits of coal beside the town, and near by copper-mines and petroleum wells. Pop. 17,000.

Sancroft, WILLIAM, Archbishop of Canterbury, was born at Fressingfield in Suffolk on 30th January 1616-17, and from Bury St Edmunds grammar-school passed in 1634 to Emmanuel College, Cambridge, of which in 1642 he was elected a Fellow. In 1651 he was expelled from his fellowship for refusing to take the 'Engagement'; and in 1657 he crossed over to Holland, whence, after a year and a half at Utrecht, he visited Geneva, Venice, and Rome. In 1660, the Restoration accomplished, his friend Bishop Cosin of Durham appointed him his chaplain, and his subsequent advancement was rapid, to be a king's chaplain and rector of Houghton-le-Spring (1661); prebendary of Durham and master of Emmanuel (1662); Dean first of York and next of St Paul's (1664), as such having a principal hand in the rebuilding of the burnt cathedral; Archdeacon of Canterbury (1668); and Archbishop (1678). A Tory and High Churchman, he is of course belittled by Burnet and Macaulay; but the manner in which he discharged his high duties deserves the warmest commendation—the one flaw, perhaps, in his conduct that he employed an Italian spy in Holland who dared propose to him the assassination of Sir William Waller. Sancroft attended Charles II. on his deathbed, and used great freedom of speech to him on the nature of his past life. He refused to sit in James II.'s Ecclesiastical Commission (1686); and in 1688 was sent to the Tower for presenting the petition of the Seven Bishops (q.v.) against the reading of the second Declaration of Indulgence, but on their trial in Westminster Hall he and his six brethren were acquitted. In the events that immediately preceded and attended the Revolution he preserved on the whole a position of non-intervention; still, having taken the oath of allegiance to James, he would not take it to William and Mary. Accordingly, he was suspended by act of parliament (1st August 1689), though he did not quit Lambeth until his ejection on 23d June 1691. He then retired to his native village, where he died on 24th November 1693. Of eight works ascribed to him one only retains much interest. *Fur Prædestinatus* (1651), a dialogue between a Calvinist minister and a thief condemned to the gallows; and this seems to be really a translation from a Dutch pamphlet.

See NONJURORS, with works there cited; Dr D'Oyley's *Life of Archbishop Sancroft* (1821); and the *Political History of England*, vol. viii., by Sir R. Lodge (1910).

Sanctis, FRANCESCO DE. See DE SANCTIS.

Sanctuary, a consecrated place which gives protection to a criminal taking refuge there; or the privilege of taking refuge in such a consecrated place. Among the Jews there were cities of refuge to which the slayer might flee who killed a man unawares (see CITY), and something analogous to a right of sanctuary may also be traced in pagan communities. In the ancient Greek states certain temples afforded protection to criminals, whom it was unlawful to drag from them, although the supply of food might be intercepted. As early as the 7th century the protection of sanctuary was afforded to persons fleeing to a church or certain boundaries surrounding it. The canon law recognises this protection to criminals as continuing for a limited period, sufficient to admit of a composition for the offence; or, at all events, to give time for the first heat of resentment to pass before the injured party could seek redress. In several English churches there was a stone seat beside the altar where those fleeing to the peace of the church were held to be guarded by its sanctity. One of these *frith-stools* ('peace-stools') still remains at Beverley and another at Hexham; while the sanctuary knocker is still visible at Durham. The privilege of sanctuary did not extend to ordained clerks or to persons accused of committing felonies in churches. Connected in England with the privilege of sanctuary was the practice of *abjuration of the realm*. By the ancient common law, if a person guilty of felony took the benefit of sanctuary, he might afterwards go before the coroner, confess his guilt, and take an oath to quit life realm and not return without the king's license. On taking this oath he was allowed to proceed in safety to a port assigned to him. He must reach this port and embark from it within a certain number of days. In the reign of Henry VIII. the privilege of sanctuary was regulated and restricted by legislation. Finally, in 1623-24, the privilege of sanctuary and abjuration, as a legal institution, was abolished by the statute 21 James I. chap. 28.

From an early period the privilege of sanctuary was made use of by debtors in England for the purpose of evading payment of their debts; and after sanctuary had been abolished as a legal institution there continued to exist certain so-called sanctuaries which gave practical immunity to fraudulent debtors, and even to criminals. An act of 1696-1697 (8 and 9 Will. III. chap. 37) compelled sheriffs to arrest debtors though they had fled to certain 'pretended privileged places' enumerated in the act, including the districts of Whitefriars and the Savoy, which had for centuries claimed the privilege of sheltering debtors against their creditors. A similar privilege claimed for the Mint in Southwark was successfully maintained until 1723 when an act (9 Geo. I. chap. 28) was passed, making it a felony to obstruct the execution of a writ within the Mint and enabling the sheriff of Surrey to raise a *posse comitatus* for taking by force debtors from the Mint. That statute put an end to the quasi-sanctuaries which, in defiance of the law, had continued in existence after the act 21 James I. chap. 28.

In Scotland the privilege of sanctuary conferred by the canon law on churches and religious houses was finally abolished at the Reformation. But the privilege continued in the case of the Abbey of Holyrood House, not as a religious establishment, but as a royal residence. The precincts of the palace, to which the privilege belongs, are extensive, including Arthur's Seat and the King's Park; and the whole are placed under the protection of a baillie appointed by the Duke of Hamilton, the heritable keeper of Holyrood House. This time-

honoured sanctuary afforded protection against imprisonment for debt only; to a criminal it gave no protection. For twenty-four hours after passing the confines the debtor was protected against personal diligence; but in order to enjoy protection for a longer period he must enter his name in the books kept by the bailie of the abbey. On his name being entered in these books a certificate of protection was given him. Neither crown debtors nor fraudulent bankrupts nor persons under an obligation to perform an act within their power could claim protection; while within the precincts there was a prison for debtors against whom diligence had been brought for debts contracted within the sanctuary. To retire to the abbey was by the act of 1696, chap. 5, made one of the circumstances which, combined with insolvency, constituted legal bankruptcy. The Debtor's Act, 1880, which abolished imprisonment for debt, except as a mode of execution for taxes, fines, crown penalties, assessments, and sums decreed for aliment, rendered the privilege of sanctuary practically obsolete.

See Stephen, *History of Criminal Law of England*, vol. i.; Holdsworth, *History of English Law*, vols. iii. and vi.

Sanctus. See LITURGY, BELL.

Sand, one of the products of the disintegration of rocks, is composed mainly of grains of quartz—some sands being more purely quartzose than others. Speaking broadly, we may say that all rocks undergoing disintegration are eventually resolved into two kinds of sediment—viz. sand and clay or silt—the former representing the practically insoluble quartz of the original rock, the latter the insoluble constituents of the other minerals. Sand is formed in various ways. It is, as every one knows, one of the most common sediments of rivers, lakes, and seas. Sea-sand exactly resembles river-sand—one cannot be distinguished from the other except by means of included organic remains. As a rule the grains of aqueous sands are angular and subangular in form, especially in the case of fine-grained deposits. When the grains are large they may be more or less well rounded. These last have been rolled over each other and pushed forward in the bed of stream or sea, while the smaller particles, carried in suspension, have in some measure escaped trituration. Aqueous sands are very widely distributed. They are commonly met with forming terraces along the courses of streams and rivers—not infrequently they occupy the sites of ancient lakes and estuaries—and now and again they form what are known as raised beaches in maritime districts. Most of these sands are of recent geological age; others, however, such as the sands of the Tertiary basins of England, France, Belgium, Austria, &c., represent the sea-floors of much more remote times. Sands of wind-blown origin occur frequently in maritime regions and in dry desiccated desert countries. In coast-lands the material of the dunes is obviously washed up by the sea; while in certain inland tracts, as in Poland, the sand which is there blown about by the wind is derived from wide-spread fluvio-glacial deposits—relics of the ice age. But in other countries, as in the Libyan Desert, the sand has resulted from the subaerial degradation of granites, schists, sandstones, and other rocks. As the rock-ingredients are swept forward over the ground they are subjected to much attrition, so that eventually even the smallest grains become well rounded, and when seen under a magnifying glass resemble little pebbles. Sand-deposits are also the result of volcanic action. These consist of the very finely comminuted debris of volcanic rocks, and are readily distinguished from sedimentary and æolian sands.

Now and again, however, volcanic sands are sifted by the winds and heaped up into dunes.

Sand varies in texture from extremely fine-grained, almost dust-like material, up to coarse granular grit. Indeed all gradations occur from sand through coarse grit into fine gravel. Pure white sands are not uncommon, but shades of yellow, brown, and red predominate, especially in the case of æolian and aqueous sands. The colour is generally due to the presence of iron. Gray, dark-brown, green, and black sands are also met with. The latter are often largely composed of magnetite, and have been derived from the disintegration of certain igneous rocks such as basalt. Green sands usually owe their colour to glauconite. Volcanic sands are generally dingy—chiefly dull gray or black. Some sands are rich in gold, others in precious stones and gems. These are alluvial deposits which have been derived from the disintegration of crystalline igneous rocks, schists, &c. Pure white sands are in demand for the manufacture of glass, while others are employed as abrasives in sawing marble, &c., and in smoothing the surfaces of that and other ornamental stones. Sharp sand, again, is largely used for mixing with mortar. See DRIFT, GRAVEL, PLOECENE SYSTEM, QUICKSAND, SAHARA, SANDSTONE.

MUSICAL SAND.—Some kinds of sand, which consist of well-rounded and polished grains of tolerably uniform size, and which are clear or free from dust and small particles, exhibit remarkable sonorous qualities when struck or subjected to friction. The well-known 'musical sand' of the island of Egg (Inner Hebrides) is a good example, and was at one time believed to be almost unique; but, as Professor Bolton of Hartford, Connecticut, and Dr A. Julien of New York have shown, sonorous sands are widely distributed in Europe and America. The sounds emitted are often decidedly musical, and distinct notes can be produced, high or low, according to the nature of the friction and the quantity of sand operated upon. When one walks over a bed of strongly sonorous sand a tingling sensation is perceived even through the boots. After being subjected to friction for some little time musical sand gradually loses its peculiar qualities, and the same result is produced when the sand is wetted. There is nothing in the appearance of musical sand to distinguish it from mute sand—sonorous and non-sonorous sand of precisely similar aspect lying side by side on the same beach. Carus-Wilson holds that the sounds are 'due to the rubbing together of millions of clean and incoherent grains of quartz, with no angularities, roughness, or adherent matter investing the grains.'

SANDBANKS in rivers, usually lengthwise with the current, are liable to constant changes as the force and direction of the current become modified. Opposite the mouths of rivers sandbanks tend to accumulate. Much of the material of which these bars are composed is brought down by the rivers, but a large proportion is also swept up by the sea itself. Such banks are constantly changing their form, and oscillating to and fro, according as the sea or the river is the more active. The sea also tends to form sandbanks across the mouths of shallow inlets and other indentations of a coast-line, so that eventually a secondary coast-line may come to be formed in this way—shallow lagoons separating the new from the old coast-line. Islands are in like manner converted into peninsulas by the heaping up of sandbanks by tidal-currents between them and the mainland. The Eye peninsula in the Island of Lewis is an example, and there are many islets off British coasts which in time will be converted into similar peninsulas by the growth of sandbanks, which in some cases has proceeded so far that the islets become peninsulas

at low tide. In the shallow seas that surround the British Islands sandbanks are of common occurrence. Some of these are doubtless due to tidal action, as is the case with the sandbanks of similar shallow seas all the world over. Others again probably mark the sites of undulating land-surfaces submerged during a recent geological period. It is thought by some that the Dogger Banks of the North Sea may consist largely of the morainic debris laid down by the great Scandinavian ice-sheet of the glacial period, now more or less modified by current-action.

Sand, GEORGE, the *nom de guerre* of Armandine (or Amantine) Lucile Aurore Dupin, 'Baronne' Dudevant, was born in Paris on the 5th July 1804, and died at Nohant in Berry on the 7th June 1876. Her father Maurice Dupin was the son of M. Dupin de Francueil (well known in the writings of Rousseau and his circle) by a natural daughter of the Marshal de Saxe and of Mlle. Verrière, also well known in the 18th century. Aurore's own mother was a Parisian milliner. Her father died when she was very young, and she was the subject of continual disputes between her mother and her grandmother, Madame Dupin (by her first marriage Comtesse de Horn). Aurore lived with both in turn, but principally at Nohant with her grandmother, on whose death the property descended to her. She was educated partly at home, partly at the English convent in Paris, and represents herself in her voluminous *Histoire de ma Vie* (which contains little fact and much fancy) as a child full of reverie of all kinds. An heiress as has been said, though in no great way, and with no near relations except her mother, she was married at the age of eighteen to a certain M. Dudevant, the natural son of a colonel and baron of the empire, who also had some small fortune. The marriage was quite of the ordinary French kind, with no love, but also no particular dislike, between the parties. Two children were born of it—a boy, Maurice (1825-89), who afterwards took his mother's assumed surname and became a man of letters of some little accomplishment, and a girl, Solange, who married the sculptor Clésinger. Very little is known of M. Dudevant, who seems, however, to have been by no means especially tyrannical or offensive, but merely an ordinary squireen, devoted to sport, not actively sympathising with, but also not violently opposing his wife's bookish tastes, and probably, as her letters show, a good deal tried by the increasing number of her doubtless Platonic friendships. After nine years of married life, towards the end of which the situation became very much strained, she 'threw her cap over the mills,' and at first resigning her property to her husband as the price of an amicable separation, went to Paris to make her living by literature, to associate (often in men's clothes) with the Bohemian society of the time (1831), and in short to 'see life' generally in a very full sense. Nevertheless after some years the local tribunals found sufficient cause in her husband's behaviour to turn the amicable into a legal separation, and to give her the complete enjoyment of her own property. For the best part of twenty years her life (apart from its literary features, to which we shall come presently) was spent in the company and partly under the influence of divers more or less distinguished men, with some of whom she certainly, and with others probably, was on the terms which might be expected in such circumstances. But George Sand's was a very peculiar temperament, and it is not safe to take too much for granted in respect to her. During the first few years her interests were chiefly directed towards poets and artists, the most famous being Alfred de Musset

and Chopin, with the former of whom she took a journey to Italy notable in the lives of both; while the second was more or less her companion for several years, including a dismal winter which they spent together at Majorca, and which she has recorded in a noteworthy book. In the second decade her attention shifted to the wilder sort of philosophers and politicians, such as Lamennais, Pierre Leroux, and Michel (de Bourges). But the advance of years and the revolution of 1848 with its consequences put an unexpected end to her rather protracted *Sturm-und-Drang* period. By a revolution not by any means universal among men and almost unexampled among women, she settled down as the quiet 'châtelaine of Nohant,' and spent her life for more than a quarter of a century thus, occupying it with wonderful literary activity, varied only by foreign travel now and then, and by occasional visits to Paris. She was exceedingly hospitable: almost all French and many foreign men of letters of eminence visited at Nohant, which was an unostentatious but pleasant Liberty Hall, the especial diversion being a marionette theatre. No private event of any importance disturbed this long and quiet period, which only closed by her death with the words '*Laissez la verdure*' on or almost on her lips.

We must now pass from this curious existence—a youth of dream, a womanhood of racket and license, an old age of laborious calm—to her work. In this some have marked three, others four periods, the last two of which do not seem to be separated by any very real gap. The threefold division corresponds almost exactly to her life experiences as above sketched. When she first went to Paris, and with her companion Jules Sandeau, from the first half of whose name her pseudonym was taken, settled, partly under the guidance of Henri de Latouche, to novel-writing, her books partook of the Romantic extravagance of the time, specially informed and directed by a polemic against marriage and by the invention and glorification of the *femme incomprise*. *Indiana*, *Valentine*, *Lélia* (the most remarkable of all), and *Jacques* are the chief works of this period. In the next her philosophical, political, and (if they can be so called) religious teachers got the upper hand, and in a fashion fathered the rhapsodies of *Spiridon*, *Consuelo* (one of her best books, however), and the *Comtesse de Rudolstadt*. Between the two groups should be placed in time the novel of *Maupratt*. Towards the middle of the century appeared the extraordinary study called *Lucrezia Floriani*, the chief characters of which are undoubtedly in part drawn from herself and Chopin; while she also now began to turn towards the studies of rustic life, of which *La Petite Fadette*, *François le Champi*, and *La Mare au Diable* are the chief, and which some of her admirers regard as her greatest works. Some critics (the chief of whom is M. Caro) would make these rustic novels a third division by themselves, and construct a fourth for the miscellaneous and less spontaneous works of the last twenty years of her life. Some of those last, such as *Les Beaux Messieurs de Bois Doré*, *Le Marquis de Villemer*, *Mlle. la Quintinie* (a duel with Feuillet), and others, are of high merit. Not a title of her enormous list of novels can be mentioned here, while there has to be added to it a considerable *Théâtre*, the bulky *Histoire de ma Vie* already referred to, some nondescript work, such as the *Hiver à Majorque* referred to above, and *Elle et Lui* (a sort of vindication of her relations with Musset (q.v.), written after his death), and a delightful and extensive collection of letters published posthumously. One division of this last—those to Flaubert—is of the very first literary and personal

interest, and the whole exhibits the personal and literary character of the writer in such a light as to have conciliated to her the affection of some who had previously been rather recalcitrant.

The popularity of George Sand, like that of most very voluminous authors, has sunk considerably since her death. Nor have critical estimates invariably agreed about her. The one thing which both friends and foes accord her is the possession of a most remarkable style, somewhat too fluent and facile, but never slipshod or commonplace, if never exquisite or distinguished. To this gift may be added the still more important one of a faculty of imagination which always idealised the subject and treatment to the point necessary to fix the work as literature. A third, though a more disputable gift, was a singular faculty of receptivity which enabled her to catch and render not merely the aspects of scenery and the outline of personages, but the fleeting ideas of the day on all manner of subjects. She had no great or deep originality; despite her fertility, she scarcely ever (the sole great exception is the wonderful study of insatiable jealousy and outworn love in *Lucrezia Floriani*) achieved the analysis which results in synthesis and fixes a character for ever. She wrote with something like the business-like regularity of Anthony Trollope in England; and her work cost her so little that in a very few years she as regularly forgot all about it, and read her own novels as if they were those of others. It is scarcely paradoxical to doubt whether—though her books are unceasingly occupied with love, and a good portion of her life was at least not closed to it—she ever felt in her own person a passionate affection. In conversation, it is said, she was awkward and dull, and there is hardly any wit or humour even in her books. They are also notoriously destitute of plot or composition. It seems to have been her portion to produce or reproduce with a certain passivity, but in never-failing yield, novels as the earth produces crops. All this sounds like unfavourable criticism, and so to a certain extent it is and must be. It is a commonplace of criticism on her to say that George Sand's novels are seldom read a second time. Story they have as a rule not much to tell, and their characters, though never exactly unreal, are too slightly provided with life to exercise an absorbing fascination. Yet after all exceptions are made, and after allowing the utmost that criticism can demand, it is difficult to speak with anything but admiration of this enormous work, the very bulk of which perhaps does it harm, because the same defects recurring almost throughout become more obvious than they would be in a smaller total. The charm—not strange or deep, but constant—of the style, the vast variety and volume of the creations, the constant faithfulness to the one law of art, 'idealise, always idealise,' stand in lieu of many ornaments which are not there. If George Sand had written nothing but *Lucrezia Floriani* and the Letters to Planchet men would have gone about saying what a marvellous novelist, what an acute critic of life and letters had given but glimpses of herself. As it is we have a whole Sandian panorama, and we find fault with it.

The *Œuvres Complètes* amount to about a hundred and twenty volumes in their compact form. Critical and biographical writings on her (these latter rather meagre, but supplemented by the Letters) are numerous. That in the *Grands Écrivains* series by Caro (Paris, 1888) was translated by Masson. See also books by Bertha Thomas (1889), Revon (1896), Rocheblave (1905), Gribble (1907), Sôché and Bertaud (1900), René Donnic (trans. 1910), Karénine (1899-1912), and Maurras, *Les Amants de Venise* (new ed. 1917); her own *Correspondance* (6 vols. Paris, 1882-84); correspondence with Alfred de Musset (1897 and 1904).

Sand, KARL LUDWIG, the Jena theological student and member of the Burschenschaft (q.v.), who assassinated Kotzebue (q.v.) as a traitor to his country. Born in 1795, he was executed by the sword, 20th May 1820.

Sandakan, a port and capital of the territory of the British North Borneo Company. Founded about 1880, it has now a pop. of some 12,000, one-half being Chinese, with a few Europeans, and the rest Sulus, Malays, and Javanese.

Sandal Magna is now part of Wakefield.

Sandals. See **BOOTS**.

Sandalwood (a name corrupted from *Santal* wood), the wood of several species of the genera *Santalum* and *Fusanus*, of the family Santalaceæ (q.v.), natives of the East Indies, islands of the Pacific Ocean, and Australia. They are trees or shrubs parasitic upon roots. Sandalwood is compact and fine grained, very suitable for making work-boxes, desks, and small ornamental articles, and is remarkable for its fragrance, which is fatal to insects; so that cabinets of sandalwood are extremely suitable for the preservation of specimens in natural history, though much too expensive for general use. White Sandalwood, the most common kind, is the produce of a small tree (*Santalum album*), a native of mountains in the south of India and the Indian Archipelago, much branched, resembling myrtle in its foliage and privet in its flowers. The girth of a mature tree varies from 18 to 36 inches.

Other species of sandalwood are now brought into commerce, among which may be named *S. Freycinetianum*, which has a peculiarly rich perfume from the mountains of Hawaii, *S. Yasi* of Fiji, *S. austro-caledonicum* from New Caledonia, *Fusanus acuminatus* from South Australia, and *F. spicatus* of Western Australia. The precious oil is obtained by slow distillation from the heartwood and root. The bark and sapwood have no smell, but the heartwood and roots are highly scented, the billet nearest the root being most esteemed. The average yield is about 2½ per cent. or more of oil. As imported from India it is very dense, of a pale straw colour and of a mild but lasting odour. The best is that prepared in Europe, principally in France and England. From its high price sandalwood-oil is especially liable to adulteration.

The oil forms the basis of many perfumes, and is sometimes used for disguising with its scent articles which, really carved from common wood, are passed off for true sandal; and Hindus can afford to show their wealth and respect for their departed relatives by adding sticks of sandalwood to the funeral pile. The wood, either in powder or rubbed up into a paste, is used by all Brahmins in the pigments for their distinguishing caste-marks. In China the wood is used for carving, for incense, and for perfume.

Red Sanderswood, sometimes called Sandalwood, redwood, or calature wood, is the produce of *Pterocarpus santalinus*, of the family Leguminosæ, sub-family Papilionaceæ, a native of the tropical parts of Asia, particularly of the mountains of the south of India. The tree is about 40 feet high, with pinnate leaves, having generally three leaflets, and axillary racemes of flowers. The heartwood is dark red, with black veins, and so heavy as to sink in water. It is used as a dye-stuff, imparting a pale pink colour to cloth, and also by apothecaries to colour certain preparations. In India it is chiefly employed to mark idols and the forehead in ceremonies. The Arabs use it as an astringent, and it is the basis of some of our tooth-powders.

Sandalwood Island, called also Tjindana and Sumba, one of the Sunda group belonging to the Dutch East Indies, has an area of 4385 sq. m. The produce consists chiefly in sandalwood and cotton, horses and poultry.

Sandarac, or **SANDARACH RESIN**, is a friable, dry, almost transparent, tasteless, yellowish-white resin, completely soluble in oil of turpentine, but not completely soluble in alcohol. When heated, or sprinkled on burning coals, it emits an agreeable balsamic smell. It exudes from the bark of the Sandarac tree (*Callitris quadrivalvis*), a north African conifer. The quantity of sandarac used is not great; it is employed in making varnish, and generally speaking for the same purposes as Mastic (q.v.). The Australian species also exude sandarac. The finely powdered resin is rubbed, as *Pounce*, on the erasures of writing-paper, after which they may be written upon again without the ink spreading. The mottled butt-wood of the sandarac tree is highly balsamic and odoriferous, extremely durable and valuable for cabinet-makers. It fetched fabulous prices in Pliny's time. A current error is that the gum of the Juniper is identical with sandarac.

Sanday. See ORKNEY ISLANDS.

Sandbach, a market-town of Cheshire, near the right bank of the Wheelock, 5 miles N.E. of Crewe. It has a good parish church, public rooms (1859), a grammar-school (1594), and manufactures of boots and shoes, fastian, iron, &c. Population 5890.

Sandbags, in military works, are canvas bags (sometimes tinned), partially filled with sand or earth, and forming a ready means of giving cover against the enemy's fire, or tampering the charge in a mine. See MINES (MILITARY). They are also very useful in forming revetments to parapets, loopholes for rifle pits, and lining for embrasures. Sandbags adapt themselves to all shapes of loopholes better than anything else.

Sand-blast, a method of engraving figures on glass or metal. See GLASS.

Sandburg, CARL, American poet, was born of Swedish stock at Galesburg, Ill., in 1878, and at the age of thirteen began an astonishingly varied career as sceno-shifter, harvest hand, army volunteer in the war with Spain, salesman, and much else besides. He entered Lombard College, Galesburg, and later drifted into journalism. His poems—*Chicago Poems* (1916), *Cornhuskers* (1918), *Smoke and Steel* (1920)—reflect the whirling machinery and terrific vigour of industrial America. His style, dispensing with rhyme and at times employing slang, is angular and arresting, but there are moments of quiet beauty and romantic mysticism. The first volumes of a colossal life of Abraham Lincoln appeared in 1926.

Sandby, PAUL, 'the father of the water-colour school,' was born in 1725 at Nottingham, where he and his brother Thomas, afterwards an architect and R.A., kept a school for some years. In 1741 Paul obtained a post in the military drawing department at the Tower of London; and in 1746-52 he was draftsman of the survey of the Scottish Highlands, which was one result of the rebellion of 1745. Settling at Windsor, he made some seventy-six drawings of Windsor and Eton; and he subsequently made a series of drawings of castles in Wales. He was a member of the St Martin's Lane Academy, of the Incorporated Society of British Artists, and an original member of the Royal Academy, to whose exhibitions he regularly contributed water-colour landscapes. Appointed drawing-master to the Woolwich Military School, he became famous as a fashionable teacher of paint-

ing. His drawings of Scottish scenery were published as etchings by himself, his Welsh views in aquatint; and he was known also as a caricaturist. His water-colours are outlined with the pen, and only finished with colour; his perspective is good, and his architectural drawings admirable. But his landscapes are 'tinted imitations of nature.' He died 8th November 1809. Thomas, born 1721, died 1798. See W. Sandby, *Thomas and Paul Sandby* (1892).

Sand-crack. See HOOFs, CRACKED HEELS.

Sandean, LÉONARD SYLVAIN JULES, French novelist and playwright, was born at Aubusson in Creuse, February 19, 1811, and went at an early age to Paris to study law, but soon gave himself entirely to letters. His short-lived intimacy with George Sand produced one joint-novel, *Rose et Blanche* (1831), and suggested to the more famous of the pair her literary name. Sandean's first independent novel was *Madame de Sommerville* (1834), his first hit *Mariana* (1839). These were followed by a long series of novels, many of which first appeared in the *Revue de Deux Mondes*; the best *La Maison de Penarvan*, *Mademoiselle de Kérouac*, *Mademoiselle de la Seiglière*, *Le Docteur Herbeau*, *Catherine*, *Madeleine*, *Jean de Thommeray*, and among shorter stories, perfect in their kind, *Le Château de Montabrey*, *Le Jour sans Lendemain*, and *Un Début dans la Magistrature*. As a dramatist Sandean collaborated much with Émile Augier, his most celebrated plays being *Le Gendre de M. Poirier*, *La Pierre de Touche*, and *La Ceinture dorée*. Sandean became keeper of the Mazarin Library in 1853, was elected to the Academy in 1858, and appointed librarian at St Cloud in 1859. He died at Paris, 21st April 1883. As a novelist he never attained the popularity of some of his contemporaries, most probably because he steadily refused to make illicit love the staple of his plots. A pleasing style of reflection and an honest interest in the past are characteristic notes; his range of subjects is small and mostly confined to provincial life, but the work is fine, the characters distinct. See Saintsbury's *Essays on French Novelists* (1891).

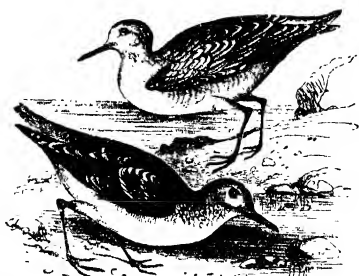

Sandec, NEU (Polish *Nowy Sącz*), a town of Galicia, on the Dunajec, 45 miles S.E. of Cracow. It was the scene of a great fire in 1890. Pop. 26,000, half of them Jews.

Sand-eel. See EEL.

Sandefjord, a watering-place of Norway, 86 miles by rail SSW. of Oslo.

Sandemanians. See GLASSITES.

Sanderling (*Calidris*), a genus of birds of the Snipe family, Scolopacidae; sub-family Tringinae,

Sanderling, Male and Female (*Calidris arenaria*).

characterised by the absence of a hind-toe. There is only one species, the Common Sanderling (*C. arenaria*), which is widely distributed, breeding in

the Arctic regions, and ranging from Iceland and east Greenland in the north to the Cape and Natal and to Chile and Patagonia in the south, and from north Alaska in the west to Ceylon, Borneo, Java, China, Japan, and the Hawaiian Islands in the east. It visits the British Isles in winter, coming about the middle of August, and beginning to depart in April, but found even till June. It is common on the coast, and is occasionally found near inland lakes. It is about 8 inches long, and it is very fat. The winter plumage is ash gray; the under parts are all white. The summer dress has the feathers of the upper surface of a reddish tinge with black markings. The sanderling in its breeding-places feeds on the buds of saxifrages and on insects, but in Britain its food is chiefly marine worms, small crustaceans, and bivalve molluscs. Its note is a shrill *wick*. It is often found in company with small plovers, and occasionally with dunlins.

Sanders, DANIEL (1819-97), German lexicographer, was born at Alt Strelitz in Mecklenburg. Educated at Berlin and Halle, he was head of the school in his native town from 1843 to 1852, and thenceforth devoted his energies to the making of dictionaries of the German language, books that enjoy a high reputation amongst his own countrymen. The most important and most popular are a *Wörterbuch* (3 vols. 1859-63), *Katechismus der deutschen Orthographie, Handwörterbuch, Fremdwörterbuch, Wörterbuch der Hauptschwierigkeiten in der deutschen Sprache, Deutsche Sprachbriefe, und Geschichte der deutschen Sprache und Literatur*, most of which have gone through numerous editions—some of them as many as twenty. He helped to edit, with Rangabe, a *Geschichte der neugriechischen Literatur* (1884).

Sanders, NICHOLAS, polemical writer, was born in 1527 of a good old Surrey family at Charlwood Place, near Reigate, and from Winchester passed to New College, Oxford, being admitted scholar in 1546, and fellow in 1548. Regius professor of Common Law (1558), in 1561 he resigned his fellowship and quitted England, at Rome was created D.D. and ordained priest, and thereafter accompanied Cardinal Hosius to the Council of Trent, 'where he showed himself to be a man of great parts by his several disputations and arguments.' He had lived at Louvain for some thirteen years as professor of Theology, and had paid two visits to Spain (1573-77), when in 1579 he landed in Ireland; and here in 1580, 1582, or 1583 (all three dates are given) he 'died,' says Lord Burghley, 'wandering in the mountains, and raving in a phrensy.' Sanders, who is to Protestants what Fox is to Catholics, was the author of fourteen works (1565-1610), of which the best known are *De Visibili Monarchia Ecclesie* (1571) and *De Origine ac Progressu Schismatis Anglicani*, edited and completed by Edward Rishton (Cologne, 1585). See the translation of the latter by D. Lewis (1877).

Sanderson, JOHN BURDON. See BURDON-SANDERSON.

Sanderson, ROBERT, Bishop of Lincoln, the greatest of English casuists, was born on 19th September 1587, either at Sheffield or at his father's seat, Giltwhaite Hall, near Rotherham. From Rotherham grammar-school he passed in his thirteenth year to Lincoln College, Oxford, of which he became a Fellow (1606), reader of logic (1608), and thrice sub-rector (1613-16), in the last year being also chosen senior proctor. He had taken orders in 1611, and in 1618 was presented to the rectory of Wytherton in Lincolnshire, in 1619 to that of Boothby-Pagnell, near Grantham, in the same county. In 1631 he

was appointed a king's chaplain: 'I carry,' said Charles I., 'my ears to hear other preachers, but I carry my conscience to hear Mr Sanderson, and to act accordingly.' He was created D.D. in 1636; from 1646 to 1648 filled the regius chair of divinity at Oxford; and continued parson of Boothby-Pagnell for upwards of forty years, even (in spite of one imprisonment and frequent plunderings) through all the Great Rebellion. In October 1660 he was consecrated Bishop of Lincoln, and in 1661 he was moderator of the Savoy Conference; to him are due the second preface to the Prayer-book and perhaps the General Thanksgiving. He died at his palace of Buckden, Hunts, 29th January 1663. His works, collected and edited by Professor Jacobson (6 vols. Oxford, 1854), comprise, besides sermons, the *Logice Artis Compendium* (1615), *De Obligatione Conscientie Prælectiones* (1647; new ed. by Whewell, 1851), *Nine Cases of Conscience resolved* (1628-78), and *Episcopacy not Prejudicial to the Regal Power* (1661). See the Life by Isaac Walton, reprinted in vol. iv. of Wordsworth's *Ecclesiastical Biography* (1853).

Sandgate, a small watering-place on the south coast of Kent, within the parliamentary limits of Hythe, from which it is, however, nearly 3 miles E. by rail. In March 1893 two hundred houses were destroyed by a subsidence of the land. Sandgate Castle dates from 1539; near by is Shorncliffe Camp. Pop. 2300.

Sand-glass. See HOUR-GLASS.

Sand-grouse (*Pterocles*), a small order of birds, quite distinct from the true grouse. There are two genera, *Pterocles* and *Syrhaptes*—the former, including over a dozen species, frequenting sandy tracts in Asia, India, and especially in Africa, the latter represented by two species, both Asiatic. The sand-grouse are birds of beautiful plumage, with heavy body, long and pointed wings, very short legs and toes. They are awkward on the ground, but swift and graceful in flight. They seem to feed chiefly on seeds. *Pterocles alchutu* is sometimes called Ganga.

Pallas's Sand-grouse (*Syrhaptes paradoxus*), named after the traveller Pallas (q.v.), is at home on the sandy steppes of central Asia, migrating northwards in winter, but at intervals since 1859 this bird has wandered westwards over Europe; in 1863, 1872, 1876, 1888, and 1889 flocks reached British shores; flocks have been seen in Ireland also, and hundreds, 'following their instinctive desire to explore the extreme west,' have found an end in the waves of the Atlantic. The predominant colour is buff, barred with black; the total length of the bird is about 15 inches. The eggs, usually three in number, are buff-coloured with purple-brown blotches, and are laid in a slight hollow in the sand. On the plateaus of Tibet *S. tibetanus*, the other species of this genus, has its home. See Macpherson, *The Visitation of Pallas's Sand-grouse to Scotland* (1889).

Sand-hopper, a name applied to various small Amphipod crustaceans in the family Talitridæ, abundant on sandy shores between tide-marks. A common species is *Talitrus locusta*, which usually burrows during the day just above high-water level. It is not suited for prolonged submersion, for at high spring-tides large numbers become very active, jumping high in the air, and often passing to the fields. A related form, *Orchestia gammarellus*, is sometimes found in gardens several miles from the sea; in fact sand-hoppers are tending to become less aquatic and more terrestrial. One species of *Talitrus*, *T. sylvaticus*, occurs in South Australian forests at high levels. On the beach at a lower level than *T. locusta* swarms of *Orchestia littorina*

occur under stones and heaps of seaweed. Sandhoppers are scavengers of the shore, fond of decaying matter. The jump is due to a sudden flexing and straightening of the body. Some forms readily assume a 'death-feigning' rigidity.

Sandhurst, a village 5 miles SE. of Wokingham, with an early English church and the remains of a Roman camp, is the seat of a great military college (see MILITARY SCHOOLS), and near it is Wellington College (q.v.).—Sandhurst was at one time a name given to Bendigo (q.v.) in Victoria.

San Diego, the principal port of southern California, and capital of San Diego county, stands on the beautiful bay of the same name, 124 miles by rail SSE. of Los Angeles. The bay, 6 miles long, forms an excellent harbour, and the port is a very busy one. There are here a military post, a quarantine station, government works and fortifications. The equable temperature and genial air have made the place a notable health resort. Oranges, figs, and olives thrive, and they and other produce, including olive, orange, and lemon oils and citric acid, are exported, as well as other fruits and fertilisers. Pop. (1880) 2637; (1910) 39,578; (1920) 76,683. The old mission of San Diego (1769), the first white settlement in California, is 8 miles north of the present city.

Sandlands, the name, taken from the estate at Sandlands in Lanarkshire, of a family which distinguished itself in the wars against the English. Sir James Sandlands, killed at Halidon Hill in 1333, obtained by marriage the estate of Calder in Midlothian. A later Sir James Sandlands of Calder was a notable reformer; this son, head of the order of knights hospitallers of St John of Jerusalem in Scotland, received a grant of the lands of the order at Torphichen and elsewhere as a temporal lordship and was the first Lord Torphichen.

Sanddiver (Fr. *saint de verre*, 'saint of glass'), a product of the glass furnaces. When the materials used in the manufacture of glass are melted a scum arises which has to be removed: this is called sanddiver, and is, when powdered, used as a polishing material.

Sand-martin. See SWALLOW.

San (or Santo) Domingo, capital of the Dominican Republic, stands on the south coast of the island of Hayti, at the mouth of the Ozama. It was founded by Bartholomew Columbus as early as 1494. The principal buildings are the Gothic cathedral (1514-40), where the ashes of Christopher Columbus found a rest from 1538 till 1796, a college, a museum, a hospital, an arsenal, and the government buildings. The streets are broad and straight, the houses mostly of wood, and the town is surrounded by a wall. The harbour is defended by forts and batteries. Pop. 30,000. See also HAYTI, and DOMINICAN REPUBLIC.

Sandomierz, or SANDOMIR, in Poland, on the Vistula, 50 miles SW. of Lublin, was long the residence of the kings of Poland.

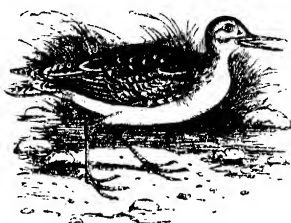

Sandoway, a district in the south of Arakan (q.v.) in Burma, named after its chief town (pop. 3702), 15 miles from the mouth of a small river of the same name, and 150 miles NW. of Rangoon.

Sandown, a watering-place on the south-east coast of the Isle of Wight, 6 miles by rail S. of Ryde. Pop. 7600.

Sandown Park, a well-known race-course (130 acres) in Surrey, near Esher, 15 miles SW. of London. All the inmates of an old hospital here were swept off by plague in 1348. See HORSE-RACING.—For Sandown Castle, see DEAL.

Sand-paper is made like Glass Paper (q.v.), but with sand in place of glass particles.

Sandpiper, the common English name for a group of birds of the Snipe family, Scolopacidae. The name as now used is applied to all the birds in three sub-families, Totaninae, Tringinae, and Phalaropodinae. In characters and habits they are all very similar. Their size is not large; their movements are active and graceful; their plumage is not gay, but pleasing and finely diversified in colour; legs rather long; lower part of the tibia naked; tail very short; wings moderately long; bill rather long and slender, grooved throughout the whole or a considerable part of its length, straight in some, a little arched in others. The feet have three long toes before, and one short toe behind, either partially webbed at the base or completely separate. They swim well, but are not often seen swimming; they frequent sandy seashores, some of them congregating in numerous flocks in autumn and winter, and seek their food by probing the sand with their bills, and by catching small crustaceans in pools or within the margin of the sea itself. Many are birds of passage, visiting high northern latitudes in summer, and spending the winter in the south. The flesh of all the species is good, and some of them are in much request for the table. The following is a summary of the British species. (1) Of the Totaninae: bill stiff and acute, no change to summer plumage. The Common Sandpiper or Summer Snipe (*Totanus hypoleucos*) is a regular summer visitor to the British Isles, especially to Scotland, Ireland, Wales,

Common Sandpiper (*Totanus hypoleucos*).

and the south-east of England. In summer it ranges from the Arctic circle to the south of Europe; in winter it frequents the Mediterranean

Redshank (*Totanus calidris*).

basin, and reaches Abyssinia and Madagascar and ranges through the oriental region to Australia and Tasmania. The Wood Sandpiper (*T. glareola*)

is a much less common visitor to the British Isles, and is much more restricted in its range northwards than the common sandpiper. In winter it reaches the Cape. The Green Sandpiper (*T. ochropus*) differs in nesting habits from all other waders. It lays its eggs in the nests of other birds, such as thrushes, blackbirds, jays, wood-pigeons, and in old squirrels' dreys, and occasionally on stumps and broken-down trees, but always near pools. The Solitary Sandpiper (*T. solitarius*) and the Yellowshank (*T. flavipes*) are American species which are found extremely rarely as stragglers to Britain. The Common Redshank (*T. calidris*), resident in Britain, is a summer bird of passage to the most northern parts of Europe and Asia, and occurs in winter in Morocco and the Cape and in Abyssinia and Natal; also in Japan, China, Borneo, and Java. The Spotted Redshank (*T. fuscus*) and the Greenshank (q.v.) are the only other species found in Britain.

(2) Of the Tringinae: bill flexible and blunt; the plumage usually assumes a chestnut or reddish-brown tint in summer; more frequently found on the shore. The Dunlin, the Curlew Sandpiper, the Knot, the Sanderling, and the Ruff are described in other articles. The Broad-billed Sandpiper (*Tringa or Limicola platyrhynchos*) is a straggler to the British Isles. The Pectoral Sandpiper (*T. maculata*), Bonaparte's Sandpiper (*T. fuscicollis*), the American Stint (*T. minutilla*), the Buff-breasted Sandpiper (*Tryngites rufescens*), and Bartram's Sandpiper (*Bartramia longicauda*) are all stragglers from America, some being fairly common, others extremely rare. The other species are the Little Stint (*Tringa minuta*), Temminck's Stint (*T. temminckii*), and the Purple Sandpiper (*T. striata*).

(3) Of the Phalaropinae: swimming sandpipers; toes lobed and webbed at the base; lower plumage as close as that of a duck. The Gray Phalarope (*Phalaropus fulicarius*), an irregular visitor, breeding in the northern regions, the courtship being conducted by the larger and handsomer female, while incubation is performed chiefly by the male; the southern range of this bird extends to Chile, North Africa, and New Zealand. The Red-necked Phalarope (*P. hyperboreus*), also an irregular visitor. The only other and largest species of this sub-family, Wilson's Phalarope (*P. wilsoni*), is confined to America.

Sandpipers are cylindrical hollows existing in chalk deposits. They descend perpendicularly into the chalk at right angles to the surface, tapering downwards, and ending in a point; they reach occasionally a depth of 60 feet, and have a diameter varying from 1 to 12 feet. They are most probably produced by the chemical action of water, charged with carbonic acid, which exists more or less in all rain-water, and is especially abundant in water that has been in contact with decaying organic matter. The pipes are filled with sand, clay, or gravel from the overlying deposit.

Sandringham, a Norfolk estate, 3 miles from the sea and $7\frac{1}{2}$ miles NNE. of Lynn. Comprising over 7000 acres, it was purchased in 1861 by King Edward VII. when Prince of Wales. The present hall was built in 1869-72, a red-brick Elizabethan country-house, repaired after damage by fire in 1891. Queen Alexandra lived mostly at Sandringham during her widowhood, and died there in 1925.

Sandrocotus, or CHANDRAGUPTA, the Hindu king of Pataliputra or Palibothra, to whom in 306 B.C. Megasthenes (q.v.) was sent by Seleucus Nicator.

Sandstone is a rock formed of compacted, and more or less indurated sand. The grains generally consist of quartz, though other mineral substances are often mixed with this; they are colourless, or of a dull white, yellow, brown, red, or green colour.

The grains vary in size, forming, as the case may be, a fine or coarse grained stone. The loose sand becomes solidified by pressure simply, but generally there is some binding material present, as argillaceous matter; or the grains may have become cemented by infiltrating water, carrying with it carbonate of lime, or silica, or ferric oxide. The colour of the rock is often due to the cement. Highly indurated sandstones often pass into Quartzite. See the classification at PETROGRAPHY; also OLD RED SANDSTONE; the New Red Sandstone falls into the Permian and Triassic systems.

Sandstorm. See SIMOOM.

Sandusky, a city and port of Ohio, and capital of Erie county, on the south shore of Sandusky Bay, an arm of Lake Erie, which, 15 miles long and 5 wide, forms an excellent harbor. The city is built upon a bed of limestone, on a site rising gradually from the shore. It has manufactories of cutlery and edge-tools, carved and turned wood-work, iron, steel, &c. From its busy wharves are shipped large quantities of fish, lime, limestone, lumber, coal, fruit, wool, wheat, and flour. Pop. 23,000.

Sand-wasp. See WASP.

Sandwich, a decayed seaport of Kent, on the right bank of the Stour, 12 miles E. of Canterbury and 68 ESE. of London. It now stands 2 miles from the sea, or 4 if one follows the windings of the river; but in the 11th century, when Edward the Confessor made it one of the Cinque Ports (q.v.), it was the 'most famous of all the English harbours.' It was the place of landing or embarkation of St Wilfrid, Cnut, Becket, Comte-de-Lion, &c.; under Edward IV. had 95 ships and 1500 mariners; but has never recovered the silting up of its harbour in the 16th century, in spite of the settlement at it of Protestant refugees (c. 1561), and of some harbour improvements since 1847. To-day its chief fame is as a headquarters of golf. The old walls have been converted into a pleasant promenade, but it retains the Fisher Gate and Barbican, and offers a great deal of interest in its churches—St Clement (Early English), St Peter, and St Mary (15th century), hospitals—St Bartholemew (12th century) and St Thomas (14th century)—town-hall (1579), and grammar-school (1564). Made a borough by Edward III., with Deal and Walmer it returned two members, but was disenfranchised in 1885. Pop. 3000. Richborough, $1\frac{1}{2}$ mile N., was the Roman *Dutunae*, the predecessor of Sandwich, like which it declined as the sea receded from its port. A new port, however, was constructed (1916) for war purposes, and sold to a coal-mining company in 1924. A great fortress, 460 feet square, Richborough still has a wealth of Roman remains—walls, towers, the base of a pharos, and a castronian amphitheatre.

Sandwich, EDWARD MONTAGUE, EARL OF, born 27th July 1625, fought for the parliament at Marston Moor, sat in the House of Commons 1645-48, divided the command of the fleet with Blake from 1653, and used his position to forward the Restoration; hence his earldom. He commanded in several battles against the Dutch, was ambassador to Spain in 1666-69, and lost his life in a naval engagement with the Dutch, 28th May 1672. See Life by Harris (1912).—The fourth earl (1718-92) is famous as the inventor of *sandwiches*, which he could eat without having to rise from the gaming-table.

Sandwich Group, or SOUTH SANDWICH GROUP, an Antarctic group of islands SE. of the South Orkneys, in about 26° W. long., 27° S. lat., on the 'rise' linking South America with Antarctica. They form a dependency of the Falkland Islands.

Sandwich Islands. See HAWAII.

Sand-worm, a general name for any of the numerous worms living in the sand of the shore. Most of them are *Chaetopoda*, with setae on their feet, but the title might also include forms without setae, such as the *Nemertean*s and the *Sipunculids*. The fisherman's *Loebworm* (q.v.) is one of the most important of the more sedentary sand-worms; the tubes of *Terebella conchilega*—mostly composed of fragments of shell—are familiar on the flat beach; while hidden under stones or burrowing deeply in the sand there are numerous species of errant *Chaetopoda*, belonging to the genera *Nereis*, *Nephtys*, *Polynoe*, *Syllis*, &c.

Sandwort (*Arenaria*), a numerous genus of plants belonging to the family *Caryophyllaceae*. The species are small, much-branched annuals, or tufted or prostrate perennials, usually glabrous and having small white flowers like those of the common chickweed, to which they are closely related. The Sea Sandwort (*Spergularia marina*) has sprouts so succulent that in Cornwall and the Isle of Wight they are pickled and sold as samphire.

Sandy Hook, a narrow sandy peninsula of New Jersey, between the Atlantic and Sandy Hook Bay, 16 miles S. of New York. It extends some 6 miles northwards into New York Lower Bay. Near the north point are a fort, a fixed electric (1894) light 90 feet high, and a life-saving station.

Sandy Point. See PATAGONIA.

San Felipe, (1) capital of the Chilean province of Aconcagua, in the fertile valley of the Aconcagua, 60 miles ENE. of Valparaiso. Pop. 12,000.—(2) A town of Venezuela, 140 miles W. by S. of Caracas, in a district producing much coffee, cacao, and cotton. Pop. 11,000.—(3) See JÁTIVA.

San Fernando, a Spanish town on the Isle of León, 9 miles by rail SE. of Cadiz. Its port has a naval arsenal. Much salt is manufactured from sea-water. Pop. 27,000.

San Francisco (often abbreviated into Frisco), one of the largest cities of the Pacific coast, is the commercial emporium of California; it is situated in 37° 47' N. lat. and 122° 30' W. long. The city occupies the end of a peninsula or tongue of land, having the Pacific Ocean on one side and the Bay of San Francisco on the other. The site is uneven, two hills within the city rising to the height of 360 feet and 294 feet respectively; from these heights and other smaller elevations the land inclines gently towards the bay. The entrance to this landlocked bay is through the Golden Gate, a worn waterway about 5 miles long and about 1 mile wide, with a minimum depth of 105 feet. The Bay of San Francisco gives the city much of its commercial importance, and extends from Fort Point past the city in a southerly direction for about 40 miles, varying in width from 6 to 12 miles. Northwards, this bay connects by a strait, with San Pablo Bay, 10 miles in length, having at its northerly end Mare Island and the Navy Yard. This bay is again connected with Suisun Bay, 8 miles long. The total length of these bays and connecting straits is 65 miles and the area 420 sq. miles. The Sacramento and San Joaquin rivers debouch near the head of Suisun Bay. Nearly in front of the city are three important islands—Alcatraz, Angel Island, and Yerba Buena or Goat Island.

The first Spanish expedition from Mexico to reach the Golden Gate in 1769 was quickly followed by others, but it was not until 1834 that a small settlement was established. In 1848 San Francisco

was ceded to the United States, and the next year the population increased from 2000 to 20,000, the town being used as a point of supplies and departure for the gold mines in the interior. Most of the houses were originally built of wood, but were largely destroyed in the fires of 1850. This was followed by a period of lawlessness, which was only stopped by the self-constituted Vigilance Committee (see CALIFORNIA), while the sixties witnessed another gold rush, this time accompanied by violent speculation on the stock exchange. Immigration of large numbers of Chinese during the last quarter of the 19th century and of Japanese during the first quarter of the 20th led to serious complications, only warded off by conciliatory diplomatic intervention. The terrible earthquake and fire of 1906, laid waste 4 square miles of San Francisco, comprising some 28,000 buildings, the damage being assessed at between \$350,000,000 and \$500,000,000. In spite of certain municipal scandals (1907), the town was rebuilt in about three years, and in 1915 the great International Exhibition was held there to celebrate the opening of the Panama Canal.

Most of the buildings are now being set up with reinforced concrete, or, in the case of dwelling-houses, with some kind of steel frame so as to lessen as far as possible the danger from earthquakes. All extensions to the city have followed the checker-board plan first adopted by O'Farrell in 1845, with little reference to the conformation of the surface. The chief points of interest are Portsmouth Square, the site of many events in the early days; the Chinese telephone exchange and other buildings in Chinatown (rebuilt after 1906 and considerably westernised); the city hall (1907-9); the gigantic Palace Hotel (1910); the public library (1917); the old church of the (Spanish) mission Dolores (1778); the Spanish Commandant's headquarters (1776); and the Golden Gate Park of 1013 acres, beautifully laid out with the ocean as west boundary, and containing the de Young Memorial Museum of Fine Art, considerably enlarged since its opening in 1894. There are about 275 churches in the city, representing nearly every religious denomination in the world, oriental and occidental; there are few church edifices of the first class, but the Protestant Episcopal Grace Cathedral is notable. San Francisco is distinguished for the number and excellence of its free schools and other institutions of learning, and certain departments of the state university at Berkeley, including the medical school, are located here. There are also polytechnic and scientific schools, and several important and extensive libraries.

San Francisco is primarily a commercial and industrial town. It is the terminus of five trans-continental railway systems, the distance from New York being 3452 miles. The bay provides an excellent harbour, and there are steamship lines to South America, Australia, Asia, &c. The exports and imports exceed in value \$130,000,000 and \$100,000,000 respectively, while the tonnage entering the ports amounts to 1½ million tons; all the port facilities, comprising some 15 miles' berthing space and 5,000,000 square feet of cargo area, belong to the state. There are important fishing and whaling interests, while the chief manufactures are sugar, boots and shoes, clothing, and there are foundries and machine-shops, woollen-mills, sash and blind factories, and shipbuilding yards, the manufacturing plants employing about 70,000 persons. There is a branch United States mint, and an army corps is garrisoned here. As the population is exceedingly cosmopolitan, there are newspapers published in all languages. Pop. (1860) 56,802; (1870) 149,473; (1900)

342,782; (1920) 506,676. See the books cited at CALIFORNIA.

San Fratello, a town of northern Sicily, 53 miles WSW. of Messina. It was founded by a Lombard colony brought here by Adelaide, wife of Roger I. Here is the cave of San Teodoro, discovered in 1859, and containing prodigious quantities of bones of mammals mixed with flint implements. Pop. 10,000.

Sangaree' (Span. *sangria*), a West Indian beverage, consisting of wine, sugar or syrup, water, and nutmeg, drunk cold.

Sangerhausen, an old town of Prussian Saxony, on the SE. of the Harz Mountains, 22 miles E. of Nordhausen, with manufactures of machinery, iron, copper, and beet-root sugar.

San German, a town in the SW. of the West Indian island of Porto Rico, about 10 miles from the sea; pop. 22,500.

San Germano, now more generally called CASSINO, a town of Italy, standing 3 miles E. of the celebrated monastery of Monte Cassino (q.v.) and 69 miles NW. of Naples. It is built on the site and from the ruins of the Roman town which replaced the ancient Volscian town of *Casimunt*. The latter must have stood on the hill now occupied by the monastery, where considerable remains of fortifications still exist. The principal ruins of the Roman town are a sepulchral monument and an amphitheatre. The first, now employed as a chapel, is built in the form of a Greek cross, constructed with enormous blocks of stone. Here, too, was Terentius Varro's villa, in which Antony lived for some time. Pop. (1921) 18,757.

San Gimignano, a town of Italy, 25 miles S. by W. of Florence, with several churches, two containing fine frescoes by Domenico Ghirlandajo and Benozzo Gozzoli. In the town hall are interesting frescoes and a small museum. The town is still surrounded by its ancient walls, and retains thirteen out of its original fifty towers; so that its appearance is thoroughly mediæval. Pop. 10,900

San Giovanni a Teduccio, a suburb of Naples, 3 miles to the SE. by rail. Pop. 20,700.

San Giovanni in Fiore, a town of South Italy, 25 miles E. of Cosenza. It is the chief town in the forest district of the Sila. The costumes are picturesque. Pop. (1921) 12,249.

San Giovanni Rotondo, a town of South Italy, 27 miles NE. of Foggia, near Monte Garano. Pop. (1921) 11,538.

Sangir Islands, a group of fifty islands, lying between the Philippines and Celebes, measure in all 400 sq. m., the largest, Great Sangir, being 28 miles long by 9 broad. All the islands are mountainous, volcanic, and fertile. The volcano Abu on Great Sangir was the scene of an eruption in 1856 that cost 3000 lives, and of another terrible one in 1892. The people are Malays, and are ruled by their own chiefs under the Dutch government.

Sang-koi. See TONGKING.

Sangreal. See GRAIL.

Sanguinaria, a genus of plants of the family Papaveraceæ, having eight to twelve petals, two stigmas, an oblong, swollen, and many-seeded capsule with two deciduous valves. *S. canadensis*, the Blood-root or Puccoon of North America, has a fleshy root-stalk with much red juice, which abounds also in the leaf-stalks; and solitary radical leaves, which are roundish, deeply heart-shaped, with about seven toothed angles. The flowers

are solitary and spring from the root, on short stalks. The whole plant is acrid and narcotic,

emetic and purgative in large doses; and in small doses stimulant, diaphoretic, and expectorant. From its use by the Indians for staining, it is also called 'red Indian paint.' It is supposed to owe its properties to an alkaloid called *Sanguinarin*. The large white flowers appear early in spring, and are a frequent ornament of flower-borders.

Sanguine, a term used in art for a drawing in red chalks. For another sense see TEMPERAMENT.

Sanguisorba. See BURNET.

Sanhedrin, or SANHEDRIM (*Sanhedrin* being the Hebrew spelling of the Gr. *synedrion*, 'assembly,' 'council'), the supreme national tribunal of the Jews. The origin of the Sanhedrin has been the subject of much controversy. According to the Mishnah (*Aboth*, i.) the prophets were followed by the 'Men of the Great Synagogue,' and from this body the Sanhedrin developed. This tradition has been disputed: the existence of the 'Men of the Great Synagogue' as a definite assembly has been denied, and the Sanhedrin has been regarded as a new and late institution. On the one hand Bacher holds that some deliberative council must have existed during the Persian period, even though the Mishnaic account underestimates the duration of this period. Kraus, too, maintains this view and argues that during this early time there must have been lay teachers of the Talmudic type as well as priests. On the other hand Schürer is inclined to relegate the Sanhedrin to the Maccabæan age. The divergent views are well discussed by Abrahams: on this point and on Büchler's theory of two Sanhedrins, one religious and one political, see the bibliography below.

Ultimately the Great Sanhedrin consisted of seventy-one members, and was presided over by the Nasi ('prince'), at whose side stood the Ab-Beth-Din ('father of the tribunal'). Its members belonged to the different classes of society: there were priests (Gr. *archiereis*); elders, that is, heads of families, men of age and experience (Gr. *presbyteroi*); scribes, or doctors of the law (Gr. *grammateis*); and others, exalted by eminent learning—the sole condition for admission into this assembly. The presidentship was conferred on the high-priest in preference, if he happened to possess the requisite qualities of eminence; otherwise, 'he who excels all others in wisdom' was appointed, irrespective of his station. The limits of its jurisdiction are not known with certainty; but there is no doubt that the supreme decision over life and death, the ordeal of a suspected wife, and the like criminal matters were exclusively in its hands. Besides this, however, the regulation of the sacred times and seasons, and many matters connected with the *cultus* in general, except the sacerdotal part, which was regulated by a special court of priests, were vested in it. It fixed the beginnings

Blood-root
(*Sanguinaria canadensis*):
a, section of ovary; b, fruit
(Bentley and Trimen.)

of the new moons; intercalated the years when necessary; watched over the purity of the priestly families, by carefully examining the pedigrees of those priests born out of Palestine, so that none born from a suspicious or ill-famed mother should be admitted to the sacred service; and the like. By degrees the whole internal administration of the commonwealth was vested in this body, and it became necessary to establish minor courts, similarly composed, all over the country, and Jerusalem itself. Thus we hear of two inferior tribunals at Jerusalem, each consisting of twenty-three men, and others consisting of three men only. These courts of twenty-three men (Lesser Synhedrion), however, as well as those of the three men, about both of which Josephus is silent, probably represent only smaller or larger committees chosen from the general body. Excluded from the office of judge were those born in adultery; men born of non-Israelitish parents; gamblers; usurers; those who sold fruit grown in the Sabbatical year; and, in individual cases, near relatives. All these were also not admitted as witnesses. Two scribes were always present, one registering the condemnatory, the other the exculpatory votes. The mode of procedure was exceedingly complicated; and such was the caution of the court, especially in matters of life and death, that capital punishment was pronounced in the rarest instances only. The Nasi had the supreme direction of the court, and convoked it when necessary. He sat at the head, and to his right hand was the seat of the Ab-Beth-Din; in front of them the rest of the members took their places according to their dignity, in a semicircle. The court met on extraordinary occasions in the house of the high-priest; its general place of assembly, however, was a certain hall (*Lisheath Hagazit*), probably situated at the south-west corner of one of the courts of the temple. With exception of Sabbath and feast days it met daily. The political troubles forced the Sanhedrin (70 B.C.) to change its meeting-place, which was first transferred to certain bazaars (*Hanuyoth*) at the foot of the Temple Mount. After the destruction of the temple and Jerusalem it finally established itself, after many further emigrations, in Babylon.

OLDER LIT.—See the histories of Ewald, Herzfeld, Jost, Graetz, Kuenen, and others; Hausrath's *Neutestamentliche Zeitgeschichte* (1898); Schürer's *History of the Jewish People in the Time of Jesus Christ* (Eng. trans. 1886-90). For the GENERAL HISTORY of the Sanhedrin, consult the fully itemized index on pp. 586-88 of vol. vi. of the American ed. of the Eng. trans. of Graetz's *History* (Phila. 1898); also index on p. 865 of vol. ii. of H. Strack and L. Billerbeck's *Kommentar z. N.T.* (Munich, 1922-26); R. Travers Herford, *Pharisaism*, ch. i. (Lond. 1912); C. H. Thomson in *Dict. of Christ and the Gospels*, ii. 566; Foskes Jackson and Lake's refs. in *Beginnings of Christianity* (Lond. 1920). On the GREAT SYNAGOGUE: C. Taylor, *Sayings of the Jew. Fathers*, p. 110 (Camb. 1897); H. Engländer in *Heb. Union Coll. Memorial Vol.* (Cincinnati, 1925; an important essay). For DATE AND ORIGIN, see I. Abrahams in Hastings's *E.R.E.*, xi. 184; S. Kraus, *Jew. Quart. Rev.*, x. 349; W. Baehler in *Jew. Enc.*, xi. 640, and in Hastings's *Dict. Bible* (1902), iv. 397; Haunburger, *Realencyclopädie*; R. Knopf, *Einführ. in d. N.T.*, pp. 181, 240; Giessen, (1919: a new edition is in the press). That there were two SANHEDRINS: A. Büchler, *Das Synhedr in Jer.* (Vienna, 1902); J. Z. Lauterbach in *Jew. Enc.*, xi. 41 ff.: this is criticised by G. A. Smith in *Jerusalem*, i. 419 (Lond. 1907). On the JURISDICTION of the Sanhedrin, (a) GEN.—W. Oosterley in Hastings's *E.R.E.*, p. 827; H. Ch.*, ii. 454 (he also criticises Büchler); H. L. Strack (in *New Schaff-Herzog*, x. 203; see also bibliogr., p. 204) rejects the thesis of J. Levy and D. Hoffmann that the head of the Sanhedrin was a layman, and accepts the evidence of Josephus and N.T. that the High Priest presided; C. L. Souvay, *Catholic Ency.*, xiii. 444.

Sanicle. See WOOD-SANICLE.

Sanidine, a clear, glassy variety of orthoclase. See FELSPAR.

Sanitation, in the widest sense of the word, is the science of sanitary conditions and of preserving health, and is accordingly synonymous with Hygiene; but the term is usually restricted to the methods and apparatus for making and maintaining houses healthy, for removing waste and nuisance by means of drainage and otherwise, for securing abundance of fresh air, and for the excluding of poisonous gases, especially sewer gas—in short, the province of the sanitary engineer. Sanitary science falls under various heads in this work: a sketch of the progress of sanitary knowledge and legislation is sketched under HYGIENE. Other branches of the subject are treated in the articles on Food and Diet, on Infection, Disinfectants, Antiseptics, the Germ Theory of Disease, on Baths, Gymnastics, Hospitals, Nursing, and the Feeding of Infants, on the Factory Acts, and on Slaughter-houses. The relation of churchyards to health, and legislation in that regard, is dealt with in the article Burial, and in that on Cremation. The subjects of Building, Ventilation, Warming, and Water-supply are dealt with under their own heads, and one of the most important subjects in sanitary science—how to remove waste substances without offence to health by drainage, how, by trapping and other methods, to prevent the entrance of poisonous sewer gases into bath-rooms—is treated in the article on Sewerage. The diseases that arise from foul air and lack of precautions to secure cleanliness are dealt with in the articles on Disease, Typhoid and Typhus Fevers, Diphtheria, Pneumia, &c.

Sanjak, a Turkish word signifying 'a standard,' is employed to denote a subdivision of a vilayet.

San Joaquin, a river of California, rises in the Sierra Nevada, and runs first SW., then NNW. to Suisun Bay, near the mouth of the Sacramento River. It receives numerous branches—the Merced, Tuolumne, Stanislaus, &c.—and has a course of 400 miles, mostly navigable for small steamboats.

San José, capital of the Santa Clara county, California, on the Guadalupe River, 8 miles from the Bay and 50 miles by rail SE. of the city of San Francisco. Besides a fine court-house, a hall of justice, a hall of records, and a city hall, it contains the state normal school, a Roman Catholic college (Notre Dame) for girls and the University of the Pacific (Methodist Episcopal; 1852). Lick Avenue extends from San José to the Lick Observatory (q.v.). The city has wide streets and several parks (including one of 600 acres), and is noted for its gardens and fruit. Its manufactures include a number of foundries, fruit-canneries, woollen and flour mills, and drug stores. It was first colonised by the Spaniards in 1777, and in 1906 suffered severely from the earthquake. Pop. 40,000.

San José, (1) the capital since 1823 of Costa Rica, stands in a fertile plain, 3816 feet above sea-level and 15 miles by rail WNW. of Cartago. It is on the transcontinental railway from Pantarenas, the Pacific port, to Limón, the Atlantic port. Its

streets are regular and well kept, with many squares and parks. The notable buildings are the presidential and national palaces, the cathedral and bishop's palace, the university, the national museum, the observatory, and the opera-house. The principal manufactures include distilleries, flour-mills, foundries, and tobacco factories. Pop. 54,000. The province has a pop. of 147,000.—(2) A southern department of Uruguay, with an area of 2688 sq. m. and a pop. of 66,800. Agriculture and cattle-rearing are carried on. The capital, San José, is a thriving inland town, 60 miles by rail NNW. of Montevideo, with a fine church; pop. 13,000.—(3) A small port of Guatemala, on the Pacific, 75 miles by rail from the capital. Pop. 1500.—(4) See CÚCUTA.

San Juan. (1) A frontier province of the Argentine Republic, bordering on Chile, with an area of 37,863 sq. m. and a population of 131,179. Half of the surface is occupied by mountains—Andean and pampa chains—and the province is rich in minerals, which have not yet all been fully developed. Agriculture lucerne, corn, and vines—is the chief occupation. The capital town, San Juan, founded in 1561, on the river San Juan, is by rail 700 miles W. by N. of Buenos Aires and 98 N. of Mendoza, and has a local trade with Chile. Pop. 20,000.—(2) San Juan or St John's, the capital of Porto Rico, is situated on a small island, connected with the mainland by bridges, and has a good harbour. The chief points of interest are the Plaza with the governor's palace, the town-hall, the hall of the legislative assembly, and the old fortifications. There are clothing and tobacco factories, while the chief products are sugar-cane and different kinds of fruits. Pop. 72,000.—(3) A port of Mexico, on the river Tabasco, 70 miles from its mouth. There is an active trade in coffee, cocoa, tobacco, sugar. Pop. 12,500.—(4) For San Juan del Norte in Nicaragua, see GREYTOWN.—(5) For San Juan in Juan de Fuca Strait, see FUCA.

Śāṅkara, or ŚĀṆKARA ĀCHĀRYA ('the spiritual teacher Śāṅkara'), is the name of one of the most renowned theologians in India. His date is disputed. Tradition places him about 200 B.C., but the best authorities assign him to the late 8th or early 9th century after Christ. Most accounts agree in making him a native of Malabar, and a member of the caste of Nambūri Brahmans. All accounts represent him as having led a wandering life, and engaged in successful controversies with other sects. He is said, on poor authority, to have died at 32 at Kedarnāth in the Himālayas. He may be regarded as having finally brought into its completed form the Vedānta philosophy or Mīmāṃsā. His principal works, which exercised a great influence on the religious history of India, are his commentary on the *Vedānta Sūtras* and his commentaries on the *Bhagavad-gītā* and the principal Upanishads. His learning and personal eminence were so great that he was looked upon as an incarnation of the god Śiva, and was held to have worked several astounding miracles. His success rested in part on the doctrine which he developed on the basis of a traditional view of the Upanishads, and of the Nihilistic tenets of Mahāyāna Buddhism. He distinguished two planes of thought and reality: on the one hand, the unchanging Absolute, which is pure being, pure thought without an object, and unqualified bliss; on the other, the illusion, self-imposed, on thought which presents that which is but one in all the illusory manifold of existence. From the latter standpoint he could accept, without criticism, belief in Hindu rites and popular theology, and he is credited with founding the sect of Śmārtas

Brahmans, and with the energetic propagation of orthodox Brahmanical views as against the unorthodoxy of Buddhism and Jainism.

Sankey, IRA DAVID. See MOODY.

Sāṅkhyā is the name of one of the three great systems of orthodox Hindu philosophy. See SANSKRIT LITERATURE.

Sankt Gallen, or ST GALL, a Swiss canton lying between the Lake of Constance on the N. and the Grisons on the S., with Zürich on the W. The country is for the most part mountainous, rising to 10,660 feet in Ringelspitz, and to 8216 in Santis, and consists of a series of valleys radiating outwards from the high canton of Appenzell, which Sankt Gallen entirely surrounds. The Rhine flows along the eastern border. Portions of the lakes of Constance, Zürich, and Wallen lie within its boundaries. Sandstone and slates are quarried. The mineral springs of Pfafers and Ragatz are well known. But the chief source of wealth is the embroidery of cottons, muslins, laces, &c., with an important export trade. Rorschach, on the Lake of Constance, is a port of some trade. Area of canton, 779 sq. m.; pop. (1920) 295,543, of whom three-fifths are Roman Catholics, the rest Protestants of the Reformed Church. They speak German. The canton is governed by a Great Council, chosen by the communes for three years. The French republicans created a canton in 1799, and in 1803 the canton as it now exists was formed.

SANKT GALLEN, the capital of the above canton, stands on the Steinach, 2196 feet above sea-level (one of the highest towns in Europe), 53 miles by rail E. of Zürich, and 9 from Rorschach. The buildings of its famous Benedictine monastery are now used as cantonal offices and for housing the monastic library, founded in 830, containing many MSS. of great antiquity and value. Other buildings are the old abbey church, thoroughly restored in rococo style, and made a cathedral in 1846; the Protestant church of St Lawrence (restored 1851-53); the town library, founded in 1536, and containing many interesting Reformation MSS.; and the museum with collections of natural history, works of art, and antiquities. The city carries on a large trade in its staple commodity, embroidered textiles (cotton, muslin, &c.), and in agricultural products. Pop. (1888) 27,910; (1920) 70,437. The original nucleus of the place was the cell of St Gall (c. 550-645), an Irish follower of St Columban, who settled here in 614. Around this soon grew up a monastery of the Benedictine order, which was promoted by Charles Martel to the dignity of an abbey. The abbey gradually became one of the masterpieces of mediæval architecture: whilst the monks were indefatigable in the collection and transcription of MSS.—biblical, patristic, historical (sacred and profane), classical, liturgical, and legendary. Several of the classics, especially Quintilian, Silius Italicus, and Ammianus Marcellinus, have been preserved solely through the MSS. of Sankt Gallen. Amongst its more distinguished pupils were Notker and Ekkehard. They were noted also for the cultivation of music, the name of Notker Labeo being most outstanding in this respect. Its abbots became princes of the empire. About the 10th century a walled town began to grow up around the monastery, but in the 13th century the townsmen threw off its supremacy. In 1454 the town was admitted to the Swiss confederation, in 1528 embraced the Reformation, but in 1531 restored the Catholic religion. At the French Revolution the abbey was secularised (1798); in 1836 St Gall was erected into a bishopric. See J. M. Clark, *The Abbey of St Gall* (1926).

Sankt Pölten, a town of Lower Austria, on the river Traisen, 38 miles by rail W. of Vienna. The cathedral, founded in the 11th century and rebuilt in baroque style in the early 18th, has some good stained glass. There are iron-factories and cotton-mills. The history of the town begins in Roman times. Pop. 15,000.

Sanlúcar de Barrameda, a seaport of Spain, stands 15 miles N. by W. of Cadiz, on the left bank of the Guadalquivir, and at the mouth of that river; it exports wines and cereals; pop. 27,000.

San Luis, a west-central province of the Argentine Republic, with an area of 20,035 sq. m. and a population of 129,655. It is mountainous in the north, and a series of dry and sterile plains in the south. Its mineral wealth, though unquestionably great, has as yet scarcely been tapped, but cattle-breeding is carried on.—The capital, San Luis, founded in 1597, is on the transcontinental railway, 490 miles W. by N. of Buenos Aires, and has a national college and a normal school, and 15,000 inhabitants. Cattle-rearing, grain, and vine-growing are the industries of the region.

San Luis Potosí, capital of the Mexican state of the same name, stands on the edge of a plateau, 7400 feet above the sea, by rail 327 miles NNW. of Mexico city. It is well built, though with steep streets, and contains a handsome cathedral, a government palace, railway workshops, and smelting-works. There are rich silver-mines near by. Founded in 1586, the city has taken a prominent part in the country's civil wars, and in 1863 was the seat of Juárez's government. Pop. 68,000.—The inland state of San Luis Potosí, largely mountainous and so far healthy, has an area of 24,000 sq. m. and a population of 441,500. Some districts are very fertile, and much gold and silver is mined, besides salt and other minerals.

San Marino, a republic lying among the eastern spurs of the Apennines, 9 miles SW. of Rimini on the Adriatic. It has an area of 33 sq. m., and comprises a small town of the same name and some villages. The town is built on a mountain crag, and is accessible only by one road; the streets are steep and narrow. Agriculture and cattle-breeding are the principal occupations. Tradition states that it was founded under Diocletian, but its history begins with the 9th century. In the 13th century the little community of San Marino cast its lot with the house of Urbino; but on the annexation of this duchy to the Papal States in 1631 its independence was recognised by the pope, and it has been maintained down to the present day. Its constitution is that of a republic; but it acknowledges the king of Italy as its friend and protector. The governing body is the Grand Council of sixty members, elected by popular vote. From this number are selected the Council of Twelve, who form the supreme court. The executive is committed to two captains-regent, chosen from the Grand Council. The militia of the republic numbers 950 men. San Marino issues postage stamps of its own, and makes a considerable profit by doing so. Many of them show the new Palazzo del Governo, in the Gothic style (1894), the principal building in the small town, and others the three summits of the mountain (Monte Titano) crowned by towers—the arms of the Republic. Total pop. 13,000.

San Martín, JOSÉ DE (1778-1850), South American soldier, was born in the Argentine, studied at Madrid, and took part in the Napoleonic wars. In 1812 he first associated himself with the Argentine patriots in their struggle against the royalists, and by his victories in 1817 and 1818 definitely secured the independence of Chile (q.v.),

which was placed under the dictatorship of his colleague, O'Higgins. In 1821 San Martín occupied Lima, at the same time proclaiming himself Protector of Peru. An able soldier and administrator, he fell a victim to political diversions and intrigues, and was forced to leave the next year for Europe, where he lived in retirement till his death.

San Miguel, (1) a town of Salvador, at the foot of the active volcano (7775 feet) of San Miguel, manufactures leather goods, and there is some mining, but the chief products are agricultural; pop. 34,000. The province has a pop. of 125,000.—(2) The principal island of the Azores (q.v.), with an area of 299 sq. m. and a pop. of 140,000.

San Miguel Allende, a town in the Mexican state of Guanajuato, built on the side of a high hill overlooking the Río de la Lara, 253 miles by rail NW. of Mexico city. It has a trade in cereals and fruit. Pop. 10,000.

San Miniato, a city of Central Italy, 22 miles W. by S. of Florence, has a cathedral with fine decorations in majolica and a castle of the Emperor Frederick I. The Bonaparte (more correctly Buonaparte) family, which settled in Florence before 1100, divided in the 13th century into two branches, one of which settled at San Miniato, the other at Sarzana. It was a member of the latter branch who emigrated to Corsica in the middle of the 16th century. Pop. 21,400.

Sannazaro, JACOPO, an Italian poet, of Spanish descent, was born at Naples, 28th July 1458. He attached himself closely to the court of Naples, and accompanied King Frederick III. when he took refuge in France (1501-4). It was during his absence that he published the *Arcadia*, a medley of prose and verse, which was greatly admired, and went through numerous editions. It has given its author the reputation of an Italian classic. Sannazaro died at Naples on 27th April 1530. Other works are *Sonetti e Canzoni* and *De Partu Virginis Libri III.*, mostly written in Latin verse. See Scherillo's edition of the *Arcadia*, with critical introduction (1888).

San Nicolás de los Arroyos, a city of Buenos Aires province, in Argentina, stands on the Paraná, 150 miles by rail NW. of Buenos Aires. It is a port with a busy river trade. Pop. 20,000.

San Pedro de Macoris, a port of the Dominican Republic, on the south of the island, with a trade in honey, rum, and hides; pop. 14,000. The province has a pop. of 44,000.

Sanpo. See BRAHMAPUTRA and TIBET.

Sanquhar, a town of Dumfriesshire, on the Nith, 26 miles NNW. of Dumfries. It has a ruined castle, was the birthplace of the 'Admirable' Crichton, and has many Covenanted memories—including the affixing to the cross of the two Sanquhar Declarations, by Richard Cameron in 1680 and by Renwick in 1685. The *Croft* of Ptolemy, Sanquhar was made a royal burgh in 1598, and with Dumfries, &c., returned one member till 1918. Pop. 3380.

San Remo, a city of Northern Italy, stands on a bay of the Gulf of Genoa, 26 miles by rail ENE. of Nice and 84 SW. of Genoa. It is built on rising ground, and is sheltered by hills behind. This, combined with its delightful climate, makes it one of the favourite winter-resorts of the Riviera (q.v.), especially for Englishmen. The visit of the Emperor Frederick of Germany in 1887-88 greatly increased its reputation among his subjects. It is also much frequented by Italians during the summer. There are two quarters, an old town of steep, narrow streets on the hill, and a new town of handsome streets and picturesque villas, hotels, and palaces near the coast. Its little harbour

serves a brisk trade in olive-oil, palms, and lemons. Pop. (1921) 23,547.

San Roque, a town of Spain, 8 miles N. by W. of Gibraltar; pop. 11,000.

San Salvador, the capital of the republic of Salvador (q.v.), stands in the midst of a fertile plateau 2000 feet above sea-level, among green hills, and at the foot of the volcano of San Salvador (8360 feet). Immense ravines, crossed for the most part only by narrow tracks, have been worn by streams in the surrounding plain, and serve as a protection to the city in time of war. The houses are mostly of one story, with walls built thick to resist the shocks of earthquake, and enclosing pleasant courts. The climate is semi-tropical. San Salvador has a cathedral, a university, polytechnic schools, a museum, a national library, an observatory, and handsome government buildings. The city, however, in spite of an excellent water-supply, is far from notable for its cleanliness. There is a busy trade in coffee, rice, sugar, while cotton goods and cigars are manufactured. San Salvador was founded in 1528. Violent shocks of earthquake have visited it in 1854, 1873, 1879, 1891, and 1917, a destructive flood in 1922. Pop. 81,000. —San Salvador is also one of the names for Bahía (q.v.), and for an island in the Bahamas (q.v.).

Sansanding, or **SANSANDIG**, a town of Africa, stands on the left bank of the Niger, some 370 miles SW. of Timbuktu, and is a place of some commercial importance.

Sansculottes, i.e. 'without breeches,' was the name given in scorn, at the beginning of the French Revolution, by the court party to the democratic party in Paris. The latter accepted the title with pride, and used it as the distinctive appellation of a 'good patriot.' According to the current interpretation in England (as in Carlyle's works), a *sansculotte* was a radical revolutionist who made a point of neglecting his apparel, and cultivating rough and cynical manners. But Littré makes no mention of breechlessness in the sense of raggedness in his definition of the word; on the contrary, he says that the *sansculottes* 'were so called because they gave up the knee-breeches in fashion during the *ancien régime* and took to wearing trousers or pantaloons.'

San Sebastián, the capital of Guipúzcoa province, Spain, on the Bay of Biscay, 402 miles by rail NNE. of Madrid, and 11 miles from the French frontier. It is built on a peninsula, stretching from the base of a conical hill, Urgull (400 feet), which is crowned with a strong fortress. Since its almost total destruction by the British, when they stormed it (1813) under Wellington during the Peninsular war, the town has been rebuilt on a regular plan. On the west is a magnificent roadstead, well protected, but difficult of access. It is bordered by a beautiful shore, which has made San Sebastián a fashionable watering-place. Large ships use the more easily accessible harbour of Pasajes, 2½ miles to the E. The exports consist chiefly of wine, minerals, textiles. Fishing and other industries are carried on. Since 1886 San Sebastián has been the summer residence of the court. The new town contains a casino, Miramar Palace, and many handsome buildings. An electric railway runs to Irún and across the frontier to Hendaye. San Sebastián suffered numerous sieges in the wars between France and Spain. Pop. 62,000.

San Severino, a small town in the Marches, Italy, 15 miles SW. of Macerata, has two cathedrals. Pop. (commune) 14,000.

San Severo, a city and episcopal see of Southern Italy, by rail 18 miles NW. of Foggia and

141 NE. of Naples, dates from the middle ages, but has twice been laid in ruins, for the second time by the French in 1799, and has also suffered damage by earthquakes. Pop. (1921) 34,606.

Sanskrit (*samskṛita*, 'perfected,' 'polished'—viz. *sam*, 'together' or 'completely,' = *ṣam*, Eng. 'same,' and *kṛita*, 'made,' probably connected with Lat. *creo*) is the name of the ancient literary language of India. It forms the easternmost branch of the great Indo-European (Aryan) stock of languages, and the one which, thanks to its early literary cultivation (from c. 1500 B.C.) and grammatical fixation, and its consequent transparency of structure and fullness of form, approaches nearest to the parent language. In some respects, however (notably in the change of a single *a*-vowel in place of the vowels *a*, *e*, *o*, prevailing in the European languages—e.g. Sansk. *bhāraṇam* = *φέρω*), the primitive appearance of the Sanskrit, as of the closely allied Iranian or Persian branch, is now generally ascribed to a special Indo-Iranian development of the parent language. Whilst it is normally admitted that the Indo-European dialect out of which the literary language of India has developed cannot have been indigenous to the peninsula, but must have been introduced from the north-west, there is still considerable difference of opinion as to the original home of the primitive Indo-European community—whether it is to be sought for in Asia, a view supported by the discovery of the Tocharian language in Central Asia, or whether it was from some part of Europe that the Asiatic Indo-Europeans—the Armenians and Indo-Persians—originally came. On entering India, the Indo-European tribes found the country occupied by people of different races; but, favoured perhaps by physical and intellectual superiority, they gradually succeeded in extending their sway, as well as their language and their social and religious institutions, over the whole of Northern India. Owing, however, to various causes, such as original differences in the invading tribes, new political formations, or racial and tribal differences in the population absorbed by the ruling race, local dialects gradually sprang up within this area, which eventually developed into the modern vernaculars of Northern and Western India. See **INDIA**.

Although the term Sanskrit, as the 'perfected' language, properly speaking only belongs to the grammatically fixed form of the language which was employed from about the 4th or 5th century B.C., and which came more and more to assume the character of a mere literary and learned idiom, it is usual to extend the term so as to include an earlier form of the same language used in the Vedic writings, and hence often called Vedic or Vedic Sanskrit. The two phases of the language show considerable differences as regards both vocabulary and grammar. The vocabulary of the older language includes numerous words which are no longer used in Classical Sanskrit, and the very meaning of which had often become unknown; whilst, on the other hand, many of the commonest words of the later language are not found in the Vedic writings. As regards the inflectional system, the original wealth of grammatical forms has become considerably reduced in the later phase of the language. Thus, whilst the Classical Sanskrit has but a single infinitive in *tum*—being the accusative case of a verbal abstract noun in *tu*, and corresponding to the Latin first supine (e.g. Sansk. *datum*, *yuktum* = Lat. *datum*, *junctum*)—the Vedic Sanskrit also makes use for the same purpose of different case-forms of quite a number of verbal nouns, several of which occur again with a similar function in one or other of the allied languages—e.g. Sansk. *vidmāne* = *ῥέω*; Sansk. *dāraṇe* = *δοῖρα*, *δοῖρα*; Sansk. *jīvaṇe* = Lat. *vivere*; Sansk.

bhāradhaya = *phēroba*. Similarly the subjunctive mood, which formed a regular feature of the Indo-European and Vedic verb-systems, has almost entirely disappeared from the Classical Sanskrit; and alternative declensional and conjugational forms have usually been reduced to a uniform level. Indeed, levelling processes of this kind are seen to have been at work from the earliest times. Thus, a comparison of the language of the older portions of the *Rigveda* with that of the later hymns, and the closely allied *Atharvaveda*, shows how, both in declension and conjugation, vowel-stems gradually supersede the original radical and consonantal stems, which less readily adapt themselves to case and personal affixes, and hence are apt to produce anomalies and irregularities. Such modifications become still more marked in the later Vedic prose-writings, the *Brāhmanas* and *Sūtras*, which may be considered an intermediate link between the two periods of the language. Though the process of change was at length arrested by rigid grammatical rules, to which every cultivated writer had to conform, it found all the more scope in the popular dialects, which soon lost touch of the literary language and became more and more removed from it. Sanskrit, originally a refined form of the vernacular of the Brahmins and the ruling class, easily understood by their inferiors, came more and more to be restricted in employment for ordinary speech outside the Brahminical schools, but in addition to its supremacy in literature, which resulted in its use even by Buddhists and Jains, it became from the period of the Gupta revival of Hinduism (c. 300) the normal language of official life.

Literature.—In accordance with the general development of the language, the history of the ancient literature of India may conveniently be divided into two chief periods, the *Vedic Literature* and the *(Classical) Sanskrit Literature*. It must be understood, however, that the two periods overlap each other to some extent, inasmuch as certain classes of works, on account of their subject-matter as well as the archaic character of their language, have to be grouped along with the Vedic literature, though they cannot have originated in their present form till after the language had become settled. The Vedic Literature forms the subject of a separate article. See *VEDA*.

Classical Sanskrit Literature.—The dates of many important Sanskrit works being still very uncertain, it is not yet possible satisfactorily to subdivide this period chronologically; and the usual practice of treating it under the different departments of literature is therefore adhered to.

A. Belles Lettres.—(1) *Epic Poetry.*—The Hindus possess two great national epics, the *Mahābhārata* (q.v.) and the *Rāmāyana* (q.v.). Along with these may be classed the *Purāṇas* (q.v.), which, although, in their present form they were doubtless composed or recast for sectarian purposes several centuries after Christ, seem to contain a considerable amount of genuine old legendary matter akin to large portions of the *Mahābhārata*. Though the final redaction of that epic can scarcely be assigned to an earlier period than the early centuries of our era, it is clear that the vast mass of legendary lore and epic lays of which the *Mahābhārata* is composed must have required centuries to grow and assume its present shape. At a subsequent period, from about the 4th century A.D. onwards, there are extant epic poems of a different character; their literary affinity is with the *Rāmāyana*, especially in its later portions, which reveal in embryo their essential features. Whilst the old poems are composed in easy, natural language, such as might well have formed the living though cultured language of the people, these later works are

evidently the artificial product of an age when the literary language had long lost touch of the popular speech. Their subject-matter, such as there is, is entirely derived from the old legends; but the form in which it is here presented has nothing of the old popular ring about it—elaborate metres, long and complicated compounds, and elaborate figures of speech through which the epic narrative hardly progresses at all being the characteristic features of most of these productions, built up in accordance with a narrow code of rhetoric. They are nevertheless replete with poetic thoughts and genuine artistic feeling, which only require a less artificial form of presentment to please even the Western taste. Of such poems (*kāvya*) there existed a considerable number. The oldest extant are, curiously enough, two Buddhist epics, composed by the great philosopher and dramatist, *Aśvaghoṣa* (2d century A.D.), the *Buddhacharita* and the *Saundarānanda*. Though already marked by the characteristics of the *kāvya*, they are much less elaborate than even those of *Kālidāsa*, who manifestly was influenced by his predecessor. Indian taste has singled out six of them as *mahākāvya*s or great poems—viz. two by *Kālidāsa* (q.v.), by far the greatest poet of this period, the *Raghuvamśa* and the *Kumārāsambhava*; further the *Kirātārjunīya* by *Bhīravi* (probably about 600 A.D.); the *Śūpādābhadra* by *Māgha* (about 700 A.D.); hence also called *Māgha-kāvya*; the *Rāvaṇavādha* or *Bhaṭṭikāvya*, composed by *Bhaṭṭi* before 650 A.D. with the view of illustrating the less common grammatical forms of speech; and the *Naishadhīya* of *Śiṣi Harsha* (12th century).

(2) *Lyric, Descriptive, and Didactic Poetry.*—In this class of poetic production the highest rank is usually assigned to two poems by *Kālidāsa*—viz. the *Meghadūtā*, 'cloud-messenger,' where an exiled demigod sends a message of love to his wife by a cloud, to which he describes, in glowing verse-pictures, the places and scenes it will have to traverse, and depicts with true pathos the sorrow of his beloved during their parting; and the *Ītūhasaṃhāra*, a description of the seasons. Of high poetic merit, though of a very sensuous character, is also the dramatic lyric *Gītagovindā* (12th century) of *Jayadeva* (q.v.), which describes the love-making of the god *Kṛṣṇa* among the milkmaids, his separation from, and ultimate reconciliation with, his wife *Rādhā*; and which, like the biblical Song of Songs, is considered capable of being explained in a mystic-allegorical sense. Moreover, scattered over dramas and manuals of rhetoric, or collected in poetic anthologies, there are extant thousands of single stanzas, composed with the view of depicting some striking local scene or emotional sensation. They may be compared to our sonnets, being like them artificial productions, often composed with remarkable skill and neatness, and inspired by genuine poetic feeling. Didactic poetry, in Indian literature, takes chiefly the form of moral maxims, or sententious truths, expressed in single stanzas. There are a number of collections of such stanzas, intended to serve as manuals of ethical and social science, the best known of which are the *Rājatarīṅgīśūcchikāya*, 'collection on the conduct of kings,' ascribed to *Chāṇakya*; the *Kāmandakya-Nītisāra*, by *Kāmandakī*; and the *Nītikāṭaka*, 'century (of stanzas) on ethic science,' by *Bhartrihari*, who also wrote two centuries of erotic and devotional verses. To render moral instruction more attractive to the youthful mind, sententious verses of this kind were also combined with humorous stories and fables.

(3) *Fables, Fairy Tales, and Romances.*—The best fable, inculcating moral lessons, was early popularised in India by the *Tantrākhyāyikā*, of

which the famous *Panchatantra* (q.v.) and the very popular *Hitopadesa* are versions. These works are in prose, interspersed with maxims in verse either expressing in pithy form moral principles or summing up the point of the story in a form easy to remember. A famous early collection of fairy tales, the *Brhatkathā* of Guṇādhya (4th century) written in Pāliśai Prakṛit—whether in prose or verse is disputed—is represented in Sanskrit by three versions, one, found in Nepal, by Budhaśvāmin, and two in Kashmir, derived from a common source which considerably altered the original, the *Brhatkathāmanjari* of the polymath Kāśhemendra, and the *Kathāsaritsaṅgāra* of Somadeva, both of the 11th century and written in verse. Other well-known collections are the *Veṭilapanchamiṣati*, 'twenty-five tales of a vampire,' recounted to the legendary king Vikramāditya; the *Śephaśanubhāṣinīśikā*, 'thirty-two tales told by the lion-throne' of that king; and the *Śukasaptati*, 'seventy tales told by a parrot' to dissuade his mistress in her husband's absence from rash adventures. These three are in prose and of no great length. Their style is on the whole simple, and in this respect they contrast greatly with the prose romances extant, of which the oldest is probably the *Dakṣaśatracarita*, 'adventures of ten princes' by Daṇḍin (c. 600), a work in the picaresque manner of considerable force and power. Much more complicated in style are the *Viśavadvāitī* of Śubandhu (c. 625) and his contemporary Bāna's *Kūṭambāri*, though Bāna's skill in depicting passion and pathos is undoubted. A variety of this form of literature is the Champū, in which verse and prose are intermingled, as in the *Damayantīkathā* of Trivikrama Bhaṭṭa (c. 915).

(4) *History*.—The Brahmanical outlook on life, which saw in the material side of existence nothing that could endure, the lack of vital national happenings in Indian history, the naive belief in the reality of the heroes of the epic, combined to divert the mind of Sanskrit writers from historical research. Besides inscriptions, numerous and often valuable, there is little of importance. Bāna's *Harshacharita*, despite much brilliance of description, contains very little history, in striking contrast with the full account of Harsha given by the Chinese pilgrim Hsien Tsiang. It is written in ornate prose, while verse is used by Padmagupta in his *Navasahasīnīkacarita*, written in honour of Śindhurāja of Dhārā in the 10th century, and Bilhana's *Vikramānīkacarita* (c. 1050) celebrating the Chālukya prince Vikramāditya VI. Much more ambitious is the great chronicle of the kings of Kashmir, the *Rājatarangīṇī* of Kālhana (c. 1150); but Kālhana is not concerned so much to narrate facts as to incantate by the record of the rise and tragic fall of dynasties the supreme truth of the essential fact of resignation.

See A. A. Macdonell, *Sanskrit Literature* (1900); M. Winternitz, *Geschichte der indischen Literatur*, vol. iii. (1923); A. B. Keith, *Classical Sanskrit Literature* (1923).

(5) *Drama*.—None of the existing plays are probably older than the 2d century of our era, and at one time the theory of Greek influence, through the New Comedy or the Mime, was in vogue. There is, however, reason to believe that, as in Greece, drama arose from religion, for Patanjali (q.v.) records the dramatic representation of the struggle between Kṛishna and his uncle Kamsa, and it is significant that the earliest dramatic fragments extant are those of plays written to extol the Buddhist faith by Aśvaghosha in the 2d century A.D. The number of extant plays has been greatly increased by recent discoveries in Southern India. Their plots are largely derived from epic legends, or

from the literature of the fable and popular tale, but many farces represent more or less conventionally the life of the people of the cities. The unities of time and place are ignored, and the number of actors is often very large, though the monologue is also a favourite form. Common types are heroic plays (*nāṭaka*), often based on the Rāma legend, and comedies of love intrigue in court circles or in humble life (*nāṭikā*, *prakaraṇa*). The language is usually of a mixed nature, higher male characters speaking in Sanskrit, whilst women and lower male characters use Prakṛits, stereotyped forms of popular dialects. Plays frequently begin with a prelude in the form of a dialogue between the stage-manager and one of the actors, containing some allusion to the author, and leading over to the opening scene. Two interesting characters of the Indian stage are the *Vita*, or dissolute associate of the hero, somewhat resembling the parasite of the Greek comedy, and the *Viśākhā*, his humorous companion, or Gracioso. The oldest extant plays are the thirteen dramas of Bhāsa, perhaps 300 A.D., discovered in 1910 in Travancore. The finest of these is the *Śauna-Vāsavadattā*, but the *Pratijñā-Yaugandharayana*, *Armadraka*, and *Cārudatta* are all of distinct merit as romantic comedies; the *Bālacharita* is devoted to the early deeds of Kṛishna, and among his one-act dramas the *Urubhanga*, describing the death of Duryodhana, approaches more nearly than any other extant drama the character of tragedy, which is forbidden by the later rules of drama. On the *Cārudatta* is based the *Mṛichchhakatikā*, ascribed to a King Śādraka, in which the love of a noble Brahmin for a hetaira is cleverly mingled with a revolutionary conspiracy. The greatest of Indian playwrights is Kālidāsa (q.v.; c. 400 A.D.), the author of the *Sakuntalā*, the *Vikramorvashī*, and *Mālavīkagnimitra*. Next to Kālidāsa, in the estimation of Indian scholars, ranks Bhavabhūti (q.v.; c. 700), likewise the author of three plays—viz. the heroic dramas *Mahāvīracarita* and *Uttarāraṇacharita*, and the domestic drama *Mālatīmādhava*. He is, however, far less of an artist than his great rival, and his language is much more artificial. Besides these may be mentioned Harshadeva, king of Kānaṇj (c. 625), the reputed author (or patron) of the *Ratnavali*, *Nāgvananā*, and *Pragdarśinī*; Bhaṭṭa Nārāyaṇa, author of the *Vajrasūphāra*; and Kṛishnamisra (12th century), who wrote the *Prabodha-chandrodaya*, or 'moonrise of Intelligence,' a clever allegorical play, the characters of which consist entirely of abstract ideas—virtues and vices—ranged in two contending armies.

See H. H. Wilson, *Theatre of the Hindus* (1871); S. Levi, *Le théâtre indien* (1890); A. B. Keith, *Sanskrit Drama* (1924).

B. *Scientific Literature*.—The first beginnings of nearly all the branches of scientific inquiry cultivated in medieval India may be traced back to the later Vedic times, being the natural outgrowth of the Vedic religion and of the study of the sacred writings. This fact indeed receives a direct recognition in the traditional classification itself, inasmuch as it includes among the Vedic literature, under the title of *Vedāṅga*, or members of the Veda, the original or fundamental treatises of six sciences—viz. phonetics (*śikṣā*), prosody (*chandas*), grammar (*māhārāya*), etymology (*nirukta*), astronomy (*jyotiṣha*), and ceremonial law (*kāpa*). Though some of these treatises, in their present form at all events, cannot justly lay claim to so high an antiquity, it is not improbable that they are based on older treatises on their respective subjects.

(1) *Law* (*dharma*).—The earliest attempts at an orderly statement of social and civil usages are to be found in the Dharmaśāstras, or rules of law,

which form part of some of the Kalpasūtras, or ceremonial rules (see VEDA), in close connection with the Grihyasūtras, or rules of domestic rites, out of which they may indeed have originally grown. The few extant sets of old Dharmaśāstras—viz. those of Baudhāyana, Āpastamba, Gautama, and Vāsishtā (all trans. by G. Bühler)—though mainly composed in aphorisms, are interspersed with couplets or stanzas, giving the substance of several rules; and it is in these detached verses that many scholars would trace the first tendency toward the composition of the versified codes of law, the Dharmaśāstras or Smṛitis, which, somewhere about the beginning of our era, came to supplant the Sūtra-codes, and remained for centuries the standard authorities on matters of law. Whilst some few of these new codes, like their prose prototypes, appear to have been directly connected with certain Vedic schools, such does not seem to have been the case as regards the vast majority of them, which were called by their authors, more or less fancifully, either after some old semi-mythic teacher or sage, such as Ātri, Hārta, Śātātapa, or even after some god, such as Viṣṇu, Brihaspati, Yama. Hindu law usually recognises three distinct divisions—viz. *āchāra*, or established usage and religious observances; *nyayāchāra*, or civil and criminal law and procedure; and *prajāśchitta*, or penances. The three most important Smṛitis are those of Manu (q.v.), Yājñavalkya, and Parāśara. This last code lacks, however, the section on civil law, which was only supplied some 500 years ago by the famous exegete Mādhyama, who composed a digest of law, based on Parāśara, with a special chapter on Vyavahāra. The new school of practical jurisprudence to which this work belongs was ushered in by Vijñāneśvara's *Mūlaksharā* (11th century), which, though primarily a commentary on Yājñavalkya, constantly quotes other authorities, and thus serves the purposes of a digest of law, and remains to this day one of the standard works on Hindu law. Amongst other famous digests may be mentioned Lakṣmīdhara's *Smṛitikalpatara* (c. 1125); Devaṇabhāṭa's *Smṛitichandrikā* (c. 1200), highly esteemed in Southern India; Jinātavāhana's *Dharmabhāṭya* (15th century), the chief authority on inheritance in the Bengal school; the *Vivamitradyaya*, by Mitranisra (c. 1625); and the *Vyavahāranayajikha*, being the civil law section of a general digest by Bhāṭya Nilakantha (c. 1640).

(2) *Philosophy*—Whilst the main body of the Vedic hymns is the immediate outgrowth of a worship of the elemental forces of nature, not a few of the hymns, especially the later ones, evidence a strong tendency towards metaphysical speculation. It is only in the Upanishads (see VEDA), however, that we meet with the first attempts at some kind of systematic treatment of the great problems of mundane existence, and of the nature of the absolute spirit and its relation to the human mind. The drift of speculative inquiry in those days, as over afterwards, is determined by two cardinal notions which are seldom questioned, and have assumed the force of axioms in Hindu philosophy—viz. the pantheistic notion of the spiritual unity of all sentient beings, and the transmigration of souls. Though of different origin the two views coalesce, the latter notion seeming the necessary consequence of the former. All individual souls are identical in nature, having emanated from, and being destined to return to, the infinite, all-pervading spiritual essence, the Brahman or Ātman. The apparent difference of the spiritual element in different kinds of animated beings (elemental gods, men, demons, animals, plants) is due to a greater or less degree of contamination with matter, and consequent obscuration; and it is only by a gradual process of

improvement and purification, in repeated terms of bodily existence—i.e. through metempsychosis—that lower beings can raise themselves to the state of purity requisite for their union with the Supreme Spirit (*paramātmā*). Ignorance of its own real nature, and of its identity with the world-soul, is what alone keeps the individual soul chained to matter, and to material existence with its hateful accompaniment of passion and suffering. To dispel this ignorance by setting forth the true relations between the individual being and the Brahman, as a preliminary to final emancipation, is the task and aim of philosophy.

Six philosophical systems (*darśana*) are recognised as orthodox by Hindus, which fall, however, into three pairs so closely connected that each pair forms a common school of philosophy—viz. *Mīmāṃsā* and *Vedānta*, *Sāṅkhya* and *Yoga*, *Nyāya* and *Vaiśeṣika*. Nothing certain is as yet known as to their date or order. The tenets of each system are propounded in a manual of concise aphorisms (*sūtra*), ascribed to the respective founder, and commented upon by numerous writers.

The *Mīmāṃsā*—or properly *Pūrva-Mīmāṃsā*, 'Prior Inquiry'—is mainly a systematic exposition of the principles of scriptural interpretation. Its chief object is to maintain the authority of the Veda, and to urge the necessity of performing the duties enjoined therein, especially those of a ceremonial kind, with a view to securing the benefits, temporal and eternal, accruing from these meritorious works as the logical effect of an operative cause. A philosophical basis is secured for these dogmatic theories by the inclusion of verbal communication (*śabda*) among the five or six sources of knowledge, or modes of proof, agreed upon by both schools of the *Mīmāṃsā*. The sage Jaimini is the reputed founder of this school, and author of its fundamental *sūtras*, which were afterwards commented upon and supplemented so as to cover the field of metaphysics by Sabara Svāmī (? c. 400 A.D.), Prabhākara (c. 600), and Kumārla Bhāṭya (c. 700).

The *Vedānta*, i.e. 'end of the Veda'—as the *Uttara-Mīmāṃsā* ('Later Inquiry') is more commonly called—is the system most closely in accord with the development of religious thought in Brahmanical India. In its main features it simply formulates and carries on the speculations of the older Upanishads. According to this system, God is the omniscient and omnipotent cause, efficient as well as material, of the world: He is both creator and nature; and at the consummation of things all are resolved into Him. The individual soul is of the same essence as the supreme one; it emanates from Him like one of the sparks that issue from a blazing fire, and ultimately returns to Him. It is not a free agent, but ruled by God; its activity—the source of its suffering—being solely due to its bodily organs. Whilst the evolution of the elements and organised bodies is minutely expounded in the original aphorisms—the *Brahma-sūtras* of Bādarāyana—the questions as to the *raison d'être* of material existence and the origin of evil find no satisfactory explanation. It is only by a later school of Vedāntists, represented by the *Kṛtikās* of Gaṇḍapāda (c. 700) on the late *Māṇḍūkya Upanishad*, and by the famous theologian Śaṅkara Āchārya (q.v.), in his commentary on those *sūtras*, that a solution is found in the theory that the material world has no real existence, but is a mere illusion (*māyā*). This school is called the *Advaita*, or non-duality, school of Vedānta philosophy; its origin can be traced to certain passages in the Upanishads, and it was powerfully affected by the nihilistic views of Mahāyāna Buddhism. In opposition to it arose two other schools, both of which identify the supreme spirit with Viṣṇu—

viz. that of Rāmānuja (c. 1100), the founder of the Śrī-Vaiṣṇava sect, usually called the *Vaiśiṣṭhādvaita*, or school of 'the non-duality of that which is qualified,' because they allow the Brahman to be 'qualified' by all good qualities, and to be 'distinct' from matter; and the school of Mādhva Āchārya (13th century), called the *Dvaita*, or duality, school from their maintaining the supreme spirit to be distinct both from man and from matter. These schools in fact show a certain leaning towards Sāṅkhya doctrines. The Rāmānujas and other Vaiṣṇava sects—especially the one founded by Chaitanya (c. 1500)—have, moreover, grafted on the Vedānta the doctrine and practices of *bhakti* (implicit faith, fervent devotion), which had early found expression in works such as the famous philosophic episode of the *Mahābhārata*, the *Bhagavadgītā* (trans. by J. C. Thomson and by K. T. Telang), and the *Bhāgavata-Purāṇa*, and are formulated in the late *Sāṅkhya-Bhakti-sūtra* (trans. by E. B. Cowell). In the system of Vallabha (c. 1500) *bhakti* is degraded into sensual love.

The *Sāṅkhya* system, as propounded in the *Sāṅkhya-sūtras* ascribed to Kapila, represents the realistic school of orthodox Indian philosophy. The *sūtras* are late (c. 1500), and the system appears in almost complete form in the *Sāṅkhya-Kārikā* of Gauḍapāda (4th century). It is apparently a development of ideas implicit in the *Kaṭha Upaniṣad*, where, however, the individual spirits are evolved, like matter, from the absolute self. Its influence on Buddhism is much discussed without clear results. It often appears in the *Mahābhārata*, where, however, there is a tendency to fuse it with Vedānta doctrines, and in the later Vedānta texts, such as the popular *Vedāntasāra* of Saṅānanda (c. 1500), much of its detail is worked into that system. It maintains the eternal co-existence of a material first cause—the *mūla-prakṛti*, or prime origination (plastic nature); also called *pradhāna*, or 'principal (cause)'—and a plurality of spiritual entities or selves (*puruṣas*). From the material first cause, devoid of intelligence, the phenomenal universe has been developed by a process of unconscious evolution. Consciousness arises from connection of the spirits with nature, which involves them in misery, and disappears with the recognition of the real separateness of spirit and matter. The school, since it does not admit the existence of an intelligent ruler (*īśvara*), is often called 'godless' (*nirīśvara*). The most popular summary of the doctrines of this system is the *Sāṅkhya-sāra* (trans. by H. J. Colebrooke, and by J. Davies), by Vijnāna Bhikṣu (16th century).

The *Yoga* school, whose *sūtra* is ascribed to a Patañjali, perhaps of c. 300 A.D., accepts the speculative system of the Sāṅkhya with its twenty-five principles; but adds thereto a twenty-sixth—viz. the '*nirguṇa Puruṣa*' ('the self devoid of attributes'), the supreme god of the school, whence the *Yoga* (originally 'practice' as opposed to Sāṅkhya, 'reasoning') is also called the *Theistic (śeṣvara)* Sāṅkhya. Moreover, the school has developed, as its most characteristic feature, a complicated system of ascetic practices for the mortification of the senses, with a view to bringing about, even during life, the isolation of the spirit from matter, which in this system represents the transformation of the more popular idea of a spiritual union with the supreme spirit.

The *Nyāya* and *Vaiśeṣika*, though differing from each other on some important points, such as the number of the modes of proof, came in the 11th century to be considered as two branches of a single analytical system of philosophy which supplement each other and are commonly studied together. The *Nyāya* (lit. 'method,' 'rule'), ascribed to a probably mythical Gotama (or Gautama, also

called Akṣhapāda), though, like the other systems, it professes to deal with the whole round of metaphysical subjects necessary for complete knowledge and final emancipation, is especially remarkable for the very complete system of dialectics which it has developed, and which has gained for it the title of the Hindu science of logic. Originally a simple system of argument from particular instances, it is later developed into a complex doctrine of the nature of universals. A regular argument, or complete syllogism (*nyāya*), according to this system, consists of five members—viz. (a) the proposition (*pratijñā*): e.g. 'this hill is fiery'; (b) the reason (*hetu*): 'for it smokes'; (c) the instance (*udāharaṇa*): 'as a culinary hearth'; (d) the application (*upanayaṇa*): 'accordingly the hill is smoking'; (e) the conclusion (*niṣṇāna*): 'therefore it is fiery.' The *Vaiśeṣika* system, ascribed to a legendary Kaṇāda, also called Kāśyapa, whilst on the whole accepting the analytical principles of the *Nyāya*, occupies itself more especially with the physical or cosmic aspect of metaphysics; its name being probably derived from the assumption of atoms (*anu*), or ultimate substances possessed of separate individuality (or 'particularity,' *viśeṣa*), which are innumerable and eternal, and of which the phenomenal world is composed, rising out of them and periodically being resolved into them. Their aggregation, according to the original view of the school, is caused by an invisible force (*adṛṣṭa*), the effect of the actions of spirits in past lives, whilst at a later stage it is ascribed to a supreme soul (*paramātmān*), distinct from the individual souls (*jīvātman*) forming the immaterial atoms. The systems were developed by the 4th century A.D., and may be considerably older; Greek origin for both their logic and atomism has been suggested. By Dignāga (c. 400 A.D.) and later Buddhist writers very considerable advance was made in developing a profound and quasi-Kantian theory of knowledge. Both schools, originally atheistic or recognising a deity only formally, became later strongly theistic.

Of heterodox systems of philosophy—besides those of the Jains (q.v.) and Buddhists (q.v.)—only one deserves special mention—viz. the *Chārvākas*, or *Loṅgātikas* ('materialists'). The doctrines of this school, traditionally ascribed to Bṛhaspati, admit but one source of knowledge and proof—viz. perception. According to them there is neither a supreme spirit, nor a future life, nor a soul distinct from the body; and the sole end of man is enjoyment derived from sensual pleasures.

A kind of mystic philosophy—in the sense in which the peculiar practices of the *Yoga* are regarded as such—underlies the doctrines promulgated by the Tantras, the religions text-books of the numerous sects of *Śāktas*—i.e. worshippers of the *śakti*, or active divine energy, personified in some female deity, especially in one of the many forms of Pārvatī, the wife of Śiva. In its origin a relic of primitive savage beliefs, the worship of the female principle as a means of obtaining transcendental powers came to receive philosophical support in the Sāṅkhya notion of the *prakṛti* (form) or plastic material principle as the prime cause of the universe; and considering that this form of belief is referred to amongst the heterodox doctrines contended against by Śaṅkarāchārya (c. 800 A.D.), it would seem to be of tolerable antiquity. The form in which it is incultured in many of the Tantric writings is grossly licentious. The number of original Tantras is usually fixed at sixty-four. The best-known works of this class are the *Rudrayānala*, *Kālārāya*, *Syāmārāhasya*, and *Kālikātāntra*.

The best Indian survey of the Indian systems (except Mīmāṃsā) is Mādhava's *Sarvadarśanasamgraha* (trans.

by E. B. Cowell and A. E. Gough); see F. Max-Müller, *Six Systems of Indian Philosophy*; S. Radhakrishnan, *Indian Philosophy*; A. B. Keith, *Sāṃkhya System*, *Indian Logic and Atomism*, *Karma-Mīmāṃsā*.

(3) *Grammar (vyākaraṇa)*.—Grammatical research in India probably goes back to nearly as early times as the redaction of the Vedic hymns. The work traditionally accepted as the Vedāṅga-treatise in this science—viz. the *Aṣṭādhyāyī*, 'eight chapters' of aphoristic rules, by Pāṇini (q.v.)—marks the very highest point of its development, and would seem to presuppose a long period of growth. To the same author is ascribed the original treatise of another Vedāṅga—viz. phonetics (*śikṣā*), treating of the nature of the letters and accents, and the proper mode of sounding them. To this latter branch of science have to be referred the *Prātiśākhya*s, elaborate treatises on the phonetic changes undergone by words in the connected form of the Vedic texts. Such treatises are in existence for all the Sāmhitās, except the *Sāmaveda*; those of the *Rik* and *Atharvan* being ascribed to Sannaka, that of the *Vijasaneyi-sāmhitā* to Kātyāyana, whilst the author of the *Taittirīya-prātiśākhya* is unknown. Whether these works are in whole or part anterior or posterior to Pāṇini is still doubtful. Here must also be mentioned the oldest work on etymology and Vedic interpretation, Yaska's *Nirukta*, which is older than Pāṇini's grammar. Pāṇini's rules were partially amended and supplemented in Kātyāyana's *Vārttika*s, which on their part were critically examined by Patanjali (2d century B.C.) in his *Mahābhāṣya*, 'great commentary.' So minute and complete was the grammatical analysis of the language presented in these works that the efforts of subsequent authors of grammars were mainly directed towards the best rearrangement of the linguistic matter for practical educational purposes. The most important of these grammars, forming the text-books of special grammatical schools, are the *Chāndra-vyākaraṇa*, by Chandra-gomin of Kashmir (c. 600 A.D.); the *Kātantra*, by Saivayana (c. 4th century), the text-book of the Kālāpi or Kaumāra school; the *Jainendra-vyākaraṇa* of Pūjyapāda Devanandin (c. 678); the *Sākalīyana-vyākaraṇa* (c. 850); the *Samśikṣiptaśāstra* of Kramadīvara; the *Śrāvastī prakṛiṇā*, by Amubhūti-svarūpāchārya; the *Haima-vyākaraṇa*, by Hemachandra (12th century); the *Mughdhabodhi*, by Vopadeva (13th century); and the *Siddhānta-kaumudī*, by Bhattoji Dikṣita (17th century).

(4) *Lexicography*.—Native dictionaries (*koṣa*), generally composed in verse, are either homonyms or synonyms. In the former the words explained are usually arranged according to the final consonant and then according to the number of syllables they contain. The most famous dictionary (chiefly synonymous), and one of the oldest, is the *Anarakoṣa*, by Amarasiṃha (c. 550). Of others the most important are Śāvata's *Anekārthasamuccaya* (homonymous), Yādavaprakāśa's *Vaijanānti* (c. 1050), Hemachandra's *Abhidhāna-chintāmaṇi*, Halāyudha's *Abhidhāna-ratnamālā* (10th century), and the *Medinī* (c. 14th century). See Th. Zachariae, *Die indischen Wörterbücher* (1897).

(5) *Prosody (chandas)*.—The privilege of representing this science among the Vedāṅgas is assigned to the *Chāndogya-sūtra*, ascribed to Pingala, who is traditionally identified with Patanjali, the grammarian, but is probably rather later in date. But, strange to say, the section of this work treating of Vedic metres is very meagre, whilst the chapter on post-Vedic metres is tolerably complete, and, with a commentary on it by Halāyudha (probably the lexicographer), still forms one of the chief authorities on prosody. Of other important manuals may be

mentioned the chapter on metre in the *Bhāratīya-Nāṭyaśāstra*, the *Vṛttaratnākara*, 'jewel-mine of rhythms,' by Kedarabhāṭa (before the 13th century); and the *Chhandamanjari*, 'cluster of metres,' by Gaṇādāsa. See Colebrooke, *Misc. Ess.* ii.; A. Weber, *Ind. Stud.* viii.

(6) *Music (saṅgita)*.—The existing treatises other than the chapters in the *Nāṭyaśāstra* on music are of comparatively modern origin. The two most important are the *Saṅgita-ratnākara*, 'jewel-mine of harmony,' by Śārngadeva, and the *Saṅgita-darpaṇa*, 'mirror of harmony,' by Dāmodara. These works treat not only of music proper—including the notes, melodies, and measures, singing, concerted music, and instruments—but also of dancing, acting, and mimic representation.

(7) *Poetics (alankāra śāstra)*.—The theory of poetic composition and the approved forms of literary style has been a favourite subject with Hindu writers; and the result of their labours is a minute classification of the various forms of composition, and an elaborate system of rules regarding the different sentiments and forms of speech applicable to certain characters and conditions of life. Dramatic poetry, as the most varied form of literary composition, usually occupies a large share of the attention of rhetorical writers. The *Bhāratīya-Nāṭyaśāstra* (c. 300) is the most ancient of the existing manuals of this art. The earliest work the date of which has been fairly ascertained is the *Kāvya-darśana*, 'mirror of poetry,' by Daṇḍin (c. 600); Bhāmaha is rather later. About 800 there developed a subtle doctrine of suggestion (*dhvani*) as the soul of poetry, and this was developed by Anandavardhana (c. 850) and Abhinavagupta (c. 1000). Of other works on poetics generally may be mentioned the *Kārya-prakāśa*, or 'lustre of poetry,' by Maṇimatī (c. 12th century), and especially the *Sāhitya-darpaṇa*, or 'mirror of composition' (trans. in *Bibl. Ind.*), by Viśvanātha Kavirāja (15th century), the standard authority on literary criticism. The favourite manual of dramaturgy is the *Daśarūpa*, 'ten forms' (of plays), by Dhnanajaya (c. 10th century). See S. K. De, *Sanskrit Poetics* (1923-25).

(8) *Medicine (ayurveda, vaidyaśāstra)*.—The oldest systematic treatises on medical subjects are the *Sāmhitā*s of Charaka and Suśruta (2d century), both composed in verse mixed with prose sections, and characterised by great diffuseness; they are largely interpolated and rewritten. The *Bhela-Sāmhitā* is of uncertain age. Of later handbooks of medical science may be mentioned Vāgbhāṭa's *Aśhāṅgaśrīḍaya* and Bhavamiśra's *Bhāvaprakāśa*; whilst the *Rājanyāghaṇṭa*, by the Kashmirian Narahari, is the most approved manual of materia medica. See T. A. Wise, *Commentary on Hindu Medicine* (1845), and *History of Medicine* (vol. i. 1867); J. Jolly, *Medicin* (1901).

(9) *Astronomy and Mathematics*.—Astronomy appears as one of the Vedāṅgas, or members of the Veda; and the treatise which has been handed down as such is in the *Rik* and *Yajus* recensions—viz. the *Jyotiṣa*—presents indeed a comparatively primitive appearance, as it knows only a cycle of five years, each of 365 days, and mentions neither the zodiac nor the planets. Much the same phase of knowledge is represented by some other works, such as the *Gārgi Sāmhitā* (? c. 50 B.C.). A new scientific era, brought about by a knowledge of Greek astronomy, commenced about 250 A.D., and gave rise, in the first place, to five works called *Siddhānta* (*Sāryasiddhānta*, &c.), summarised in Varāhamihira's *Panchasiddhāntikā* (c. 550), and later on to the standard works on astronomy—viz. Āryabhaṭa's *Āryabhaṭya* (c. 500), Varāhamihira's *Bṛhat-sāmhitā*, Brahmagupta's *Brāhma-Sphuṭa-siddhānta* (c. 625), and Bhāskara Achārya's *Sid-*

dhāntasiromani (1150). In the field of mathematics the greatest writers are Āryabhata, Brahmagupta, and Bhāskara in his *Līlāvati* (arithmetic) and *Bījaganita* (algebra). The Indian origin of decimal notation is probable, but disputed; their algebraical discoveries were of considerable note. See G. Thibaut, *Astronomie, Astrologie, und Mathematik* (1899).

Sanson. See EXECUTION.

Sansovino, ANDREA CONTECCI DEL MONTE, Florentine sculptor, was born at Monte Sansovino in 1490. He worked in Florence, Portugal, Rome, and Loreto. He died in 1529. See *Life* by Schönfeld (1881).—His pupil, JACOPO SANSOVINO or TATTI (1486–1570), sculptor and architect, was born in Florence, and lived from 1527 in Venice.

Sans Souci. See POTSDAM.

San Stefano, a village 6 miles W. of Constantinople, where was signed (3d March 1878) the preliminary Russo-Turkish agreement.

Santa Ana, an important town of Salvador, capital of the province of the same name, 40 miles inland, with trade in coffee, cigars, sugar, and cattle. There is a fine town-hall, and an important fair is held annually. Pop. 70,000.

Santa-Ana, ANTONIO LÓPEZ DE, president of Mexico, was born in Jalapa, 21st February 1795. At the age of fifteen he entered the Spanish army, and served against his countrymen until 1821, when he joined Iturbide, who made him brigadier and governor of Vera Cruz. Iturbide had established an imperial rule over Mexico (q.v.), but in 1822 Santa-Ana proclaimed a republic, and brought about his patron's downfall. In 1828 he headed a rising which placed Guerrero in the presidential chair; and in 1829 he defeated and captured a division of Spanish troops which had landed near Tampico, with the view of again bringing Mexico under Spanish rule. He now engaged in a series of intrigues which culminated in an open revolt against the president, Bustamante, in 1832, and his own election. Santa-Ana, however, desired power without responsibility for the irksome details of government, and he retired to his country seat, leaving the executive in the hands of the vice-president; and when he ceased to be able to control this lieutenant, in 1834 he headed a rising against him, and had him deposed in 1835, and another appointed in his stead. But Santa-Ana's reactionary policy, which reduced the states to provinces and placed all the power in the hands of the central government, in 1836 cost the country Texas (q.v.). He invaded the revolted province with 6000 men, and defeated and massacred his opponents with unbroken success until April, when he was routed at San Jacinto by Houston, and soon after taken prisoner. He escaped with eight months' imprisonment and a short detention in the United States; but at home his influence was not restored until, luckily for him, in 1838 the French attacked Vera Cruz, and in the gallant defence of the city he lost a leg. He was now encouraged to renew his intrigues, which were again successful, and from 1841 to 1844 he was either president or the president's master. Then there was a revolution on the other side, the army deserted him, and he fled towards the coast, but was arrested, imprisoned for a time in 1845, and ultimately permitted to retire to Havana. From this exile he was recalled in 1846 to be first commander-in-chief and then president. The war with the United States had begun, and begun badly: Palo Alto and Resaca had been lost, and in September Monterrey fell. In February 1847 Santa-Ana, who had brought together some 20,000 men, attacked Taylor's weakened force of 5000 at Buena Vista; but the narrow pass and the strength of the American artillery were fatal

to him, and he was repulsed with heavy loss. At Cerro Gordo, in April, Scott defeated him and took 3000 prisoners. Santa-Ana retired on the capital, but when its fall became certain he resigned the presidency and withdrew from the city by night. He was allowed to retire to Jamaica in 1848, but was recalled by a revolution in 1853, and appointed by an obedient congress president for life, with the title of Most Serene Highness. His harsh rule quickly produced a number of revolts, and in 1855 he was driven from the country, finally finding a refuge in St Thomas. On the establishment of the empire under Maximilian he was permitted to return on condition of his not interfering in political affairs; but he could not refrain from intriguing for himself and issuing the old proclamations, and so before long Bazaine sent him back to St Thomas. Even the appointment of grand-marshal of the empire could not keep him faithful, and a second conspiracy against Maximilian ended in another flight. He now vainly endeavoured to obtain employment against the empire, and in 1867, after the emperor's death, tried to effect a landing at Sisal, but was captured, tried by court-martial, and sentenced to death. Juárez, however, pardoned him on condition of his leaving Mexico; and the old man spent the succeeding years mainly on Staten Island, New York, in conspiring, cock-fighting, and card-playing, until a general amnesty in 1872 enabled him to return to his own country. There, disregarded and harmless, he died in the capital, 20th June 1876.

Santa Barbara, a health resort of California, is situated on the Pacific coast, 90 miles WNW. of Los Angeles. It is the centre of an important farming and fruit district, while petroleum wells and fisheries are also valuable. The old Franciscan Mission, rebuilt after an earthquake in 1786, was with other buildings again damaged by earthquake in 1925. Pop. 20,000.

Santa Caterina Villarmosa, a town in the south of Sicily, 9 miles NW. of Caltanissetta, with sulphur-mines and manufacture of earthenware. Pop. (1921) 8716.

Santa Catharina, a southern coast state of Brazil, with an area of 20,785 sq. m. and a population of 668,743. The coast is very irregular, the interior mostly a plateau sinking gently to the west. The climate is not unhealthy, but moist. The industries are mainly in the hands of the very numerous German settlers, who maintain the use of their language and customs. The capital is Florianopolis (35,000), a port of call, on the hilly, fertile island of Santa Catharina (210 sq. m.).

Santa Clara, a province of Cuba, has a flourishing trade in coffee, tobacco, rice, cocoa, fruit, and some mining; area, 8257 sq. m., and pop. 692,000. The inland town, Santa Clara, its capital, is in the centre of rich farming and grazing country, with factories of high-class tobacco; pop. 20,000.

Santa Claus. See NICOLAS (St.).

Santa Cruz, or SAINTE CROIX, (1) one of the Virgin Islands, sold by Denmark to the United States (1916–17), with an area of 84 sq. m. and a population of 15,000. Sugar-growing and cattle-rearing are the chief industries; the capital is Christiansted, the chief port Frederiksted. Discovered by Columbus (1493), the island was held by Dutch, English, Spanish, French, and the Knights of Malta at various dates, and was bought by Denmark in 1733.—(2) The largest (area, 216 sq. m.) of a group of Melanesian islands, sometimes called Queen Charlotte Islands, east of the Solomon archipelago and 100 miles N. of the New Hebrides.—(3) Santa Cruz de Tenerife, capital of the Canary

Islands (q.v.), and the chief seaport of the group, stands on the north-east side of the island of Tenerife. Its port, enlarged and improved, is protected by moles, affords excellent anchorage, and is much resorted to by steamers for re-coaling. Santa Cruz is a closely-built town, with houses of the Spanish style, flat-roofed and with square patios, and is defended by forts and redoubts. It is the seat of a bishop and the headquarters of the Spanish governor; it has an observatory, a technical institute, and a naval school. Pop. 52,500. See BLAKE (ROBERT), under dato 1657, and NELSON (1797).—(4) Santa Cruz de la Palma is the capital of Palma, another of the Canary Islands (q.v.), with an important harbour; pop. 7300.—(5) A southern territory of the Argentine Republic, between 46° S. lat. and Cape Dungeness, and stretching from the Atlantic to the watershed of the Andes. Area, 109,142 sq. m. It is a land of desolate plateaus, with little water and scanty pasturage, where, however, thousands of wild horses range.—(6) A province of Bolivia, with rich forest and mineral resources; cattle-rearing and agriculture are carried on; area, 144,941 sq. m., and pop. 345,000. Santa Cruz, founded 1592, the capital of the province, has an observatory, a national college, a geographical institute and law-courts; pop. 20,000.

Santa Fé, a wealthy province of the Argentine Republic, stretching north from Buenos Aires to 28° S. lat., and so embracing a considerable portion of the Gran Chaco. Area, 50,713 sq. m.; pop. 1,007,000. The province is well watered by the Paraná and its tributaries. Wheat, maize, and lucerne are grown in large quantities, and the pasture-land is very rich. Cattle-breeding is carried on. The largest town is Rosario. The capital is Santa Fé, on the Río Salado, which exports chiefly cereals, timber, and quebracho. There are two large docks for ocean-going steamers, and a university (1920). Pop. 60,000.

Santa Fé, the capital of New Mexico, is built among the Rocky Mountains, 6840 feet above the sea, and 1327 miles by rail WSW. of Chicago. The climate is very dry, so that irrigation is necessary for agriculture; and most of the houses are built of *adobe*. There is some mining in the vicinity. A School of American Research (1907) occupies the old Spanish governor's palace. Pop. 7000.

Santalaceæ, a family of dicotyledons, mostly trees and shrubs, semiparasitic. The leaves are undivided, sometimes minute. The European and most of the North American species (chiefly *Thesinn*) are obscure weeds, whilst the trees of the family occur chiefly in the East Indies, Australia, and the South Sea Islands. Sandalwood (q.v.) is the produce of plants of this family. The leaves of *Osyris arborea* are used for tea. Some species are used in medicine in their native countries. *Ficus acuminatus* is the Quandang Nut of Australia. Its taste and qualities resemble those of Sweet Almonds, as do also those of the seed of the *Cervantesia tomentosa* of Peru. *Pyralaria pubera*, the Buffalo Tree or Oil Nut, has a large seed, from which, in the southern states of America, oil is obtained.

Santalín, or SALTALIC ACID, the colouring matter of red Sandalwood (q.v.).

Santals, an aboriginal tribe of India, belonging to the Kolarian family, occupy a long narrow strip of country between the mouth of the Mahanadi in Orissa and the Ganges near Bhagalpur. In 1921 the total number of persons speaking Santali was 2,265,282, including Christian converts, and 100,000 Santals labouring in the Assam tea-plantations. They are fond of change, and prefer to live on the edges of the great forests: when the

ground gets well cleared and cultivated they move to a new site. In personal appearance they are not unlike negroes, having a broad round face, a broad flat nose, a large mouth with projecting lips, and coarse black hair. Their chief occupations are cultivating the soil, hunting, playing the flute (in which they are great proficient), and dancing round dances. They worship the sun for their supreme god, and after him a number of malignant spirits, whose evil influence they seek to avert. They are divided into twelve tribes, and their village government is patriarchal in type. The exactions of the Hindu money-lenders provoked the Santals to revolt in 1854; the rising was not suppressed without a good deal of bloodshed. Since then this people have been allowed to exercise their own forms of self-government, under the supervision of the British authorities. There is a Santal grammar by Skrefsrud (Benares, 1873).

Santa Lucia. See ST LUCIA.

Santa Marta, a town of Colombia, on the Caribbean Sea, was founded in 1525, the second Spanish town planted on the mainland. In 1834 an earthquake almost utterly destroyed the place, which is still, however, a bishop's see, and has an excellent harbour. Huge quantities of bananas are exported. Simón Bolívar died close by in 1830. Pop. 15,000. See also SIERRA NEVADA.

Santa Maura. See LEUKAS.

Santander, a thriving seaport on the north coast of Spain, stands on an inlet of the Bay of Biscay, about equally distant from Oviedo on the west and San Sebastián on the east, and by rail 316 miles N. of Madrid. The bay on which it stands is accessible to the largest vessels at all times. The town occupies a picturesque site, and has a cathedral and municipal library. Among the industries are fisheries, cigar factories, breweries, cotton, paper, and flour mills, iron-foundries, and shipbuilding-yards. The exports include iron ore, zinc, pig-iron, wine, cider, preserved fish and meat, sardines, mineral waters, wool, nuts; and the imports coal, iron and steel goods, tobacco, food-stuffs, codfish, textiles, petroleum, chemicals, timber, &c. In 1893 a ship in the harbour took fire, and the consequent explosion of a cargo of dynamite destroyed quays, whole streets of houses, and hundreds of lives. Santander is a favourite seaside resort in summer. Population, 72,000. There are caves used by prehistoric man some 20 miles away. It was here Charles I. embarked for England after his trip to the Spanish court, and in 1808 the town was sacked by Soult.—The province, a mountainous land, with fertile transverse valleys, is the seat of active pastoral, mining (iron, zinc, copper, magnesite, salt), and other industries, such as fish-canning on the coast. Area, 2108 sq. m.; pop. 332,000.

Santarem, (1) capital of the Portuguese province of Estremadura, stands on the right bank of the Tagus, 46 miles NE. of Lisbon by rail. An old Moorish castle, crowning a hill that overlooks the town, was during the middle ages the residence of the kings of Portugal. It has a cathedral and several churches: the kings Diniz I. and Henry died here, and Ferdinand I. lies buried here, as well as Cabral, the discoverer of Brazil. The army of Pedro of Brazil under Napier and Villafior routed here the forces of the usurper Miguel on 16th May 1834. It trades in wine, oil, grain, cork. Pop. 8000.—(2) A town in Para State, Brazil, near the junction of the Tapagos and Amazon. Pop. 5000.

Santa Rosa, capital of Sonoma county, California, on Santa Rosa Creek, 51 miles by rail N.

by W. of San Francisco. It is the centre of an agricultural district, with large dairy interests. Pop. 8700.

Santa Rosa, (1) A mining town of Colombia, in Antioquia; pop. 16,000.—(2) Santa Rosa de los Andes, a town of Chile, in Aconcagua; it is the centre of a cereal and fruit region, while brandy-distilling is carried on; pop. 10,000.

Santayana, GEORGE, American philosopher, was born of Spanish parents at Madrid in 1863, but was educated at Harvard, where he afterwards became for a time professor of Philosophy. In his principal work, *The Life of Reason* (1905), in 5 vols.—*Common Sense, Society, Religion, Art, Science*—he expounds with a lucid style his philosophy, a kind of fastidious Materialism. With Berkeley, he rejects the independence of matter, only considering it in virtue of what is attributed to it by direct contact with ideas. The philosopher delights in the pageant of life, and conceives the life of Reason as a mere romance. His other writings include *Winds of Doctrine* (1913), *Scepticism and Animal Faith* (1923), and a collection of *Selected Poems* (1923).

Santee, a river of South Carolina, is formed in the centre of the state by the junction of the Congaree and Wateree, flows south-east, and empties into the Atlantic Ocean. It is about 150 miles long, and is navigable for steamboats to Columbia and to Camden.

Santerre, ANTOINE JOSEPH, a French revolutionist, who for some time exercised an influence quite out of proportion to his abilities, was born at Paris, 16th March 1752. He followed the trade of a brewer in the Faubourg Saint-Antoine, and his wealth and generosity gave him an immense influence in the district. On the establishment of the National Guard in 1789 he received the command of a battalion, and took part in the storming of the Bastille. During the year 1792 the Jacobin agitators of the faubourgs often met in the brewery of Santerre, and it was there that the *Écluse* of the 20th June was preconcerted, on which occasion Santerre marched at the head of the mob who invaded the National Assembly and turned out the Girondists. He also played a conspicuous part on 10th August, when he was made commander-in-chief of the National Guard. He was charged to keep order at the execution of the king, and it was he who bade the drummers drown the king's voice when he essayed to speak to the people from the scaffold. On 30th July he was appointed a general of division in the French army, and marched at the head of 20,000 men against the Vendéan royalists, but was miserably beaten (18th September), and in consequence recalled and imprisoned, and he only obtained his liberty after the death of Robespierre. He then withdrew into private life, and died 6th February 1809. Though he was hugely fond of 'brave words,' and menaced his opponents with all the bellicose grandiloquence of a French revolutionist, he was nearly as soft at heart as he was in the head. See *Life* by Carro (Paris, 1847).

Santhals. See **SANTALS**.

Santiago, (1) the capital of Chile and of Santiago province, stands in a wide and beautiful plain near the western base of the Andes, 1700 feet above sea-level, and 115 miles by rail ESE. of Valparaíso. The snow-capped cordilleras seem to enclose it on the north and east; while on the east side the picturesque Cerro de Santa Lucia—now ornamented with gardens, statues, balconies, &c.—rises abruptly within the city, some 400 feet from the level of the plain. Through the northern part rolls a small but turbulent stream, the Mapocho, now crossed by five handsome bridges. The city is regularly laid out, with streets comparatively broad, and

tramways in all directions; the Alameda, a magnificent avenue, 2 miles long, lined with trees, is especially beautiful. Some of the houses, however, are of one story only, owing to the earthquakes (the most serious have occurred in 1575, 1647, 1730, 1822, 1835, 1906), though handsome private buildings are becoming every year more numerous. The principal square is the great Plaza Independencia, with the government palaces, and the cathedral and archbishop's palace. The cathedral is a large plain building of brick and stone, but inside it is very richly furnished. On the site of the Jesuit church, burned down in 1863, there stands the monument in memory of the 2000 worshippers who perished in the fire. Other buildings of note are the mint, with the official residence of the president; the law-courts; the Casa Moneda, containing painting, sculpture, and historical relics; the Military Museum; and the National Library. Santiago possesses two universities, the State University of Chile (1743) and the Catholic University (1888). There are also a teachers' training college, schools of agriculture and of fine art, a geographical institute, an observatory, and several good libraries. The suburbs of Santiago are very beautiful, with villas and gardens bright with flowers. The climate is dry and generally agreeable, but the changes of temperature are somewhat trying. The city is of importance as a commercial place, and it has a busy stock exchange. Its manufactures include cloth, ship's biscuits, beer, brandy, &c., and it has also ice, fruit-conserving, and copper-smelting works. Santiago was founded by Pedro de Valdivia in 1541. Pop. (1920) 507,296.—Area of the *provincia*, 5893 sq. m.; pop. 685,000.—(2) A province of the Dominican Republic. Cotton, tobacco, coffee, and cacao are grown, and there are some gold mines; area, 1490 sq. m.; pop. 123,000. Its capital, Santiago de los Caballeros, has a pop. of 17,000.—(3) The largest and most populous of the Cape Verde Islands (q.v.); area, 396 sq. m.; pop. 60,000.—(4) An inland town of Panamá; the chief products are indiarubber, rice, coffee, and timber, and there are copper and gold mines; pop. 11,000.

Santiago de Compostela, a city of Spain, formerly the capital of Galicia, stands in a picturesque situation, surrounded by hills, 33 miles S. by W. of Coruña, and 26 by rail N.E. of its port, Carril. Here in 835 the bishop of Iria discovered, according to the legend, the bones of St James (San Iago), being guided to the spot by a star, whence Compostela (*campus stella* = 'field of a star'); the relics were in 1884 solemnly affirmed by the pope to be still beneath the cathedral. This building, Romanesque in style, was built 1078-1188, and contains some fine sculptures and metal-work. It was the shrine that attracted every 25th July so many thousands of pilgrims in the middle ages, it being an especial favourite with Englishmen. It is now, however, out of repute, and is scarcely ever visited. This fact and the many ruined monasteries give the town a deserted and dreary appearance. Nevertheless it is still an archbishop's see, and has a university (1504). There is some trade in cereals, wool, and fruit. Pop. 26,000. The Spanish spelling is Compostela, not Compostella. See *The Story of Santiago de Compostela*, by Gasquoine Hartley (1912).

Santiago de Cuba, formerly the capital of the island of Cuba, and now the chief town of the eastern department, stands on a bay on the south coast, 475 miles from Havana, and has a harbour, deep, well protected, and fortified. During the Spanish-American War of 1898 Santiago was besieged by the United States forces; the Spanish fleet under Admiral Cervera, which had taken

shelter in the harbour, made a dash out (3d July), but all the ships were sunk or captured. The town surrendered 17th July. It produces sugar, copper, iron ore, cedar, hides, coffee, tobacco, and mahogany, and has a large cathedral. Pop. 70,000.

Santiago del Estero, a north central province of the Argentine Republic, with an area of 55,385 sq. m. and a population of 298,000. Except for a few insignificant sierras, it forms a vast plain, inclining gently from the north-west to the south-east. In the south-west and elsewhere there are great salt marshes. The only rivers are the Salado and Dulce; agriculture (sugar, maize, wheat, lucerne, cotton) depends mainly on irrigation. Cattle-farming is a leading industry.—The capital, Santiago, on the Río Dulce, 630 miles by rail NNW. of Buenos Aires, was founded in 1553, has a national college, a normal school, a racecourse opened 1923, and a pop. of 23,000.

Santipur, a town of Bengal on the Hágli, 43 miles N. of Calcutta. Pop. (1921) 24,792.

Säntis, or SENTIS, a mountain on the borders of the Swiss cantons of St Gall and Appenzell, consists of three parallel ridges, separated by deep valleys and connected by lofty saddles. The highest point is 8216 feet above sea-level. There are on the mountain, which commands very beautiful views, an observatory (since 1887) and a hotel.

Santley, SIR CHARLES (1834–1922), baritone, was born in Liverpool, and trained as a singer partly in Milan (1855–57). He made his first appearance in England in Haydn's *Creation* in 1857, singing the part of Adam, and up to 1876 appeared regularly in opera. He was even better known from his appearances at concerts and in oratorio. He made tours in America and the Dominions, and in 1892, when he had largely withdrawn from public work, he published *Student and Singer*. Further *Reminiscences* followed in 1909.

Santo Domingo. See SAN DOMINGO.

Santonin, $C_{12}H_{18}O_6$, is a crystalline neutral principle extracted from *Santonica*, the latter being defined in the British Pharmacopoeia as the dried unexpanded flower-heads of *Artemisia maritima*, var. *Stoechianniana*. The plant grows in Russia, and belongs to the family Compositae. Santonin occurs in brilliant white flat crystals, which become yellow on exposure to light, few specimens being colourless unless they have been recently prepared or very carefully kept in the dark. It is odourless, and almost tasteless; practically insoluble in water. Santonin is used in medicine solely as an anthelmintic, and is especially poisonous to the round worm (*Ascaris lumbricoides*), being much less so to the thread-worm (*Oxyuris vermicularis*). The dose is 6 to 20 centigrams (1 to 3 grains) for an adult; it may be given in powder, alone or mixed with sugar, or dissolved in a little olive or castor oil, or as the official lozenge (1 grain in each). It should be used with caution in weakly children. It is excreted in the urine, to which it imparts a deeper yellow colour, changing to red if the urine become alkaline. On colour vision it has often a peculiar effect, the cause of which has never been satisfactorily determined. Objects appear first purple or blue and then yellow, colour vision finally becoming lost.

Santorin, or THERA, an island of the Aegean, the southernmost of the Cyclades, 70 miles N. of Crete. It is shaped like a crescent, the horns pointing west; between them lies the island of Therasia. The space so enclosed, 18 miles in circuit, resembles a volcanic crater, and three small islands it encloses (the Kanmenes) are all of volcanic origin. Santorin and Therasia have lofty and precipitous shores (up to 1000 feet) next the

crater; on their outer sides they slope away gradually to the sea, except that in the south-east of the former Mount St Elias rises to 1887 feet. The chief town, Thera or Phera, on the west coast of Santorin, is built in the cliffs of tufa and perched some 900 feet above the water's edge. Excellent wine is grown on the disintegrated volcanic soil. Eruptions have taken place, chiefly near the Kanmenes, in the years 196 B.C., 726 A.D., 1573, 1650, 1707, 1866, and 1925. Interesting prehistoric dwellings, containing pottery and other remains, have been found in the southern half of Santorin. There are also ruins of Greek temples and other buildings. There were important excavations in 1895–98, described in *Thera* (2 vols., Berlin, 1899–1902).

Santos, a port of the state of São Paulo in Brazil, founded in 1546, on the island of São Vicente. Santos has now become the leading coffee port in the world, being the outlet for most of the produce of the São Paulo (q.v.) state. It has modern buildings and splendid avenues, but formerly was very unhealthy. Pop. 114,000.

San Vicente, a town of Salvador, 40 miles NE. of San Salvador. Woollen goods are manufactured, and sugar, coffee, and tobacco are produced. Pop. 30,000.

São Francisco, a large river of Brazil, rises in the south-west part of the province of Minas Geraes, flows north, north-east, and east south-east to the Atlantic, and in its lower course separates the provinces of Bahia and Sergipe from Pernambuco and Alagoas. Length, 1800 miles; drainage area, 248,000 sq. m. It is navigable as far up as its junction with the Paraopêba, except at three points.

São Luiz, a town of Brazil, capital of the state of Maranhão, situated on an island in the Bay of Maranhão, with a trade in rice, cotton, and sugar; pop. 53,000.

Saône, a river of France, an affluent of the Rhone (q.v.), rises in the dept. of Vosges, in the Faucelles Mountains, flows south-west as far as Chalons, thence south to the Rhone at Lyons. It is joined by the Doubs from the left. Entire length, 282 miles, of which 170 are navigable. Area of basin, 11,418 sq. m.

Saône, HAUTE, a département in the east of France, slopes south-west from the southern extremity of the Vosges, whose spurs diversify the north-east. It is watered chiefly by the Saône and its tributaries. Forests abound everywhere (one-third of area), and one-half of the total area is cultivable. The principal natural products are wheat, potatoes, and oats, iron, coal, and salt; and the manufactured, iron goods, glass and pottery, bricks, paper, and cottons. Fruit, especially cherries, is extensively cultivated. There are several mineral springs, the best known at Luxeuil. The arrondissements are Gray, Lure, and Vesoul; and Vesoul is the capital. Area, 2074 sq. m.; pop. (1920) 228,348.

Saône-et-Loire, one of the largest départements of France, part of ancient Burgundy, is bounded on the SE. by the Saône and on the W. by the Loire. The country consists for the most part of fertile plains, separated by rich vine-clad hills. The wines are well known as *vins de Mâcon*. Agriculture, iron and coal mining, and manufactures of cotton fabrics, pottery, iron rails and plates, machinery, engines, glass, &c. are carried on. The cattle are an exceptionally fine breed (white). There are five arrondissements—Autun, Chalons, Charolles, Louhans, and Mâcon; capital, Mâcon. The iron-town of Le Creusot, the pilgrimage resort of Paray-le-Monial, and the once famous abbey town of Cluny are all in this département. Area, 3330 sq. m.; pop. (1920) 554,816.

São Paulo, capital of the Brazilian state of the same name, stands almost 3000 feet high on a wide plain bounded by low hills, 4 miles from the Rio Tiete and 310 by rail W. by S. of Rio de Janeiro. It has a fine situation, is well laid out, and has tramways to the beautiful suburbs. Among the buildings are the old Jesuit college, now the government palace, the bishop's palace, a law college, a magnificent opera-house, and a polytechnic school. São Paulo is the headquarters of the coffee-trade, and four railways connect it with the great coffee districts in the interior. There are cotton-works, and manufactories of tobacco, boots and shoes, gloves, and hats. Pop. (1902) 332,000; (1920) 579,033, including many thousands of Italians and Germans.—The state (area, 112,278 sq. m.; pop. 4,592,188), the most promising in the republic, stretches from the ocean to the river Paraná, and consists of a tropical coast-belt (8 to 80 miles broad) and a temperate elevated region, occupying all the interior, and rising from 1600 feet. The principal ranges are the Serras da Mantiqueira and do Mar, while the rivers are numerous, and many of them of importance. The state produces more than half the world's supply of coffee, more than 3,160,000 acres being under cultivation, while cotton has become also very important. Every kind of agricultural enterprise, however, including cattle-ranching, is undertaken, the other principal crops being tobacco, maize, and vines. There is also a certain amount of mineral wealth, and rubber is grown.

São Salvador, or BANZA CONGO—the former being the Portuguese and the latter the native name—a town of Africa, in the Portuguese province of Angola, 170 miles E. by S. from the mouth of the Congo. A ruined fort and ruins of several churches are the only signs of what was an important town during the 16th and 17th centuries.

São Thomé, a volcanic island of Africa belonging to Portugal, lies in the Gulf of Guinea about 125 miles off the coast of Africa. Its southern extremity almost touches the equator. Measuring 32 miles by 21, it has an area of 360 sq. m.; pop. nearly 60,000, mostly natives. Although it rises to the altitude of 6000 feet, it has the reputation of being very unhealthy. Cocoa is grown, under regulations (1910-11) made necessary by contract-labour abuses; and other products are coffee, rubber, and cinchona. Chief town, São Thomé, on the north-east coast, the seat of a bishop. The island was discovered in 1470, and colonised in 1493 by the Portuguese, to whom it reverted after a Dutch occupation from 1641 to 1844. With the small island of Príncipe it constitutes a province under a governor.

Sap. See PHYSIOLOGY (VEGETABLE).

Sap, in Military Engineering, is a narrow ditch or trench by which approach is made from the foremost parallel towards the glacis or covert-way of a besieged place (see SIEGE). For Sappers and Miners, see ENGINEERS.

Sapajou, a name sometimes applied to all that division of American monkeys which have a prehensile tail, and sometimes limited to those of them which are of a slender form, as the genera *Ateles* (see SPIDER-MONKEY), *Cebus* (q.v.), &c.

Sapindaceæ, a family of dicotyledons, trees and twining shrubs furnished with tendrils, very rarely herbaceous climbers, the leaves often marked with lines or pellucid dots. They are natives of warm climates, especially of South America and India. Some produce delicious fruits, others are purely medicinal, some again abound in a saponaceous principle, while a few are dangerously poisonous, and still fewer yield wholesome food-

products. The root of *Cardiospermum Halicababum* (Heart-seed) is diaphoretic, diuretic, and aperient, while in the Moluccas its leaves when cooked are eaten as a vegetable. The genus *Serjania* is poisonous; and the same poisonous principle resides in the genus *Paullinia*; yet from the seeds of *P. Cupana* Guarana Bread (q.v.) is made. These three genera take the common name of *Supple-Jack* from the long rambling stems which are cut into lengths for walking-sticks. In the genus *Schmidelia* the same contradictory qualities are exhibited. The Soapberry (q.v.) is the fruit of *Sapindus Saponaria*, the type of the order.

Sapium. See TALLOW-TREE.

Sapodilla Plum, the fruit of *Achras Sapota*, also known as Black-billy, Bally-tree, and Naseberry or Nisberry, a tree of the family Sapotaceæ common in Mexico, Central America, and the north of South America. The bark is febrifugal. The seeds are aperient and diuretic, but an overdose is dangerous. The pulp of the fruit is subacid and sweet, and is much esteemed for dessert in the West Indies. The wood, which is greenish and very durable, is used for shipbuilding. The inspissated resinous latex, called chicle gum, is the most usual basis of American Chewing-gum (q.v.).

Saponification. See OILS, FATS, and SOAP.

Saponin is a vegetable principle contained in various plants, including the *Saponaria officinalis*, or Soap-wort, the *Polygala Senega*, several varieties of *Lycchnis*, the fruit of the horse-chestnut, and in *Quillia* bark. It is readily extracted from the root of soap-wort by means of boiling alcohol, which, as it cools, deposits the saponin as an amorphous sediment. It derives its name from its behaviour with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken like a solution of soap, if even $\frac{1}{1000}$ th part of saponin be present. Its solution, or an infusion of soap-wort, is sometimes employed in place of a solution of an alkaline soap for cleansing the finer varieties of wool from grease. Various preparations for cleaning kid gloves, &c., sold under fancy names, owe their virtues to saponin. It is also employed by aerated water-makers to give upparent body to their lemonade, &c.

Sapotaceæ, a family of dicotyledons, consisting of trees and shrubs, often abounding in milky juice. The leaves are leathery, entire, and without stipules. They are natives of the warmer regions of both hemispheres, but are comparatively rare in Australia, the Cape of Good Hope, North-west Africa, and South America. The most important species from an economical point of view is the Gutta-percha Tree (q.v.; *Dichopsis Guttata*). The substance called *Monesia*, an extract from the bark of *Lucuma glycyphlla*, employed in France in medicine, is a moderate stonachic excitant, alterative, and mild astringent. The Mammee-Sapota, or American Marmalade, is the fruit of *Lucuma mammosa*, a lofty tree of tropical America and the West Indian Islands (not the Mammee-apple, q.v.). The pulp is luscious, but the kernels abound to a dangerous extent in prussic acid, a very little of one kernel being capable when eaten of causing sickness. The fruit of *Chrysophyllum Cainito* is the Star Apple (q.v.). *C. Roxburghii*, a native of Silhet, also produces a fruit prized by the natives; but neither of these fruits finds much favour with Europeans. The Sapodilla Plum (q.v.) is the fruit of *Achras Sapota*. The flowers of some of the species of *Bassia* (see BUTTER-TREE) are edible; they are eaten raw or cooked in various ways; those of *B. latifolia* yield a strong ardent spirit by distillation. Oil is also expressed from the fruit of some of these, which is used in the

manufacture of soap and as an inferior lamp-oil and lubricant. The seeds of *Argania Sideroxylon*, a Moroccan tree, yield argan-oil, a substitute for olive-oil. *B. butyracea* and *Butyrospermum Parkii*—the latter the Shea Tree of tropical Africa—both yield from kernels of their fruits a fine vegetable-butter. Valuable timbers are produced by some species of this family; one of the Iron-woods (q.v.) is the timber of *Sideroxylon inerme*. The Galineta Wood of Jamaica is the timber of *Diphotis salicifolia*. The flowers of *Mimusops Elengi*, a native of the East Indies, are powerfully aromatic, and yield a fragrant water by distillation, and the seeds abound in oil which is used by painters. *M. Balata* yields Balata (q.v.; see also BULLET-TREE). Djavi Nuts and Donka Mahogany are got from the tropical African *M. djave*. *M. elata* is the Masseranduba or Milk-tree of Brazil, from which exudes, when the bark is cut, an abundant thick creamy milk, which can be used not only as food, but as glue. Exposed to air, it becomes tough like gutta-percha. The fruit is edible, the timber durable.

Sappan Wood, or SAPANWOOD. See BRAZIL-WOOD.

Sapper, the name given to a private soldier in the corps of Royal Engineers (q.v.).

Sapphire, a gem variety of Corundum (q.v.). All precious varieties of corundum other than those coloured red (i.e. Rubies) are termed sapphire. Colourless stones are called *white sapphire*, yellow stones *yellow or golden sapphire*, and pale pink stones *pink sapphire*. The true sapphire is blue, the most valuable stones being coloured royal blue, velvet blue, or cornflower blue. The so-called *Brazilian sapphire* is a blue variety of the mineral Tourmaline. Sapphire crystallises usually in six-sided prisms, terminated by six-sided pyramids; it is sometimes found embedded in gneiss, but more frequently occurs in alluvial soils. It occurs in Scotland and Saxony, but European sapphires are of no commercial importance. The finest are found in Ceylon; Kashmir and Burma also produce fine specimens; and sapphires are found in Siam, Madagascar, Victoria, New South Wales, Queensland, Tasmania, North Carolina, and Montana. The value depends on quality more than on size, and does not increase with the size as does that of the ruby. One of 165 carats has been sold for £8000. In spite of its hardness it is sometimes engraved. Like the ruby, the sapphire is nearly pure alumina; and genuine sapphires, like rubies, are now made on a commercial scale of ammonia alum fused in the blow-pipe flame. See RUBY, and Herbert Smith's *Gem Stones* (1912).

Sappho, according to Swinburne the greatest poet that ever lived, was born either at Mitylene or at Eresos in Lesbos. She was only six years old when she lost her father Seamandronymus, and she must have flourished about the end of the 7th century B.C., as she was contemporary with Alceus, Stesichorus, and Pittacus. But little is known with certainty of her life, save that she had a daughter named Cleis, and was acquainted with Alceus. We are told, with much less certainty, that she fled about 596 from Mitylene to some place of refuge in Sicily, but after some years was again at Mitylene, the centre of a group of girls with a passion for poetry. Her famous plunge into the sea from the Leucadian rock, because Phaon did not return her love, seems to have no historical foundation whatever. The traditional account of her moral character was first assailed by Welcker (1816), who made her a paragon of virtue. This view Bergk and Colonel Mure both attacked, and the progress of the controversy may be seen in the *Rheinisches*

Museum (1857-58). About the much more important question of her genius there can be no doubt whatever. For sincerity, depth of feeling, passion, and exquisite grace of form her lyrics stand alone among the masterpieces of antiquity. Her poems were divided by the Alexandrine scholars into nine books, according to their metres. Till recent times but two of her odes, one to Aphrodite, with a number of short fragments, were known. Most of these were composed in the metre named from her the *sapphic strophe*, rendered familiar from its use by Horace. Since 1879 many fragments and some almost complete odes, discovered in Egypt, have been published.

A standard text is that in Bergk's *Poeta Lyrici Graeci*; see also H. T. Wharton's text, with life, translation, &c. (4th ed. 1898). The fragments are to be found in Grenfell and Hunt's *Oxyrhynchus Papyri* and in Lobel's edition (1925). There are treatises on her by Arnold (1871), Brandt (1905), Steinert (1907), Bascoul (1911), Patrick (1912), and Tucker (1914); imitations by Michael Field (in *Long Ago*) and Bliss Carman (1906); and translations by Futen (1903), Way (1920), and Haines (1926).

Saprolegnia, a fungus once thought to be the cause of disease in Salmon (q.v.).

Saprophytic Plants are plants that feed upon decaying organic matter. In common with many of the Parasitic Plants (q.v.), which are plants that live on or in and at the expense of other organisms, they are often devoid of chlorophyll. The reason of this peculiarity is obvious. Chlorophyll being the material used by ordinary plants for the decomposition of the carbon dioxide of the air in order that they may retain the carbon, and with it build up all the carbon compounds characteristic of organic nature—see PHYSIOLOGY (VEGETABLE)—it is plain that those plants which in virtue of a saprophytic or a completely parasitic habit obtain their carbon compounds ready-made up to a certain point do not require a special mechanism of green stuff to manufacture them. If the saprophytism be not complete or 'pure' there will be at least some chlorophyll remaining, as in the flowering axis of the orchid *Neottia*. Saprophytes may obtain their nourishment and especially their carbon compounds either from the remains of dead organisms or from organic compounds formed by living organisms. The fungi that live upon the bark of trees and the leaf-soil of forests and meadows (e.g. mushrooms) are examples of the former case; those that feed upon the juice of fruits and sugary solutions (e.g. moulds and yeasts) of the latter case. Examples of saprophytes are found in the Spermatophytes, the Fungi, and the Bacteria. Among the Spermatophytes are some well-known British plants—*Neottia*, *Coralorhiza*, and *Monotropa*.

Fungi (q.v.) may be physiologically classified as parasites and saprophytes; but this classification does not coincide with a morphological one. Further, there are certain species which lie between the two extremes, and these may be described as parasites which may become wholly or in part saprophytic, through the whole course of their development or during certain stages of it; and also there are saprophytes which, with the same variations, may

i.e. parasites which become saprophytic; (3) 'Obligate' parasites—i.e. species to which the parasitic life is indispensable; (4) 'Facultative' parasites.

The external conditions necessary for the commencement of germination of Fungi are the same as those needful to the germs and seeds of other plants: they are a certain temperature, a supply of oxygen and of water, in certain cases a supply of nutrient substances. The spores of the *Pereno-*

spores and of the Uredineæ germinate on drops of pure water; nutrient solutions may even be a hindrance. The Mucorini, on the other hand, emit only rudimentary germ-tubes in pure water; they require a nutrient solution for germination. Most Fungi vary towards one extreme or other according to the species.

A further characteristic of many Fungi is that certain species are only to be found upon a specific substratum. For instance, the *Saccharomycetes*, which excite alcoholic fermentation, appear on fruits.

are found on various other fruits. When they attack, and very rarely in any other place. Further, the effect upon the substratum varies with the species to a greater or less extent. On the other hand, many diverse species live on the same substratum and effect the same results upon it—e.g. many species of *Saccharomycetes* and certain species of *Mucor* produce very similar fermentations in saccharine fluids (see FERMENTATION). A destructive effect is witnessed in the reduction of timber to a mass of dirt by *Merulius lacrymans*.

Bacteria (q.v.) may be classified physiologically in the same terms as the Fungi. And their functions vary in the same way. Many oxidise their substratum; the *Micrococcus* of vinegar oxidises ethyl-alcohol into acetic acid, and by further combustion into carbon dioxide and water. Others excite characteristic fermentations, lactic acid, butyric acid fermentations, &c. See also PUTREFACTION.

Sapucaia Nut. the seed of *Lecythis Ollaria* and of *L. zabunjo*, trees plentiful in the forests of the north of Brazil, belonging to the family Lecythidaceæ. The fruit is urn-shaped, as large as a child's head, and opens by a lid which falls off. Each fruit contains a number of seeds or nuts, as in the case of the allied Brazil nut; but the flavour is finer than that of the Brazil nut. Its form is oval, somewhat pointed at both ends, which are slightly bent in opposite directions.

Sarabaitai. See MONACHISM.

Saraband (Fr. *sarabande*, Span. *zarabanda*—word and thing both derived from the Moors), originally a slow dance, and hence a short piece of music, of deliberate character, and with a peculiar rhythm, in 3 time, the accent being placed on the second crochet of each measure. The saraband is of frequent occurrence among the *suites* of Bach and other old masters.

Saracens, a name variously employed by mediæval writers to designate the Mohammedans of Syria and Palestine, the Arabs generally, or the Arab-Berber races of Northern Africa, who conquered Spain and Sicily, and invaded France. At a later date it was employed as a synonym for all infidel nations against which crusades were preached, and was thus applied to the Seljuks of Iconium, the Turks, the Gypsies, and even the pagan Prussians. The epithet *Sarakēnoi* was applied by the Greek writers (from the 1st century A.D.) to some tribes of Bedonin Arabs in eastern Arabia, though they do not agree among themselves as to the particular tribe so denominated. Pliny and Ammianus place the Saracens in Arabia Petra and Mesopotamia, on the common frontier of the Roman and Persian empires; and the description of them by Ammianus, a most painstaking and accurate historian, coincides, in every important particular, with what is known at the present day of the Bedonin tribes of those regions. See ARABIA, KHALIFS, CRUSADES, MOHAMMEDANISM, MOORS, SALADIN, SPAIN, TEMPLARS; also the *Cambridge Mediæval History*, vol. ii. (1913); for Saracenic architecture, see ARABIAN ARCHITECTURE, and the section on architecture in the articles INDIA and PERSIA.

Saragossa (Span. *Zaragoza*), a city of Spain, formerly the capital of the Kingdom of Aragon, by rail 212 miles N.E. of Madrid and 227 W. by N. of Barcelona, stands on the Ebro, which divides the city into two parts, and is crossed by a noble stone bridge of seven arches, built in 1437. The city has an imposing appearance from a distance, being adorned with numerous slender towers and spires; but inside the walls it is full of narrow winding lanes, with brick houses of most solid structure, though many of them are now falling into decay. The quarters that have been rebuilt since the French siege are of course different; the streets wide and the houses of better appearance. Saragossa was the Celtiberian *Salduba*, changed to *Cæsarea Augusta* in 25 B.C., of which the present name is a corruption. Although a place of importance under the Romans, there are few remains of the Roman city. One of the first cities of Spain to adopt Christianity (3d century), it afterwards became rich in relics, to which miraculous powers were ascribed. Saragossa was taken by the Goths the 5th and by the Moors in the 8th century, and was recovered from them in 1118 by Alfonso of Aragon after a siege of five years, during which great part of the inhabitants died of hunger. The most momentous event in its recent history was the siege by the French (June to August 1808 and December 1808 to February 1809), in which the inhabitants offered a most determined resistance, some 60,000 in all perishing (see PALAFOX). The services of the 'Maid of Saragossa,' said to have assisted or fought by the side of her artilleryman-lover, seem to have been greatly exaggerated by Southey, Byron, and Sir David Wilkie in treating the theme. Saragossa has two cathedrals, the older a Gothic edifice (1316); the more modern (17th century) boasts of a pillar on which the Virgin descended from heaven (40 A.D.), to which pilgrims still flock. Its defences include the citadel (Aljaferia), anciently the palace of the kings of Aragon and later the headquarters of the Inquisition in this part of Spain. There are also a university (1474), an academy of sciences, and an archiepiscopal palace. The leaning Torre Nueva, dating from 1504, was 84 feet high and 10 feet out of the perpendicular, but as misdeeds were taken down in 1894. The town makes cloth, silks, leather, soap, and chocolate. Pop. (1900) 99,118; (1920) 141,350.—The province has an area of 6726 sq. m. and a pop. of 501,495.

Sarajevo, or BOSNA-SERAI, capital of Bosnia, stands on the hill-slopes that overlook the Bosna River (3 miles distant), 100 miles N.N.E. by rail (1891) of Metković, a port near the mouth of the Neretva in the Adriatic. The citadel and the minarets of 100 mosques, the crowded 'charšija' or bazaar, and the steep and narrow streets climbing the hillsides amidst gardens, represent the ancient Moslem town; the wide streets on the plain near the railway station, the Roman Catholic cathedral, and the Bosnian museum reflect the swift progress that was made after the Austrian occupation in 1878. The Bogova-Jamnia mosque dates from 1506; the Greek cathedral is a large building; and the Moslem college (1890) is in Oriental style. The town has considerable trade, and manufactures tobacco, cigars, and cigarettes; the Hungarian government revived, in a large factory, the ancient Bosnian art of inlaying gold and silver in copper and wood. Pop. 66,000, mostly Bosnians by race, and more than half Mohammedans, the remainder Greek Orthodox, Roman Catholics, and Jews. Sarajevo was the scene, on 28th June 1914, of the murder of the Archduke Franz Ferdinand, the immediate occasion of the outbreak of the Great European War a month later. On 31st October 1918, the National

Council which met there proclaimed the union of Bosnia and Herzegovina with Serbia.

Sarapis. See SERAPIS.

Sarasate, PABLO DE (1844-1908), Spanish violinist, was born of Basque parentage, at Pamplona, where an annual fête was afterwards held in his honour. Taken to Paris whilst still a child, he won the first prize for violin at the Conservatoire in 1857. He made extensive tours all over Europe and America, visiting England first in 1861, and everywhere met with outstanding success. Though Sarasate was not a profound musician, his style of playing was always pure, refined, easy, and graceful. His compositions are only of slight importance.

Sarasvati is, in Hindu Mythology, the name of the wife, or the female energy, of the god Brahma, the first of the Hindu Trimūrti or triad. She is also the goddess of speech and eloquence, the patroness of music and the arts, and the inventress of the Sanskrit language and the Devanāgarī letters.—Also the sacred river of Allahabad (q.v.).

Saratoga Springs, one of the chief watering-places in the United States, is in New York, 38 miles by rail N. of Albany. It contains more than a score of mineral springs, whose waters, prescribed in diseases of the liver, chronic dyspepsia, &c., are bottled in large quantities for exportation. There is a race-track, and regattas are held on Saratoga Lake, 4 miles distant. Twelve miles to the east a handsome obelisk (1877), 155 feet high, on a bluff 350 feet above the Hudson River and overlooking the scene, commemorates the surrender of Burgoyne (q.v.) to Gates, on 17th October 1777. Pop. 13,000.

Saratov, a city of Russia, on the right bank of the Volga, exactly 500 miles by rail SE. of Moscow. It is a city of broad streets and fine squares, and stands on terraces rising from the river. It has a handsome new cathedral (1825), an old cathedral (1697), a fine art gallery and library, and a university. Manufactures of brandy, liqueurs, flour, oil, and tobacco are carried on. Fishing is prosecuted in the river, and market-gardening (especially fruit and the sunflower) in the vicinity. There is an important trade in corn and other cereals, wool, leather, and textiles. The population has grown rapidly—70,000 in 1860; 137,109 in 1897; 190,000 in 1920. Pillaged by Pugachev in 1774, the city suffered much from fire several times during the 19th century.

Sarawak, a state on the north-west of the island of Borneo, placed by its ruler, Raja Brooke, in 1888 under the protection of Britain. The Chinese Sea washes its north-west side; on the north-east is the protected state of Brunei; and on every other side it is surrounded by Dutch Borneo. The area of Sarawak is estimated at 42,000 sq. m., and its pop. 600,000. The coast-belt is in many parts low, the interior hilly, rising to close upon 8000 feet near the frontiers. The country is drained by a number of short streams, several of which have wide estuaries; the longest, the Rajang, has a sinuous course of 350 miles, and is easily navigable for 150 miles up. The state contains valuable coal and oil fields; gold is mined, and antimony is found, also diamonds from time to time. The chief products, all of which are exported, are sago, rubber, gutta jelutong, pepper, benzine, oil-fuel, and cutch. The trade is principally with Singapore. The chief town is Kuching, 23 miles inland, on the Sarawak river; pop. 25,000. Round Kuching there are roads; there is a government telephone system, and several wireless stations. Dying in 1868, Sir James Brooke was succeeded by his nephew,

Sir C. J. Brooke, who, greatly extending his territory northwards after 1881, was succeeded by his son, Sir C. V. Brooke, in 1917.

See BORNEO and BROOKE (Sir J.), and the books there cited; also Baring-Gould and Bampfylde, *History of Sarawak* (1909).

Sarcina. See BACTERIA.

Sarcocaulon, a small South African genus of Geraniaceae, presents pronounced aerophytic construction in all parts, the spau-high stems being very fleshy and covered with a thick layer of wax, preventing excessive evaporation during the high winds. In many places Sarcocaulon constitutes the sole vegetation on the sand and gravel plains, *S. Burmanni*, the so-called Hottentot Candle, being particularly plentiful. The leaf-blades disappear soon, leaving thorns in their place, which add to the strange appearance of these extraordinary plants, fit companions of the even stranger Welwitschia.

Sarcocystis. See GREGARINIDA.

Sarcode. See PROTOPLASM.

Sarcolemma is the term applied to the delicate sheath which invests each primary muscular fibre. See MUSCLE.

Sarcoma is an ancient term which was vaguely used of tumours of a more or less flesh-like consistence, but had fallen into disuse. It was adopted by Virchow as the general name for a large and important class of new formations, and is at present universally employed as defined by him. The tumours now called Sarcomata are mainly composed of cells resembling those of some form of embryonic or imperfectly developed connective tissue, rather than those of any part of the adult organism. Their structure, as well as their individual cells, usually suggests an embryonic condition: the cells are imbedded in a structureless matrix; and the blood-vessels are often mere channels between the tumour-cells. They are thus distinct from the Carcinomata, or cancers proper, which consist of epithelial cells in a framework of fully organised fibrous tissues; though they share with them the property of malignancy (see TUMOUR). They are generally classified, according to the form of their most characteristic cells, as round-celled, spindle-celled, and myeloid sarcomata. They are most common before middle life, and may occur in any organ of the body. Their course presents the greatest possible variety: some myeloid and spindle-celled sarcomata are slow in their growth, and but little apt to recur after removal: some forms of round-celled sarcoma may rival and even surpass the true cancers in rapidity of growth and diffusion through the body. When secondary tumours occur they are not commonly in the neighbouring lymphatic glands, as in cancer, but in distant organs, and particularly in the lungs.

Sarcophagus (Gr., 'flesh-eater'), any stone receptacle for a dead body. The name originated in the property assigned to a species of stone, found at Assos in Troas and used in early times, of consuming the whole body, with the exception of the teeth, within the space of forty days. The oldest known sarcophagi are those of Egypt, some of which are contemporary with the pyramids. The earliest of these are of a square or oblong form, and either plain or ornamented with lotus leaves; the later are of the form of swathed mummies, and bear inscriptions. The pyramids were sepulchral tombs built to contain the sarcophagi of the kings of Egypt: the Phœnician and Persian kings were also buried in sarcophagi. The Roman sarcophagi of the earlier republican period were plain. Sarcophagi were occasionally used in the later republic,

although burning had become the more general mode of disposing of the dead. The use of stone chests for the interment of distinguished persons has not been altogether discontinued in modern times. See BARROW, BURIAL, COFFIN, MAUSOLEUM.

Sard, or **SARDA**, a variety of quartz, differing from carnelian only in its very deep red colour, blood-red by transmitted light. It is rare, and brings a much higher price than common carnelian. The name is probably from Sardis. The Sardonix is an Onyx (q. v.) containing layers of sard.

Sardanapa'us. See ASSYRIA.

Sardes, or **SARDIS**, the capital of ancient Lydia, stood at the northern foot of Mount Tmolus (5906 feet) and $2\frac{1}{2}$ miles S. of the Hermus. Through its market-place flowed the Pactolus over sands rich in gold, an allusion in all probability to the wealth of the inhabitants, who wove woollen stuffs and carpets, and organised the traffic between the highlands of the interior and the coast; it was, moreover, the grand and luxurious capital of Croesus, a monarch of fabulous wealth. In spite of the strength of its citadel, it was destroyed by the Cimmerian Gauls in the 7th century B.C., by the Athenians in the 6th, by Antiochus the Great in 215 B.C., and by Timur in 1402; besides this it was overwhelmed by earthquake in the reign of Tiberius. Both Xerxes and Cyrus the Great resided here before setting out on their great expeditions. As Byzantium rose to importance, Sardis lost the advantages of its situation on the great land-route between Persia and Rome, and gradually declined. At the present day there is nothing left at its site, Sart, except a small village and ruin mounds. The cemetery of the ancient city, 4 miles distant across the Hermus, is of great extent, and has been in part opened up. Other excavations have been made in the 20th century. See reports of the American expedition in the *Amer. Journ. of Archaeology*.

Sardine (Gr. *sarde*, Lat. *sarda*, *sardina*; perhaps 'the Sardinian fish,' used possibly of the pilchard, possibly of a kind of tunny), the French name for Pilchard (q. v.), and specially for small pilchards specially prepared. In France and Portugal sardines are cured with oil in tin boxes, forming a much-esteemed delicacy, and, at the same time, a most wholesome article of food; in this form they are exported to all parts of the world. To cure them in this way, they are first carefully washed in the sea, then sprinkled with fine salt, and after a few hours the head, gills, &c. are removed; they are then washed again, and spread out on willow branches or wire-work, exposed to the sun and wind, if the weather is dry, but in damp and rainy weather to a current of air under cover. They are next put into boiling oil, in which they remain for a short time, and when they are taken out the oil is drained away from them as much as possible, and they are put into the tin boxes whose shape and appearance are so familiar to everyone. The boxes, being filled with sardines, are filled up with oil, the lid is soldered on, and they are placed for a short time in boiling-water, or exposed to hot steam. The boxes which have leaked or have burst in boiling are rejected, and those which remain sound are now ready for the market. Trade usage extended the name to any small fish of the herring kind thus prepared, specially the Norwegian sprat or brisling; but the Court of King's Bench in 1915 decided that this is illegal. Maine, U.S., produces excellent 'sardines' from a small kind of herring; menhaden and anchovies are also so called. And there are Japanese and Australian 'sardines.'

Sardinia, an island of Italy, after Sicily the largest in the Mediterranean, lies 135 miles W. of the Tiber mouth, and immediately south of Corsica, being separated from it by the Strait of Bonifacio, $\frac{7}{8}$ miles wide. In shape it resembles an oblong set on end, with a deep wide bay, the Gulf of Cagliari, in the south, and another, the Gulf of Porto Torres, in the north.¹ From north to south it measures 160 miles, and from east to west, on the average, 75 miles. Area, 9187 sq. m. Off various points along the shores lie islands, the largest being Sant' Antioeo, San Pietro, Asinara, Maddalena, Caprera, Tavolara, &c. The surface is generally mountainous, the configuration that of a tableland running up into ranges and isolated peaks. The highest points occur along the eastern side of the island, and reach 6016 feet in Gennargentu in the centre, and 4468 in the mountains of Linbara in the north. The western side of the island ranges at about 1240 feet, though the extinct volcano of Monte Ferru reaches 3448. The south-west corner is separated from the main mass of the island by the low alluvial plain of Campidano, which stretches from the Gulf of Cagliari to the Gulf of Oristano, on the west coast; at both extremities of it there are extensive salt lagoons. The only other low-lying tracts are the lower portions of the river valleys. The streams, however, are mostly short, the longest not exceeding 65 miles. The north-eastern shores are high and rocky. On the west the coast-line is more irregular than on the east; the grotto of Neptune, on this west coast, is one of the finest in Europe.² Ever since the time of the Roman possession the climate of the island has been in evil repute. This is because of the malaria that prevails in the low-lying tracts, where there is often much stagnant water after the rains, and much decaying vegetable matter in the hot season. The parts that lie at a higher level are quite as healthy as the corresponding districts of Italy. A more extended cultivation of the soil and the drainage of the marshes or inland lagoons would greatly diminish the malaria, as experiment in certain districts has proved, and further works of the kind are in contemplation, but considerable capital will be needed.

Sardinia is in nearly all respects a backward island. It has fine natural resources—fertile soil, valuable mines, extensive forests, rich fisheries, and excellent facilities for manufacturing industry. But owing to the old-fashioned conservatism of the people, their primitive methods of agriculture, lack of enterprise and capital, and want of means of communication, and long years of neglect if not inefficient government, its resources have by no means been developed to their full extent, and the population is only one-fourth of that of Sicily, whereas the area of the two islands is practically the same. Further, there are practically no facilities for the ordinary tourist. With the defects, however, of a long isolated mountain race, the Sardinians have all its virtues—less affected, so anthropologists maintain, by foreign admixture than most parts of southern Europe, and preserving many of the physical characteristics of the so-called Mediterranean race of Neolithic days. They possess a strong sense of honour and of hospitality, a considerable national dignity, and a fine courage. National costumes and village festivals and customs are very remarkable. Feudalism was not finally abolished in the island until 1865. Of the total area about one-third is arable land, one-third pasture, and nearly one-third (28 per cent.) forest. The first place amongst the natural resources is taken by the agricultural

¹ The Greek name, *Ἰζωρνα*, was given it from a supposed resemblance to a footprint.

² It is situated near Alghero (q. v.).

products, in spite of the backward farming, the heavy taxation, and the extremely minute subdivision of the soil. The principal produce is wheat, barley, beans, potatoes, wine (a considerable quantity consisting of some strong, sweet varieties which are practically unknown outside Italy), olive-oil, oranges, lemons, tobacco, flax and hemp, cheese, butter, and wool. The breeding of horses is an important industry; and large numbers of cattle, sheep, swine, and goats are kept. The growing of fruits and the breeding of the domestic animals are both carefully attended to, and the products of both industries are improving; but the only improvement in the management of the soil (much of which, it is true, is very poor) is the drainage of the marshes by the government (who own one-fifth of the area) and private individuals. The artificial lakes of the Tirso and the Coghinias provide a considerable quantity of electric power and also water for irrigation, which is necessary to facilitate intensive cultivation and thus conquer the malaria. Besides being in ancient times the granary of Rome, Sardinia was renowned for its mineral wealth. After lying unused from the fall of the Roman empire the mines were again worked by the Pisans in the 14th and 15th centuries; but work was not resumed in them with any degree of energy until towards the middle of the 19th century. At the present time some 12,000 persons are employed in extracting of lead (with silver) and zinc, and to a less extent lignite, antimony, and manganese. Iron and copper also exist. Granite, marble, and clay for pottery are quarried. Salt is manufactured from sea-water, chiefly by convicts at Cagliari. The mines are mostly situated in the south-west, in the neighbourhood of Iglesias. The centre and north of the island are chiefly covered with forests, though they are being all too rapidly diminished. The commonest as well as the most valuable trees are the oak, ilex, cork, and wild olive, which yield timber, cork, bark for tanning, acorns, and charcoal. The seas yield large quantities of tunny, sardines, anchovy, and coral, though the fisheries, except for tunny, are not prosecuted by Sardinians, but by Italians; the native fishermen prefer to catch trout, eels, lobsters, crabs, &c., in the rivers and inland lagoons. Sardinia has no extensive manufacturing industries, though there is some tanning and making of cigars, aerated waters, macaroni, flour, and spirits. There are, however, a variety of domestic industries for home use; most of the women still ply the spinning-wheel. Until the year 1828 Sardinia had no roads for wheeled vehicles, the Roman roads having gone to ruin centuries ago. Now there are good roads throughout the island upon which motor omnibus services run; and they are supplemented by 770 miles of railway. In spite of their maritime situation the Sardinians are not fond of the sea. The island has numerous fairly good ports—Cagliari (the capital), Porto Torres, Terranova, Tortoli, Alghero, Carloforte, and Bosa—most of which are being improved by the construction of harbour-works. Pop. (1815) 352,867; (1840) 524,000; (1871) 636,660; (1901) 791,754; (1921) 866,681; (Sicily, with an area of 9960 sq. m., has a pop. of 4,132,156). This gives a density of 93 persons to the square mile; Italy has 329 to the square mile. Education is in a very backward state. The two universities at Cagliari and Sassari are frequented by only 420 students in all. The practice of the vendetta and brigandage were extremely prevalent amongst the people; but both have now almost entirely ceased. The language is a mixture of Latin, Spanish, and Italian; but the dialects of different parts differ considerably. The mouflon or wild sheep, with red deer, fallow deer, wild boar, and an abundance

of smaller game, such as hares, partridges, woodcock, snipe, &c., are still to be found. Administratively the island is divided into the two provinces of Cagliari and Sassari. There are three archbishoprics, Cagliari, Sassari, and Oristano, and eight bishoprics.

History.—The early history of Sardinia is entirely unknown, though it has been believed by many that we should identify with the Sardinians the Shardana, who occur as foreign mercenaries of the kings of Egypt, from the time of Rameses II. onwards. Traces of habitation in the Neolithic period have been found; but the island must have been well populated during the Bronze Age, when a large number of important monuments were erected. There are as many as 6000 *nuraghi* still traceable in the island—circular towers built of rough blocks of stone; the diameter is some 30 feet at the base, but decreases rapidly; and within the massive walls are one, two, or even three superposed chambers with beehive roofs. This simple form is often strengthened by additional towers, bastions, and curtain walls; and they sometimes protected or enclosed a settlement of small round huts of similar construction, just as the baronial castle protected the mediæval village. Besides these considerations, their collocation in positions of strategic importance and of relation to one another shows that they cannot have been tombs, as some have believed, but were strongly fortified dwellings. Indeed, the tombs of their inhabitants are of two classes: (1) the so-called giants' tombs, chambers 30 or 40 feet long, in which many bodies could be accommodated, with a curved façade in front, developed out of the simple dolmen; (2) the *domus de gianas* (houses of the spirits), which are small grottoes cut in the rock. A considerable amount of research has recently been carried on among the remains of this period, and some very interesting sanctuaries, several of them erected over sacred springs, have been brought to light. (See *Cambridge Ancient History*, II. 1926, chap. 21, where a full bibliography is given.) The existence of a numerous and powerful population may explain the comparative rarity of Greek colonies, only Olbia, the modern Terranova (q.v.), and Neapolis, on the west coast, being attributable to them. The conquest of the island by the Carthaginians (500–480 B.C. ?) led to the foundation of a few cities in the south-west of the island—Cornus, Tharros, Sulci, Nora, Carales (the modern Cagliari). They treated it as a granary, and their rule, as far as it reached, seems to have been oppressive. How far they obtained the mastery of the interior is very doubtful. In 238 B.C. their mercenaries revolted, and the Romans demanded and obtained the surrender of the island. The resistance of the native tribes was quelled after several campaigns; and after a rebellion in 215 B.C. they were still more severely dealt with, being treated as a conquered race, and forced to pay a tithe in corn and a further tribute in money. With Sicily and Africa, it became one of the chief sources of the corn supply of Rome. Saltworks were also in operation. Cicerio gives the inhabitants a very bad character; and under the early empire it was remarkable for its unhealthiness and for the audacity of its brigands, and was often used as a place of exile. Administratively it was coupled with Corsica, and alternated between the Senate and the emperor. Carales was the chief place in the island, and next came Turris Libisonis (Porto Torres), Olbia, Othoca (Oristano), Neapolis, Forum Traiani (Fordungianus), Ussellis, and Cornus. There was an extensive road system, and numerous milestones have been found. Constantine gave to Corsica and Sardinia a separate governor for each, dependent on the *vicarius urbis Romæ*. After

the fall of the Roman empire evil days fell upon the island: it was overrun by Vandals and Goths, and then for many years was incessantly harassed by the Saracens. During this time its nominal masters were the Byzantine emperors (till the 10th century in name at least) and the popes, to whom it seems to have been given in 774 or 817 by a not very effective donation. In the beginning of the 11th century the Pisans and Genoese undertook the task of driving out the Saracens and holding the island against them; but they had a hard task for twenty years or more. Then, the Moslems beaten off, they took to quarrelling with one another, and only agreed to divide the island between them in 1284, Genoa taking the north, Pisa the south. But the real internal government was in the hands of four 'judges' or chiefs, each ruling a separate province; this arrangement existed several centuries before the Pisans came, and continued to exist for several centuries longer. The pope, who still claimed the over-lordship, in 1297 gave Sardinia to the king of Aragon; and he made himself definitively master of it in 1326. The Aragonese and their sovereign successors, the Spaniards, kept possession of it till the treaty of Utrecht (1713); it then passed to Austria, but in 1720 was given to the House of Savoy in exchange for Sicily. United with Savoy and Piedmont, it gave title to a new kingdom, the kingdom of Sardinia. In ecclesiastical architecture either Pisan Romanesque or Spanish Gothic survives, the Renaissance having had little influence upon it. See SAVOY.

Sardis. SEE SARDES.

Sardonic Smile is a term applied by the older medical writers to a spasmodic affection of the muscles of the face, somewhat resembling laughter. It may occur in tetanus or lock-jaw, and other convulsive affections, or may result from the action of certain vegetable poisons. The name is said to be from a rannunculus termed *Herba sardonica*, a Sardinian plant; but is probably from the root *sar*, 'to grin' (Gr. *sairein*).

Sardonix. SEE ONYX, and SARD.

Sardon, VICTORIEN (1831-1908), French dramatist, was born at Paris. He studied medicine, but took to the writing of dramas instead of practising. His first efforts were decidedly failures, but through his marriage with an actress, who nursed him when sick and in the extremity of want, he became acquainted with the celebrated Dujazet, for whom he wrote two very successful pieces, *Monsieur Garut* and *Les Près Saint-Gervais* (1860). In a few years he had amassed a fortune. He was almost as prolific as Scribner, with whom he may be fitly compared, but whom he in many respects excelled. With a first-rate knowledge of stage-effect he combined an unrivalled instinct for what would just suit the taste of the playgoing public. His comedies are in general loosely constructed, but full of rapid action; the character-sketching and the emotional elements are both superficial; the dialogue is brilliant and witty, but the episodes are often very improbable. Sardon makes fun of the foibles of his contemporaries in a very clever, amusing fashion. His works are hardly literature; they are much better suited for acting than for being read. Pieces like *Nos Intimes* and *Les Ganaches* (1861), *Les Vieux Garçons* and *La Famille Benotton*

(1865), *Nos Bons Villageois* and *Maison Neuve* (1866), *Rabagas* (1872), *Dora* (1877), *Daniel Rochat* (1880), *Odette* (1882), and *Marquise* (1889) make a fair sample of his capabilities and style. For Sarah Bernhardt he wrote the well-known *Fedora* (1883), *Théodora* (1884), and *La Tosca* (1887). Historical plays are *La Patrie* (1869), *La Haine* (1874), and *Thermidor* (1891). Sardon was elected to the Academy in 1877. See the study by Claretie (1883) and Jerome Hart, *Sardon and the Sardon Plays* (1913).

Sargasso Sea. SEE ATLANTIC, GULF STREAM, GULFWEEK.

Sargent, JOHN SINGER, perhaps the greatest portrait-painter of his age, was born of American parents in Florence, 12th January 1856, was educated abroad, studied art at Florence and then under Duran at Paris, but from 1884 till his death lived mostly in London. He was elected A.R.A. in 1894, R.A. in 1897. His chief works comprise the mural decorations in Boston Public Library, *Carmencita*, *Carnation Lily Lily Rose*, *Gassed*, some water colours, and a long series of magnificent portraits, including those of the Wertheimer family exhibited at the National Gallery, London—one of the very few occasions on which this honour has been accorded to a living artist. His output is characterised by a brilliancy of execution and a sureness of touch, while his portraits reveal a ruthless and vivid analysis of character. He died at Chelsea 14th April 1925. See Life by Downes (1926), with catalogue and plates.

Sargon, king (722-705 B.C.) of Assyria (q.v.).

Sark (or *Sercq*), the most beautiful and wildest of the Channel Islands (q.v.), 6 miles E. of Guernsey (and in the bailiwick thereof) and 12 N.W. of Jersey. Only 3 miles long and $\frac{1}{2}$ mile wide, it is almost entirely rockbound, and consists of Great Sark (1035 acres) and Little Sark (239 acres), connected by an isthmus called the Coupee, 5 to 8 ft. broad, 300 ft. long, and as many high. Lead and silver were mined during 1835-45; fishing and agriculture are carried on. The seigneur and tenants of the manor form practically a feudal court. Pop. 580.

Sarmatians (anc. *Sarmatae*) a race who spoke the same language as the Scythians (q.v.), and who are believed to have been of Median descent and so Iranian in stock, though some authorities think they belonged to the Ural-Altaic family. They were nomads, wild and savage in appearance, excellent horsemen and archers, and dressed in leather armour. Their young women went into battle on horseback; hence probably the Greek legends about the Amazons. Several tribes were embraced under the name; they roamed over the wide plains of eastern Europe, from the Vistula and the Danube to the Volga and the Caucasus. Their country was arbitrarily divided by the ancient writers into European and Asiatic Sarmatia, the river Don being made the dividing-line. In the second half of the 4th century B.C. they subjected the Scythians to their yoke. Their empire lasted until the 4th century A.D., when it was overthrown by the Goths. Shortly after that their name disappears from history. The Jazyges (q.v.) were a Sarmatian tribe who also disappeared amongst Goths and Huns. But the name of Sarmatia is sometimes applied to the vast region in which the Sarmatians roamed, and is sometimes rhetorically used for Poland. See ART; and Rostovtzeff, *Iranians and Greeks in South Russia* (1922).

Sarnia, a town and port of Ontario, just below the issue from Lake Huron of the St Clair River, 170 miles WSW. of Toronto by rail. There are

oil-refineries, foundries, and fisheries. A great tunnel beneath the St Clair (q.v.) connects it with Port Huron (q.v.) on the American side. Pop. 15,000.

Sarno, a city of Southern Italy, 30 miles by rail E. of Naples, on the farther side of Vesuvius, has an ancient castle, a cathedral (1625), a seminary, paper, cotton, linen, and ribbon manufactories, and produces fine silk. Pop. 19,100. Here Teias, king of the Goths, was vanquished and slain in a desperate battle with the army of Justinian I., commanded by Narses, in 552.

Sarpi, PIETRO, better known as FRA PAOLO, born at Venice, 14th August 1552, from 1575 was professor of Philosophy in the Servite monastery there. In early life he devoted himself to Oriental languages, mathematics, astronomy, &c., including the medical and physiological sciences, in which he attained to great proficiency, being by some regarded as entitled to share in the discovery of the circulation of the blood. In the dispute between Venice and Paul V. on the subject of clerical immunities Sarpi became the champion of the republic and of freedom of thought. On the repeal (1607) of the edict of excommunication launched against Venice he was summoned to Rome to account for his conduct. He refused to obey, was excommunicated, and was seriously wounded by assassins. He afterwards busied himself with writing his great *Istoria del Concilio Tridentino* (London, 1619). He died 15th January 1623. His collected works were published at Naples (24 vols. 1789-90).

See Laves by A. G. Campbell (1869), Bianchi-Giovini (1836), A. Robertson (1894 and 1912), and T. A. Trollope's *Paul the Pope and Paul the Friar* (1861).

Sarraceniaceæ, a family of dicotyledonous pitcher-plants, including the genera *Sarracenia*, *Darlingtonia*, and *Heliamphora*. See INSECTIVOROUS PLANTS.

Sarre, **Sarrequeimines**, &c. See SAAR, SAARGEMÜND, &c.

Sarsaparilla, or **SARSA**. This is the dried root of the *Smilax officinalis*, a plant belonging to the Liliaceæ, and a native of Central America. In medicine the root, known as *Sarsa Radix*, or Jamaica Sarsaparilla, was at one time much used as an alternative, having been brought into Europe from the West Indies about 1530. Other species of *Smilax* with the same properties grow in the warmer parts of America. They are twining shrubs, sometimes attaining a considerable height, and growing only where there is abundance of water. The roots, many feet long, thick as a goose-quill, brownish, with numerous rootlets, are folded and packed into bundles about 18 inches long and 4 inches in diameter, bound by a long root. The taste is mucilaginous, slightly bitter and acrid. The root contains a crystalline glucoside, *smilacin*, a volatile oil, resin, starch, &c. The preparations act as diuretics and diaphoretics, and are used as alternatives in syphilis, rheumatism, and some skin diseases, but their value is now much discredited. *Hemidesmus indicus* is called Indian Sarsaparilla; *Smilax aspera*, Italian Sarsaparilla; and the roots of various species of *Carex*, German Sarsaparilla.

Sarsdens, or **SARSEN STONES**, the Greywethers (q.v.) of Cornwall (from some confusion about Saracens). See STONEHENGE.

Sarsfield, PATRICK, Irish Jacobite, had fought abroad under Monmouth, and in England at Sedgemoor against him, when in 1688 he was defeated in the skirmish of Wincanton, and crossed over to Ireland (he was member for Dublin county). Created Earl of Lucan by James II., he drove the English out of Sligo, was present at the battles of

the Boyne and Aghrim, defended Limerick (q.v.), and on its final capitulation in 1691 entered the service of France. He fought at Steenkirk (1692), and was mortally wounded at Neerwinden, 19th July 1693. See Life by Todhunter (1895).

Sarthe, a dept. of France, north of the Loire, formed out of the old provinces of Anjou and Maine. Area, 2410 sq. m.; pop. (1866) 465,615; (1921) 389,235. The Sarthe flows south through the department, and the Loire west along the southern border. Essentially an agricultural department, it produces wheat, oats, barley, and potatoes, sends its geese, chickens, eggs, cattle, and swine to Paris, is famous for its horses, and makes much wine and cider. There are also engineering, brick and linen works, tanneries, and paper-mills, while pottery is carried on. The arrondissements are Le Mans, La Flèche, Mamers, and St Calais; capital, Le Mans.

Sarti, GIUSEPPE (1729-1802), composer, born at Faenza, held posts at Copenhagen, Venice, Milan, and St Petersburg, and died at Berlin. He composed a dozen operas, masses, sonatas, &c.

Sarto, ANDREA DEL, Florentine painter, whose real name was Vannicchi, was born 17th July 1486; 'del Sarto' was an allusion to his father's trade of tailor. In 1509-14 he was engaged by the Servites in Florence to paint for their church of the Annunciation a series of frescoes; and a second series was next painted for the Recollets. In 1518, on the invitation of Francis I., he went to Paris, returned next year to Italy with a commission to purchase works of art, but squandered the money and dared not return to France. He died of the plague at Florence, 22d January 1531. Andrea's most celebrated single pictures are the several Madonnas, a Last Supper, the 'Fathers of the Church Disputing,' a Pieta, and two Annunciations—most of them at Florence. He was a rapid worker and accurate draughtsman, displaying a refined feeling for harmonies of colour; but, though called 'the Faultless,' lacks the elevation and spiritual imagination of the greatest masters.

See books by Von Reumont (Leip. 1835), Guinness (1899), Knapp (1908); also Janitschek in *Dolme's Kunst und Künstler*; and Crowe and Cavalcaselle, *Painting in Italy*.

Sartoris, ADELAIDE. See KEMBLE.

Sarts. See TURKESTAN.

Sarum. See SALISBURY, LITURGY.

Sarzana, a city of Northern Italy, 8 miles by rail E. of Spezia. It has a cathedral (1204-1477), and an ancient fortress (now a prison), and is the birthplace of Pope Nicholas V. Its position at the entrance of the Magra valley (up which a railway runs through the Apennines to Parna) at all times made it an important frontier post. Above the town is the castle of Sarzanella. For the Bonaparte family see SAN MINIATO. Pop. 13,500.

Sasebo, a great naval dockyard of Japan, on the NW. coast of Kjusiu, 30 miles N. of Nagasaki; pop. 93,000.

Sasine. See INFENTMENT.

Saskatchewan (named from an Indian word meaning 'rushing water'), a province of the Dominion of Canada, lies between Manitoba and Alberta, bounded on the south by the United States, and on the north by the large unorganized area known as the North-west Territories. With Alberta, it was formed in 1905 from the provisional districts of Assiniboia, Saskatchewan, Alberta, and Athabasca. Area, 251,700 sq. m., including 8329 sq. m. of water. Pop. (1906) 227,000; (1911) 492,432; (1921) 757,510. The capital is Regina. The province may be divided into three well-defined zones. The southern portion consists chiefly of

open rolling prairie. The city of Saskatoon, 150 miles north of the United States boundary, is about on the dividing line between this prairie zone and the tract of partly wooded and partly prairie country known as park country, extending to about 150 miles north of Prince Albert, on the Saskatchewan. The northern part of the province is chiefly wooded and is largely unexplored. The prairie produces principally wheat. The park country also produces wheat largely, but is splendidly adapted for mixed farming and stock-raising. The principal river of the province is the Saskatchewan (with two head-streams, the North and South Saskatchewan), 1200 miles in length, rising in the Rocky Mountains and emptying into Lake Winnipeg. The Churchill in the north, 1000 miles long, drains an area of 116,600 sq. m.; smaller rivers are the Qu'Appelle, 270 miles, and the Souris, 450 miles long. There are many large lakes in the northerly portion of the province, the principal being Athabaska, 2842 sq. m., half of which is in Alberta; Reindeer, 2437 sq. m.; and Wollaston, 906 sq. m. The climate is hot in the summer months, but generally tempered by cool breezes; while the winter is cold, but dry and bracing. The southern plains of Saskatchewan, once the home of mighty herds of bison, have now been converted into cultivated fields, and the only products of animal life are water-fowl, grouse, jack rabbits, hares, and coyotes; but in the north, moose, elk or wapiti, caribou, blacktail and whitetail deer are found, and wolves are still numerous. Beaver are found in large numbers; and fish, including white fish, the most valuable of fresh-water food-fish, abound in immense quantities in the lakes.

Saskatchewan is eminently an agricultural province, but only about one-quarter (26 million acres) of the land capable of cultivation is used for that purpose. The principal crops are wheat and oats (two-thirds and one-third of the total Canadian crops), but barley, rye, and flax are also grown. Before being marketed, the grain is handled through elevators, where it is stored, awaiting transport by rail to lake ports on Lake Superior. Stock-raising is very important, the province containing large numbers of horses and cattle; and fruit and vegetable growing are carried on. In the north the production of furs is very considerable. Few minerals have yet been found, but there is evidence of silver, copper, gold, and iron in the northern limits, and coal of a fair quality is now worked extensively. Timber to a large extent is taken from the forested area in the north. The three great transcontinental railway lines traverse the province, which has a total railway mileage of 8500 miles. There is a good system of elementary and secondary schools. The University of Saskatchewan (1907) is at Saskatoon. Presbyterians, Roman Catholics, Anglicans, and Methodists are about equal in number. The affairs of the province are administered by a Lieutenant-governor, a cabinet, and a Legislative Assembly of 63 members, elected for five years. The province sends 21 representatives and 6 senators to the Dominion parliament. The early history of Saskatchewan is practically that of the Hudson's Bay Company (q.v.), but since the construction of the great railways (see CANADA) the province has made rapid progress, especially in the 20th century. The provincial government encourages all development, allowing, for instance, subsidies to co-operative creameries.

See the books cited at CANADA; also Louis Gilbert, *La Saskatchewan* (1924).

Saskatchewan, a large river of Canada, drains its waters from the Rocky Mountains, and is formed of two branches. The north branch

rises among the glaciers near Mount Hooker, the south branch in the very north of Montana (see ALBERTA). The former has a course of 760, the latter of 865 miles, before they meet in the province of Saskatchewan (q.v.) at about 105° W. long. and 53° N. lat. The united river then flows east some 300 miles to Lake Winnipeg, from which its waters are carried to Hudson Bay by the Nelson River (q.v.). The Northern Saskatchewan is navigable as far as Edmonton.

Saskatoon, a town in Saskatchewan, 160 miles NW. of Regina, on the South Saskatchewan River. It is a large railway centre and an important distributing centre in a rich wheat-growing district, with mills, elevators, &c. Here is the University of Saskatchewan (1907). Pop. 25,700.

Sassafras (*Sassafras*), a genus of trees or shrubs of the family Lauraceae. The sassafras-tree (*S. officinale*) of North America, found from Canada to Florida, a mere bush in the north,

Sassafras (*Sassafras officinale*):

a, branch of male tree in flower; b, branch with ripe fruit and developed foliage. (Bentley and Trimen.)

but a tree of 50 feet in the south, has deciduous leaves, yellow flowers, which appear before the leaves, and small dark-blue fruit. The wood is soft, light, coarse in fibre, dirty-white and reddish brown, with a strong but agreeable smell, resembling that of fennel, and an aromatic, rather pungent and sweetish taste. The wood of the root possesses these properties in a higher degree than that of the stem, and the thick spongy bark of the root most of all. The wood is brought to market in the form of chips, but the bark of the root is preferred for medicinal use, is a powerful stimulant, sudorific, and diuretic, and is employed in cutaneous diseases, gout, rheumatism, and syphilis, generally in combination with other medicines. It contains a volatile oil, *Oil of Sassafras*, which is often used instead. An agreeable beverage is made in North America by infusion of sassafras bark or sassafras wood; and a similar drink was once commonly sold in the streets of London under the name of *Saloop*. The leaves of sassafras contain so much mucilage that they are used for thickening soup.—The name is given also to *Cinnamomum Parthenocylon*, found in Sumatra, and (with or without explanatory prefixes) to trees of various families found in Victoria, New South Wales, Tasmania, Brazil, and Chile.

SASSAPRAS NUTS are the cotyledons of the South American lauraceous tree *Nectandra puchury*, used as medicinal aromatics. They are also called Picurim Beans and Brazilian Beans.

Sassanidæ. See PERSIA.

Sassari, a city in the north-west of Sardinia, ranking next after the capital Cagliari; it stands 12 miles by rail from the Gulf of Asinara, where its port, Porto Torres (pop. 6260), is situated, and 162 miles N. by W. of Cagliari. A prosperous-looking town, with both old and new houses, embosomed in orange and olive groves, it has a cathedral (12th century to 1531), an old castle (1327-31), a university (1677, reopened in 1766), a museum of prehistoric, Phœnician, and Roman antiquities, a natural history collection, and a library (1556), and is the seat of an archbishop and of several of the old Sardinian nobles. There is a busy trade in grain, olive-oil, cheese, and hides. It was no doubt founded by refugees from Porto Torres, whence the see was transferred in 1441. Pop. (1921) 42,950.

Sassoferrato, an Italian painter, whose real name was GIAMBATTISTA SALVI, was born at Sassoferrato in the March of Ancona, 11th July 1605, and worked mainly at Rome, where he died 8th April 1685. He painted Madonnas, Holy Families, an Annunciation, and an Assumption.

Sassoon, or SASSUN, the scene of atrocities perpetrated on the Armenian inhabitants by Kurds and Turks in 1894 and 1915, is a small town in the mountains of Kurdistan, 50 miles W. of Bitlis.

Sassoon, SIEGFRIED, poet, was born in 1886, and educated at Marlborough and Cambridge. His *Collected War Poems* appeared in 1919, *Selected Poems* in 1925, and *Satirical Poems* in 1926. His war poems reveal a tremendous dynamic quality with a fierce hatred of trifles and shams, but sometimes the cold irony of the satirist outweighs the inspiration of the poet. The combination of passion and intellect, however, makes his best work very powerful.

Satan. See the articles DEVIL, HELL.

Sâtârâ, a town of Bombay presidency, India, occupies a high, healthy site on the Deccan plateau, near the Kistna, 56 miles S. of Poona. It is commanded by a hill-fort, which came into the hands of the British in 1848. Pop. (1921) 22,454.—The district has an area of 4910 sq. m. and a pop. of 1,026,259 (1921).

Satellites are members of the solar system which revolve round their several planets as the moon does round the earth (see MOON). The gravitational pull of the planet or 'Primary,' on account of its proximity to the satellite, exercises such a controlling influence that the satellite circulates about its primary while both are circulating round the much more distant sun. From the period of revolution of a satellite and its distance from its primary the mass of the latter may be calculated. In this way the masses of all the planets which have satellites can be readily compared with that of the earth or sun. The first satellites to be discovered were the four large satellites of Jupiter, found by Galileo when he turned his telescope on the

planet in 1610. This discovery was of great importance in removing some of the difficulties, and helping in the establishment of the Copernican theory. In the course of their movement round Jupiter, the satellites are sometimes seen projected on the face of the planet, sometimes eclipsed by the shadow of the planet, and sometimes occulted at its limb. These phenomena are of frequent occurrence, and make an attractive subject of observation with the telescope. The paths of the satellites round Jupiter are approximately circular, and the times of the disappearances and reappearances can be tabulated. It was noticed by the Danish astronomer Rømer that these phenomena actually occurred before the tabulated times when the earth was comparatively near to Jupiter, and later than the tabulated times when the earth was farther away. This was explained by Rømer as due to the greater distance the light had to travel to reach the earth. Thus the very important discovery of the finite velocity of light was made (see LIGHT, SUN). Titan, the largest of the satellites of Saturn, was found by Huyghens, who also discovered the ring, which is now known to consist of myriads of very small bodies revolving round the planet, and is thus of the nature of a collection of satellites. Eight more satellites of Saturn have been discovered since, as well as four of Uranus and one of Neptune. Two satellites of Mars were discovered in 1877. These are very small bodies, very near to Mars, and revolving very rapidly round it, the near one more rapidly than the planet rotates on its axis. In 1892 a very small fifth satellite of Jupiter was discovered by Barnard. This satellite is much nearer the planet than the four Galilean satellites, and can only be seen with the largest telescopes. In 1896 Phoebe, a very small and distant satellite of Saturn, was discovered photographically by W. H. Pickering. Two small distant satellites of Jupiter were discovered photographically by Perrine in 1906, an eighth by Melotte in 1908, and a ninth by Nicholson in 1914. Generally the satellites revolve round their primaries in the direction the primaries move round the sun. The satellites of Uranus and Neptune, the eighth and ninth satellites of Jupiter, and Phoebe, have a retrograde motion.

Satellite Towns, a name given to those garden cities (see HOUSING AND TOWN-PLANNING) intentionally built near great towns to arrest the

congestion and sporadic extensions of the latter, and at the same time to provide for the continued increase of population. The aim is to create a fresh centre of life and activity, to limit the satellite town to a certain size, and, by insisting on the importance of gardens and of a surrounding agricultural belt, to combine the virtues of urban and rural life. The whole of the land is held in direct public ownership or in trust for the community. Letchworth (q.v.) was the first garden city established in Great Britain, while Welwyn (q.v.) has been described as the first satellite town to London.

Satí. See SUTTEE.

Satin, a fabric in which so much of the weft is brought uppermost in the weaving as to give a more lustrous and unbroken surface to the cloth than is seen when the warp and weft cross each other more frequently; this will be better understood by reference to the figure than by any verbal description. A are the warp threads, of which only every tenth one is raised to allow the shuttle to pass, but they are all raised in regular succession, so that the weaving is quite uniform throughout; B are the weft threads; and C is the selvage, which is formed on each side of the piece of stuff

by the regular method of plain weaving—that is, by raising every other warp thread for the passage of the weft. The figure shows a ten-thread satin twill, but there are various others made, such as a five, a six, a seven, and an eight-thread satin. The lowest satin twill that can be produced is a four-thread, which is sometimes called the satinnet twill. The term satin is rarely applied to other than silk textiles (see SILK). A cotton, and sometimes even a woollen, fabric woven in the way described is called sateen.

Satin-bird. See BOWER-BIRD.

Satin Spar. See ARAGONITE, GYPSUM.

Satinwood. This is perhaps the most valuable of the light-coloured furniture woods. Two kinds of satinwood are known in commerce, both being somewhat similar in appearance, although they do not appear to be closely allied botanically. One kind is obtained from a moderate-sized rutaceous tree (*Chlorozylon Swietenia*), growing in Central and South India, including Ceylon. It is allied to the mahogany-tree, and as regards appearance the wood might be called a yellow mahogany. In India satinwood is used for house-building and agricultural implements, as well as for furniture purposes; but richly figured pieces of it, especially, are exported to England for cabinet-work. West Indian satinwood is the better of the two kinds—at least it is more commonly used for furniture. It comes mainly from San Domingo and Porto Rico, but, although the wood has been long used in Europe, its botanical source is not certainly known. It is, however, supposed to be furnished by an ebenaceous tree. Satinwood, of either kind, is

hard, very closely-grained, and takes a fine polish. It can be cut into small mouldings better than most woods, but it is of a greasy nature, and does not hold glue well. In colour it is of a subdued yellow passing into brown, and much of it has a rich satiny or feathery figure which is very beautiful. It has been much used in costly furniture, but not so extensively in recent years. The cabins of passenger steamers are often panelled with satinwood, which is also a good deal employed for small ornamental articles.

Satire is a species of literature more than usually difficult to define. It shades off in various directions into moral and philosophical discussion, preaching, controversy, prophetic denunciation and warning, exercises in wit, in friendly humour, indulgences in spite and in obscenity, sensational realism and tearful despondency. As it is generally used to-day, the word has reference rather to the spirit than to the form of a composition. Satire may be found in any form: prose or verse, essay, romance, comedy, epic, eclogue, even lyric, as in Dorset's hands, may be satirical. But a work is not necessarily a satire because it contains satire. Were Andrew Marvell's satires lost, his *Rehearsal Transposed* would prove that he possessed satirical powers of the highest kind, but in the author's intention and in the form of the book the satirical is outweighed by the polemical. One of the least unsatisfactory definitions of literary satire, Dr Garnett's, makes it 'the expression in adequate terms of the sense of amusement or disgust excited by the ridiculous or unseemly, provided that humour is a distinctly recognisable element, and that the utterance is invested with literary form.' Yet the least humorous of all possible poses, that of the impeccable castigator of vice, has been more than most others assumed, without humorous intention, by satirists, and that too under the influence of that literature which claimed satire as its own peculiar product. Part of the confusion is due to the composite origin of modern satire. Modern nations would be equally justified in admitting the Roman claim '*satura tota nostra est*,' and in putting forward a like claim in their own behalf. Satire has sprung up independently in many societies from the railings of rustics at their festivals, or from the taunts and jibes of champions on the battlefield or at the banquet. At later stages these have been profoundly influenced in their development by the Latin forms that had sprung from a similar source. But the Latin *satura* was already far removed from its origins. The word *satura*, that is *satura laus*, a full dish, meant, it is said, the first fruits offered to the gods at harvest festivals, and so a medley. It had reference, therefore, to the form, or formlessness, of the kind, and to its rusticity rather than its censoriousness. There are some satires among those of Horace to which nobody nowadays would give that name. To complicate matters further, a rival etymology connected satire with the satyrs of the Greeks. Thus alongside of popular satire, with its fighting efficiency as highly developed as its authors' skill allowed, there has been introduced from time to time an artificial classical kind, the plaything of scholars, in which the arbiter elegantiarum too often affects the satyr's shaggy hide, and the censor morum his lewdness.

The iambic verse of the Greeks, practised at the festivals of Demeter, was at first satirical. In its original or in its seazonic form it was used satirically by Archilochus, Simonides of Amorgos, and Hipponax. Of these little has survived; but important Greek influences were passed on to modern satire by the comedies of Aristophanes, the character-essays of Theophrastus, and later by the dialogues of Lucian. Among the Romans Lucilius

has come down only in fragments. Horace, the friendly worldling, in pedestrian verse employs the insinuating mode of satire. Persius, the high-minded Stoic, serene and philosophic in thought, is harsh and obscure in form. Juvenal, the vehement inveigher against vice, uses the most lurid colours. His power of impressing a picture on the memory is very great, though his rhetoric may bring suspicion upon his sincerity. All these reprehend chiefly private vices and follies, with violent transitions, and unexpected strokes at one victim as they pursue another. In addition to these formal satirists, Martial wrote satirical epigrams, and Petronius a form of prose fiction that anticipates the Spanish picaresque novel.

In Old English satire is difficult to detect. The railing Hunferth in *Beowulf* had doubtless successors in real life, but in literature hostility found less spirited expression in homilies and complaints. In the 12th century continental, and perhaps Welsh, influences find entrance to England in Latin verse-forms, some of which before very long became models for vernacular work. Nigel Wireker's *Speculum Stultorum*, the story of Brunellus the ass that wished for a longer tail, was long popular. From the 12th century onwards the Goliards, scholars who led irregular, wandering lives in England and Europe, wrote lively Latin rhymes, many of which attacked the morals of churchmen. The central figure was the voluptuous glutton Bishop Goliard, whose *Confession*, containing the famous 'Meum est propositum', has been doubtfully attributed to Walter Map. Continental vernacular forms of similar tendency are the fabliau and the beast-epic. The story of Reynard the Fox, popular in Germany and France, was slow to make way in England, but one section, *The Vox and the Wolf*, appears about the middle of the 13th century. *The Land of Cockayne*, with something of the fabliau character, belongs to the same time. It describes a monastery built of pasties and fat puddings, where geese fly roasted on the spit, and everything else that a sensual monk can desire is at hand. After the battle of Lewes Richard of Cornwall is derided in spirited English verses, and from that time English takes its place beside Latin, and finally supersedes it as the language of purely political ballads. International animosities are seen in Scottish jeers at the maidens of England who had lost their lemans at Bannockburn, and in the vigorous crowing of Laurence Minot over Halidon Hill and Sluys. Shortly before this time France produced a satirical writer destined profoundly to influence the literature of Europe. Guillaume de Lorris's unfinished love-allegory, the *Roman de la Rose*, had been written in the troubadour spirit. Jean de Meung seasoned his encyclopedic continuation with mockery of women and priests. Chaucer was perhaps not exactly a satirist, but there is much satire of the finest kind diffused through his work. His tolerant, urbane humour, trained by his Italian studies, enabled him to practise one of the gentlest though most effective modes of satire. A very different kind of satirical power belongs to the author (or authors) of *The Vision of William concerning Piers the Plowman*. Langland has sometimes been likened to Juvenal. He resembles him in vividness; but Juvenal is a rhetorician, Langland a prophet, whom few satirists have approached in moral earnestness. His subject is the whole commonwealth of England and the duty of each man to perform his own function faithfully. In the more worldly William Dunbar an equal visualising power is combined with wildly grotesque humour, and employed for the amusement of the Scottish court and his own advancement therein.

Renaissance and Reformation flooded Europe with satire, Latin and vernacular. In Latin,

scholars like Erasmus and Scaliger fell foul of one another, or like George Buchanan in his attacks on the Franciscans, and Ulrich von Hutten, Johann Jäger, and other authors in the *Epistolæ Obscurorum Virorum*, joined in the quarrel of religion. Besides Buchanan, the Scottish Reformers had an ally in their own tongue in Sir David Lyndsay, who used the morality play and other mediæval forms. The same shrewd humour of the German people that had shown itself in *Reynard* had again appeared in the merry roguery of *Till Eulenspiegel*. In South Germany Sebastian Brant gave a new turn to the methodical mediæval satire of classes by changing abstractions to types in his *Narrenschiff* (1494); and Niklaus Manuel showed what pungent dialogue could do to advance the Reformation. Manuel found English imitators; but Brant, who at home influenced Geiler, Fischart, and Murner, is the strongest German force in English satire. His influence seems traceable in the real types introduced by that reckless and breathless railer at Wolsey, John Skelton. Alexander Barclay, who introduced satirical eclogue in imitation of Baptista Mantuanus, is better remembered for his *Ship of Fools* (1509), partly translation, partly imitation of Brant. One of Brant's fools, Gribianus, in the hands of Dedekind and other Germans became the patron saint of slovens, and the centre of a literature that reached England in Dekker. To mediæval despondency over the world's instability a new tone of serene philosophical rectitude, and a new polish and scholarly ease, were given by Wyatt in his paraphrases of Horace, Persius, and the Italian Alamanni. Gascoigne's long, solemn, monotonous blank-verse poem, *The Steele Glas* (1576), classical in intention, is almost wholly mediæval in character. It is a moral discourse for staid readers. At least two of the master works of European literature, produced in the Renaissance spirit, are more than touched with satire. Italy, if it had no Rabelais or Cervantes, had a school of cultured mock-heroic in Pulci, Ariosto, and Berni, who blended satire with romance. In England, however, the romantic spirit of Elizabeth's reign did not favour satire, though Spenser at some time in his youth wrote the beast-fable *Mother Hubbard's Tale*, which passed on the mediæval tradition to Drayton (*The Owl*) and William Goddard. Spenser only printed his satire in 1590, when a reaction was already becoming visible. A taste was springing up for realistic and picaresque literature on the one hand, and on the other for analysis of humours in preference to full presentation of complete human characters. Under the influence of didactic theories of literature these, and sometimes erotic writings, often assumed a satirical mask. Books on coney-catching and thieves' slang, descriptions of tavern-scenes and swashbucklers, approach satire, and some of the prose works of Nash, Lodge, Dekker, and Breton come within its borders. Jonson placed satire on the stage in the comedy of humours. A new generation in the universities, more studious than adventurous, dissatisfied with romanticism, sought in social changes the causes that made it difficult for purely academic accomplishments to make a living without recourse to flattery, simony, or charlatanism. These young men showed a snappish irritability in satires pieced together, in great measure, out of Juvenal. Donne stands apart because of his metaphysical style, his use of Horace, and above all the expression of his genius and personality in his satires. Lodge gave Horace's tone to Juvenal's matter. Joseph Hall used Persius as well as Juvenal. Marston, Guilpin, and others followed Hall. These writers deal not with politics—for that was dangerous—nor with offences against the commonwealth, as older English satirists had done, but with vices seen from Juvenal's

point of view; and they write with one eye upon Elizabeth's England and one upon Domitian's Rome. Their satire is self-conscious and histrionic. They cultivated obscurity, harsh versification, uncouth jargon, and lubberly manners. Nicholas Breton protested against their absurdities in *No Whipping nor Tripping, but a kind friendly Snipping* (1601), one of the most melodious and sweetest-tempered satires in English, much resembling the Bernesque manner.

Early in the 17th century John Barclay, in Latin prose, imitated Petronius in his *Euphronis Satyricon*, and in *Argenis* essayed political romance; Quevedo in Spanish passed on the dream-form to the German Moscherosch; and in Italian Tassoni gave an example of the mock-heroic in *La Secchia Rappita*.

After 1600 the school founded by Hall gradually abandoned satire and affectation, and split into a realistic branch represented by Samuel Rowlands and a moral branch represented by Wither and Brathwaite. Meanwhile a lighter satire appeared, still scholarly, but convivial and unguarded, carelessly written in popular forms. Ballads, drinking songs, epistolary itineraries, were written by Bishop Corbet, Alexander Brome, Sir John Mennis, and Dr James Smith; and Suckling's *Scissions of the Poets* had many imitators. Others combined this manner with the vivacity and metaphysical wit of Donne, which they turned to playful or political use. Of these Cleveland yields in brilliance only to Butler; but though his explosions of wit emit amazing flashes of light the damage they inflict upon the enemy is trifling. Wit and animosity, though present together, do not co-operate. Butler's *Hudibras* takes its plan from *Don Quixote*, and is indebted to the *Satyre Ménippée* (1594), in which the French Politiques had mocked the Leaguers. It is a sordid, cynical burlesque, not on the Puritans only but on the whole spirit of the early 17th century, written by one in whom the impulses of that spirit were baffled by a sense of futility that came from the Restoration craving for criticism and restriction.

After Butler political satire becomes more and more journalistic. Lampoons, epigrams, and occasional satires abound in the Restoration period. Denham and Marvell found means of combining these elements into longer satires by parodying the *Instructions to a Painter*, in which Waller had too hastily celebrated the Duke of York's exploits in the Dutch War. Marvell exceeds his contemporaries in earnestness, moral weight, and pictorial power. He had previously written good-humoured witty satires in the metaphysical manner; and now in addition to what he did in more dignified forms he wrote popular ballads of great vigour and epigrammatic sting. Such prose satire as was written in the 17th century was very largely in the form of character essays. A cynical, satirical tone prevailed on the stage and in conversation. Every turn in politics was followed by a crowd of dreams, prophecies, ghost-speeches, burlesque litanies, and other old forms, as well as verse essays and directions to painters. The standard of accomplishment could hardly have been lower, but the age of satire had begun, and satirists were eager to find out each other's faults. Writers on satire such as Casaubon and Dacier were studied; and above all neo-classical France, to which all eyes were turned, had then one of the world's most influential satirists to offer as a model. Satire of the classical kind had already been practised in France by R  gnier. Boileau as a disciple of Horace now remodelled French verse, laid down laws that held for many a day, and executed them himself upon his weaker contemporaries. His satires show strong prosaic common-sense. Over

a basis of platitude he lays a highly polished veneer of Horace and Juvenal. He taught Butler, Rochester, and Oldham to translate and adapt the Latin satirists; and they used Boileau himself in the same way. Oldham's coarse and hectoring *Satires on the Jesuits* (1681) borrow their matter from Juvenal and Buchanan. As a rule Horace and Boileau are preferred by others; and Englishmen at last decide, as Mulgrave puts it, that 'A satyr's smile is sharper than his frown.' This doctrine tempered Dryden's native energy. He owes his pre-eminence to his combination of technical accomplishment, strength, and a sure instinct for selecting the right means and stopping at the right point. *The Medal* is a fine piece of satirical reasoning, *Macflecknoe* a dignified and on the whole decorous mock-heroic influenced by, rather than imitated from, *Le Lutrin* of Boileau. But Dryden is at his best in the mingled narrative and character-drawing of *Abdolon and Achitophel*. After Dryden, Boileau's influence became paramount in Garth and in Pope. What Dryden did in the exhilaration of execution could only be very imperfectly followed by smaller men. Pope substituted minute, patient finish for Dryden's breadth and strength. To the heroic couplet, which even in Wither's hands had shown an epigrammatic tendency, he gave the last degree of point and sparkle, and fixed the technique of verse satire for a century. Among contemporaries Prior and Gay wrote light verse; Edward Young assailed *The Universal Passion* for fame; while Defoe, Arlthnot, and above all Swift, excelled in prose. In 'sava indignatio,' expressed in relentless irony, Swift has never been equalled. The influence of these English writers has been traced in the German satire of Liscow, Rabener, Wieland, and Lessing, and in French in the brilliant mockery of Voltaire. Johnson adapted Juvenal; Goldsmith showed himself one of the most genial of satirists; and Cowper was intermittently successful; but between Pope and the end of the century the greatest satirists in English are Churchill and Burns. Churchill, a vigorous slashing follower of Dryden, was an immoral champion of morality, a carper of great verve, with a knack of writing lines that only wanted to be a little better to become commonplace of quotation. His lack of judgment was more fatal to his memory than the obscurity of his victims or the falsity of his charges. Burns belongs to a different tradition, which reaches back through Robert Fergusson and Allan Ramsay to Dunbar; but Dunbar alone can claim comparison with the humour and biting sarcasm that Burns turned against the hypocritical orthodox. The odes of Wolcot ('Peter Pindar') are amusing in small quantity, but soon grow nauseous. In his imitations of Persius and Horace William Gifford bullied the Della Cruscan poetasters with unnecessary acrimony and strenuity but some felicity of expression. Under his editorship *The Anti-Jacobin* (1797-8), to which George Canning, George Ellis, and John Hookham Frere contributed their brilliant parodies, nearer to Aristophanes than anything before them in English, far outshone the Whig *Rolliad*. Moore and Byron both deserted the Popian convention of their earlier satires, Moore to write witty but watery Hudibrastics and anapestics against the Prince Regent and the Tories, Byron to follow Frere in acclimatising Bernesque satire which had come down in Italian to Casti. Less exquisite in form than Frere's, and less delectable in humour, Byron's are as satires among the greatest; but he puts so much of himself into them, and of his revolt against the spirit of his age, that they are not satires pure and simple. His function in history has analogies with Voltaire's and with Heine's. Though denunciatory

verse has been written by Coleridge, Shelley, Tennyson, Browning, Swinburne, and Sir William Watson, pure satire has dwindled away as the hard-and-fast lines of fixed dogmas have faded out under the influence of romanticism and scientific criticism. Canning's prayer, 'Save, save, oh! save me from the Candid Friend,' has not been answered. But if the Candid Friend's discrimination and tolerance seldom allow him to be scornful, they do allow a refined spirit of satire to pervade general literature more thoroughly and more subtly than before. Peacock gave a well-compounded flavouring of Aristophanes, Petronius, and the Italians to his songs and novels. Landor, Sydney Smith, Carlyle, Thackeray, Dickens, and Mr Bernard Shaw have mingled satire, or something like it, with their work. Even Samuel Butler's *Erewhon* is not un-mixed satire. Satire of the humorists, and therefore tolerant, kind has been written by Southey and Coleridge, Hood, Præd, Thackeray, Sir W. S. Gilbert, and Sir Owen Seaman, and in America by Washington Irving, J. R. Lowell, Wendell Holmes, and many others.

See the articles on the several writers and literatures; such articles as BURLIQUES, CARICATURE, CHARACTER, PARLIAUX, and PARODY; HURRAY, *Satire and Satirists* (1854); Allen, *Rise of Formal Satire in England* (Philadelphia, 1899); Freville-Orton, *Political Satire in English Poetry* (1910); Hugh Walker, *English Satire and Satirists* (1925).

Satisfaction. See ATONEMENT.

Satrap was the governor of a province in the ancient Persian monarchy. His duties and position were clearly defined by Darius I. in the 6th century B.C., although there had been satraps before his day. They enjoyed the right to command the royal army in the province (though not the troops in the fortresses), to levy mercenaries, and to coin money. Alexander in the 4th century greatly curtailed their power. When the Persian monarchy began to decline some of the satraps founded independent kingdoms, the most famous being that of Pontus.

Satsuma. See JAPAN, POTTERY.

Saturn, an ancient Italian divinity, who presided over agriculture. His name, from the same root as *satum* (*sero*, 'I sow'), indicates what was probably one of the earliest personifications in the Italian religion Saturn being the god who blessed the labours of the sower. His identification with the Greek Kronos by the later Græcising myth-mongers was a peculiarly infelicitous blunder, the two having absolutely nothing in common except their antiquity. The Greek *Demeter* (Ceres) approaches far more closely to the Italian conception of the character of Saturn. The process of amalgamation in the case of Kronos and Saturn is visible enough. First, there is the Greek myth. Kronos, son of Uranos ('Heaven') and Gæa ('Earth'), is there the youngest of the Titans. He married Rhea, by whom he had several children, all of whom he devoured at birth except the last, Zeus (Jupiter), whom his mother saved by a stratagem. The motive of Kronos was his hope of frustrating a prophecy which declared that his children would one day deprive him of his sovereignty, as he himself had done in the case of his father Uranos; but fate is stronger even than the gods, and when Zeus had grown up he began a ten years' war against Kronos and the Titans, which ended in the complete discomfiture of the latter, who were hurled down to Tartarus, and there imprisoned. So ran the common myth. But other myths added that after his banishment from heaven Kronos fled to Italy, where he was received hospitably by Janus, who shared his sovereignty

with him. At this point the Greek myth coalesced with the Italian. Saturn, the old homely deity of the Latin husbandmen, was transformed into a divine king, who ruled the happy aborigines of the Italian peninsula with paternal mildness and beneficence, taught them agriculture and the usages of a simple and innocent civilisation. Hence the whole land received from him the name of *Saturnia*, or 'land of plenty,' and his reign was that 'golden age' of which later poets sang as the ideal of earthly happiness. At the foot of the Capitoline, where the fugitive god had formed his first settlement, there stood in historical times a temple dedicated to his worship. Ancient artists represented him as an old man, with long, straight hair, the back of his head covered, his feet swathed in woollen ribbons, a pruning-knife or sickle-shaped harp in his hand. Other attributes are of later invention. For the planet Saturn, see PLANETS.

The SATURNALIA was most probably an ancient Italian rural festival of the old Italian husbandmen, commemorative of the ingathering of the harvest, and therefore of immemorial antiquity. Its characteristic cessation from toil and its self-abandoning mirth were expressive of the labouring man's delight that the work of the year was over, and not of an artificial enthusiasm for a 'golden age' that never had been. During the festival the distinctions of rank disappeared or were reversed. Slaves were permitted to wear the *pileus*, usually the mark of freedom, and sat down to banquets in their master's clothes, while the latter waited on them at table. Crowds of people filled the streets, and roamed about the city in a peculiar dress, shouting '*Io Saturnalia!*' sacrifices were offered with uncovered head; friends sent presents to each other; all business was suspended; the law-courts were closed; schoolboys got a holiday; and no war could be begun. During the Republic the Saturnalia proper occupied only one day—the 19th of December (xiv. Kal. Jan.). The reformation of the calendar by Julius Cæsar caused the festival to fall on the 17th (xvi. Kal. Jan.), a change which produced much confusion, in consequence of which the Emperor Augustus ordained that the Saturnalia should embrace the whole three days 17th, 18th, and 19th of December. Subsequently the number was extended to five, and even seven; but even in the times before the Empire it would appear that the amusements often lasted for several days. But while the whole week was regarded in a general sense as devoted to the Saturnalia, three distinct festivals were really celebrated—the Saturnalia proper; the *Opalia*, in honour of *Ops*, the wife of Saturn, and the goddess of field-labour (from *opus*, 'a work'); and the *Sigillaria*, in which *sigilla*, or little earthenware figures, were exposed for sale, and purchased as children's toys. The modern Italian carnival would seem to be only the old pagan Saturnalia baptised into Christianity.

Saturnian Verse, the name given by the Romans to that species of verse in which their oldest national poetry was composed. In the usage of the later poets and grammarians the phrase has two different significations. It is applied in a general way to denote the rude and unfixed measures of the ancient Latin ballad and song, and perhaps derived its name from being originally employed by the Latin husbandmen in their harvest-songs in honour of the god Saturn (q.v.). It is also applied to the measure used by Nevius, and a common opinion, sanctioned by Bentley, is that it was a Greek metre introduced by him into Italy. But most scholars now maintain that the measure of Nevius is of Italian (Hermann even thinks of Etruscan) origin, and that it merely improved on the primitive Saturn-

ian verse. According to Hermann, the basis of the verse is contained in the following schema:

— — — — — | — — — — —,

which, as Macaulay points out, corresponds exactly to the nursery rhyme,

The queen was in her parlour | eating bréad and hóney,
and is frequently found in the Spanish poem of the *Cid*, the *Nibelungenlied*, and almost all specimens of early poetry; but in the treatment of it a wide and arbitrary freedom was taken by the old Roman poets, as is proved by the extant fragments of Nævius, Livius Andronicus, Ennius, and the old inscriptionary tables in the Capitol.

Satyriasis is a phase of insanity in man of which the characteristic is ungovernable sensuality. The term has also sometimes been applied to Leprosy (q.v.), on account of the disfigurement of the face to which it leads. See SATYRS.

Satyrs, in Greek Mythology, were a race of woodland deities, half human, half animal in their attributes. They are generally described as roaming the hills in the train of Dionysus (Bacchus). In appearance they were at once grotesque and repulsive, like all old woodland demons. They are described as robust in frame, with broad snub noses, large pointed ears like those of animals (whence they are sometimes called *theres*, 'wild beasts'), bristly and shaggy hair, rough skin, little horny knobs on their foreheads, and small tails. The satyrs are of course sensual in their inclinations, and ravishers of the woodland nymphs, fond of music, dancing, wine, and of the deep slumbers that follow a debauch. To men they were mostly inimical. The Roman poets identified them with the *Fauni* of their own mythology, and gave them larger horns and those goats' feet with which they are so often represented (see FAUNS). Ancient sculpture was fond of the Satyr as a subject. The older satyrs were called *Sileni*, and were represented as already described; the younger had a handsomer and more pleasing exterior—e.g. Praxiteles' famous Satyr at Athens.

Sauces. See DIET.

Sauchleburn, a battlefield of Stirlingshire, adjoining Bannockburn. See JAMES III.

Sauerkraut, a preparation of the common white cabbage, in extensive use in Germany and the north of Europe. The cabbages are gathered when they have formed firm white hearts, are sliced or cut fine, and then placed in a succession of thin layers in a cask, each layer being sprinkled with fine salt, to which some add juniper-berries, cummin-seed, caraway-seeds, or other condiment. A board is placed on the top, with a heavy weight, so as to press the whole down firmly, but gently; and ere long fermentation takes place. Sauerkraut is generally eaten boiled, in the same way as fresh cabbage, but is sometimes sweetened.

Saugor. See SAGAR.

Saul, the first king of Israel, was the son of Kish, a wealthy chief of the tribe of Benjamin. The circumstances that marked his election to the royal dignity are familiar to all readers of Scripture. Gigantic in stature, noble in mien, and imperious in character, he was admirably fitted to accomplish the task of consolidating the tribes of Israel. His earlier achievements augured hopefully for his future. The deliverance of the men of Jabesh Gilead, above all his victories over the Philistines, Ammonites, and Amalekites, were unmistakable proofs of his military capacity; but gradually there showed itself in the nature of the man a wild perversity—'an evil spirit of God' it is called—which found vent, along with other forms, in a mad jealousy of David, his son-in-law and

the chief of his bodyguard, and culminated in paroxysms of insane rage, which led him to attempt David's life with his own hand, and to commit such frightful deeds as the massacre of the priests of Nob. Saul had, however, apparently the strong opposition of the priestly class to contend against, for at length Samuel retired from court, and secretly anointed David as king; see the article SAMUEL. Saul fell in a disastrous and bloody battle with the Philistines on Mount Gilboa, and all his work seems to have been undone.

Sauley, FÉLICIEN CAIGNART DE, numismatist, was born at Lille, 19th March 1807, became an artillery officer, and after lecturing for a few terms on mechanics, was made keeper of the artillery museum in Paris in 1842. A member of the Academy and a senator, he travelled in Iceland and Greenland, and subsequently in Syria and Palestine. Besides innumerable works on numismatics, he wrote on Palestine, Jerusalem, and the Dead Sea, on Julius Caesar in Gaul, and on Jewish history. He died 4th November 1880.

Saulte Ste Marie (pron. *Soo*), a port of Ontario, on the St Mary River, near the outlet of Lake Superior, 822 miles by rail W. of Montreal. A canal avoids the obstruction caused by the rapids (*sault*), and the tonnage passing through it is 40 per cent. greater than that of the Suez and Panamá canals combined. There are paper-mills, foundries, engineering and steel works, and it is the centre of a farming and lumber district. Pop. 21,000.—(2) A city and port of Michigan, on the St Mary River, opposite the above, with which it is connected by ferry and railway bridge. It manufactures leather, paper, flour, woollen goods, &c., and the fishing is important. Pop. 12,000.

Saumarez, JAMES, BARON DE, English naval commander, was born at St Peter-Port, in Guernsey, on 11th March 1757. He entered the navy as midshipman at the age of thirteen, and served in the American war (1774-82), for his gallantry at the attack of Charleston (1775) being promoted to lieutenant. He did good service in the action against a Dutch convoy fleet off the Dogger Bank (August 1781), and was made commander, being soon afterwards placed under the orders of Admiral Kenpenfeldt on the Jamaica station. In the great fight between Rodney and De Grasse (12th April 1782) Saumarez commanded the *Russell*, a line-of-battle ship, and gained much distinction by his coolness and intrepidity. For his gallant capture on 20th October 1793 of the French frigate *La Réunion*, with one inferior in size and equipment, he received the honour of knighthood; and in command of the *Orion* he served under Lord Bridport at the battle of L'Orient, June 23, 1795. He also took a prominent part in the battle off Cape St Vincent (February 14, 1797), and was second in command at the battle of the Nile, in which he was severely wounded. In 1801 he was created a baronet and vice-admiral, and in the same year fought his greatest action, off Cadix (July 12), defeating a French-Spanish fleet of fourteen ships with a squadron of only six, causing to the enemy a loss of 3000 men and three ships. This contest, than which, according to Nelson, 'a greater was never fought,' gained for Saumarez the Order of the Bath, the freedom of the city of London, and the thanks of parliament. In the war that broke out between Sweden and Russia in 1809 he commanded the English Baltic fleet that was sent to the assistance of the Swedes. In 1814 he was promoted to the rank of admiral, to that of vice-admiral of Great Britain in 1821, was created a peer in 1831, and died in Guernsey, 9th October 1836. See Life by Sir John Ross (2 vols. 1838), and Mahan, *Types of Naval Officers* (1902).

Saumur, a town of France, dept. Maine-et-Loire, on the left bank of the Loire and on an island in it, 38 miles by rail W. by S. of Tours. The most prominent buildings are an old castle, the 16th-century town-hall, some interesting churches (including that of St Peter, dating from the 13th century), and private houses of good French architecture. There is a cavalry school. Sparkling wines are made, and rosaries and articles in enamel. Pop. 16,000. Saumur was a stronghold of the Protestants during the reign of Henry IV., but its prosperity was annihilated by the revocation of the Edict of Nantes. From 1598 till 1685 it was the seat of a famous school of Protestant theology, the most conspicuous professors being John Cameron of Glasgow (1577-1625) and his pupils Amyraut (or Amyraldus, 1596-1664) and Cappel (1585-1658). The school was noted for its freedom in biblical criticism and its less rigid doctrine of the divine decrees; it was even denounced by the opposing school of Sedan as heretical for teaching a hypothetical universalism—the view that God had not by arbitrary decree excluded any from being saved by the death of Christ. Saumur was brilliantly captured by Laroche-Jaquelin and the Vendéans in the summer of 1793. The largest dolmen in France is $\frac{1}{2}$ mile south of the town; and prehistoric caves line the river close by.

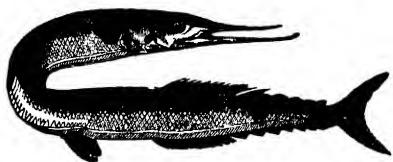

Saunderson, NICHOLAS, the blind mathematician, was born at Thurlstone in Yorkshire in January 1682. He lost his eyesight from smallpox at the age of twelve months, but received a good education in both classics and mathematics. In 1707 he proceeded to Cambridge, and there delivered a series of lectures on the Newtonian philosophy, including Newton's theory of optics. Four years afterwards he was appointed to succeed Whiston as Lucasian professor of Mathematics. He was on friendly terms with Newton, Demoivre, Halley, and other eminent mathematicians amongst his contemporaries. He died 19th April 1739. A Life is prefixed to his *Elements of Algebra* (2 vols. 1740); another treatise by him on *Fluxions*, including a discussion of the principal propositions in Newton's *Principia*, appeared in 1756. It is said that, in spite of his blindness, he understood the rules of perspective, the projections of the sphere, and some of the more recondite propositions of solid geometry.

Sauria, in the system of Cuvier an order of reptiles, including what are now distinguished as separate orders—the lizards (*Lacertilia*) and the crocodilians (*Crocodylia*). Saurian is often used as a very general title for extinct reptiles, and Huxley applied the term Saurid to birds and reptiles which he included under the technical title Saur-opida. See REPTILES.

Saurin, JACQUES, a celebrated French Protestant preacher, was born at Nîmes, 6th January 1677, studied at Geneva, and was chosen minister of a Walloon church in London in 1701. But the climate of England did not agree with his delicate health; and in 1705 he settled at the Hague, where his extraordinary gift of pulpit oratory was prodigiously admired. But at length his clerical brethren enviously assailed him with the accusation of heresy. The dispute was carried to the synod of the Hague, and Saurin was subjected to a series of petty persecutions that shortened his days. He died at the Hague on December 30, 1730. As a preacher he has often been compared with Bossuet, whom he rivals in force, if not in grace and subtlety. His chief productions are *Sermons* (12 vols. the Hague, 1749; abridged Eng. trans. 6 vols. 1775-76); *Discours sur les Evénements les plus Mémemorables du V. et du N. T.* (Amst.

1720-28), often called Saurin's Bible; and *Etat du Christianisme en France* (The Hague, 1725).

Saury Pike (*Scomberesox saurus*), a species of fish of the family Scomberesocidae, having the body greatly elongated, and covered with minute scales; the head also much elongated, and the jaws produced into a long sharp beak, as in Belone; from which, however, this species differs in the division of the dorsal and anal fins into filets, as in mackerels. The Scomberesocidae are usually placed among the Physostomi, although the air-bladder has no opening. They resemble the Physostomi in the abdominal position of the

Saury Pike (*Scomberesox saurus*).

pelvic fins. The saury pike is about 15 inches long, the back dark blue, the under parts white; the fins dusky-brown. It approaches the coast in summer and autumn and enters firths in shoals, which are pursued by larger fishes, porpoises, &c.; and in order to escape from these it often leaps out of the water, or rushes along the surface, for a distance of one hundred feet, scarcely dipping or seeming to touch the water. Hence the name Skipper, which it very commonly receives on the British coasts. Vast shoals sometimes enter bays, so that they may be taken by pailfuls, and great numbers are sometimes found among the sludge at the ebbing of the tide in the upper parts of the Firth of Forth and elsewhere. It is not uncommon on the east and west coasts of England, but most abundant on the south coast, where it is often taken in pilchard nets. The eggs are furnished with long filaments, like those of other species of the family, by which they are entangled in clusters and attached to solid objects. As food the saury pike is said to be palatable, but it is not commonly sent to the market.

Sausage-poisoning. See BOTULISM.

Saussure, HORACE BÉNÉDICT DE, Swiss physicist and geologist, was born at Conches, near Geneva, 17th February 1740. He early showed an interest in the study of nature, his inclination being quickened by his uncle Bonnet, the naturalist, and his friend Haller, the physicist. In 1762 he obtained the chair of Physics and Philosophy in the university of Geneva. In 1768 he commenced a series of journeys which were fraught with important consequences to science; he visited the Jura and Vosges Mountains, Germany, England, Italy, Switzerland, Sicily and the adjacent isles, the extinct craters of Auvergne, and traversed the Alps in nearly all directions. He was the first 'traveller' (a party of guides were actually the first) who ever ascended to the summit of Mont Blanc, in 1787. During this course of travel he made numerous observations on the minerals, physical features, botany, and meteorology of the districts he visited; and these were put together in the work *Voyages dans les Alpes*, &c. (4 vols. Geneva, 1779-96). His observations were made with considerable labour; he had in many cases to perfect or even invent the instruments he used. In 1786 he resigned his chair, and, after a long period of suffering, died at Geneva, 22d January 1799. He always took a deep and active interest in the public affairs of his native canton. Besides the great work

above mentioned, and some minor productions, he wrote *Sur l'Hygrométrie* (1783), which Cuvier pronounced to be one of the most important contributions to science in the 18th century. His life was written by Senebier (1801), by Cuvier in *Biographie Universelle*, by De Candolle in *Phil. Magazine*, i. 4, and by Douglas Freshfield (1920).—His son NICOLAS THÉODORE (1767–1848) lived a very retired life, and wrote a valuable work on the physiology of plants, entitled *Recherches Chimiques sur la Végétation* (Paris, 1804).

Saussurea, a genus of composites near allied to the thistles, inhabiting the mountainous regions of high northern latitudes and the most elevated mountain ranges of the northern hemisphere, with one species in Australia. Of *S. gossypina*, Hooker in his *Himalayan Journals* says: 'It forms great clusters of the softest white wool six inches to one foot high, its flowers and leaves seeming clothed with the warmest fur that nature can devise.' This and several other species grow on Mt. Everest; one of these, *S. tridactyla*, was thought to be the highest-going flower till an *Arenaria* put the matter in doubt. *S. alpina* is found in Great Britain and western Donegal.

Saussurite (named after Saussure), a dull, opaque, white, gray, or greenish compact mineral, of indeterminate or variable composition, which has resulted from the alteration of feldspar, as in the rock called Gabbro (q.v.).

Sauterne, a district near Bordeaux, famed for its white Wine (q.v.). The village of Sauternes (dept. Gironde) is 8 miles NW. of Bazas.

Sauvage, FRÉDÉRIC (1785–1857), a shipbuilder of Boulogne, is by Frenchmen regarded as the inventor of the screw-propeller, in virtue of his having in 1832 improved the pattern in use.

Savage, RICHARD, a minor English poet, who loudly claimed to be the illegitimate child of Lord Rivers and the Countess of Macclesfield—a story for which he himself was the only original authority. His alleged mother married in 1683, but lived unhappily with her husband, and separated from him in March 1685. She bore two children to Richard Savage, fourth and last Lord Rivers, during the period of separation; the one, christened Ann Savage, was born in 1695, and died in infancy; the other, whom Richard Savage afterward claimed to be, was born January 16, 1697, was baptised and registered as Richard Smith, and most probably died also at nurse. The Earl of Macclesfield raised proceedings against his wife in the Archers Court in 1697, and obtained a divorce in the House of Lords in 1698, but some extenuation seems to have been found in the husband's conduct, for the whole of the wife's fortune was restored to her. Two years later she married Colonel Henry Brett, who died in 1724, apparently before the startling story was made fully public. Meantime the disreputable claimant, having no profession, had become by necessity an author, and had assumed the name of Savage at least as early as 1717 in the title to a pamphlet on the Bangorian controversy. In the title-page and dedication to *Love in a Veil* (1718) he first claims the parentage openly, but in Curll's *Poetical Register, or Lives of the Poets*, edited by Giles Jacob (1719), the story is for the first time fully given, no doubt by his own pen: Aaron Hill befriended him, and in June 1724 published in *The Plain Dealer* a brief outline of his story. Further letters and allusions followed, together with significant hints of pecuniary distress, which brought subscribers for his *Miscellanies* (1726). A life appeared in 1727, from the pen of Beekingham and another, and undoubtedly helped to get him off the sentence of death for murder in a tavern brawl. His insulting attacks upon Mrs

Brett now became louder and more bitter—in a 'Preface' (1728) to the Life of the year before; in his poem, *The Bastard* (1728). Mrs Brett herself took not the slightest notice of the claim; but her nephew, Lord Tyreconnell, seems to have laboured privately to procure Savage's pardon, and after the publication of *The Bastard* to have silenced him with a bribe. *The Wanderer* was dedicated to him in 1729, but his bounty soon ceased, and Savage was again thrown upon the world. His disreputable habits brought with them misery and hunger, and the pension of £50 which the queen allowed him in return for a birthday ode was usually dissipated in a week's debauchery. On the queen's death Pope set agoing a subscription to find him the means of living quietly at Swansea, but after about a year of impatient exile he went over to Bristol, where he wearied out the benevolence of the most long-suffering sympathising friends, was flung into gaol for debt, and there languished till he died, July 31, 1743.

Neither to his poetry nor yet to his remarkable story does Savage owe his enduring reputation, but solely to the noble and touching Apology in which Samuel Johnson immortalised his ill-fated friend (1744). He knew Savage in his own years of hunger in London, had walked round St James's Square with him all night for want of a lodging, warned only by the resolution to stand by their country, and out of the profound pity of his heart for a dead friend's sufferings wrote what is perhaps the most perfect shorter Life in English literature. He had heard Savage's story from his own lips, and the natural strength and shrewdness of his own intelligence was betrayed by the partiality of friendship. Yet Savage had not been communicative of the facts of his early life, and he never furnished the world with the proofs he boasted in 1724 that he possessed. All Johnson's authorities were traceable to Savage himself, and the story remains imperishably enshrined in literature, although marked by 'inherent improbabilities, cautious vagueness, inconsistencies, and proved falsehoods.' But even so stout a friend as Johnson should have paused for proof of such startling and unnatural changes as that Mrs Brett kept the child out of a death-bed legacy (1712) of six thousand pounds by giving Lord Rivers a false assurance of his death, and still further that she tried to kidnap him to the American plantations, and even laboured to prevent his obtaining a pardon when lying under sentence of death.

See W. Moy Thomas in *Notes and Queries* (1858), and Stanley Makower, *Richard Savage* (1909).

Savage Island, or NIUE, a coral islet to the east of the Friendly Islands. The Polynesian inhabitants were notorious for their ferocity, but are now Christianised. Niue was annexed to New Zealand in 1901. See *Savage Island*, by Basil Thomson (1902).

Savaii. See SAMOA.

Savanilla, a port of Colombia, on a bay of the same name on the Caribbean Sea, 17 miles WNW. of Barranquilla by the railway to Puerto Colombia. The roadstead is roomy but shallow, and its trade has passed to Puerto Colombia.

Savannah (Span. *zabana*, said to be a Carib word; not connected with Span. *sábana*, 'a sheet'), a name given by the early Spanish settlers to the great treeless plains of the North American continent. It is practically the equivalent of 'prairie' and 'steppe'; but is a term in use mainly in the southern Atlantic States of the American Union, especially Florida.

Savannah, a river which, with its right branch, forms the boundary between Georgia and South

Carolina, rises near the southern border of North Carolina, and flows south-south-east to the Atlantic. Its length is 450 miles, and it is navigable from November to June for large vessels to Savannah, for steamboats of 150 tons to Augusta.

Savannah, a city and port of Georgia, stretches several miles along the south bank of the Savannah River, 18 miles from its mouth, and 115 miles by rail SW. of Charleston. It is built on a sandy plain, 40 feet above the river, with broad streets shaded by beautiful trees, while many commodious parks are a delightful feature of the place. The chief buildings are the custom-house, city exchange, cotton exchange, court-house, Hodgson Hall, the Telfair Academy of Arts and Sciences, a Roman Catholic cathedral, the Independent Presbyterian Church, Christ Church, on the site of the chapel where John Wesley first ministered to the colonists, and the hospitals and asylums. The coloured people have churches and good schools for themselves. There are many handsome private houses. Savannah has an excellent deep-water harbour with nine miles of river frontage, and, besides coastwise sailings, has a large steamship connection with European, South African, and Pacific ports. It has long been the first naval stores station and the leading port in the South Atlantic coast in respect of the quantity of cotton exported. The shipments of timber, rice, wool, and hides are also very heavy, and there is an immense shipping business in fruits and early vegetables for the northern markets. Sugar and tobacco are grown, and there are several large shipbuilding plants. The city was founded by General James Oglethorpe in 1733, and incorporated in 1789. It was taken by the British in 1778, and by General Sherman in December 1864. Pop. (1880) 30,709; (1900) 54,244; (1920) 83,252.

Savary, ANNE JEAN MARIE RENÉ, Duc de Rovigo, a French general and diplomatist, was born at Mareq, in Ardennes, 26th April 1774, entered the army as a volunteer in 1790, and served with distinction under Custine, Piechgru, and Moreau on the Rhine, under Desaix in Egypt, and in the battle of Marengo (1800). Napoleon, whose notice he had attracted, made him commander of his bodyguard, and employed him in diplomatic affairs, for which he showed an admirable capacity. In 1804, as commandant of the troops stationed at Vincennes, he presided at the execution of the Duc d'Anguien, an event which he is believed to have unduly hastened; and in the wars of 1806-8 he acquired high military reputation at Jena, in the capture of Hameln, and by his victory at Ostrolenka (February 16, 1807), a brilliant achievement. Created Duke of Rovigo in the beginning of the following year, he was sent to Spain by the emperor, and negotiated the perfidious arrangement by which the Spanish king and his son were kidnapped. In 1810 he superseded Fouché as minister of Police. After the fall of Napoleon, to whom he had always been passionately devoted, and whom he served with a fidelity that stopped not at unscrupulous acts, he wished to accompany him to St Helena; but he was confined by the British government at Malta for some months, and at last made his escape to Smyrna. After experiencing several vicissitudes he returned to Paris in 1818, and was reinstated in his titles and honours. In 1831 he was appointed commander-in-chief of the army in Algeria; but ill-health forced him to withdraw to France in March 1833, and on the 2d of June following he died at Paris. Savary's *Mémoires* (Paris, 8 vols. 1828) are among the most curious and instructive documents relating to the first empire.

Save, a river of Yugoslavia, and an important affluent of the Danube, rises in the angle of the Julian Alps and the Karawanken, and flows south-east through Slovenia, passing Lailach; then it traverses Croatia, and going eastwards separates Bosnia and Serbia on the south from Slavonia on the north, and after a course of 556 miles effects its junction with the Danube at Belgrade. It is navigable up to Sisak in Croatia, 366 miles from Belgrade.

Savernake, a beautiful woodland region in Wiltshire, to the south of Marlborough.

Savery, THOMAS (1650?-1715), military engineer and inventor. See STEAM-ENGINE.

Savigliano, a town of North Italy, by rail 32 miles S. of Turin. It is surrounded by old fortifications, and has a triumphal arch to Victor Amadeus I. of Savoy. There are large railway-carriage works. Pop. 18,000.

Savigny, FRIEDRICH KARL VON, writer on jurisprudence, was born, of an old Alsatian family, on 21st February 1779 at Frankfort-on-the-Main, and studied law at Marburg and other German universities. In 1800 he began to teach as a *privat-docent* at Marburg; three years later he was made professor of Jurisprudence there and published a treatise on the Roman law of property, *Das Recht des Besitzes* (Eng. trans. 1849), that quickly won him European fame. In 1808 he was called to the chair of Jurisprudence at Landshut, but in 1810 removed to the corresponding chair at Berlin. This he held, along with several state offices, such as member of the commission for revising the code of Prussia, member of the Supreme Court of the Rhine Provinces, &c., until 1842. In that year he devoted his energies entirely to the task of reforming the laws. He resigned office in 1848, and died in Berlin on 25th October 1861. His greatest books were *Geschichte des römischen Rechts im Mittelalter* (6 vols. 1815-31) and *System des heutigen römischen Rechts* (8 vols. 1840-49), and the continuation of this last, entitled *Das Obligationenrecht* (2 vols. 1851-53). Savigny in those works applied the principles of the historical school to the study of the historical aspects of Roman law with brilliant success. From 1815 onwards he edited in conjunction with Eichhorn and others the *Zeitschrift für geschichtliche Rechtswissenschaft*. His *Vermischte Schriften* appeared in 5 vols. in 1850. There are biographies by Arndt (1861), Rudorff (1862), Bethmann-Hollweg (1867), Landsberg (1890), and others.

Savile. See HALIFAX (MARQUIS OF).

Savile, SIR HENRY, a learned scholar, was born in Yorkshire, 30th November 1549, entered Brasenose College, Oxford, but migrated in 1561 to Merton College, where he was elected to a fellowship. He travelled on the Continent (1578); after his return was Queen Elizabeth's tutor in Greek and mathematics; became Warden of Merton College in 1585; Provost of Eton in 1596; was knighted in 1604; and died 19th February 1622. Three years before, he had founded chairs of Geometry and Astronomy at Oxford which still bear his name.

His principal works are *Reverum Anglicanarum Scriptores post Bedam præcipui* (1596), a folio containing the works of William of Malmesbury, Henry of Huntingdon, Roger Hoveden, and Ingulph; *Commentaries concerning Roman Warfare* (1598); *Four Books of the History and the Agricola of Tacitus* (1581); and a magnificent edition of St Chrysostom (8 vols. folio, 1610-13), a work which cost £8000, one-fourth for paper alone.

Savine, or SAVIN. See JUNIPER.

Savings-banks.—*General History*.—Savings-banks, for the receipt of small deposits, and their accumulation at compound interest, are either (1) voluntary associations, the property and manage-

ment of which are vested in their trustees and managers, or (2) institutions established and managed by the state. The first class comprises: (a) certified *Trustee Savings-banks*, governed by the Trustee Savings Banks Acts, 1863-1920, and some banks in Scotland registered under the Scottish act of 1819, 59 Geo. III. c. 62; (b) *Penny Banks*, largely under the control of Trustee and Post-office Savings-banks; (c) *Railway Savings-banks*, established under private acts of parliament for the benefit of railway employees; (d) certain societies acting as savings-banks, existing in various industries. The second class includes (a) *Post-office Savings-banks*, regulated by the Post Office Savings Banks Acts, 1861-1908, and under the control of the Postmaster-general; (b) *Military Savings-banks*, established under the Military Savings Banks Act, 1859, for the benefit of non-commissioned officers and men of the military forces, and controlled by the War Office; (c) *Naval Savings-banks*, established under an act of 1866 and controlled by the Admiralty for the benefit of warrant officers and men in the Royal Navy; (d) *Seamen's Savings-banks* for the benefit of seamen in the merchant service, established under the Merchant Shipping Acts, 1894-1925, and regulated by the Board of Trade; (e) to these must be added the *National Savings Certificate* system, the continuation of the War Savings movement started during the Great War (1914-18).

The formation of trustee savings-banks was first suggested by Defoe in 1697. Though, however, the project was revived by Francis Maseres, Cursitor Baron of the Exchequer, in 1771, and by Jeremy Bentham in 1797, it was not practically carried out in England till the year 1799. The first savings-bank established in Europe is said to have been that of Brumath in France, established in 1765, which was followed by one at Loire (dept. Rhône) in 1790. In Germany savings-banks were first established at Hamburg in 1778 and Oldenburg in 1786; in Switzerland at Bern in 1787, Basel 1792, Geneva 1794, and Zurich 1805; and in Denmark at Kiel in Holstein in 1796. The first English bank was established in 1798 by Mrs Priscilla Wakefield at Tottenham, who made provision for a 'Children's Bank' in the rules of a 'Female Benefit Society' then instituted by her. Another was founded in 1799 by the Rev. Joseph Smith, rector of Wendover, Bucks, who, in order to encourage frugality in his parish, offered with two other inhabitants to receive any weekly sums not less than 2d., and if the amount were not touched before Christmas to add one-third to it on every 3s. paid in, as bonus or encouragement. In Scotland the Rev. John Mackay established a friendly bank for savings of the poor at West Calder in 1807, and in 1810 the Rev. Henry Duncan founded a similar institution at Ruthwell in Dumfriesshire, which has served as a model for all subsequent ones. In Ireland a savings-bank was established at Stillorgan, County Dublin, in 1815; and one of the earliest founded in Wales appears to have been that at Brecon, established in 1816.

The establishment of savings-banks under government supervision was proposed as early as 1806 by Samuel Whitbread (q.v.); but the credit of first suggesting their formation in connection with the post-office is due to the Ven. George Hans Hamilton, Archdeacon of Northumberland, who propounded a scheme to this effect in 1852 and again in 1858. In 1869 a paper, containing many valuable suggestions subsequently adopted by the Postmaster-general, was read by Sir Charles Sikes of the Huddersfield Banking Company, before a Social Science Congress at Bradford. The plan of the present system was drawn up in 1860 and established by the Post Office Savings Bank Act, 1861.

Trustee Savings-banks.—The first two savings-banks acts were passed in 1817, and authorised the formation of banks in Ireland and England respectively for the benefit of depositors, deducting from the income earned on deposits only sufficient to provide for the expenses of management, but 'deriving no benefit from such deposits or the produce thereof.' In 1818 the rules, like those of friendly societies, were made subject to confirmation by justices at quarter sessions, and in the following year the system was introduced into Scotland. In 1828 it was, however, enacted that the rules should be submitted to a barrister appointed by the National Debt Commissioners, who was to certify that they were in conformity with law, and who, in 1844 was also empowered to settle all disputes between the trustees and the depositors. In 1863 the law was consolidated by an act which repealed all previous acts, and enacted that the rules of all banks should contain regulations providing for (1) the attendance of at least two trustees, managers, or specially appointed paid officers on all occasions of public business; (2) the comparison of the pass-books of the depositors with the ledger on every repayment, and also on their first production at the bank after each 20th November; (3) the audit half-yearly of the books of the bank by a public accountant, or one or more auditors appointed by the trustees and managers, but 'not out of their own body'; (4) a book containing an extracted list of the depositors' balances made up every year to the 20th November, to be kept open at any time during the hours of public business for the inspection of the depositors; (5) meetings of the trustees and managers half-yearly at least, the keeping of minutes of their proceedings in a separate book, and the transmission by them of weekly returns, showing the amount of the week's transactions, to the National Debt Commissioners.

Post-office Savings-banks were established in 1861 by an act designed to grant additional facilities for depositing small savings at interest, with 'the direct security of the state' for the repayment of the deposits. It empowered the Postmaster-general, with the consent of the Treasury, to authorise 'such of his officers as he shall think fit to receive deposits for remittance to the principal office and to repay the same,' under such regulations as, with the consent of the Treasury, he may prescribe, paying the moneys so received to the National Debt Commissioners. It provided for the transfer of deposits to and from trustee savings-banks, and fixed the rate of interest on deposits at £2, 10s. per annum. The Act of 1861 was amended in 1863 by one which facilitated the transfer of the accounts of minors, and also provided for the closing, under certain conditions, of trustee banks, and the transfer of unclaimed accounts to the post-office banks.

Since 1863 several acts relating to savings-banks have been passed, a few of which apply to trustee banks only. In 1876 the Savings Bank Barrister Act transferred the powers of settling disputes and certifying rules invested in the barrister appointed by the National Debt Commissioners to the Registrar of Friendly Societies. The interest payable by those commissioners on the funds of the banks invested with them was originally 3d. per cent. per diem—i.e. £4, 11s. 3d. per cent. per annum, reduced to 2½d. in 1828—i.e. £3, 16s. 0½d. per cent. per annum, the rate to depositors being fixed on the latter occasion at 2½d. per cent. per diem—i.e. £3, 8s. 5½d. per cent. per annum. In 1844 these rates were reduced to £3, 5s. and £3, 0s. 10d. respectively. The Savings Bank Act of 1880 reduced the interest payable to the trustees of savings-banks to 3 per cent., and that payable to depositors to a maximum of £2, 15s., and the

National Debt (Supplemental) Act, 1888, lowered the respective rates still further to £2, 15s. and £2, 10s., depositors thus getting the same as in the post-office banks. An act of 1920 permitted the rate payable to the banks to move between £2, 15s. and £2, 17s. 6d., according to Treasury Order, the addition being in aid of management expenses.

Other important provisions of the 1880 act were those authorising the investment of deposits in post-office and trustee banks in government stock, to the amount of £100 in any one year, and to a total amount of £300. Regulations issued under this act in 1881 were amended by those of 1888, which fixed the minimum amount of stock purchasable at one shilling. In 1893, £50 was made the statutory maximum for yearly money deposits; government stock to the extent of £200 in one year, and to a maximum holding of £500 at any one time, could be purchased in addition. All limits were temporarily removed by a Treasury Order in 1915, and the Savings Banks Act, 1920, left their re-imposition in the hands of the Treasury, subject to certain safeguards. An Order of 1923 imposed an annual limit of £500 for cash deposits. Apart from the above regulations there are those which govern the Special Investment departments of trustee banks, in which a depositor with at least £50 to his credit in an ordinary account, may invest up to £500 in any manner authorised by law in the case of investments by trustees approved by the National Debt Commissioners.

From very early in their history savings-banks began to come under the legislative influence of the state, the purpose being the protection of the depositors against loss of their money. Failures, chiefly caused by negligence in controlling the work of the paid officers of banks, were of frequent occurrence, one of the earliest being that of the Mildenhall Bank (Suffolk) in 1825. Between 1842 and 1857 there were twenty-three in England and four in Ireland, involving loss to the depositors in some cases, but in others losses were made good by the trustees; after 1857 there were a number of cases of defalcations by paid officials, resulting in closings of banks. Prior to 1828 the trustees and managers were personally liable for any deficiency, unless they protected themselves by their rules. The Act of 1863 provided that no trustee or manager of any bank in the United Kingdom should be personally liable except (1) for moneys actually received by him on account of or for the use of the bank, and not disposed of as directed by the rules; (2) for neglect or omission in complying with the regulations prescribed by the act as to the maintenance of checks, the audit and examination of accounts, the holding of meetings and keeping minutes of proceedings; (3) for neglect or omission in taking security from officers as required by the act. In 1887 events led to the passing of the Trustee Savings Bank Act of that year, empowering the Treasury, on the representation either of the depositors or of the National Debt Commissioners, to appoint a commissioner to hold a local inquiry with regard to any trustee bank, and it also provided for the winding-up of trustee banks as "unregistered associations" under the Companies Acts. The Savings Bank Act, 1891, took a very important step in the same direction by providing for the appointment of an Inspection Committee of Trustee Savings-banks, charged with the duty of ascertaining, by means of inspectors, whether the banks were duly complying with their rules, and keeping their expenditure within due limits. If the committee on the report of any inspector, were of opinion that a bank had made default in either of these respects, they must report the matter to the National Debt Commissioners, who might, in their discretion, either

close the account of the trustees, or report to the Treasury, in order that an inquiry be held under the Act of 1887. Further provision was made by an act of 1904 for the amalgamation of trustee banks, for superannuation allowances for retired bank officials, for the foundation of subsidiary penny-banks; also for the annual appointment of auditors, and an annual presentation before Parliament of a statement of liabilities, &c. This act restored the Special Investment business of trustee banks, and an act of 1918 established further safeguards in this department.

Progress of the System.—By the end of 1817, when legislation on the subject first began, upwards of 135 trustee savings-banks were in existence, of which 122 were in England, 4 in Wales, 5 in Ireland, and 4 in Scotland. The establishment of the post-office system in 1861 almost immediately caused a decrease in the business of the older institutions, and by the end of 1869, 145 of the 638 trustee banks open in 1860 had been closed, and capital amounting to £1,816,335 transferred to the post-office banks, the number of which has risen rapidly. To-day post-office savings-banks exist at all money-order offices, and at some smaller offices as well.

In 1829, after the passing of the Act of 1828, the number of savings-bank accounts in the United Kingdom was 409,714, amounting to £14,311,192. In 1845, after the passing of the Act of 1844, it rose to 1,062,930, amounting to £30,748,868; and at the introduction of the post-office system was 1,585,778, amounting to £41,258,368. In 1912 the total number of depositors in the trustee savings-banks was 1,870,510, and the total amount due to them was £53,811,899, an average of about £28, 15s. In the same year the depositors in the post-office savings-banks totalled 8,868,008, and the total amount due to them was £182,104,564, an average of about £20, 10s. The trustee banks were arrested from a decline by the administrative improvements resulting from the Acts of 1891 and 1904, which re-established public confidence in them. Their growth has been slower than that of the post-office banks, although it must be admitted the spread of the latter is facilitated by the fact that in most cases the offices already exist, and the savings-bank is merely a new department requiring little or no addition to staff or premises.

During the war years of 1914-18 savings-banks, far from succumbing to financial embarrassment—which fate had been predicted for them by some prophets—actually strengthened their positions as agencies for promoting thrift, the number of their accounts growing fast. This fact was the more remarkable as a new competitor had meanwhile entered the field, the Treasury issuing through the post-office various securities to attract the small investor, the best known being War Savings Certificates. These appeared in February 1916 at a price of 15s. 6d. each, repayable plus 4s. 6d. interest on the fifth anniversary of issue, although they could be withdrawn at any previous date if desired. The maximum holding was 500, and the interest was free of income-tax. The work of the Central National War Savings Committee was aided

of patriotism being specially appealed to. By 1920 over 440 million certificates had been sold. The scheme was continued after the war under the National Savings Committee, the certificates being called National Savings Certificates. The rate of interest has been lowered since 1922. By 1925 the net balance due to holders of certificates (including accrued interest) was about 459 million pounds. In spite of the competition of this attractive invest-

ment, the trustee and post-office savings-banks with their interest limited to £2, 10s. per cent.—a limitation which was appealed against in vain—continued to enlarge their holdings. In 1925 the trustee savings-banks held £83,396,491 in respect of 2,340,644 accounts, and the post-office savings-banks held £285,491,388 in respect of 12,431,373 active accounts. These figures exclude holdings of government and other stock. The other types of savings-banks are of relatively small importance. Depositors in railway savings-banks in 1924 numbered about 150,000 and deposits over £14,000,000.

The Government Annuity and Insurance System.—The foundations of the government insurance system were laid in 1833 by the 3 and 4 Will. IV. chap. 14 (extended to Scotland in 1835), which allowed the purchase of annuities, immediate or deferred, through the medium of savings banks or of societies authorised to be established for the purpose in parishes where there were no savings-banks, and the system was further developed in 1853 by the 16 and 17 Vict. chap. 45, and in 1864 by the 27 and 28 Vict. chap. 43. The latter act is embodied in the Government Annuities Act, 1882. Under these statutes a 'savings-bank annuity' may be of any amount not exceeding £100 a year, and may be granted to any person not under five years of age, while a 'savings-bank insurance' may be granted for not exceeding £100 to any person between the ages of fourteen and sixty-five, or for not exceeding £5 to a person not under eight years: 'Annuity and insurance regulations' under the acts are made by the National Debt Commissioners as respects trustee, and by the Postmaster-general as respects post-office savings-banks, and in practice this business is confined to the latter class.

Savings-banks Abroad.—A savings-bank was established in Paris by a law of 1818, and the system spread rapidly throughout the departments. A post-office savings-bank system was instituted in France by a law of 1881. Savings-banks in Germany are of great variety. The first municipal bank was opened in Berlin in 1818. The post-office bank has not developed in Germany, but is a feature of all the other principal states of Europe, as well as of India and the Dominions.

In 1816 the first savings-banks in the United States—the Philadelphia Savings Fund Society, suggested by Condé Ragnet, and the Boston Savings-bank—were established, and in 1819 were followed by one at New York. Savings-banks in the United States are not as clearly separated from banks in general as in the United Kingdom. In the eastern states the business is pursued mostly by mutual savings-banks, which have no capital and whose earnings go as dividends to depositors; in the other states mostly by stock savings-banks managed by a board of directors elected by the stock-holders, who obtain as dividends the earnings left after paying interest to depositors. But savings-bank business is also carried on by special departments of state banks, national banks, private banks, trust companies, and by school savings-banks. The number of depositors in 1926 totalled 46,762,240. A postal savings system was founded by an Act of 1910. It receives deposits up to 2500 dollars and pays interest at 2 per cent. A depositor may take up Postal Savings Bonds yielding a tax-free interest of 3½ per cent. The system counted, in 1924, 402,325 depositors.

See Lewins, *History of Banks for Savings in Great Britain and Ireland* (1866); Scratchley's *Practical Treatise* (2d ed. 1863); A. Urquhart Forbes, *The Law relating to Trustee and Post-office Savings-banks* (1878-84); the reports of various Select Committees on Savings-banks and kindred topics (1867, 1889, 1902, 1916, 1923); the annual reports and returns. Savona, a seaport of Northern Italy, on the Gulf of Genoa, by rail 26 miles S. by W. of the city of that name and 91 SSE. of Turin. A handsome modern town enlivened in orange-groves, it has a Renaissance cathedral (1589-1602), with a chapel containing the tomb of the parents of Pope Sixtus IV., a member of the Della Rovere family, fine choir-stalls, &c.; a castle (1542), now used as a prison, in which Mazzini was confined in 1830-31; the Della Rovere Palace, built for Pope Julius II., nephew of Sixtus IV., by Antonio da Sangallo; a picture-gallery, a marine institute, &c. The industries embrace ironworks, potteries, glass-works, tanneries, and brick-yards. Coal, wheat, and iron are imported, and chestnut staves and pottery exported. The coal is dealt with by the largest telpherage plant in Europe. The poet Chiabrera (1552-1637) was born here. The history of Savona begins in the 7th century. In the main it has been a long struggle against its successful rival Genoa, which in the 16th century filled up its harbour; it was only opened again in 1815. Pop. 58,700 (commune).

Savonarola, GIROLAMO (JEROME), religious and political reformer, was born of a noble family at Ferrara, September 21, 1452. He was educated at home, and at a very early age became deeply versed in the philosophy of the schools; but his disposition was from the first tinged with religious asceticism, and in 1474 he formally withdrew from secular affairs, and entered the Dominican order at Bologna. Having completed his novitiate and the studies of the order, he seems to have made his first public appearance as a preacher in 1482, at Florence, where he had entered the celebrated convent of his order, San Marco, and where he preached the Lent in that year. His first trial, however, was a failure; his voice was harsh and unmusical, and his simple, devout earnestness failed to interest his hearers, so that, after a time, the course of lectures was entirely deserted. Some time afterwards Savonarola was sent to a convent of his order at Brescia, where his zeal began to attract notice, and the disadvantages of manner and address ceased to be felt under the influence of his sterling genius and irresistible enthusiasm. In 1489 he was once more recalled to the convent of San Marco at Florence. His second appearance in the pulpit of San Marco was a complete success. The great subject of his declamation was the sinfulness and apostasy of the time; and in his denunciation of the vices and crimes of his age he took as his theme what has been the topic of enthusiasts in almost every age, the mystical visions of the Apocalypse. These he applied with terrible directness to the actual evils with which, as with a moral deluge, the age was inundated; and for his half-expositions, half-prophetic outpourings his followers claimed for him the character of an inspired prophet. Under the rule of the great head of the Medici family, Lorenzo the Magnificent, art, literature, and philosophy had all followed the common direction of that elegant but semi-pagan revival which the scholars of the 15th century had inaugurated; and the whole spirit of the social as well as intellectual movement of which Florence, under the Medici, was the centre was utterly at variance with the lofty Christian spirituality and severe asceticism in which Savonarola placed the very first conditions of the restoration of true religion and morality. His preaching,

therefore, in its spirit, as well as in its direct allusions, was no less antagonistic to the established system of the government than to the worldly and irreligious manners of the age; the visions and predictions ascribed to him had quite as much of political applicability as of religious significance; and thus, to the aristocratic adherents of the Medici, Savonarola early became an object of suspicion, if not of antipathy and dread. It is said by Pico de Mirandola that he refused to grant absolution to Lorenzo when the latter lay dying in 1492 as the Magnificent declined to accede to the demands made by his confessor.

Up to this time, however, Savonarola's relations with the church were, if not of harmony, at least not of antagonism; and when, in the year 1493, a reform of the Dominican order in Tuscany was proposed under his auspices, it was approved by the pope, and Savonarola was named the first vicar-general. About this date, however, his preaching had assumed a directly political character, and the predictions and denunciations which formed the staple of many of his discourses pointed plainly to a political revolution in Florence and in Italy as the divinely ordained means for the regeneration of religion and morality. In one of his discourses he pointed plainly to the advent of the French under Charles VIII.; and when this prediction was fulfilled by the triumphant appearance of the French expedition, Savonarola was one of a deputation of Florentines sent to welcome Charles VIII. as the saviour of Italy, and to invite him to Florence. Very soon, however, the French were compelled to leave Florence, and a republic was established, of which Savonarola became, although without political functions, the guiding and animating spirit, his party, who were popularly called *Piagnoni*, or 'Weepers,' from the penitential character which they professed, being completely in the ascendant. It was during this brief tenure of influence that Savonarola displayed to the fullest extent both the extraordinary powers of his genius and the full extravagance of the theories to which his enthusiastic asceticism impelled him. The republic of Florence was to be the model of a Christian commonwealth, of which God Himself was the chief ruler, and His Gospel the sovereign law; and thus the most stringent enactments were made for the repression of vice, and of all the sinful follies by which it is fomented and maintained. All the haunts of debauchery were suppressed; gambling in all its forms was prohibited; the vanities of dress were restrained by sumptuary enactments; and, under the impulse of the popular enthusiasm which the enthusiasm of the prophet engendered, women flocked in troops to the public square to fling down their costliest ornaments, and his followers made in the piazza an immense 'bonfire of vanities,' destroying in one hecatomb large numbers of cards, dice, masks, carnival costumes, and probably some books of licentious poetry and indecent pictures. There seems no ground for the charge often made that he and his disciples destroyed in indiscriminating zeal valuable statues and rare manuscripts.

Meanwhile, the extremes of his rigorism; the violence of his denunciations, which did not spare even the pope himself (Alexander VI.); the assumption by him, or attribution to him, of a supernatural gift of prophecy; and the extravagant interpretation of the Scriptures, and especially of the Apocalypse, by which he sought to maintain his views, drew upon him the displeasure of Rome. He was cited, in the year 1495, to answer a charge of heresy at Rome; and, on his failing to appear, he was forbidden to preach; the brief by which the Florentine branch of his order had been made independent was revoked; he was offered a cardi-

nal's hat on condition of his changing his style of preaching—an offer he indignantly refused; and he was again forbidden to preach. Once again Savonarola disregarded this order. But his difficulties at home now began to deepen. The measures of the new republic proved impracticable. The party of the Medici, called 'Arrabbiati' ('Enraged'), began to recover ground. A conspiracy for the recall of the exiled House was formed; and although, for the time, it failed of success, and five of the conspirators were condemned and executed, yet this very rigour served to hasten the reaction. The execution of these conspirators was afterwards laid to the charge of Savonarola, who was said to have been the chief opponent of the proposal to grant them an appeal—a charge for which there seems to be no foundation. But all circumstances seemed now to count against the once all-powerful Savonarola. At the critical point of the struggle of parties came, in 1497, a sentence of excommunication from Rome against Savonarola. Savonarola openly declared the censure invalid, because unjust, and refused to hold himself bound by it. During the plague Savonarola, precluded by the excommunication from administering the sacred offices, devoted himself zealously to ministering to the sick monks. A second 'bonfire of vanities' in 1498 led to riots. In the same year, when the new elections took place, the party opposed to Savonarola, the Arrabbiati, came into power. He was ordered to desist from preaching; and the struggle was brought to a crisis by the counter-denunciations of a preacher of the Franciscan order, long an antagonist of Savonarola, Francesco da Puglia. In the excited state of the popular mind thus produced an appeal was made by both of the contending parties to the interposition of divine providence by the ordeal of fire; and one of Savonarola's disciples agreed to make trial of the dread ordeal along with a Franciscan friar. But at the moment when the trial was to have come off (April 1498) difficulties and debates arose, and nothing was actually done. The result of this was to destroy with the populace the prestige of Savonarola's reputation, and to produce a complete revulsion of public feeling. In the midst of this reaction he was cited before the council, and brought to trial for falsely claiming to have seen visions and uttered real prophecies, for other religious errors, and for political insubordination. He denied the charges; but, put to the torture, he made avowals which he afterwards withdrew. The conclusion was a foregone one; he was declared guilty of heresy and of seditious teaching, and of being an enemy to the peace of the church. The acts of the trial were sent to Rome, where the sentence was confirmed; he, with two disciples of his order, was given up to the secular power; so on May 23, 1498, this extraordinary man and his two companions, brothers Domenico and Silvestro, were strangled, and their bodies burned by the executioner. They died professing their adherence to the Catholic Church, confessed and received absolution, and on the morning of the execution Savonarola administered the last communion to his two companions and himself. There seems no doubt that Savonarola firmly believed in the dogmas of the Roman Catholic Church; and it is only as a moral and religious reformer, and not a theological teacher, that he can in any way be regarded as a forerunner of the Reformation of the 16th century.

His works, mainly sermons, religious essays, theological treatises (of which the chief is *The Triumph of the Cross*), some poems, and a political discourse on the government of Florence, were mainly written in Latin. An edition in 6 vols. appeared at Lyons in 1638-40; and one by Baccini of his Sermons at Florence since 1889. The principal work on him is the Life by Professor

Villari (1863, Eng. trans. by Horner; 2d ed., much altered, 1887; Eng. trans. by Linda Villari, 1888). There are also English works by R. Madden (1854), W. R. Clark (1878), Herbert Lucas, S.J. (1899), and P. Villari (1918); see also Mrs Oliphant's *Makers of Florence* and George Eliot's *Romola*.

Savory (*Satureja*), a genus of plants of the family Labiate, nearly allied to Thyme (*Thymus*). The species are herbaceous and half-shrubby plants, all natives of the south of Europe and the East. The Common Savory, or Summer Savory (*S. hortensis*), is commonly cultivated in kitchen-gardens for flavouring dishes. It is an annual plant, $\frac{1}{2}$ to 1 foot high, with lilac or white flowers, has a strong and agreeable aromatic smell, and an aromatic pungent taste, and is in common use both fresh and dried for flavouring dishes, and especially for flavouring beans. It is stomachic and tonic. Winter Savory (*S. montana*) is used in exactly the same way. It is a half-shrubby plant, with prickly-pointed leaves and larger flowers. Its taste is pungently aromatic. Summer savory is propagated by seed; winter savory by slips and cuttings.

Savoy, formerly a province of the kingdom of Sardinia, was transferred to France in 1860, and divided into the two departments of Savoie and Haute-Savoie. It is an alpine region, having the Graian Alps on the eastern frontier, as the boundary next Piedmont. On that side it runs up to 15,782 feet in Mont Blanc, and to 11,792 in Mont Cenis; thence it falls away gradually to the Rhone (950 feet), which separates it on the west from the French department of Ain. The northern boundary passes through the Lake of Geneva; and on the south west lies the French department of Isère. The area is 4162 sq. m. (2388 in Savoie and 1774 in Haute-Savoie); the total population (1891) 531,564; (1921) 560,702, of whom 225,034 were in Savoie and 235,668 in Haute-Savoie. The rivers are mostly mountain-torrents, as the Isère, Drance, Arve, and Fier, all tributaries of the Rhone, though the Drance falls into the Lake of Geneva. A large part of the surface is covered with forests (29 per cent.) of pine, fir, larch, beech, oak, elm, ash, hazel, walnut, and chestnut, and with pastures (20 per cent.), on which many cattle, sheep, and goats are kept. The vine is extensively grown, from 7 to 10 million gallons of wine being produced annually according to the season. Only 21 per cent. of the surface is cultivated. Potatoes, oats, rye, and wheat, with hemp, beet root, tobacco, colza-seed, and maize, are the principal crops; much honey is made; butter and cheese are exported in large quantities; silk-worms are bred; and chestnuts form an article of commerce. Building-stone of various kinds, slate, iron ore, and anthracite are the most valuable of the mineral products. Mineral springs are found at Aix-les-Bains, Evian, Thonon, and other places. There is considerable manufacturing industry, especially in the making of cottons, silk stuffs, gauze, woollens, iron, clocks, leather, paper, flour. The peasant women make rough woollen stuffs for home wear. The people are poor, thrifty, and industrious; large numbers leave home every year to fill the lower grades of domestic service in Paris and other large towns; but nearly all return home when they have made a little money. The dept. of Savoie has the four arrondissements of Albertville, Chambéry, Montiers, St Jean-de-Maurienne; capital, Chambéry. Haute-Savoie has the four arrondissements of Annecy, Bonneville, St-Julien, Thonon; capital, Annecy.

HOUSE OF SAVOY.—The territory of Savoy formed a part of ancient Gaul. After the decline of the Roman empire it was occupied by the Burgundians (437), and from them passed to the

Franks in the next century. Subsequently it formed part of the Burgundian kingdom of Arles, and towards the middle of the 11th century became a fief of the empire. The counts of Maurienne, the ancestors of the Savoy counts and dukes, are sometimes stated to have been descended from Wittekind, last king of the Saxons; it is more probable that they had a local or Provençal origin. The emperor Conrad II. invested Humbert I. (d. 1048), Count of Maurienne, with the counties of Chablais and Lower Valais. For some centuries the chief features in the history of the house are the successive additions of territory that were made to this early nucleus, until, in the beginning of the 15th century, the dominion of the Savoy rulers extended from the Lake of Geneva southwards to the Gulf of Genoa, and from the river Saône south-eastwards to Lago Maggiore, and Vercelli and Alessandria in Piedmont. Otto (1048-60) acquired by marriage the marquise of Susa and the counties of Val d'Aosta and Turin. The province of Bugey and the lordship of Tarentaise were added by the next two counts. Amadeus III. (1103-49) called himself margrave of Turin and Count of Savoy, being the first to use the latter title. Amadeus IV. (1233-53), following the traditions of the family, gave his support to the emperor, Frederick II., against the pope, and was rewarded by being created Duke of Chablais and Aosta. Peter (1263-68) before succeeding to power had spent some time in England, where he built in London the palace afterwards called the Savoy; two of his nieces married Englishmen, King Henry III. and Richard Earl of Cornwall. Amadeus V. (1285-1323), surnamed the Great, extended his territories considerably in the north-west (Geneva, Faucigny, Bresse, &c.), acquired the county of Asti in Piedmont, and was made a prince of the empire. The protectorate over Nice, Ventimiglia, Villafranca, and Barcelonnette was acquired by Amadeus VII. (1383-91). The Emperor Sigismund made the eighth Amadeus (1391-1433) Duke of Savoy and of Piedmont (1416), and afterwards invested him with the county of Vercelli. But this prince resigned the title and retired to a monastery. In 1439 the Council of Basel deposed Pope Eugenius IV. and elected Amadeus of Savoy pope in his stead; he took the name of Felix V., but resigned the papal dignity in 1448, and died a cardinal in 1451.

A succession of weak rulers followed, though Charles I. (1482-90) did something towards checking internal strife. The reign of Charles III. (1504-53) was one long train of misfortunes, occasioned by the fact that he sided with the Emperor Charles V. in his great duel with Francis I. of France: Geneva and Valais put themselves (1533) under the protection of the Swiss Confederation; Bern in 1536 seized Chablais, Gex, and Vaud; and by the treaty of Nice France kept possession of Savoy (which she had seized) and the emperor garrisoned the cities of Piedmont, so that Nice only was left to the duke. Emmanuel Philibert, his son, the next duke (1553-80), obtained great renown as an imperial general in the Netherlands, where he won the great victory of St Quentin (1557); this gained him the recovery of his hereditary dominions (except Pignerol, Savigliano, and Saluzzo) in 1559, 1560, and 1564. Ten years later he received again Pignerol and Savigliano, and subsequently acquired the principality of Oneglia and the county of Tenda. His son, Charles Emmanuel (1580-1630), waged war against Henry IV. and Louis XIII. of France, and was deprived of large slices of territory and several fortresses. The succeeding dukes vacillated between the empire and France. Victor Amadeus II. (1675-1730) was at last saved from the clutches of France by the military genius of the

celebrated Prince Eugene of Savoy, a distant cousin, who routed the French before Turin in 1706. By the treaty of Utrecht (1713) the Duke of Savoy gained the principality of Montferrat, the kingdom of Sicily, and the recognition of his claim to the crown of Spain should the Bourbon family become extinct. Seven years later the emperor of Austria forced him to exchange the crown of Sicily for that of Sardinia. Henceforward, for 140 years, the sovereignty was known as the kingdom of Sardinia.

The principal immediate aim of the new kings was to get possession of Milan and its territory—i.e. virtually Lombardy (Turin had been the capital of Savoy since the reign of Emmanuel Philibert.) Charles Emmanuel III. (1730-73) aided France against Austria in two long wars, and thereby gained accessions of territory on his eastern frontier, but he did not get Milan. Under his son and successor, Victor Amadeus III. (1773-96), Savoy, having put herself at the head of the Italian princes in opposing the French Republic and Napoleon, was along with Nice annexed to France. The next duke, who succeeded whilst the French were masters of his continental territories, took refuge in Sardinia (1798), and in 1802 Piedmont was incorporated with France. Victor Emmanuel I. (1802-21) returned to Turin in 1814, not only receiving back his patrimony, but becoming master also of Genoa. This prince left the government to his wife, an Austrian princess, and his father confessor; their efforts were directed to the extirpation of the elements of liberal sentiment and politics implanted by the French during their occupation. This policy provoked a rising of the liberal-minded in 1821, whereupon the king abdicated in favour of his brother Charles Felix (1821-31), who brought in an Austrian army and continued the oppressive and reactionary policy dictated by Austria. He was the last of the elder branch of the family; and on his death the crown passed to Charles Albert (1831-49), the head of the branch Savoy-Carignano, that had been founded by a younger son of Charles Emmanuel in the 17th century. He abdicated in favour of his son Victor Emmanuel II. during the fever of the revolution of 1848-49. From the time of the French Revolution the Sardinian monarch was one of the most influential potentates in Italy, and from the reign of Charles Felix he was singled out by Italian patriots as the man to effect the future unity of Italy. The history of the monarchy from the accession of Charles Albert has been already sufficiently told under Italy (q.v.).

See *Histories of Savoy* by Cibrario (1840-47), Frézet (1826-28), Bertolotti (1890), St-Genis (1869); *The Early History of Savoy*, by C. W. P. Orton (1912). For the Stuart connection with the House of Savoy, see STEWART, and *The Romances of Savoy*, by the Marchessa Vitelleschi (1905).

Savoy, a cultivated variety of Cabbage (q.v.), forming a large close head like the true cabbages, but having wrinkled leaves. A number of sub-varieties are in cultivation. The mode of cultivation and the uses are the same as those of cabbage. Savoyes are much cultivated for winter use; they require a light, rich soil.

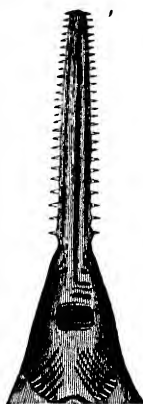

Savoy Palace, an ancient palace of London, situated between the Strand and what is now the Thames Embankment, was first built by Peter, Count of Savoy, uncle of Henry III.'s queen, Eleanor of Provence. It was the prison of the captive king John of France after the battle of Poitiers. Then it was the town residence of John of Gaunt, and was burned by the peasants during Wat Tyler's revolt (1381). Henry VII. rebuilt it, and in 1505 endowed it as a 'hospital' or house for one hundred poor people—'rogues and masterless men' they came to be. In its precincts was held

in 1661 the Savoy Conference. See PRAYER (BOOK OF COMMON). 'The Savoy' also included a chapel royal, built in 1515; it was injured by fire in 1864, but restored at the expense of Queen Victoria. The Savoy Theatre occupies part of the site.

Savu, a Dutch East Indian island W. of Timor, produces maize, tobacco, rice, cotton, and horses.

Sawdust can be turned to account in many ways. Oxalic Acid (q.v.) is got by oxidising it with a mixture of the hydrates of potash and soda. Chilled sawdust is superior to and cheaper than ice for packing fish. Carbonised sawdust makes a better filter for many purposes than ordinary charcoal. Boxwood sawdust is used for cleaning jewellery, that of mahogany for smoking fish. *Bois-durci*, of which beautiful ebony-like medallions and other ornaments are made, consists of the fine sawdust of rosewood, ebony, and other woods formed into a paste with blood and pressed into moulds or dies. The furrier finds a use for the sawdust of mahogany and rosewood in dressing his furs. It may be distilled so as to secure charcoal, alcohol, and tar. It is not serviceable for wood-pulp in paper-making. Sawdust sinks in water although the wood from which it is cut floats.

Sawfish (*Pristis*), a genus of cartilaginous fishes distinguished by the prolongation of the snout into a formidable weapon bordered on each side by sharp teeth. The five or so species include *P. antiquorum* in the Mediterranean and in many other seas, and *P. pectinatus* off the southern coasts of North America and in the Gulf of Mexico. With its saw, which is sometimes six feet in length, the sawfish slashes or rips up its prey, and its assault is often fatal to large cetaceans. The torn-off pieces of the victim are swallowed by the sawfish, whose true teeth are small and adapted for crushing. The sawfishes are viviparous. The flesh of the sawfish is coarse and almost inedible; the shagreened skin is sometimes used for polishing. Analogous to *Pristis*, which, although it is somewhat shark-like, belongs to the order of rays, is the genus *Pristiophorus*, which is ranked among the sharks.

Lower View of Head of Sawfish.

Sawfly, the common name of a number of Hymenopterous insects, injurious to plants. They owe their name to the saw-like ovipositors with which the females drill holes in which to lay their eggs. In one family (Tenthredinidae) the ovipositor is like a double saw, in the other family (Sicidae) it is rather comparable to a borer. The adults differ from bees and wasps and other Hymenoptera in having the abdomen attached to the thorax by the whole width of its base instead of by a narrow waist. The larvae are peculiar in having three pairs of thoracic legs, with which in the Tenthredinidae a number of abdominal appendages are also associated. They are thus somewhat like caterpillars. Indeed the larva of the Gooseberry and Currant Sawfly (*Nematulus ribesii*)—a most destructive pest—is often called a caterpillar. The Corn Sawfly (*Cephus pygmaeus*) lays its eggs on the young stalks of corn, which the grubs afterwards destroy. The Turnip Sawfly (*Athalia spinarum*) is a beautiful insect of an orange colour with deeper red shade behind the black head; the destructive larvae,

which frequently ruin the turnip crop, are almost black, and are familiarly known as *Black Jacks* or *Niggers*. The larvæ of the Pine Sawfly (*Lophyrus*

Turnip Sawfly (*Athalis spinarum*) in its various stages of development.

pini) are destructive in young fir-woods; and the young of various species of Sirex—e.g. *Sirex gigas*—bore galleries in the wood of various kinds of pine. See Ormerod's *Injurious Insects* (new ed. 1891).

Sawtre, or CHATRY. See HENRY IV.

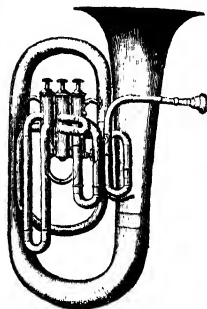

Saxe, MAURICE, Marshal, a celebrated soldier of the 18th century, was the natural son of Augustus II. (q.v.), Elector of Saxony and king of Poland, and the Countess Aurora von Königs-mark, and was born at Goslar, 28th October 1696. When only twelve years of age he ran off from home, made his way to Flanders, joined the army of Marlborough, and took part in the capture of Lille and the siege of Tournay. With a boyish love of change he joined the Russo-Polish army before Stralsund (1711), and distinguished himself under his father's own eyes. Then, returning to Dresden, he was induced by his mother to marry the young Countess Löben; but the union did not last long, being dissolved in 1721. In the meantime Maurice had fought against the Turks in Hungary under Prince Eugene, and studied the art of war in France. In 1726 he was elected Duke of Courland, and for a time maintained himself in his new possession against both Russians and Poles, but was compelled to retire to France in 1729. Joining the army on the Rhine, under the Duke of Berwick, he signalled himself at the siege of Philippsburg (1734), and decided the battle of Ettlingen by a desperate charge; for these services he was made a lieutenant-general in 1736. On the breaking out of the war of the Austrian succession he was given command of the army which was appointed to invade Bohemia, and took the strongly-fortified city of Prague by storm. The capture of Eger was effected a few days afterwards, and the rest of the campaign showed that his abilities in the field were not inferior to his skill against fortifications. Heretofore known as the Comte de Saxe, he was in 1744 made a marshal of France, and appointed to command the French army in Flanders; and on this occasion he gave decisive proofs of the superiority of his system of tactics by reducing to inaction an enemy much superior in number, and taking from him, almost before his face, various important fortresses. The following year was for him more glorious still: he defeated the Duke of Cumberland in the battle of Fontenoy. In 1746 Maurice by a series of able manœuvres threw back the allies on the right bank of the Meuse, and gained (11th October) the brilliant victory of Raucoux, for which he was rewarded with the title of marshal-general, an honour which had been conferred upon none but Turenne. For the third time,

at Laufeldt (2d July 1747), the victor of Culloden suffered complete defeat at the hands of Maurice, and the brilliant capture of Bergen-op-Zoom brought the allies to peace. The Dutch, however, were still disposed to hold out, till the capture of Maestricht (1748) destroyed their hopes, and the peace of Aix-la-Chapelle followed. Saxe had previously carried on a correspondence with Frederick the Great of Prussia; he now took occasion to visit him at Berlin, and met with a brilliant reception. He then retired to his estate of Chambord, and died there of dropsy, 30th November 1750. His work on the art of war, entitled *Mes Réveries*, was published at Paris in 1731. Saxe was a gallant soldier, but no scholar. When the French Academy wanted to make him a member he declined the proffered honour in a sentence whose extraordinary orthography accidentally rebuked, more than the most cutting sarcasm could have done, the sycophancy of the Academy: '*Il s'en veut me fere de la cademie; s'ela m'et come une laye a un chas.*' His love for the actress Adrienne Lecouvreur forms the subject of one of Scribe's best-known plays; and from an illegitimate daughter of his George Sand (q.v.) was descended.

His character and genius are well, though not flatteringly, portrayed in Carlyle's *Frederick the Great*; and see also Lives by Karl von Weber (German, 2d ed. 1870); Saint-René Tallandier (French, 1865); and Vitziump von Eckstädt (French, 1867), with the Duc de Broglie's *Maurice de Saxe et le Marquis d'Argenson* (2 vols. 1891).

Saxe-Coburg, &c. See SAXON DUCHIES, THURINGIA.

Saxhorn, the name of a series of brass wind musical instruments invented by Antoine, Joseph, or Adolphe Sax (1814-94), born at Dinant in Belgium, who settled in Paris in 1842, taught instrumental music, and died in poverty. By inventing Saxhorns and Saxophones he greatly influenced military music over the world. The saxhorn consists of a conical tube opening out to a wide bell, is sounded through a cupped mouthpiece, and is provided with valves or pistons, usually three in number, on a principle similar to the Cornet (q.v.). Saxhorns are made in several sizes, the principal being the soprano in F and E♭; the contralto in C and B♭; the tenor or althorn in F and E♭; the baritone and euphonium in C and B♭; the bass or bombardon in F and E♭; and the contra-bass or contra-bombardon in B♭. These have all the usual open harmonic notes of their respective tubes (see HARMONICS, HORN, &c.), the pistons providing the intermediate tones and semitones. The series have a compass of some five octaves, the soprano saxhorn more or less corresponding to the soprano voice, and the contra-bass descending an octave below the bass voice. They are all more or less like the one (the euphonium) shown in the figure, except the contra-bombardon, which, on account of its size and weight, is usually made circular, so as to go round the shoulders of the performer. Their number and variety supply all the different parts required by a brass band, and in many places very efficient bands are entirely composed of them. From the fact that their fingering is all alike, a

Euphonium.

performer, having mastered one, can by a little practice play with equal facility on any of the others.

Their compass, richness, and flexibility of tone render them peculiarly suitable for military music, especially if played in the open air, and their form renders them easy to play either on the march or on horseback. They do not, however, blend well with stringed instruments, and the bombardon, also known as the bass tuba, is the only one which has found a place in the orchestra. See **BAND, SAXO-PHONE**.

Saxicava. See **BORING-ANIMALS, HARBOUR**.

Saxifragaceæ, a family of dicotyledons, comprising herbs, shrubs, and trees, so varied in character that botanists are not in agreement respecting its limits. If the *Ribes* acæ be reckoned an independent family (see **CURRANT, GOOSEBERRY, RIBES**), the British genera of *Saxifragaceæ* are three, *Saxifraga* (see **SAXIFRAGE**), *Chrysosplenium* (q.v.), and *Parnassia* (see **GRASS OF PARNASSUS**), all of which are herbs. Diverse as these are, they yet give very little idea of the range of generic character in the family till they are compared with the ligneous or arborecent exotic genera. They are all, however, distinguished by their regular flowers; four, five, or rarely ten-lobed calyx, more or less adherent to the ovary; petals equal in number to segments of calyx or wanting; stamens also generally equal in number or twice as many, still more rarely indefinite in number; ovary either adherent or inserted in a broad base, either two or four-celled, or, if one-celled, having two or more parietal placentas often lobed at the top, with the same number of styles or stigmas as cells or placentas, rarely twice as many; fruit a capsule, with several seeds, usually many to each cell or placenta; the albumen usually copious. The family is spread over nearly the whole world, most numerously in the mountainous regions of the northern hemisphere: they are rare in tropical America, in Peru and Java, and in southern Australia. The prevailing property is astringency. But the only species of the numerous herbaceous class having any well-based reputation for medicinal virtues is the Alum-root (q.v.). *Escallonia*, a South American genus, found chiefly in the Andes, consists of shrubs with leathery sticky leaves, well known in our gardens. Some make it the type of a separate family. To another section belong *Hydrangea* (q.v.) and *Philadelphus*, commonly misnamed *Syringa* (q.v.).

Saxifrage (*Saxifraga*, 'stone-breaker,' because

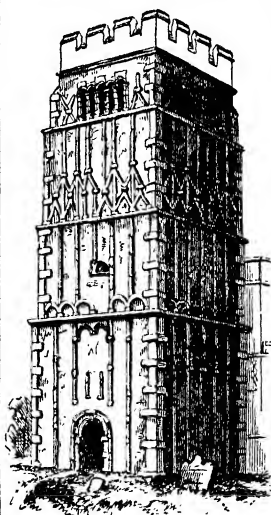

Tufted Saxifrage
(*Saxifraga moschata*).

supposed to break stones in the bladder), a genus of *Saxifragaceæ* (q.v.). The genus is a numerous one, consisting of annual and perennial herbs, mostly tufted. The species are chiefly mountain or rock plants, and are most abundant in the northern hemisphere. Many species are cultivated in gardens for their pretty flowers and neat habit of growth, being especially valued for ornamenting rockeries. Some thirteen species are natives of Britain, the best known of which is *S. umbrosa*, which, under the popular names London Pride, None-so-pretty, and St Patrick's Cabbage, finds a place in nearly every cottage garden.

Saxo Grammaticus (i.e. Saxo the 'Grammarian' or 'Scholar'), the most celebrated of the early Danish chroniclers, flourished in the end of

the 12th century. He was secretary to Archbishop Absalom of Roskilde, was a Zealander by birth, and is said to have died at Roskilde in 1208. At the request of the archbishop he wrote a chronicle of the early kings of Denmark, and brought his narrative down to the year 1185. The work is entitled *Gesta Danorum*, or *Historia Danica*. The earlier portions are uncritical, but in regard to times near his own Saxo Grammaticus is a most invaluable authority. According to his own statement, he derived his knowledge of the remoter period of Danish history from old songs, Runic inscriptions, and the historical notices and traditions of the Icelanders. The best editions are by P. E. Müller and Velschow (Copen. 1839-58) and A. Holder (Strasb. 1886). There are good translations from the original Latin into Danish by Vedel (new ed. 1851) and Grundtvig (3 vols. 1818-20). To an English translation in the Folklore Society series by O. Elton of the first nine books (1892) is prefixed a mythological commentary by York Powell.

Saxon Architecture, the style of building

Tower of Earl's Barton,
Northamptonshire.

used in England before the introduction of the Norman architecture at the Conquest. There are few specimens remaining which can be depended upon as genuine. The Saxons built chiefly in wood, and all their wooden edifices are now lost. It seems probable that a rude and simple style, in which many features resembling Norman work were introduced, was that used by the Saxons in the 11th century. But there are also more ancient structures, still partly preserved, in which more characteristic features exist. Amongst these

the towers of Earl's Barton and Barnack, Northamptonshire, a church at Bradford-on-Avon (q.v.), and the crypt at Repton are good examples. The peculiar 'long and short' work of the quoins, the projecting fillets running up the face of the walls and interlacing like woodwork, and the baluster-like shafts between the openings of the upper windows resembling the turned woodwork of the period, are all characteristic of the style. Ancient Roman bricks seem also to have been used in some of the Saxon works, as at the churches of Bixworth, Northamptonshire, and that on the Castle Hill of Dover.

Saxon Duchies, the name formerly applied to a group of federal states in the centre of Germany, lying W. of the kingdom (now republic) of Saxony, N. of Bavaria, E. of Hesse-Nassau, and S. of Prussian Saxony. The smallest, Saxe-Altenburg (capital, Altenburg), consisted of two principal portions with smaller fragments. Saxe-Coburg-

Gotha (capitals, Coburg and Gotha) was similarly divided up. Saxe-Meiningen (capital, Meiningen), in addition to a long narrow crescentic piece of territory, had some detached parcels. Saxe-Weimar-Eisenach (capital, Weimar) embraced three large divisions; it was known as the Grand-duchy of Saxony. The dukes who reigned over the four duchies had a common ancestor (see SAXONY), and were united by family compacts and agreements. The Grand-duke of Saxony ranked above the other three, and was heir to the throne of Saxony if the royal family died out. In 1918, following upon the German Revolution, the duchies were declared republics, and two years later they became part of the united state of Thuringia. Coburg, however, with the adjacent portion of Saxe-Coburg-Gotha decided to merge with Bavaria (q.v.). See THURINGIA. In all these names *Saxe* is in German *Sachsen*.

History.—Saxe-Altenburg was ruled by imperial burgraves from the 12th to the 14th century; in 1485 it became subject to the younger or Albertine branch of the Wettin family, but in 1554 was transferred to the elder or Ernestine branch. It continued in that line till the abolition of the dukedom in 1918. From 1672 to 1825 it was united (for the most part) with Gotha; from that time it formed an independent duchy. Saxe-Coburg had been ruled over by the Saxon house since 1353, as an independent duchy from 1680. In 1826 its duke became duke of Gotha too, but the two duchies were not constitutionally united until 1873. Saxe-Gotha was made a duchy in 1641, was united with Altenburg 1672–1825, and then joined to Coburg. As Duke Ernest II., brother of the Prince Consort Albert (q.v.), died childless (1893) the succession passed to the Duke of Edinburgh, and at his death (July 1900) to his nephew, the young Duke of Albany, who reigned till 1918. In Prince Albert's son, Edward VII., the Saxe-Coburg family ascended the British throne (see D'AUVERGNE, *The Coburgs*, 1911). In Leopold (q.v.) the house had given a king to Belgium; and in Ferdinand, in 1835, a royal consort to Portugal (q.v.). Saxe-Meiningen was a separate duchy from 1681. In 1826 the duchy of Saxe-Hildburghausen, founded in 1680, and that of Saxe-Saalfeld, which had been merged with Saxe-Coburg in 1735, were added along with some smaller districts to Saxe-Meiningen, more than doubling its area. Saxe-Weimar had been under the rule of the Saxon house since 1376. Duke Karl August (1758–1828) made Weimar (q.v.) the centre of the intellectual and artistic life of Germany by gathering round him Goethe, Schiller, Herder, Wieland, and others, and by encouraging the theatre, the university of Jena, and the fine arts.

Saxons. (Lat. *Saxones*, Ger. *Sachsen*; perhaps from *sachs*, 'a knife'), a Germanic people first mentioned by Ptolemy as dwelling in the south of the Cimbric Peninsula. In the 3d century a 'Saxon League' or 'Confederation,' to which belonged the Cherusci, the Angrivarii, the Chauci, and other tribes, was established on both sides of the estuary of the Elbe and on the islands off the adjacent coast. During the reigns of the emperors Julian and Valentinian they invaded the Roman territory; but their piratical descents on the coasts of Britain and Gaul are far more famous. In 287 Carausius, a Belgic admiral in the Roman service, made himself 'Augustus' in Britain by their help; and about 430 they, in conjunction with the Angles, established themselves permanently in the island and founded the Anglo-Saxon kingdoms. Before the 5th century they had settled along the North Sea coasts from the Elbe to the Loire, a part of what was later Flanders being called the 'Saxon Shore.' But these Saxon settlements soon became

absorbed in the kingdom of the Franks. In Roman times the coast districts of Britain from Brighton northwards to the Wash were called *Litus Saxonicum*, or Saxon Shore. These localities were particularly exposed to the attacks of the Saxons from across the North Sea, and were placed under the authority of a special officer, the Count of the Saxon Shore (see Miss J. Mothersole, *The Saxon Shore*, 1924). At home the Old Saxons enlarged their territory by conquest till it embraced all the lands between the Rhine and Elbe, the North Sea and the Harz Mountains. Along with the Franks they destroyed the kingdom of the Thuringians in 531, and obtained possession of the land between the Harz and the river Unstrut; but this region too was forced to acknowledge the Frankish sovereignty. But the Saxons having thrown off the yoke, wars between the Saxons and the Franks were constant after 719; and the latter after 772 were, under the vigorous leadership of Charlemagne, generally successful, in spite of the determined opposition offered by Wittekind (or Widukind). The desperate resistance of the Saxons was not finally broken until 804, though Wittekind submitted in 785. After the final submission the conquered people accepted Christianity, having before defended their heathen faith in conjunction with their freedom. By the treaty of Verdun (843) the Saxon districts fell to Austrasia, the nucleus of the German empire (see SAXONY). The 'Saxons' of Transylvania (q.v.) are not all of pure Saxon descent; the name is used rather as synonyms with 'German.' See HELIAND and ANGLO-SAXON.

To the Celtic Britons the English or Anglo-Saxon invaders were known only as Saxons, and *Sassenach*, or other Celtic form of the word Saxon, is still the name for Englishmen and their language alike in Wales, the Scottish Highlands, and Ireland. But the 'hated Saxon' as a political war-cry was the coinage of O'Connell.

Saxony, a republic of Germany, taking in respect of area the fifth place, but in respect of population the third place, amongst the states. It is surrounded by Bohemia (on the S.), Silesia (NE. and N.), Prussian Saxony (N. and NW.), and Thuringia (W.). It measures 130 miles from east to west, 90 miles from north to south, and has a total area of 5787 sq. m. (a little smaller than Yorkshire); in shape it roughly resembles a right-angled triangle, the right angle being in the north-west, the hypotenuse in the south, along the Erzgebirge (to 3343 feet). The greater part of the surface is diversified by the spurs (2800 feet) of this mountain-chain, with to the west the outliers (2900 feet) of the Fichtelgebirge and to the east the northern extensions (2600 feet) of the Riesengebirge. The northern districts pass over into the great North German plain. On the whole the surface is therefore elevated (nearly 60 per cent. above 800 feet); in many parts it is studded with isolated peaks of basalt and sandstone (e.g. the fantastic pinnacles of the Saxon Switzerland, skirting the Elbe just above Dresden). It lies almost wholly within the basin of the Elbe. The climate, owing to the elevation, is somewhat colder and severer than the latitude (50° 10' to 51° 28' N.) would indicate. The population grows fast: (1815) 1,178,802; (1840) 1,706,276; (1864) 2,344,094; (1880) 2,972,805; (1910) 4,802,485; (1919) 4,670,311; (1925) 4,980,689. Saxony, whose area is less than half that of Belgium, is more densely populated, having 805 inhabitants per sq. m. to Belgium's 659. In origin the majority of the people are Germanised Slavs; some 50,000 are Wends, living in Lusatia; the non-Slavonic remainder are descended from ancient immigrants from Franconia and Thuringia. Over 90 per cent.

of the population are Lutherans. The capital is Dresden; the largest towns are Leipzig, Dresden, Chemnitz, Plauen, Zwickau, Meissen, the first two having over 600,000 inhabitants.

Saxony is essentially a mining and manufacturing country. The first place amongst the manufactures is taken by the textile industries, which embrace the making of linen, damask, muslin, hosiery, ribbons, cloth and buckskin, flannel, woollen goods, and waxcloth; to these must be added numerous dyeworks and factories for printing and stamping textiles. The other branches of industry deal with machinery, pottery, porcelain and glass, potash, chemicals, beer, spirits, lace, paper, straw-plait, tobacco, artificial flowers, pianofortes and other musical instruments, hats, toys, watches, books, ornamental wooden articles, &c. The principal mineral products are coal, argentiferous lead, tin, zinc, iron, nickel, bismuth, and cobalt. Building-stones, turf, lime, slates, potter's clay, &c. are extracted in considerable quantities. Freiberg is one of the chief centres in Germany for smelting metals. Though agriculture is very highly developed in Saxony, grain and fat animals are imported annually in very considerable quantities, the home produce being insufficient for the people's wants. The greatest acreage is devoted to rye; next in importance come oats, potatoes, wheat, barley. Fruit-culture, market-gardening, the breeding and fattening of cattle and sheep, and of geese, and bee-keeping are carried on with much zeal and success. Eighty-six per cent. of the area of the land in cultivation is divided into farms ranging between 2 and 250 acres. A vast amount of trade is done in all kinds of produce, on the Elbe and on the railways (some 2000 miles). Amongst the educational institutions are the university and the conservatorium at Leipzig, famous high schools at Meissen and Grimma, a polytechnic at Dresden, a superior industrial academy at Chemnitz, a mining academy at Freiberg, a forestry school at Tharandt, and numerous inferior mining and technical schools throughout the manufacturing districts. There are about 3500 common and continuation schools; illiteracy is practically non-existent. The *Oberlandesgericht* (Supreme Court of Justice) is situated at Dresden, and the *Reichsgericht* (High Court of Justice for the German Reich) at Leipzig. The constitution of the republic, dated 26th October 1920, provides for an assembly (*Landtag*) of ninety-six members, elected on a principle of proportional representation, and by a vote which is universal, equal, secret, and direct. There is a president with a ministry which exercises the supreme power.

To understand the history of Saxony it is necessary to go back to the Old Saxons (see SAXONS), who, before their submission to the Franks, had been accustomed to choose a 'duke' to lead them in war. After the division of the Frankish dominion into an eastern and western kingdom, in which division the Saxons and their territory passed to the eastern half or Austrasia, the Saxons were greatly exposed to the attacks of the Northmen on the north-west and of the Slav tribes on the north and north-east, and so they chose them a duke again, one Otto (880-912), who not only defended his people valiantly but extended their supremacy southwards over Thuringia. His son, Henry (912-936), was in 919 chosen king of the eastern or German kingdom, and thus the Saxon chief ruler became the head of all the peoples in the future Germany. Henry reduced the Slav tribes living beyond the Elbe, and so made himself master of all the territories included in the present republic of Saxony, the Prussian province of Saxony, part of the Thuringian state, and more besides. His son, Otto II., king of the Germans, made Count

Hermann Billung duke of the Saxons, and the dignity continued in his family down to 1106. The princes of this house, to whom the Saxon people were greatly attached, were the most difficult enemies of the German emperors, who after 1024 were again men of Frankish race. The power of the Saxon dukes was greatly increased under Henry the Proud of Bavaria, who succeeded to the dignity in 1137, and especially under his son Henry the Lion, who conquered Mecklenburg, Hither Pomerania, and Holstein. This prince was deprived of his possessions by the Emperor Frederick I. (1180), who confined the duchy of the Saxons to the territories lying east of the Elbe, and divided those to the west of it between the Archbishop of Cologne and numerous petty bishops and princes. The dignity of duke of the Saxons was given to Bernard of Ascania, son of the prince of Brandenburg. His descendant, Rudolph II. (1356-70), called himself Elector of Saxony. In 1423 the Emperor Sigismund invested Frederick, Landgrave of Meissen and of Thuringia, with the title of Saxony. This prince, of the House of Wettin, was the ancestor of the late reigning family of Saxony and of the various dukes of the minor Saxon states. The princes and nobles of the House of Wettin frequently divided and interchanged their possessions in whole or in part, and all the sons of a deceased elector often ruled in common or in conjunction with uncles, so that the history of the house is extremely complicated down to the beginning of the 19th century. But in 1485 a division was made which in its broad features continued to hold good down to the revolution. The family split into two main branches, called, from the two brothers who divided the territories between them, the (elder) Ernestine and the (younger) Albertine line. The electoral dignity fell to Ernest, who ruled over Thuringia and the western part of modern Saxony. His son, his grandson, and his great-grandson were all zealous supporters of the Reformation, whilst the heads of the Albertine branch, who ruled in the eastern lands (beyond the Elbe), although they were Protestants, supported the pope and the emperor. In 1547 the emperor, after defeating the Elector of Saxony in battle, deprived him of the dignity and of the greater part of his lands; and gave title and lands to his own ally, the head of the younger line, and with that line they remained, the title being exchanged in 1806 for the higher dignity of king. Only the Thuringian territories (see SAXON DUCHIES) remained with the older line.

During the 'Thirty Years' War the reigning elector, John George I. (1611-56), remained neutral until Tilly invaded his territories; this drove him over to the Protestant side (1631). He made his peace, however, with the emperor in 1635, receiving Lusatia; but in revenge for this desertion the Swedes wrought terrible havoc in his land and amongst his people ten years long. The Elector Frederick Augustus I. (1694-1733), a vain man, fond of magnificence and eager to make a stir in the world, went over to Roman Catholicism and made an eager canvas for the throne of Poland. He was chosen king as Augustus II. (q.v.); after that the headship of the Protestant states of Germany passed to the Elector of Brandenburg (see PRUSSIA), and the court and dynasty of the Protestant kingdom of Saxony remained Catholic ever after. Saxony, in consequence of this alliance with Poland, was drawn into the war against Charles XII. of Sweden, and again suffered greatly from the Swedish armies. In the second Silesian war she sided with Austria, was beaten, and had to pay a million thalers' indemnity to Prussia. When the Seven Years'

War broke out Frederick the Great refused to recognise the neutrality of Saxony, and, capturing her army, treated her as a conquered province, and forced the elector (Frederick Augustus II.) to take refuge in Poland, to the crown of which country he had been elected in succession to his father. Frederick Augustus III. (1763-1827) bent himself energetically to the task of building up his state again and restoring the prosperity of his subjects, matters in which he was eminently successful. He took part with Prussia in the early Napoleonic wars, though not always very willingly, and in 1806 proclaimed himself king of Saxony as Frederick Augustus I. Then he went over entirely to the side of Napoleon, and sent the Saxon army to fight side by side with the French down to the battle of Leipzig (1813). After the rout of the French in that battle Frederick Augustus was taken prisoner, and his land occupied by the allies. The congress of Vienna deprived him of a large portion of his territories and subjects, namely 7720 sq. m. out of 13,510, and 864,404 inhabitants out of 2,047,148; these formed part of the new province of Prussian Saxony. This separation of lands that for centuries had been ruled over by the House of Wettin encountered the strongest opposition on the part of the people. In 1832 the old machinery of government, consisting of a secret cabinet and the two chambers of the fiefal estates, was abolished to give place to a constitutional system, granted by Antony, who reigned 1827-36. But under his nephew and successor, Frederick Augustus II. (1836-54), the new system did not work well. In May 1849 the Russian Bakunin and other democratic socialists stirred up a rising in Dresden, which resulted in a week's severe barricade-fighting in the streets. John was king from 1854 to 1873; but from 1858 to 1866 the ruler *de facto* of Saxony was Count von Beust (q.v.), an open enemy of Prussia, who opposed Bismarck's policy in every way he could. In the Austro-Prussian war of 1866 Saxony sided with Austria, but, being along with her ally defeated, she joined the North German Confederation and paid an indemnity of 10 million thalers to Prussia. In the Franco-German war the Saxon army fought of course on the side of Prussia. From 1871, when the kingdom became part of the German Empire, the country was peaceful and in a wonderful degree prosperous. John was succeeded in 1873 by his son Albert, who reigned till 1902, when he was followed by his brother George. The latter died two years later, and his son and successor, Frederick Augustus III., reigned until Saxony was proclaimed a republic on 9th November 1918.

The standard history is Böttiger's (ed. Flathe, 3 vols. 1867-73). See GERMANY.

Saxony. PRUSSIAN, a province of Prussia, formed in 1815 out of districts taken from the kingdom of Saxony, part of the duchy of Magdeburg, the Altmark, the principalities of Halberstadt and Erfurt, and some smaller territories. It lies between Brandenburg, Hanover, Brunswick, Hesse-Cassel, Thuringia, and the republic of Saxony. The state of Anhalt almost divides it into two portions. Area, 9758 sq. m.; pop. (1925) 3,281,291. The greater part of the surface belongs to the North German plain, being watered by the Elbe and its subsidiary streams, the Saale, Mulde, two Elsters, Ilm, &c. The soil, except in the north and on the mountains (Harz and Thüringerwald) in the south, is extremely fertile, the valley of the Golden Meadow (*Goldene Aue*) being particularly famous. Lignite and salt are extracted and copper is mined. Wheat, beetroot, flowers, vegetables, hops, &c. are extensively grown. There are important manufactures of cloth, cottons, machinery,

oil, small-arms, beer, chemicals, and other articles. Halle is the seat of one of the first universities of Germany. The capital is Magdeburg; other large towns are Halle/Erfurt, Halberstadt, Mühlhausen, Nordhausen, and Aschersleben.

Saxophone, the name of a family of musical instruments invented by Sax (see SAXHORN). They consist of a conical brass tube, in the larger varieties curved at both ends, sounded

by a mouthpiece furnished with a single reed similar to that of the Clarinet (q.v.), and are made in the following keys: soprano in E_♭, soprano in B_♭, alto in E_♭, tenor in B_♭, baritone in E_♭, bass in B_♭. They have twenty holes covered by keys and studs for the first three fingers of each hand, and are all fingered alike. The series have a compass of about three octaves, ranging from C above the treble clef to C in the bass. Sax designed the saxophone for use as an instrument in military bands, and it has obtained considerable vogue as such in Britain and in France, and has been occasionally used in orchestras. The instrument has gained an immense popularity in connection with syncopated music, its strident tone being one of the chief characteristics of the jazz band.

Alto Saxophone.

Say, JEAN BAPTISTE, a French political economist, was born at Lyons, 5th January 1767. Being destined for a commercial career, he passed a part of his youth in England, and on his return to France began his work in a life-insurance office. On the outbreak of the Revolution he made his way to Paris, and worked for Mirabeau on the *Courrier de Provence*, and a year or two later acted as secretary to Clavière, the minister of finance. From 1794 to 1800 he edited a journal called *La Décade*, in which he expounded with great effect the views of Adam Smith. After 18th Brumaire (1799) he was appointed a member of the tribunal, but at the end of a few years he began to express his disapprobation of the arbitrary tendencies of the new consular government, and in 1804 ceased to be a member of a body that had become a mere tool in the hands of Bonaparte. Under the despotism of the empire Say was forced into private life, and betook himself to industrial pursuits. In 1803 he issued the first edition of his principal book, *Traité d'Économie Politique*. In 1814 the French government sent him to England to study the economical condition of that country; he laid down the results of his journey in *De l'Angleterre et des Anglais* (1816). From 1819 he lectured on political economy at the Conservatory of Arts and Trades, and in 1831 was appointed professor of Political Economy at the Collège de France, but died 16th November 1832. A follower of Adam Smith, but an independent and sagacious writer, Say was the first to teach Frenchmen to consider rationally such questions as customs-duties, the currency, public credit, the colonies, and taxation, and to him belongs the credit of having made Adam Smith extensively known on the Continent. Besides the

books cited he also wrote *Catéchisme d'Economie Politique* (1815), *Cours Complet d'Economie Politique* (1823-30)—this merely an expansion of the *Traité*—and *Mélanges et Correspondance* (1833). His principal writings form vols. ix.-xii. in Guillaumin's *Collection des Economistes*.

SAYCE, ARCHIBALD HENRY, philologist, was born at Shirehampton, near Bristol, 26th September 1846, and was educated privately and at Grosvenor College, Bath. He entered Queen's College, Oxford, in 1865, took a classical first-class in 1869, and became fellow, then tutor, of his college. He took orders in 1870, and was appointed in 1876 deputy to Max-Müller in the chair of Comparative Philology at Oxford, which office he resigned in 1890. Professor Sayce joined the Old Testament Revision Company in 1874, was elected a member of numerous home and foreign learned societies, and received the degree of LL.D. from Dublin in 1881, and D.D. from Edinburgh in 1889. He was Hibbert lecturer in 1887, Gifford lecturer in 1900-2, and Rhind lecturer in 1906.

Among his many books the most important are *The Principles of Comparative Philology* (1874), *Introduction to the Science of Language* (2 vols. 1880), *The Ancient Empires of the East* (1884), *Origin and Growth of Religion as illustrated by the Ancient Babylonians* (1887); and admirable short popular works on *Fresh Light from the Ancient Monuments, Assyria, the Hittites, and the Users of the Old Testament* (1891), in 'By-paths of Bible Knowledge.' Besides his *Assyrian Grammar* (1872) and *Lectures on the Assyrian Syllabary* (1875), he has contributed many books and papers on the subject to the learned journals, and he edited George Smith's *History of Babylonia* (1877) and *Chaldean Genesis* (1880). Further works were an edition of *Herodotus I.-III.* (1883), an *Introduction to Ezra, Nehemiah* (1885), *Records of the Past* (2d series, 1888-93), *The Times of Isaiah* (1889), *Egypt of the Hebrews* (1895), *Early History of the Hebrews* (1897), *Israel and the Surrounding Nations* (1898), *Babylonians and Assyrians* (1900), *Egyptian and Babylonian Religion* (1903), *Archæology of Cuneiform Inscriptions* (1907), and a volume of *Reminiscences* (1923). He contributed the articles ASSYRIA, BABYLONIA, and HITTITES to this work.

Sayers, Tom. See PUGILISM.

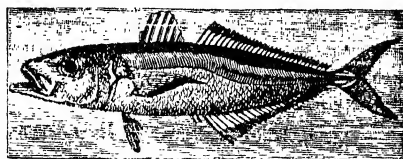

Scab. In Sheep, like itch in man, or mange in horses or dogs, depends upon the irritation of three varieties of minute acari, some of which burrow in the skin, especially if dirty and scurfy, causing much itching, roughness, and baldness. But the parasite which causes ordinary sheep scab is the *Psoroptis communis*. It readily adheres to hurdles, trees, or other objects against which the affected sheep happen to rub themselves, and hence is apt to be transferred to the skins of sound sheep. Sheep Scab is scheduled under the Diseases of Animals Acts, and as dipping is the only satisfactory method of treatment, the Board of Agriculture prescribes special dips, and the manner and times of using them, or, the Board has to be satisfied of the efficiency of the dip used. See the Sheep Scab Orders of the Board.

Scabious. See ITCH.

Scabious (*Scabiosa*), an extensive genus of herbaceous plants, exclusively natives of the eastern hemisphere, of the family Dipsacaceæ (see TRASEL). The flowers are collected in terminal heads, surrounded by a many-leaved involucre, so as to resemble those of the Compositæ. The Devil's-bit Scabious (*S. Succisa*) is a very common autumnal flower in British pastures. The plant possesses great astringency, but no important medicinal virtues, although it was formerly supposed to be of great efficacy in all scaly eruptions, and hence the name scabious, from Lat. *scabies*, 'scab,' 'itch.' The end of the root appears as if abruptly bitten off, and the superstition of the middle ages regarded

it as bitten off by the devil, out of envy, because of its usefulness to mankind. The Sweet Scabious (*S. atropurpurea*, with several sub-species) is a well-known fragrant garden-flower. It is a native of the Mediterranean region.

Scad (*Caranx trachurus*, or *Trachurus trachurus*), a fish of the family Carangidae, sometimes called the *Horse Mackerel*, because of its resemblance to the mackerel, and its comparative coarseness. It is from 12 to 16 inches long, of a dusky olive colour, changing to a resplendent green, waved with a bluish gloss, the head and lower parts silvery, the throat black. It has two dorsal fins, the first short, the second long, and one long ventral fin opposite the second dorsal. There are two small free spines in front of the anal fin. The ordinary scales are very small, but those of the lateral line are large, spiny, and strongly keeled, the keel terminating in a curved spine. The species of *Caranx* are very numerous, and it is sometimes divided into several genera; but the scad is the only species found on the British coasts. It is common on the south-western coasts of England, but comparatively rare to the north. It sometimes appears in immense shoals, pursuing the fry of herring or similar prey, and the multitudes have sometimes been so great and so

Scad (*Caranx trachurus*).

crowded together that they could be lifted out of the sea by buckets, and overloaded nets have been torn to pieces. The scad has something of the mackerel flavour. Although not much cared for when fresh, it is often salted, and in that state is esteemed as an article of food in Cornwall and the Scilly Isles. This species has a very wide range: it is rare on the west coast of Norway, but abounds along the coasts of France and Portugal and in the Mediterranean. It is found along all the Atlantic coast of Africa to the Cape of Good Hope, and is also abundant in Australia and New Zealand, and on the west coast of South America.

Scævola, the cognomen of a great Roman family. The most renowned is the patriot Gaius Mucius Scævola, who, during the siege by Porsena, tried to stab the Etrurian prince, but by mistake killed his secretary. Porsena ordered his would-be assassin to be burned alive; but when the Roman showed his contempt for pain by thrusting his right hand into a blazing fire and holding it there without flinching, Porsena ordered him to go free. By return courtesy Mucius told Porsena he was but the first of a band of 300 who had sworn to slay their country's enemy; and Porsena, startled by the prospect of having to face in succession a band of such reckless men, was, according to the legend, moved to make peace and depart. Mucius received the name of Scævola ('left-handed') in reference to his loss of the right, and proudly handed this cognomen down to his posterity.—PUBLIUS MUCIUS SCÆVOLA, lawyer and orator, was consul in 135 B.C., and became pontifex maximus three years later.—QUINTUS MUCIUS SCÆVOLA, an eminent jurist, wrote an important treatise on Roman law. He was consul in 95, pontifex maximus later, and was slain in 82 during the struggle between the fac-

tions of Sulla and Marius the younger.—**QUINTUS MUCIUS SCAEVOla** was governor of Asia in 121, consul in 117, and was a distinguished lawyer, counting Cicero among his pupils.

Scafell, a double-peaked mountain in Cumberland, on the Westmorland border, 14½ miles SSW. of Keswick. The loftiest summit in England, it is a chief feature in the scenery of the Lake District (q.v.), in the heart and centre of which it stands. Of its two peaks, the higher, Scafell Pike, attains 3210 feet, the other 3162.

Scagliola, a composition made to imitate the more costly kinds of marble and other ornamental stones; and so successfully that it is often difficult to distinguish between the artificial and the real stone. It consists of finely-ground plaster of Paris mixed with a thin solution of fine glue, and coloured with any of the earthly colours, such as ochres, umbers, Sienna earth, Armenian bole, and sometimes chemical colours, such as the chrome yellows, &c. This is spread over the surface intended to represent marble; and whilst still soft, pieces of fibrous gypsum, marble, alabaster, and other soft but ornamental stones are pressed into it, and made level with the surface. When the composition is set hard it is rubbed down, and polished with the ordinary stone-polishing materials, which give it a very fine gloss. This kind of work is only adapted for interiors, because scagliola will not bear exposure to damp for any length of time; but its lightness, and the extreme ease with which it may be applied to walls, pillars, pilasters, and even cornices, render it very useful for the decoration of the better class of dwellings and public buildings.

Scala. See MILAN, VERONA, SCALIGER.—For the Scala Santa, see LATERAN.

Scalacronica, a Norman-French chronicle (trans. Sir Herbert Maxwell, 1907), written by Sir Thomas Gray, warden of Norham Castle, while a prisoner in Scotland; specially valuable for the Scottish wars in which he and his father (taken prisoner at Baunockburn) served. Sir Thomas died about 1369. A ladder (*scala*) was the crest of the Grays.

Scala Nova, or KUSCHADASSI, a seaport of Asia Minor, at the head of a gulf opposite Samos, near the ruins of Ephesus (q.v.); pop. 7000.

Scaldhead. See FAVUS.

Scalds. See BURNS.

Scale (It. *scala*, 'a ladder'; cf. Ger. *Tonleiter*, 'a ladder of sounds') is in Music any regular succession of sounds between one note and its octave which has been established by custom. The perfection of the octave interval (see HARMONICS) is the natural reason why it has been chosen as the limit, but the scale itself varies, and has varied at different periods and in different countries. The most important scales which differ from those in ordinary use are the *pentatonic*—the foundation of Chinese and other Oriental scales, as well as of Scottish and those of Celtic origin—and the Gregorian scales or 'modes' (see PLAIN-SONG). The first can easily be illustrated by playing the black notes on a pianoforte, beginning from F♯; 'Auld Lang Syne' will serve as an example of a pentatonic air. As a result of the adoption of equal Temperament (q.v.) in the 17th century, there emerged the *chromatic* and *diatonic* scales. The chromatic, proceeding by uniform degrees, includes all the twelve semitones into which the octave is divided. Diatonic scales are *major* and *minor* according to the disposition of the tones and semitones. They may begin from any note in the octave, and are, therefore, twenty-four in number—twelve major and twelve minor. In the major scale the order

of the intervals always remains the same, the scale of C being given as example. (The semitone intervals are marked by brackets, those not so distinguished being tones. T indicates the tonic, D the dominant.) There are two forms of minor scales, *harmonic* and *melodic*. In the former the seventh or 'leading' note is sharpened a semitone; and in the latter, both the sixth and seventh notes are sharpened while the scale is ascending, and both are flattened while the scale is descending. The harmonic form of C minor is given as an example. (The interval marked N.B. is a tone and a half, the other intervals being tones or semitones.) Every major scale is related to two minor scales, and every minor to two major. Thus, in relation to C major, C minor is the *tonic* minor and A minor the *relative* minor. In the former case the key-signature is changed, in the latter it remains the same. Similarly, in relation to C minor, C major is the *tonic* and E♭ major the *relative* major.

One of the characteristics of 20th-century musical development has been the employment, generally experimental, of different forms of scales, either by reviving the mediæval modes (Holt) or by proceeding by uniform degrees along the accepted divisions of the octave, such as whole tones (Debussy) or quarter tones (a feature of some Oriental music); or by selecting a series of more or less arbitrary intervals to suit the mood or form of composition (Scriabin). Atonality, another modern development, insists on the equal importance of every note of the octave, and regards none particularly as the tonic (Schönberg), while polytonality implies the usage of two or more tonalities at the same time (Stravinsky). Atonality and chromaticism are not synonymous, as the chromatic scale is entirely dependent on and is only used in conjunction with the diatonic.

See HARMONY, SOUND, and the books there cited; also the treatises of Helmholtz, Riemann, Busoni.

Scale Insect. See COCCUS.

Scale of Intelligence, BINET-SIMON, a means devised by two French doctors, Binet and Simon, for measuring the intelligence level of children. The scale, first propounded in 1905 after much careful investigation among Paris school-children and definitely formulated in 1911, consists of some fifty questions or tests arranged in groups in ascending order of difficulty to correspond to the ages of three to fifteen years. Children of normal intelligence were tested in fixing the standard of each age-group, and it was finally observed that a normal child of three could be expected to have sufficient intelligence to indicate its nose, eyes, mouth, repeat two digits, &c., while a child of four should succeed in stating its sex, in repeating three digits, naming objects, &c., and so on up to the boy or girl of fifteen, who should be able to repeat seven digits, give three rhymes, &c. Thus, on the one hand, children of exceptional intelligence; and, on the other, backward or mentally deficient children can be singled out, and their mental level discovered by referring them to the group of tests which they can satisfy. Defectiveness especially engaged the attentions of Binet and Simon, who urged that

diagnosis of such cases calls for the expert psychologist as well as for the medical man, and who recommended special classes in which defectives might be trained to be at least 'socially useful.' Their scale has created great interest in Europe and America, and several revisions of it have appeared, while its application has been extended by numerous writers to matters of delinquency, school-grading, eugenics, and other social problems. Their most important writings exist in English translations, viz. *Mentally Defective Children* (trans. 1914), *A Method of Measuring the Development of the Intelligence of Young Children* (trans. 1915), *The Intelligence of the Feeble-minded* (trans. 1916), *The Development of Intelligence in Young Children* (trans. 1916).—ALFRED BINET (1857-1911) was born at Nice, studied law and medicine at Paris, but came to interest himself principally in experimental psychology, establishing a great centre of research at the Sorbonne in 1894. His most important work *L'Étude expérimentale de l'Intelligence* appeared in 1913.—THÉOPHILE SIMON (b. 1873) was born at Dijon, and, qualifying in medicine at Paris in 1908, became physician to the mental hospital at St Yon near Rouen. He succeeded Binet as president of the 'Société libre pour l'Étude psychologique de l'Enfant.'

Scales. Besides the articles which precede and follow, see BALANCE, WEIGHTS AND MEASURES, DEGREE, GRADUATION, THERMOMETER, FAHRENHEIT, VERNIER; also EPIDERMIS, SKIN.

Scales, modifications of the skin especially characteristic of fishes and reptiles. Those of lizards and serpents are due to folds of the epidermis, the outer or horny layer of which is in various degrees hardened. So the scales of the pangolin and of the beaver's tail, or those which cover the legs and toes of many birds, are epidermic. On the other hand, the scales of most bony fishes (Teleostei) and of the Dipnoi are developed from the under skin or dermis, and are thus comparable to the little bony plates which occur in the skin of not a few lizards, to the large bony 'scutes' of the crocodilians and many extinct reptiles, and to the armature of the armadillos. A third type of scale is represented by the skin-teeth or 'dermal denticles' of Elasmobranch fishes, for in these, as in the teeth of the mouth, the epidermis forms an external coating of enamel, while the bony core and base are developed from the dermis. To this type the hard scales of some Ganoids (e.g. the sturgeon, bony pike) and a few Teleostei are also to be referred. Dermal scales are of especial interest, for in a coalescence of these the 'investing bones' of the skull and shoulder-girdle had probably their origin. See FISHES, SKELETON.

Scales, MATHEMATICAL. Maps, estate plans, architectural, engineering, and other proportionate drawings are made to scale. An inch, for example, of the scale may represent a foot, yard, mile, or other length of the space to be shown. The first thing to be determined is the *representative fraction*, which shows the ratio between the scale and the object it represents, and should always be given with the scale. If the scale is to be of 1 inch to 8 miles, as there are 506,880 inches in 8 miles the representative fraction will be $\frac{1}{506880}$, which is usually printed on maps 1:506880. From this fraction a workable length of scale is easily found.

Fig. 1.—Simple Scale of 1:506880.

Suppose a scale showing 20 miles would be convenient to work from; as there are 1,267,200

inches in 20 miles, the proportion would be 506880:1::1267200:25. But this result is usually more readily arrived at by taking the proportion of the original lengths instead of using the representative fraction. Thus, 8:20::1:2.5. To make the scale, draw a line 2½ inches long. This line represents 20 miles. Bisect it, and each half shows 10 miles. Subdivide the half to the left into ten equal parts, and each of these tenths stands for 1 mile. This is a *simple scale* ready for use, and how it is usually drawn and figured is shown in fig 1.

The *diagonal scale* is a vertical subdivision over the simple one, and is an application of the principle in geometry that the sides about the equal

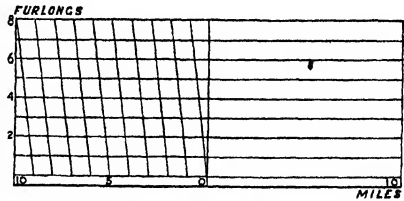

Fig. 2.—Diagonal Scale of 1:506880.

angles of equiangular triangles are proportional. Suppose the further subdivision of miles into furlongs were required. Draw above the simple scale eight parallel lines at equal distances from each other (fig. 2). From its ends and point of bisection draw perpendiculars to the eighth of these parallel lines. Subdivide the left half of the eighth line as the same half of the simple scale is subdivided. Join the first subdivision of the uppermost line from its bisection with the point of bisection of the simple scale, and draw lines parallel to this one from the other nine points of subdivision. The space between the bisecting line and the diagonal nearest it on the first parallel shows one furlong, the space above it two, and so upwards according to the geometrical principle stated. Suppose 16 miles 6 furlongs were to be measured. Put the one leg of the divider on the right end of the sixth parallel line and the other where the diagonal line sixth from the centre cuts that parallel, and the length required is found. The diagonal scales on mathematical rules are generally engraved with ten parallel lines, so as to give subdivision of tenths, this being the most generally useful proportion.

The *comparative scale* involves no new principle. It is a scale drawn in a different denomination to the same representative fraction. A scale in leagues comparative to the scale in miles would be three times as long itself and in each of its subdivisions; and if the comparative scale were drawn to the same number of units it might be inconveniently long or short. Thus, a comparative scale showing 20 leagues to the representative fraction given above would be 7.5 inches, which might be too long for working purposes or to be exhibited in print or on the plan. But it is not necessary that the same number of units in the larger or smaller denomination be taken; and the length of scale for a convenient number is easily found by proportion. Thus, in a scale 40 Russian versts are represented by 4.5 inches; draw a comparative scale in English miles. Show 20 miles. Take the verst roundly as 1187 English yards. There are 1780 yards in a mile. In 40 versts there are 46,880 yards; in 20 miles, 35,200 yards. Then 46880:35200::4.5:3.4. This line 3.4 represents 20 miles to the same representative fraction as the

Russian scale of versts, and it can be divided and subdivided like the simple and diagonal scales above.

Scalesia, a genus of composite plants related to the sunflower, consisting of ten species, each of which inhabits only one of the Galápagos islands. This pronounced endemism on so very small an area is one of the strangest phenomena of the distribution of plants. The Galápagos group furnishes an analogy in the animal world.

Scales of Notation, in Arithmetic, have to do with the representation of numbers of any magnitude by means of a few symbols. We ordinarily express numbers in terms of the first nine digit symbols and the symbol known as the cipher—i.e. ten in all. The number 'ten' is then represented by 10, a combination of the 'one' and cipher symbols, and so on in the familiar manner. Mathematically there is no reason why ten should be chosen in preference to any other number as the radix of our common scale of notation. Its convenience arises from the way in which it suits our numeration or naming of numbers. Historically the development of decimal arithmetic—of which our denary scale is the highest phase—is intimately connected with the fact that man has ten fingers. The full significance of the denary scale will be best seen if we take some other number, seven say, as the radix. Our object is now to express all numbers in terms of the cipher and the first six digits only. The number seven itself will be represented by 10, eight by 11, twelve by 15, fourteen by 20, forty-nine, or seven times seven, by 100, and so on. In other words, 49 to radix ten is the same number as 100 to radix seven. As another example take the number of days in the year, and let it be expressed in terms of scales whose radices are twelve, ten, seven, and three. Remembering that 365 to radix ten is a concise notation for $3 \times 10^2 + 6 \times 10 + 5$, we must, in order to express it in the duodenary scale, throw it into a similar form with twelve substituted for ten. We find easily

$$\begin{aligned} 365 &= 30 \times 12 + 5 \\ &= (2 \times 12 + 6) \times 12 + 5 \\ &= 2 \times 12^2 + 6 \times 12 + 5. \end{aligned}$$

Hence 365 to radix ten is the same number as 265 to radix twelve. In the other cases we get

$$\begin{aligned} 365 \text{ to radix ten} &= 265 \text{ to radix twelve} \\ &= 1 \times 7^4 + 0 \times 7^3 + 3 \times 7^2 + 1, \text{ or } 1031 \text{ to radix seven} \\ &= 1 \times 3^5 + 1 \times 3^4 + 1 \times 3^3 + 1 \times 3^2 + 1 \times 3 + 2, \\ &\quad \text{or } 111112 \text{ to radix three.} \end{aligned}$$

These examples show that the simplicity of having a few symbols is balanced by the disadvantage of having to use long expressions for large numbers. The attempt to work in other than the denary scale is moreover greatly hampered by our lifelong habit of thinking and naming our numbers according to a decimal system.

The fact that there are twelve pence to the shilling and twelve inches to the foot has often suggested the introduction of the duodenary scale. According to this scale twenty-four feet nine inches would be represented symbolically by 20-9. To use this scale we should be compelled to invent two new symbols for what we call ten and eleven. But unless we altered our numeration so as to be in accord with the symbolism, the method would be impracticable. For example, we should have to rename *fourteen* and *twenty-six* so as to bring them into line with their duodenary symbols 12 and 22. At present in all calculations involving shillings and pence or feet and inches we are compelled to *work* partly in the duodenary scale; but the numbers themselves are expressed both symbolically and verbally according to the denary scale

and decimal nomenclature. As a matter of history the denary scale is the only one that has ever been used purely; to establish any other would necessitate a complete revolution in modes of thought and habits of language.

Very similar to the mixture of decimals and duodecimals in the examples just given is the method of sexagesimals, which still survives in the subdivision of hours and degrees. There are sixty minutes to the hour (or degree), and sixty seconds to the minute. This method is of great antiquity, and had no doubt an astronomical origin. To the early astronomers it offered special facilities for calculation and for representation of fractions. It was used extensively by Ptolemy and the Alexandrian mathematicians, who employed for symbols the usual Greek numerals as far as the symbol for sixty (see NUMERALS). At its best, however, the sexagesimal notation must have been very cumbersome, even when assisted, as it probably was, by use of the Abacus (q.v.). It is evident that it does not form a pure scale; to do so sixty distinct symbols including the zero would be required. The Alexandrians no doubt borrowed the system from the Chaldeans. In the older Babylonian inscriptions there is found a sexagesimal notation identical, in so far as it is a notation, with that used by Ptolemy and his school. The symbolism is of course quite different, all numbers being represented by appropriate combinations of two cuneiform characters. The numbers up to nine are represented each by the proper number of the simple wedge-shaped character. Ten is symbolised by the angle-shaped character, two of which give twenty, three thirty, four forty, and five fifty. *Sixty*, however, is represented by the same simple character as one; five times sixty, or 300, by the same character as five, and so on. The famous tables of Senkereh contain the squares and cubes of all numbers from 1 to 60, expressed in terms of this sexagesimal notation. A few examples will suffice. Thus we find

$$\begin{aligned} \left\{ \begin{array}{c} \text{YYY} \\ \text{YYY} \end{array} \right\} \left\{ \begin{array}{c} \text{YYY} \\ \text{YYY} \end{array} \right\} \text{ given as the square of } \left\{ \begin{array}{c} \text{YYY} \\ \text{Y} \end{array} \right\} \\ \text{—i.e. } 48 \times 60 + 36 = 2916 = (54)^2. \end{aligned}$$

We may most simply exhibit the Babylonian method by using heavy figures for the tens and light figures for the units. Thus the above example would be translated $4836 = \text{square of } 54$. Others from the table of Senkereh are

$$\begin{aligned} 12153 &= \text{cube of } 17 \\ (1 \times 60^2 + 21 \times 60 + 53 = 4913 = 17^3) \\ 73 &= \text{cube of } 3 \text{ (i.e. thirty).} \end{aligned}$$

This last must mean $7 \times 60^2 + 30 \times 60$, although there is nothing in the notation to show what *place* in the sexagesimal representation is to be occupied by the 3 (or thirty). The example is instructive as showing how far short the Accadians and Assyrians fell of our modern cipher system. It is clear, however, that they were in possession of a sexagesimal scale as true and as complete as the much later Alexandrians. It was used probably only for purposes of calculation; for in simply representing numbers the Assyrians, if not the earlier Accadians, used another scale, in which a special symbol for the hundred was introduced. In this scale, however, the sexagesimal symbolism for 60, 70, 80, and 90 was retained. In the later cuneiform inscriptions of the Persians all trace of the sexagesimal scale is obliterated.

Scaliger (Ital. *Della Scala*, Fr. *De l'Escale*), JULIUS CÆSAR, according to the account given of him by the famous son Joseph Scaliger, was born in 1484 in the castle of Riva, at the head of the Lago di Garda, in the north of Italy. On the same authority we are told that Julius was the second son of

Benedetto della Scala, a descendant of the princely family of Verona of that name, which had been dispossessed of its territory by the republic of Venice. In all probability this genealogy is a pure fiction, as in Julius' letters of naturalisation as a French citizen he is styled simply 'a native of the town of Verona in Italy.' If we may trust his son's further account of him, Julius was bred to the profession of arms along with other noble youths under the immediate supervision of his kinsman the Emperor Maximilian, whom he subsequently served in his wars in different parts of Europe. The son of a fallen house, he was at one time so hopeless of his future that like other noble youths of Italy in similar circumstances he seriously thought of entering the brotherhood of St Francis. With this object he proceeded to the university of Bologna, where he devoted himself mainly to the study of Duns Scotus. His zeal for a monastic life, however, soon cooled, and 'to the last day of his life he would never willingly interchange a word with any Franciscan.' Returning to his former profession of arms, he took service in the French armies then attempting the conquest of Italy, and distinguished himself alike by his marvellous feats of strength and his adventurous courage. Having gained the command of a troop of light horse, he behaved with such gallantry as to win for him the special notice of King Francis himself. Notwithstanding his restless life Scaliger never neglected his studies, and to other attainments he added a knowledge of medicine and Greek. Such is the account of Julius Scaliger up to this point in his life which is given by his son in the epistle entitled '*De Vetustate et Splendore Gentis Scaligeræ et Jul. Cæs. Scaligeri Vita.*' An account more likely to be true is that Julius was the son of a sign-painter of Verona, by name Benedetto Bordonone, and that he studied at Padua, where he took the degree of doctor of medicine.

It is only from his naturalisation as a French citizen in 1528 that our knowledge of Scaliger is drawn from authentic sources. In that year, on the invitation of the Bishop of Agen, he settled in that town as a physician, and remained there for the rest of his life. Here he married a girl of nineteen, Andiette de Roques Lobejac, by whom he had fifteen children. The best-known circumstance of his later life is his attempt to gain notoriety by an unscrupulous attack on Erasmus, the foremost scholar and man of letters of the age. In ridicule of the Latin stylists of Italy Erasmus had published a satire entitled *Ciceronianus*. Construing this satire as a censure of Cicero himself, Scaliger attacked Erasmus (1531) in an oration which for sheer wantonness of abuse is unparalleled even in that age of unscrupulous controversy. As Erasmus paid no heed to this attack, Scaliger produced a second oration which in brutal scurrility surpassed even his former effort, but before its publication Erasmus was dead. Into all his work, much of which was of undoubted value, Scaliger carried the same coarse and jealous temper. Yet his son Joseph, while frankly admitting his father's faults, which, indeed, were largely his own, claimed for him an essential nobility of character, and an especial hatred of everything that suggested falsehood or hypocrisy. Engaged to the last in his labours as a scholar, Julius died in 1558, under suspicion of decided leanings towards the religious teaching of Calvin.

As a scholar Scaliger's fame has been overshadowed by that of his greater son. His vast attainments, however, and his natural force of mind have been admitted by every generation of scholars. But what Lessing said regarding one of his works (*Poetices libri septem ad Sylvium Aflivum*) is the accepted opinion regarding them all:

'Scaliger's judgments as often show want of sanity and taste as insight and good sense.'

For the life of Julius Scaliger, see the epistle of his son above referred to; Charles Nisard, *Les Gladiateurs de la République des Lettres* (1860); Bourouasse de Laflotte, *Étude sur Jules César de Lescaze* (Agen, 1860); Magen, *Documents sur Julius Cæsar Scaliger et sa famille* (Agen, 1873). Exclusive of his Latin poems, Scaliger's chief works are *De Causis Lingvæ Latinæ libri tredecim*; *Exotericarum Exercitationum liber quintus decimus de Subtilitate ad Hieronymum Cardanum*; *Poetices libri septem ad Sylvium*; *Commentarii in sex libros de causis Plantarum Theophrasti*; *Animadversiones in Theophrasti Historias plantarum*; *Aristotelis Historia de Animalibus*, J. C. Scaligero interprete, cum ejusdem Commentariis; *Commentarii in Hippocratis Librum de Insomniis*.

Scaliger, JOSEPH JUSTUS, the tenth child and third son of the foregoing, was born at Agen, in the district of France then known as Guyenne, in 1540. At the age of eleven he was sent to the Collège de Guyenne at Bordeaux, then, according to Montaigne (himself one of its scholars), the best institution of its kind in France. Owing to the outbreak of one of the many plagues which then devastated that part of the country, in 1555 he returned home, where he remained till his father's death some three years later. Julius Scaliger was too old to give his son methodical instruction; but indirectly the boy profited by his father's attainments. In accordance with the practice of almost all the scholars of the 16th century, the elder Scaliger was an indefatigable writer of Latin verse. Almost daily he was in the habit of dictating from 80 to 200 lines of his own composing, which it was the business of his son to copy. Daily also the boy had to present to his father a Latin theme on any subject which he himself might choose. Thus, without the regular training of other boys, Joseph early acquired that mastery of the mechanism of Latin prose and verse in which he surpassed all the scholars of his time.

Shortly after his father's death Scaliger proceeded to the university of Paris with the special purpose of acquiring the Greek language, with which he had as yet no acquaintance. The teacher whom he sought was Adrian Turnebus, since the death of Budæus the first Greek scholar in Europe. After two months' attendance in the class of Turnebus, Scaliger discovered, to his mortification, that he was too ignorant to profit by it. With the invincible resolution which was the basis of his character, he shut himself up in his own room and set himself to master the elements of the language. His method of procedure and its extraordinary result have a place among the anecdotes of scholarship. With the help of a Latin translation he read through Homer in twenty-one days, making a grammar for himself as he went along. From Homer he proceeded to the other Greek poets, and in four months he had gone through the whole series. Encouraged by his success with Greek, he next attacked Hebrew, but of Hebrew, according to his best biographer, Bernays, he never acquired that mastery which he showed in the case of Latin and Greek. Eventually he boasted that he spoke thirteen languages, ancient and modern. It is to be noted, however, that he acquired these languages, not in the vain spirit of a mere polyglot, but with the aim of a scientific scholar, who realised that the language and literature of one people are indispensable to the thorough understanding of another. Scaliger remained four years at the university of Paris, but of this period of his life only one notable circumstance is related. It was at this time that he adopted the Protestant faith, a change which eventually proved of the first importance in the subsequent direction of his life.

In 1563 he was invited by Louis Chastaigner de la Roche-Pozay to join him in the capacity of

travelling companion, and with the family of this noble he was more or less closely connected for the next thirty years. In 1665 he accompanied Roche-Pozay to Italy, of whose scholarship and religion he received the most unfavourable impression. Of England, which they next visited, Scaliger formed an equally unfavourable opinion. Scotland was also included in their tour, but of the Scots he speaks more kindly, specially mentioning the beauty of their ballads. In 1670 he settled at Valence in Dauphiné, where for about two years he studied under the great jurist Cujacins. From 1672 to 1674 he was in Geneva in the capacity of professor in the academy established there by Calvin. Returning to France, he found a home in the family of Roche-Pozay for the next twenty years. It was the period of the Huguenot wars, and Scaliger, like the rest of his countrymen, suffered from the confusions of the time. It was during these years, however, that he produced a series of works which placed him at the head of European scholars. Among them may be mentioned his editions of Catullus, Tibullus, and Propertius, his commentaries on which are equally remarkable for their learning and spirit of vainglorious assumption. But the works which definitively established his reputation were his edition of Manilius in 1679 and his *De Emendatione Temporum* in 1683. By these works he founded the science of modern chronology, an achievement unsurpassed in the history of scholarship. This labour he crowned by his edition of Eusebius in 1696.

In 1593, on an invitation from the Netherlands in the highest degree flattering to his vanity, Scaliger went as successor to Justus Lipsius in the university of Leyden, where he remained for the rest of his life. Though his connection with the university was almost nominal, it is to his example and inspiration that Holland owes her long line of scholars during the 17th and 18th centuries. Scaliger's last years were embittered by controversies which he had himself largely provoked by his indifference to the feelings of others. His chief enemies were the Jesuits, who regarded him as the most formidable foe of their order. In Gaspar Scioppius they found a match for Scaliger himself in the use of trenchant Latin, and one, moreover, who carried the qualities of a hired bravo into the domain of letters. The vulnerable point in Scaliger's coarse nature was his pride in his descent from the family of La Scala. In what is perhaps the most unscrupulous lampoon in literature, Scioppius, in his *Scaliger Hypobolimus* ('The Supposititious Scaliger'), held the great scholar up to Europe as a baseborn impostor, a profligate, and an atheist. Scaliger wrote a reply; but it was ineffectual against the poisoned weapons of Scioppius. It is generally accepted that the attack of Scioppius hastened Scaliger's death. He still continued his labours, indeed, but his spirit was broken, and he died in 1609, in the arms of his favourite scholar Heinsius.

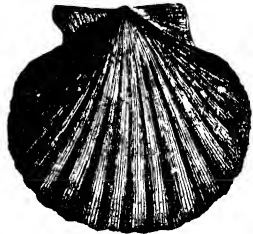

By his combined knowledge, sagacity, and actual achievement, Scaliger holds the first place among the scholars of all times. 'More than any one before or after him,' says Bernays, 'he approached to a complete conception of the life of antiquity.' To the same effect is the statement of Niebuhr, that 'Scaliger stood on the summit of real and universal knowledge, as no one after him has done.' In his personal character Scaliger was vainglorious, overbearing, and exacting to the verge of absurdity. It was his single-minded devotion to learning, his love of truth, his noble independence of spirit that redeemed a nature essentially coarse and unlovable.

See Jacob Bernays, *Joseph Justus Scaliger* (Berlin, 1855); Charles Nisard, *Juste Lipse, Joseph Scaliger, et*

Isaac Casaubon (Paris, 1852); Tanizay de Larroque, *Lettres françaises inédites de Joseph Scaliger* (Agen, 1881); Mark Pattison, *Essays*, edited by Henry Nettleship (vol. i. Oxford, 1889). It was Pattison's intention to write a biography of Scaliger; but the fragments that appear among these essays are all that he actually accomplished of his book. A list of Scaliger's works and their various editions is given by Bernays.

Scallop (*Pecten*), a well-known genus of bivalves, with fan-shaped valves which are closed by a single muscle. The left, which is the upper, is often more or less flat; the right is more markedly arched. Both are ornamented with sinuous radiating ribs, to which the name *Pecten* (Lat., 'a comb') refers; the brilliant colours, mostly red and yellow, are hardly surpassed by any other bivalves. The hinge-line is without teeth, it is drawn out in two lateral ears. The mantle is quite open below, with the margin folded back and bearing hundreds of lightly developed sparkling eyes. The foot is a small finger-like process; in some cases it secretes a little attaching byssus. Many scallops, especially when young, are able to swim by rapidly opening and closing their valves. When they become more sedentary they are often overgrown with acorn-shells, serpulid tubes, and zoophytes. Many of the large forms are called 'clams,' e.g. *P. mazanus*, a British species about 6 inches broad; they are sometimes eaten, but are said to be rather indigestible. The Mediterranean *P. jacobaeus* is the scallop-shell which pilgrims used to wear in front of their hat in token of having visited the shrine of St James at Compostela. Scallops are found in all seas; they are mostly littoral, but some occur in the abysses. The genus dates back to the Palaeozoic, and is represented by numerous extinct and extant species.

Scalp, the term employed to designate the outer covering of the skull or brain-case. Except in the fact that hair in both sexes grows more luxuriantly on the scalp than elsewhere, the skin of the scalp differs so slightly from ordinary skin (q.v.) that it is unnecessary to enter into any details on this point. But besides the skin the scalp is composed of the expanded tendon of the occipito-frontalis muscle, and of intermediate cellular tissue and blood-vessels. Injuries of the scalp, however slight, must be watched with great caution, for they may be followed by erysipelas, or by inflammation and supuration under the occipito-frontal muscle, or within the cranium, or by supuration of the veins of the cranial bones, and general pyæmia that may easily prove fatal. If dressed antiseptically at an early stage the risk of such accidents is of course greatly diminished. In the treatment of a wound of this region surgeons often make a practice of cutting out the bruised and torn edges so that smooth clean surfaces can be brought together and heal by first intention. The retention of discharges in such a wound is dangerous. The patient should be confined to the house (and in severe cases to bed), should be moderately purged, and fed upon non-stimulating but not too low diet. Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the brain is comparatively seldom affected in these cases. Tumours of the scalp are

Pecten opercularis.

not uncommon, the most frequent being the cutaneous cysts popularly known as *Wens* (q.v.), and vascular tumours. See HAIR; and for diseases of the scalp, see BALDNESS, and other references given at HAIR.

SCALPING is the act, characteristic of North American Indian warfare, of partly cutting, partly tearing off a piece of the skin of the head, with the hair attached; whether the victim is alive or dead at the time does not affect the operation. The Indians, with whom scalps are the trophies of victory, have always left a long lock or tuft on the scalp as a challenge. Bounties have, in American history, more than once been offered for scalps: in 1724 £100 was offered by Massachusetts for Indian scalps; in 1754, during the French and Indian war, a bounty was offered by the French for British scalps, and £100 by the Colonies for Indian scalps; in 1755 Massachusetts offered £40 for every scalp of a male Indian over twelve years old, and £20 for scalps of women and children; &c.

Scamander, the ancient name of a river in the Troad (see TROY), which was also called Xanthus (Gr., 'yellow') by the gods. As a divinity Scamander took an important part in the Trojan war through its destructive floods. The river rose in Mount Ida and discharged itself into the Hellespont, after being joined by the Simois about two miles from its mouth: the two rivers, however, since the 1st century A.D. have had separate courses. There has been much controversy as to what modern river corresponds to the ancient Scamander; but recent investigators have decided in favour of the Menderes.

Scammony is a gum-resin of an ashy-grey colour, tough externally, having a resinous, splintering fracture. Few drugs are so uniformly adulterated as scammony, which, when pure, contains from 81 to 83 per cent. of resin (the active purgative ingredient), 6 or 8 of gum, with a little starch, sand, fibre, and water. Ordinary adulterants are chalk, flour, guaiacum, resin, and gum tragacanth. Scammony, when pure, is an excellent

Scammony (*Convolvulus Scammonia*): a, portion of root (Bentley and Trimen).

and trustworthy cathartic of the drastic kind, well adapted for cases of habitual constipation, and as an active purgative for children. The resin of scammony, which is extracted from the crude drug by rectified spirit, possesses the advantage of being always of a nearly uniform strength, and of being almost tasteless. The Scammony Mixture, composed of four grains of resin of scammony, triturated with two ounces of milk, until a uniform emulsion is obtained, forms an admirable purgative for young children in doses of half an ounce or more. According to Christison, 'between 7 and 14 grains of resin, in the form of this emulsion, constitute a safe and effectual purgative' for adults. Another popular form for

the administration of scammony is the *Compound Powder of Scammony*, composed of scammony, jalap, and ginger, the dose for a child being from 2 to 5 grains, and for an adult from 6 to 12 grains. Scammony is often given surreptitiously in the form of bismit to children troubled with thread-worms.

The plant which produces this valuable drug is *Convolvulus Scammonia* (see CONVULVULUS), a native of the Levant. It is a perennial, with a thick fleshy tapering root, 3 to 4 feet long, and 3 to 4 inches in diameter, which sends up several smooth slender twining stems, with arrow-head-shaped leaves on long stalks. The root is full of an acid milky juice, which indeed pervades the whole plant. The scammony plant is not cultivated, but the drug is collected from it where it grows wild. The ordinary mode of collecting scammony is by laying bare the upper part of the root, making incisions, and placing shells or small vessels to receive the juice as it flows, which soon dries and hardens in the air. Most scammony comes now from *Ipomoea oribazensis*.

Scandalum magnatum, in English law, means slander against the great men of the realm, an offence which consisted in spreading false reports concerning a peer, judge, or other great officer. The statute of 1275 which created this offence was repealed in 1887, and the special forms of action or criminal process formerly in use are superseded by the more general rules of the law relating to Libel (q.v.) and Slander (q.v.). A somewhat similar offence in Scotland is called Leasing-making (q.v.).

Scanderbeg, i.e. Iskander (Alexander) Beg or Bey, the patriot chief of the Albanians, was born in Albania about 1403, but his parents were both of Serbian descent. By the Christians he was commonly called George Castriot, though the Serbian family name was Branilo. Young George was carried away by the Turks when only seven years of age, and was brought up in the creed of Islam. His personal prowess and skill as a military leader made him a favourite with Sultan Murad (Amurath) II., who gave him the command of a division in the Ottoman armies. But when about forty years of age he took a momentous step, which he had some time been meditating: after the Turks were repulsed by the Hungarian forces at Nissa (Nish) in 1443, Scanderbeg deserted with three hundred Albanian followers, having first extorted from the sultan's secretary an order to the governor of the mountain fortress of Croya (Ak-hissar) that he was to hand over that stronghold to him (Scanderbeg). From that time the Albanian chief, who now renounced Islam for Christianity, the creed of his fathers and his countrymen, was an unrelenting foe to the Turks; they never beat him but once, and his name grew to be a terror to their soldiery. In less than a month after the capture of Croya the whole of Albania was up in arms, and the Turkish garrisons had been seized or compelled to retire out of the country. Early in the following year the Albanian chiefs unanimously elected Scanderbeg their leader. He collected an army of 15,000 men, and with them nearly annihilated in the defiles a Turkish force of 40,000; and other columns shared the same fate in the succeeding campaign. The years 1446-48 were chiefly occupied with a fierce war against Venice. At length Amurath II. himself took the field (1449) with 150,000 men; but the little hill-fort of Stetigrad successfully defied him until he had lost 30,000 soldiers, and then it was only taken through treachery. And being after that effectually foiled before the walls of Croya, the sultan withdrew in disgust. These splendid achievements brought to Scanderbeg congratulations, as well as

material assistance in stores and volunteers, from the potentates of Italy and Hungary; but none of them sent the brave leader an army, or took up the war with him. The proud Albanian chiefs too began to fall away, mainly because of Scanderbeg's manifest purpose of aggrandising his own family and enlarging its power; some of them even went over to the enemy and led Turkish armies against him. But he nevertheless continued to crush every force that the Turks poured into the mountain fastnesses of Albania, or stationed near its frontiers. At length in 1461 a truce of ten years was concluded between the combatants. Two years later, however, at the instigation of Pope Pius II., who tried in vain to league the Christian princes together against the all-conquering Ottomans, Scanderbeg renewed the war, and again defeated every force that dared to attack him. Even Mohammed II., conqueror of Constantinople, conducted two campaigns in person against the invincible chief, and retired baffled both times, on the first after losing 35,000 men before Croya. Scanderbeg died at Alessio on 17th January 1468, of malarial fever, doubtless also worn out by a quarter of a century's fierce and incessant fighting. He was personally a man of tall stature and commanding appearance, terrible in battle, inflexible in resolution, of wonderful activity, and full of resource, a man whom victory did not demoralise, nor desertion dishearten; nor was natural kindness wholly destroyed by the savage nature of the strife he was engaged in. There can be no doubt that for a time he broke the force of Moslem irruption, and had he been adequately supported would have inflicted some permanent injury upon the Turkish power. After his death the Albanian opposition speedily collapsed—an incontestable proof of Scanderbeg's genius. See C. Paganal, *Histoire du Scanderbeg* (1855), and the *Edinburgh Review* (October 1881).

Scanderoon, ALEXANDRETTA, or ISKANDERUN ('Alexander's town'), a port of north-western Syria, stands on the east shore of the Gulf of Scanderoon, in the extreme north-east of the Levant, 30 miles N. of Antioch, and 77 NW. of Aleppo, for which it is the port. With Aleppo it communicates by the Beilan pass (the marshes behind the mountains having been partly drained), and indirectly by a railway which joins the Bagdad line in Turkish territory. It is a poor but reviving place, of some 15,000 inhabitants, with a large but neglected harbour, for which, however, something has been done and much is contemplated. It imports goods destined for Aleppo and the towns of northern Syria, and exports cattle, liquorice root, silk cocoons, pistachios, morocco leather, and hides. It is expected that port improvements will divert much trade from Beirut and Tripoli. Alexandretta was founded by Alexander the Great to commemorate his victory of Issus (333 B.C.). Off here Sir Kenelm Digby defeated a Franco-Venetian squadron (1628); and close by the Egyptian Mehemet Ali defeated the Turkish troops in 1832.

Scandinavia, a large peninsula in the north of Europe, bounded on the N. by the Arctic Ocean, on the W. by that branch of the Atlantic now called the Norwegian Sea, and on the S. and E. by the Baltic Sea and the Gulf of Bothnia. The character of the country, its physical features, industries, &c., are given under NORWAY and SWEDEN. In a historical sense Scandinavia includes Denmark and Iceland, and in a literary sense besides these the intellectual productions of the Swedish people in Finland. For the languages and literatures of Scandinavia, see ICELAND, NORWAY, SWEDEN, DENMARK, and EDDA; and for the history in general, Nisbet Bain's *Scandinavia* (1906).

Scandinavian Mythology is largely the groundwork of Teutonic mythology, and is built up of many elements. Throughout the Scandinavian countries are found monumental stones on which runic inscriptions have been written in heathen times. Of these 'runic monuments' no less than four folio volumes were got together by George Stephens, a work of great importance to the student of mythology. From heathen Germany we have a few ancient laws, and a few glossaries containing mythological words. The *Lex Sælica*, of which we have a Latin translation, was doubtless originally produced in the German tongue. Then there are formulæ by which the new converts to Christianity renounced the old gods, and in which names of heathen divinities therefore occur. But precious though it be, the amount of mythological information to be gathered from these and similar sources is very small. A richer vein of information is the tolerably well-represented collection of German heroic poems, among which the most important are the Nibelung story and Gudrun. The Heland preserves a number of heathen phrases and figures of speech. Old English literature holds but scanty traces of the old religion. Iceland is the Mecca to which all must turn who would understand the Odinic religion; Iceland is the Patmos where Scandinavian mythology was recorded. There we find a large mythological literature put in writing after the introduction of Christianity (1000 A.D.), and after the people had adopted the Roman alphabet, but still written in the spirit of the asafæith, 'naught extenuating and putting down naught in malice.' The most important of the Icelandic documents are the Elder or Poetic Edda and the Younger or Prose Edda. The *Heimskringla*, completed by Snorre Sturlasson about the year 1230, contains much information concerning Scandinavian heathendom, for it gives a very elaborate account of the introduction of Christianity in the north, portraying the conflict between the old and the new religion, and begins with sketches of a number of kings who ruled Norway 140 years before the introduction of Christianity. Hence valuable information may be found in that work not only in regard to the rites and ceremonies prescribed by the Odinic ritual, but also of the morals and habits inculcated and produced by the Odinic code. Several of the Icelandic sagas are also of value in this respect. Caesar and Tacitus furnish some important data, and next after them come the Christian writers down through the foggy and dark middle ages, who wrote in Latin; but the very small amount of mythological information contained in their books is due in part to their ignorance, but mainly to their hostility to the heathen religion. Among this class of writers Denmark presents a remarkable exception in Saxo Grammaticus, who lived in Denmark in the 12th century. He wrote a *Historia Danica*, and embodied in it an outline of Scandinavian mythology based on old songs. But he presents it as history, assuming Odin, Thor, and the other deities to have been kings and potentates in the north. The first eight books of his history are exclusively mythological. Saxo had a world of valuable light, though he himself saw nothing. Finally the student of Scandinavian mythology must look for fragments of Odinism in the customs, habits, speech, traditions, ballads, folklore tales, and in the usages of the Christian churches throughout Teutondom.

It was Time's morning
When Ymer lived;
There was no sand, no sea,
Nor cooling billows;
Earth there was none,
No lofty heaven;
No spot of living green;
Only a deep profound.

Thus the Elder Edda. The beginning was this: Many ages ere the earth was made there existed two worlds. Far to the north was Niflheim—i.e. the nebulous world, and far to the south was Muspelheim—i.e. the fire world. Between them was Ginungagap, the yawning deep. In the middle of Niflheim lay the spring Hvergelmer, and from it flowed twelve ice-cold streams called the Elivogs (Elivagar), of which Gjøl was situated nearest Hel's gate. Muspelheim was so bright and hot that it burned and blazed, and could only be entered by those who had their home there. In the midst of this intense light and burning heat sat Surt, guarding its borders with a flaming sword in his hand. The Elivogs flowed far from their spring-head in Hvergelmer into Ginungagap, and the venom they carried with them hardened as does dross from a furnace, and became ice. Vapours gathered and froze to rime, and thus were formed in the yawning gap many layers of congealed vapour. But the south side of Ginungagap was lighted up by sparks from Muspelheim. Thus, while freezing cold and gathering gloom proceeded from Niflheim, the other side of the gulf was exposed to the dazzling radiance and scorching blasts from Muspelheim, and when the heated blasts met the frozen vapours they melted into drops, and, *by the might of him who sent the heat*, these drops quickened into life and took the form of a giant man. His name was Ymer, and he became the progenitor of all the evil race of giants. At the same time and in the same manner sprang into life a cow, Audhumbla, by whose milk Ymer was nourished. The cow fed herself by licking the salt rime on the rocks, and at the end of the first day she produced by licking the stones a man's hair, on the second evening a head, and on the third evening a perfect man. His name was Bure. He was fair, great, and mighty. He begat a son by name Bor. Bor married the giantess Bestla, and she bore him three sons, Odin, Vile, and Ve (Spirit, Will, and Holiness), and Odin became the father of the gods, who rule heaven and earth. The three brothers, Odin, Vile, and Ve, slew the giant Ymer, and when he fell so much blood flowed that all the race of giants were drowned excepting Bergelmer and his wife, who escaped in a boat and perpetuated their race. The three sons of Bor dragged Ymer's body into Ginungagap, and out of it they made the world: of his flesh the land, of his blood the ocean, of his bones the rocks, of his hair the forests, of his skull the vaulted sky, which they decorated with red hot flakes from Muspelheim to serve as sun, moon, and stars. Ymer's brain they scattered in the air, and made of it the melancholy clouds. Dwarfs quickened like maggots in Ymer's flesh. But there were yet no human beings upon the earth. One day Odin, Hœner, and Loder were walking by the sea, and found two trees, an ash and an elm. They made of them the first man and woman. Odin gave them the breath of life (*and*), Hœner gave them feeling (*ad*), and Loder gave them blood and the form (image) of the gods (*lâ ok lito góða*). The man they called Ask and the woman Embla, and from them are descended the whole human family.

It is worthy of note that the world does not pass from chaos to cosmos. The old Scandinavians took a step farther back into primeval time, and conceived first a *pre-chaotic* state (Muspelheim, Niflheim, and Ginungagap), then a *chaotic* epoch (Ymer, Audhumbla, Bure, Bor, Bestla, Bolthorn, Odin, Vile, and Ve), and finally *cosmos* made from Ymer slain. The gods belonging to the Asgard pantheon and also giants came into being in the chaotic epoch. Odin was born in chaos. But the Scandinavian mythology conceived living and life-giving beings in the pre-

chaotic age also. Surt guarded Muspelheim before any creation or birth had taken place. Surt is also the last figure who appears in Ragnarok, where he flings fire and flame over the world, and he is the last one who appears in that terrible act of the drama. The Edda says that Nidhug, a terrible serpent, dwelt in Hvergelmer in Niflheim. Venom flowed with the Elivogs rivers out of Hvergelmer. This points to an evil being in pre-chaotic Niflheim. This dualism in the pre-chaotic epoch is a very interesting point in Scandinavian mythology. The Odinic pantheon has twelve gods to whom divine worship is due, and there are twenty-six goddesses. The twelve gods are Odin, Thor, Balder, Hermod, Tyr, Brage, Heimdal, Hoder, Vidar, Uller, Vale, and Forsete. The asa-god Hœner disappears from the circle of gods, having been given as a hostage to the Vans. To the number of gods must however be added Njord and Frey, who originally were Vans, and also Loke, who was of giant descent, but had entered into foster-brotherhood with Odin himself, and was adopted by the gods. Chief among the goddesses is Odin's wife Frigg; Thor's wife is Sif, Balder's is Nanna, and Brage's is Idunn. Freyja is the goddess of love. The gods and goddesses dwell in Asgard, but nearly every one has a separate dwelling. Odin's high-seat is in Hlidskjalf, whence he looks out upon all the nine worlds. He also has a large hall, the famous Valhail, whither he invites all men fallen in battle. Thor lives in Thrudvang, Balder in Breidablik. Concerning the different gods, and particularly about Thor, Odin, Balder, and Frey, there are a number of myths giving accounts of their exploits.

The most poetical and significant myth is that of the great world-tree, the ash Ygdrasil. It is the tree of existence, the tree of life and knowledge, the tree of grief and fate, the tree of time and space; it is the tree of the universe. This tree has three roots extending into the three principal worlds. The lowest strikes down into Niflheim into the well Hvergelmer, where it is gnawed by the ancient dragon Nidhug and all his reptile brood. The second root stretches into Jotunheim to the fountain of Mimer, where wisdom and wit lie hidden, and of whose waters Odin once purchased a draught, leaving one of his eyes as a pledge with Mimer. The third root is found in Asgard among the gods, near the sacred fountain of Urd the norm of the past, where the gods sit in judgment, riding thither daily over the Bifrost bridge—i.e. the rainbow. At this fountain dwell the three norms Urd (the Past), Verdande (the Present), and Skuld (the Future), and dispense the destinies of men. They weave the web of men's lives. It is a web of golden thread from east to west, from the radiant dawn to the glowing sunset of man's horizon. The woof of this web is fixed in the far north, but the web woven by Urd and Verdande is torn into pieces every evening by Skuld. The branches of Ygdrasil spread over the whole world and aspire above heaven itself. An eagle is perched on the topmost bough, and between his eyes a hawk. A squirrel called Ratatosk runs up and down the tree seeking to cause strife between the eagle and Nidhug. Four stags leap beneath its branches, and feed on its buds. Two swans swim in the Urd fountain, and everything placed therein becomes as white as the film of an egg-shell. The norms draw water from the spring, and with it they sprinkle Ygdrasil in order that the boughs may continue green in spite of the destructive agencies that constantly assail it. Honey-dew falls from Ygdrasil, and is food for the bees. Odin hung nine nights on this tree and offered himself to himself.

In Scandinavian mythology there is a very elaborate development of the evil principle. The dragon Nidhug and his brood originated in Hvergel-

mer in Nifheim. The giant descendants of Ymer were evil, and they did not all perish in his blood-deluge, for Bergelmer and his household escaped and produced a numerous offspring, with whom Thor and the other gods carried on a constant war. But the great type or representation of evil is Loke. He is the instigator of all the misfortunes that have happened both to gods and to men. He is of giant race, but was adopted by the gods, and was already in the dawn of time a foster-brother of Odin. The countenance of Loke is fair, but his disposition is thoroughly bad. Loke frequently accompanies the gods, and they make use of his strength and cunning, and when out of sight he usually plots with the giants for the purpose of bringing ruin upon the gods. He became the father of three terrible children in Jotunheim—i.e. in the home of the giants. These are (1) the Fenriswolf, (2) the Midgard-serpent, and (3) Hel, the goddess of death. The gods knew that these children of Loke were growing up, and would some day cause them great mischief. Therefore they bound the Fenriswolf on a barren island, and put a sword in his open-stretched mouth; but for this the god Tyr had to sacrifice his right hand. They cast the Midgard-serpent into the deep sea, where he encircles the whole earth and bites his own tail. Thor was at one time out fishing with the giant Hymir. He caught the Midgard-serpent on his hook, and would have slain him with his hammer Mjolner had it not been for the giant Hymir, who got frightened and cut the fishing-line just at the moment when Thor had his hammer raised to strike. The third child of Loke, Hel, goddess of death, was thrown into Nifheim, and Odin commanded that all who died of sickness or old age should go to her, while warriors slain in battle were borne on Valkyrian arms to Valhal. Hel's dwelling is called Helheim, and is large and terrible. Her realm in the lower world is divided into nine abodes, one below the other, and it is in the lowest of these that her palace is, called Anguish, her table Famine, her waiters Slowness and Delay, the threshold Precipice, and the bed Care. The English word *hell* is of course intimately connected with her name.

Loke caused the greatest sorrow to gods and men when by his cunning he brought about the death of the good Balder. Balder was the favourite of all nature, of the gods and of men. He was the son of Odin and Frigg, and the Edda says that he is the best god and that all mankind are loud in his praises. So fair and dazzling is he in form and feature that rays of light seem to issue from him, and we may form some idea of the beauty of his hair when we know that the whitest of all flowers is called Balder's brow. Balder is the mildest, the wisest, and the most eloquent of the gods; yet such is his nature that the judgment he has pronounced can never be altered. He dwells in the heavenly mansion called Breidablik ('broad-shining splendour'), into which nothing unclean can enter. Balder was tormented by terrible dreams indicating that his life was in danger. He told his dreams to his fellow-gods, who resolved to conjure all things animate and inanimate not to harm him, and accordingly Odin's wife Frigg took an oath from all things that they would do Balder no harm. But still Odin felt anxious, and having saddled his eight-footed horse Sleipner, he rode down to Nifheim, where he waked the vala or seeress, and compelled her to give him information as to the fate of Balder. When it had been made known that all things had taken a solemn oath not to hurt Balder it became a favourite pastime of the gods at their meetings to put him up as a mark and shoot at him. But it sorely vexed Loke to see that Balder was not hurt. So he took on the guise of an old woman, went to Frigg, and asked

her if all things had promised to spare Balder. From Frigg he learned that on account of its insignificance she had neglected to exact an oath from the mistletoe. So he straightway went and pulled this up, repaired to the place where the gods were assembled, and induced the blind god Hoder to throw the mistletoe at his brother, and do him honour as did the other gods. Loke himself guided Hoder's hand. The twig did not miss its shining mark, and Balder fell dead. The gods were struck speechless with terror. When they had had time to recover their senses Frigg sent Hermod to the goddess Hel to ask her to permit Balder to return to Asgard. Hel said she would release Balder if it was true that he was so universally beloved, and this she would test by observing if all things would weep for him. Messengers were despatched throughout all the world to beseech all things to weep Balder out from Hel's domain. And all things did so with alacrity, men, animals, the earth, stones, trees, and metals. The messengers were returning confident that their mission had been successful; but on their way home they found a hag crouching on the ground. She called herself Thokk, but she was none other than Loke in disguise. Thokk said she could not weep other than dry tears; and so Hel kept her prey. Soon afterwards Loke was captured and bound with strong cords to the points of rocks in a cave. A serpent was suspended over him in such a manner that the venom fell into Loke's face drop by drop. But Sigyn, Loke's wife, took pity on him. She stands by him, and receives the drops as they fall in a cup, which she empties as often as it is filled. But while she is emptying it venom falls upon Loke's face, which makes him shriek with horror and twist his body about so violently that the whole earth shakes, and thus earthquakes are produced.

But when Balder, the bright and good god, had passed from the happy family circle of the gods to the cold and gloomy abodes of Hel the awful day of doom was impending. It was a fatal thing for the gods and for the world that they united themselves with the giant race. The gods should not have admitted Loke into Asgard. Balder's death was the result, and this hastened the day when the whole world shall be destroyed, when gods and men and giants shall perish in Ragnarok, the twilight of the gods. Increasing corruption and strife in the world are the signs that this great and awful event is impending. Continuous winters rage without any intervening summer now that Balder has been slain; the air is filled with violent storms, snow, and darkness, and these are the signs that Ragnarok is at hand. The sun and moon are swallowed by giants who pursue them in the guise of wolves, and the heavens are stained with blood. The bright stars vanish, the earth trembles in the throes of the earthquake, and the mountains topple down with a tremendous crash. Then all chains and fetters are severed, and the terrible Fenriswolf gets loose. The Midgard-serpent writhes in his giant rage, and seeks land upon the tumultuous waves. The ship Naglfar, which has been built of the nail-parings of dead men, floats upon the waters, carrying the army of frost-giants and mountain-giants over the sea, and having the mighty giant Hrym as its helmsman. Loke too is now freed from his dark cave and strong chains, and comes to the scene as the leader of the hosts of Hel. The Fenriswolf advances and opens his enormous mouth. His lower jaw rests on the earth, and the upper touches the sky. It is only from want of room that he does not open his mouth still wider. Fire flashes from his mouth and nostrils. The Midgard-serpent, placing himself by the side of the Fenriswolf, vomits forth floods of venom

that fill the air and waters. In the midst of this confusion, crashing, and devastation the heavens are rent in twain and the sons of Muspel come riding down the opening in brilliant battle-array. And now Surt, the same being that sent the heated blasts from Muspellheim into Ginungagap in the pre-chaotic world, and by whose might the drops of venom sent by Nidhug in Niflheim quickened into the giant Ymer, he who is for everlasting to everlasting, appears on the scene wrapped in flames of fire. His flaming sword outshines the sun. All the hosts here described come riding over the Bifrost bridge, that is the rainbow, which breaks beneath so great a weight. All this vast and glittering array direct their course to the great battlefield called Vigrid, and thus the evil forces on their part are ready for the final struggle.

Meanwhile Heimdal, on the part of the gods, blows his Gjallarhorn to arouse the gods, who assemble without delay. In his embarrassment Odin now for the *third* time in his life goes to the giants for advice. He rides to Mimer, with whom in his youth he had pawned his eye for knowledge, to consult him as to how he and his warriors are to enter into action. The answer is not recorded, but in the meanwhile the ash Yggdrasil begins to quake and quiver, nor is there anything in heaven or on earth that does not fear and tremble in that awful hour. The gods and all the einherjes (i.e. those fallen in battle and brought to Valhal) don their armour, arm themselves and speedily rally forth to the field of battle, led by Odin, who is easily recognised by his golden helmet, resplendent cuirass, and his flashing spear Gungner. Odin places himself against the Fenriswolf as the foe most worthy of his steel. Thor stands by Odin's side, but can give him no assistance, as he must himself contend with the Midgard-serpent. Frey encounters the mighty Surt himself; but, though terrible blows are exchanged, Frey falls, and the Edda says he owes his defeat to the fact that he did not have that trusty sword which in his passion for a giantess he gave to his servant Skirner, when he sent him to ask for the hand of the charming giantess Gerð. In the last hour the dog Garm, which for ages had been chained in the Gnipa cave, also breaks loose. He is the most terrible monster of all, and he attacks the one-handed Tyr, who had sacrificed his right hand to get the Fenriswolf bound. Garm and Tyr kill each other. Thor gains great renown by dealing the deathblow to the Midgard-serpent with his mighty hammer Mjolner, but he retreats only nine paces before he too falls dead, suffocated by the flood of venom which the expiring serpent vomits forth upon him. The Fenriswolf with his enormous and wide-open mouth swallows Odin; but Vidar, Odin's son, immediately advances to avenge his father. He places his foot upon the wolf's lower jaw, the other he seizes with his hand, and thus tears and rends him till he dies. Vidar is able to do this, for he wears a shoe, for which materials have been gathered in all ages. It is made of scraps of leather cut off from the toes and heels in making patterns for shoes; hence, says the Edda, shoemakers should throw away such pieces if they desire to render assistance to the gods in the final conflict. Loke and Heimdal meet in a duel and become each other's slayers. The conflict is still raging with unabated fury, when the immortal god Surt flings fire and flame over the world. Smoke wreathes up around the ash Yggdrasil; the high flames play against the lurid heavens, and the earth consumed sinks down beneath the watery waste.

After Ragnarok comes a new world. The earth rises a second time from the sea, and is completely clothed in green. Sparkling cascades fall, over-arched by rainbows glistening in the sunbeams.

The eagle soars on lofty pinion in pursuit of his prey. The gods risen from the dead assemble on the Ida plains and talk over the strange events of the past. The fields unsworn yield bountiful harvest, all ills cease, and the gods live in peace. A new sun brighter and more resplendent than the former appears, and there is naught but beauty, plenty, and happiness.

The Scandinavian mythology has two heavens and two hells for humanity, a heaven and hell before Ragnarok, and a heaven and hell after Ragnarok. Before Ragnarok those fallen in battle or by the sword went to Valhal, to become einherjes, who took part with Odin in the first conflict on the plain of Vigrid. Those who died a straw-death (that is, from sickness or old age) went after death to the domain of Hel, and, though the Edda is silent on the subject, they probably fought on the side of Loke. But after Ragnarok there is a heaven called Gimle and a hell called Nastrand. Gimle is a hall more radiant than the sun; it is the uppermost realm, and in it the virtuous shall dwell for ever and enjoy delights without end. Nastrand is a place set apart for the wicked. The word means strand of corpses. It is situated far from the sun, in the lowest region of the universe. It is a large and terrible cave, the doors of which open to the north. This cave is built of serpents wattled together, and the fanged heads of all the serpents turn into the cave, filling it with streams of venom, in which perjurers, murderers, and adulterers have to wade. Bloody hearts hang outside of the hearts of the damned. Their faces are dyed in gore. Strong-venomous serpent fangs fiercely pierce their hearts; and their hands are riveted together with red-hot stones. Their clothes wrapped in flames are not consumed, and remorseless ravens keep tearing their eyes from their heads. From this terrible cave the damned are, to increase their anguish, washed by the venomous floods into Hvergelmer, that fearful well in Niflheim, where their souls and bodies are subjected to even more terrible pains and woes; torn by countless clusters of serpents, and borne from agony to agony on the whizzing plumage of the primeval Nidhug, the dragon of the uttermost darkness. The Scandinavian mythology appears not to teach eternal punishment. There comes a mighty one to the great judgment, and makes Nidhug sink. In her last vision in Völuspá the vala points to a time when all that is evil shall be dissolved and washed away by the eternal streams of goodness. This is the last vision of the vala:

There comes the dark
Dragon flying,
The slinking serpent
From the Nida-mountains
In the deep.
Over the plains he flies:
Dead bodies he drags
In his whizzing plumage.
Now must Nidhug sink.

Sophus Bugge in his elaborate work, *Studier over de nordiske gude, og heltesagns Oprindelse* (German trans. by Professor Bremner, Munich, 1889), attempted to trace the influence of Greek and Roman mythology and of Christianity on Scandinavian mythology. On the other hand, Viktor Rydberg, in his monumental work *Teutonic Mythology* (trans. Anderson, 1889), gives an account of the mythology as it existed before it came in contact with and was modified by the Christian religion. The mythological materials in a more or less changed form were largely augmented by Rydberg, particularly by his subjecting the mythic portions of the *Historia Danica* of Saxo Grammaticus to a most painstaking analysis. He found the key to Saxo's method of turning myths and traditions into history, showed that the Younger

Edda is an unreliable record of the Odinic religion, and increased our stock of mythological materials by analysing the mythic fragments in the old Norse literature outside of the Elder Edda.

See Grimm's *Deutsche Mythologie* (trans. by Stallybrass), Petersen's *Nordisk Mythologie*, Munch's *Norrøne gude*, Snorok's *Deutsche Mythologie*, Mannhardt's *Germanische Mythen*, Rasmus Anderson's *Norse Mythology* (1875), Gummere's *Germanic Origins* (1892), Chadwick's *Cult of Othin* (1899), Chantepie de la Saussaye's *Religion of the Teutons* (trans. 1902), Craigie's *Religion of Ancient Scandinavia* (1906), and Meyer's *Allgermanische Religionsgeschichte* (1910).

Scandium (Sc; at. number 21; at. wt. 44.1), an element foretold by Mendeleëff, discovered by Wilson, and recognised in the chromosphere of the sun by Lockyer.

Scania, the southernmost part of Sweden (q.v.).

Scapa Flow, an expanse of water in Orkney, sheltered by Mainland on the north, Burray and S. Ronaldshay on the east, and Hoy on the west. The two main exits are Hoy Sound on the west and Holm Sound on the east, and the main roadstead is at Longhope in Hoy. During the Great War, Scapa Flow was chosen as the chief naval base for the British Atlantic Fleet, but it was not till the end of 1914 that adequate anti-submarine defences were installed. The ships of the German High Sea Fleet, which surrendered after the Armistice, were interned here, and scuttled by their crews in June 1919. In 1924 salvage operations were begun.

Scapgoat. See AZAZEL.

Scaphoid Bone. See HAND.

Scapula. See SHOULDER.

Scapular (Lat. *scapula*, 'the shoulder'), a portion of the monastic habit, so called from its being worn upon the shoulders. It consists of a long strip of serge or stuff, the centre of which passes over the head, one flap hanging down in front, the other upon the back. The colour differs for different religious orders or congregations. Besides the scapular worn by the members of religious orders strictly so called, there exists also in the Roman Catholic Church a religious association or confraternity, the members of which, while living in the world and mixing in the ordinary life, wear, under the ordinary garb, two little pieces of cloth, connected by strings passing over the shoulders. The chief duties of this confraternity consist in the recitation of certain prayers, and the observance of certain religious or ascetical exercises in devotion to the Blessed Virgin. This pious association was founded in the first half of the 13th century by an English Carmelite friar named Simon Stock, and was said to have originated in a vision; but this story is now discredited even by Catholics, while they hold that the observance itself is an aid to piety.

Scarabæus (*Ateuchus sacer*), one of the dung-beetles (*Coprophaga*), well known for the zeal with which they unite in rolling balls of dung to their holes. The dung serves as food, and a beetle having secured a ball seems to gnaw at it continuously—sometimes for a fortnight—until the supply is exhausted. Sometimes an egg is laid in the ball and the parents unite in rolling this to a place of safety, above the level of the annual inundations. The genus is represented by about sixty species in the countries around the Mediterranean. By the Egyptians the scarabæus was venerated during its life, and often embalmed after death! Entomologists have recognised four distinct species sculptured on the Egyptian monuments, and gems of various kinds of stones were often fashioned in their image. Several mystical ideas were associated with the scarabæus: the number of its 'toes,'

thirty, symbolised the days of the month; the time it deposited the balls containing the eggs was supposed to refer to the lunar month; the movement of the ball referred to the action of the sun on the earth, and personified that luminary. The scarabæus was supposed to be only of the male sex, hence it signified the self-existent, self-begotten, generation or metamorphosis, and the male or paternal principle of nature. In this

Engraved Scarab.

sense it appears on the head of the pygmean deity, Ptah-Socharis Osiris, and in astronomical and sepulchral formulas; and Khepra was a scarab-headed god. The custom of engraving scarab gems passed from Egyptians to Greeks and Etruscans. An engraved scarab of carnelian is figured at GEM.

Scaramouch (Ital. *Scaramuccia*, 'skirmish'), a character in the old Italian comedy, originally derived from Spain, representing a military poltroon and braggadocio. He was dressed in a sort of Hispano-Neapolitan costume, including a black *toque* and mantle, and a mask open on the forehead, cheeks, and chin, and always received an inglorious drubbing at the hands of halcyon.

Scarborough, called the 'Queen of Watering-places,' in the North Riding of Yorkshire, 54 miles N. of Hull, 21 SSE. of Whitby, 43 NE. of York, and 233 N. of London. Situated between moorland and sea and divided into two beautiful bays by the lofty promontory on which the castle ruins stand, the setting of Scarborough is magnificent. On the south side is the Spa. Originally a small retreat for taking the waters, the Spa is now a fashionable centre of attraction in the town. To the south of the Spa are the South Cliff Gardens and Italian Gardens with roseries and terraced walks, and on the north side the Alexandra Gardens and the Peasholm Park. Connecting the north and south bays is the famous Marine Drive extending round the foot of the Castle Hill. There are excellent bathing facilities, and the climate is delightful. Scarborough (O.E. *Skarðeborge*, 'fortified rock') is an old place, for Harold Hardrada ravaged it in 1066, and in 1181 it received a renewal of an earlier charter; and it returned two members to parliament from Edward I.'s time till 1885, when the representation was reduced to one. The castle, now a shattered Norman keep, dates from 1136, but was rebuilt as a royal fortress by Henry II. It was captured by the Earl of Pembroke from Piers Gaveston (1312), by Bruce (1318), by the Earl of Westmorland from the insurgent Lord Stafford (1553), and twice by the parliamentarians (1644-48), besides being unsuccessfully besieged by Aske in the Pilgrimage of Grace (1536). Laid bare in the castle yard is a Roman signalling station (400). The house of King Richard III. on the Sandside remains to show where he stayed whilst in Scarborough. George Fox, Quaker, was martyred in Scarborough castle in 1666. During the Great War, Scarborough was thrice bombarded. Near by the castle is St Mary's, the church originally of a Cistercian priory (1320). Transition Norman and Early English in style, with later additions, it suffered much during the siege of 1644, and was restored in 1848-50. St Martin's (1862) is a good Early English structure, with windows by Morris. Lord Leighton was born here. Resident pop. (1851) 12,915; (1891) 33,776; (1921) 46,179.

Scarf. See STOLE.

Scarlatina, or SCARLET FEVER, is one of the group of diseases called Exanthemata (q.v.). In addition to the characters common to the group,

scarlatina is almost always attended by sore throat, and the rash or eruption, which is of bright scarlet colour, commonly appears as early as the second day after the manifestation of the febrile symptoms, and is followed by very distinct desquamation of the cuticle. The period of incubation (see MEASLES) is very rarely more than a week; sometimes as little as twenty-four hours. Most writers on medicine make three varieties of this disease—viz. *S. simplex*, in which there are the fever and the rash, but only slight throat affection; *S. anginosa*, in which, in addition to the fever and the rash, the throat affection is the most prominent symptom; and *S. maligna*, a name which is applied to certain cases of extreme virulence, in which the system is at once overwhelmed by the force of the disease, or in which the symptoms disclose an extraordinary degree of weakness and want of vital power.

The disease begins with shivering, lassitude, headache, a frequent pulse, a hot dry skin, a flushed face, thirst, loss of appetite, and a furred tongue. Shortly after the appearance of the febrile symptoms the throat begins to feel irritable, and, on examination, is found to be red, and often more or less swollen. This redness becomes diffused over the interior of the mouth and the tongue. The rash on the skin begins in the form of minute red points, which soon become so numerous that the surface appears almost of a uniform red. It first appears on the neck and breast, whence it gradually spreads over the trunk and extremities. The reddened surface is smooth to the touch, and the colour temporarily disappears on pressure of the finger. The eruption, in ordinary cases, is persistent for three or four days, after which it gradually disappears, and is usually gone by the end of the seventh day. The cuticle then begins to scale off in small bran-like scurf, or in flakes of various sizes. Specimens of an almost entire epidermic covering of the hand or foot, forming a natural glove or slipper, are of common occurrence in our pathological museums; but it is comparatively seldom that such perfect moulting takes place. The desquamative process is hardly ever completed till at least five weeks from the commencement of the disease, and may last considerably longer. The fever does not abate on the appearance of the rash, but continues in a more or less decided degree till that has faded; it is often attended by delirium.

Scarlatina anginosa presents in addition to the symptoms above described much more severe affection of the throat, with great pain and swelling. The inflammation is very apt to spread from the throat to the nose and ears: to the latter it is very destructive, life-long deafness often resulting in the case of those who recover from the fever. Sometimes a form of inflammation resembling, if not identical with, diphtheria supervenes; in other cases inflammation and suppuration invade the glands or other tissues in the neck.

Malignant Scarlatina is so fatal a disease that its characteristic symptoms require a brief special notice. The rash comes out late and imperfectly, and sometimes is hardly perceptible; or, having appeared, it may suddenly recede; and sometimes it is intermixed with livid spots. The pulse is feeble, the skin is cold, and there is extreme prostration of strength. In such a case as this death may occur (apparently from blood-poisoning) in a few hours. Other cases rapidly assume a typhus-like character.

Besides the dangers connected with the severity of the fever, and the results of the throat affection, the chief risk arises from inflammation of the kidneys. It is uncertain whether they become affected in all cases; in many there is no evidence that they are. But there are none in which the risk of this complication is absent; and it

frequently supervenes in the mildest forms of the disease, if it has been unrecognised, or if due precautions have not been taken. It is essentially similar to catarrhal nephritis arising from other causes (see KIDNEYS), and may arise at any period till desquamation is completed, but most frequently in the second or third week of the disease. Rheumatic fever not unfrequently follows closely upon scarlet fever. Scarlet fever is rare in infancy and after thirty, most common between two and fifteen. But it is very apt to attack persons suffering from wounds and lying-in women exposed to the infection. It is common in Europe, whence it has been introduced into America and Australasia; but is rare in Asia, except Asia Minor, and Africa, except Algiers. In the tropical parts of these continents it is almost unknown: but in tropical America severe epidemics have often occurred.

Like all the exanthemata, scarlet fever occurs in epidemics; and nothing is more remarkable in the history of the disease than the extreme variations in severity in different outbreaks. Sometimes the mortality is almost nil; sometimes as many as 30 and 40 per cent. of those attacked succumb. It is undoubtedly caused by micro-organisms (see GERM), probably by streptococci, though this has not yet been conclusively demonstrated. It is very contagious; as, however, the contagium is given off chiefly in the discharge from the throat, &c., it is generally possible, if the patient can be isolated as soon as the disease is recognised, to prevent or greatly to limit its extension to others. On the other hand, the contagium retains its vitality with great persistence, and can be conveyed by letters, clothes, &c. Cases are on record where it has lain dormant in clothes for at least a year. Milk is a frequent vehicle for the disease; epidemics can often be traced to a dairy-worker, but it seems probable that milk may sometimes acquire its infectious properties from a form of disease affecting milch cows.

Treatment.—No specific is known which can cut short the disease; the feverish state must be treated on general principles, by rest in bed, diluents, &c.; and in simple cases little more is necessary. Severe local symptoms or complications must be met as they arise; bad sore throat by application of glycerin of carbolic acid, or some other antiseptic with a brush or as a gargle, by chlorate of potash lozenges, by poultices applied externally, &c. A severe case of scarlatina anginosa will test to the utmost the patience and resource of both nurse and doctor; while scarlatina maligna usually defies all their efforts. In ordinary cases it is of the greatest importance to guard against chills. The patient should be confined to bed for at least a fortnight, and to his room till desquamation is completed. This usually occupies about six weeks. The application occasionally of carbolised vaseline, or of olive oil with 10 per cent. of eucalyptus oil, prevents the diffusion of the infectious scales. Tonics, especially quinine and iron, are useful during convalescence. Strict isolation during the progress of the case, and careful disinfection afterwards, are absolutely essential. An anti-scarlatinal serum is sometimes used in severe cases.

In the early stage, before the appearance of the rash, scarlatina may be readily mistaken for several other febrile diseases. Even after the rash has appeared, the close resemblance between this and redness of the skin caused through irritation of the bowels as by an enema, through localised septic conditions as in quincy, &c., often makes it difficult immediately to decide whether the patient should be isolated or whether this is unnecessary. The physician should give a very

guarded opinion as to how any special case may terminate.

The popular delusion that *scarlatina* is a mild and diminutive form of *scarlet fever* should always be corrected, as the error, if uncorrected, may do much harm by leading to a disregard of those precautions which are always necessary in this disease.

Scarlatti, ALESSANDRO, composer and teacher of music, was born at Trapani in Sicily in 1659, and is stated to have studied music under Carissimi at Rome. There too, at the court of Queen Christina of Sweden, he produced in 1680 his first opera; he remained in her service, probably, until 1688. After acting as musical director at the court of Naples from 1694 to 1703, he returned to Rome to take up the duties of musical director to the church of Santa Maria Maggiore; but two years later he went back to Naples. There he conducted, one after the other, the three musical conservatoria, and became the founder of the Neapolitan school of musical composition. He died at Naples on 24th October 1757. A man of untiring energy, Scarlatti worked as composer, teacher, director, and player, and wrote a vast number of works, including nearly 120 operas, 200 masses, 10 oratorios, 500 cantatas, and innumerable motets, madrigals, and similar pieces. But, although he was so prolific, he was not a careless composer; on the contrary, he was a master of counterpoint and a fertile inventor of melodies (see OPERA). See Life by E. J. Dent (1905). The most celebrated amongst his pupils were his son, Durante, and Hasse. This son, DOMENICO (1683-1757), early distinguished himself as a composer of church music, and lived successively in Rome, London, Lisbon, Naples, and Madrid. In the history of music he figures as a clever writer of sonatas for the pianoforte, and as the author of various technical improvements in the writing and playing of pianoforte music.

Scarlett Runner. See BEAN.

Scarlett, OLD. See PETERBOROUGH.

Scarlett, SIR JAMES, BARON ABINGER, an English barrister and judge, was born in Jamaica in 1769, but sent to England to be educated. After graduating at Cambridge, from Trinity College, in 1790, he chose to follow law, and entered at the Inner Temple. His fine personal appearance, backed up by an excellent knowledge of his profession, and by a quiet unassuming manner, soon secured him a large practice, especially as his pleadings began to have an extraordinary weight with the juries. He took silk in 1816, and from that time held the front rank on the northern circuit and in the law-courts at Westminster. In 1818-31 he sat in parliament as member for Peterborough. Canning in 1827 appointed Scarlett Attorney-general, when he was also knighted. He held that office, except for fifteen months, till November 1830. In 1834 Sir James was raised to the bench as Lord Chief Baron of the Court of Exchequer, and took his seat in the House of Lords as Baron Abinger. He died 7th April 1844.—SIR JAMES YORKE SCARLETT, General, G.C.B., second son of the above, was born in 1799, educated at Eton and Cambridge, entered the army, and was colonel of the 5th Dragoon Guards (1840-53). He was sent to the Crimea in command of the heavy cavalry, which he led in their famous charge of 15th Oct. 1854. He afterwards commanded all the cavalry in the Crimea, and (1865-70) the Aldershot camp. He died in December 1871.

Scarpa, ANTONIA, anatomist (1747-1832), studied at Padua, and from 1783 to 1812 was professor at Pavia. He gained distinction by treatises on the anatomy of the nose, ear, and heart.

Scarpanto (anc. *Carpatho*), a long narrow island of the Dodecanese (q.v.), midway between Rhodes and Crete. It is 85 sq. m. in area, bare and mountainous. Pop. 7000.

Scarron, PAUL, the creator of French burlesque, was born at Paris in 1610, son of a councillor of Parliament, of good family and fortune. His mother having died early, his father married again, and not happily for the children. The step-mother's dislike of Paul's epigrams forced him at fifteen to leave the house, but at seventeen he returned to Paris, became an *abbé*, and gave himself up to a life of pleasure. About 1634 he paid a long visit to Italy, and soon after his return began to suffer from that terrible malady which racked him with tortures, and ultimately left him completely paralysed in his limbs. A mythical story used to be told how that he had first caught his disease, hiding in a swamp from the populace of Mans scandalised at an *abbé* appearing tattered and feathered at the carnival; but, as he had been seized with his disease half-a-dozen years before he obtained a prebend in Mans (1643), it is much more likely he owed it to the excessive debaucheries of his youth. After trying one physician after another, and spending about three years of decorous comfort at Mans, he gave up all hope of remedy, and returned to Paris to depend upon letters for a living. From this time he began to pour forth endless complimentary epistles in verse, sonnets, madrigals, songs of drinking and of eating, and satires; in 1644 published *Typhon*, ou *la Gigantomachie*, a long jocose poem in five cantos describing the war of the Giants against the Gods; and next year made a still greater hit with his laughable metrical comedy, *Jodelet*, ou *le Maître Valet*, followed quickly by *Les Trois Dorothes*, ou *Jodelet souffleté* and *Les Boutades du Capitain Matamore et ses Comédies*—the last apparently never represented. The plots of these Scarron owed to the Spanish, and similarly the idea of his *Virgile Travesti* he borrowed from the Italian poet J. B. Lalli's *Enéide Travestita*. The first part of this famous work of Scarron's appeared in 1648; the whole included only eight of Virgil's books, and of these the first and fourth were translated into English, in all their coarseness and vigour, by a kindred spirit, Charles Cotton. In 1648 appeared also the popular comedy, *L'Heritier Ridicule*, which, it is said, the young king Louis XIV. liked so much that he had it performed twice in one day. During the struggle of the Fronde countless satires appeared against Mazarin, and one of the bitterest of these, entitled *La Mazarinade*, was ascribed to Scarron. On the cardinal's return to Paris in triumph the facile poet addressed him in terms of unmeasured flattery—'Jule, antrefois l'objet de l'injuste satire.' But he did not recover his pensions, although the famous Surintendant Fouquet made good the loss to the poor poet. Scarron was a consummate beggar, but he always did it like a humorist and without spleen or meanness. The exceptional sufferings of this 'living epitome of human misery' extenuate his ceaseless applications for relief, and the facility with which he accepted everything, money, books, a carriage, pies, poultry, puppies. His importunities were so jocular that they never estranged him from his friends, and he never lost his own kindness of heart, for we find him troubling his powerful friends for their good offices on behalf of others, as well as sheltering within his house two nuns thrown on the world through the bankruptcy of their convent—with one of these, Céleste Palaiseau, in earlier days he had been in love.

In 1651 appeared the first part of his famous work *Le Roman Comique* (2d part, 1657), intended as a reaction against the euphuistic and interminable

novels of Mlle. de Scudéry and Honoré d'Urfé, then at the height of popular favour. It describes the adventures of a troop of strolling players in the provinces, and, loose and ill-constructed as it is, has the one surpassing excellence of the creative faculty, of bringing before us real men and women. It inspired Gautier's not altogether superior *Capitaine Fracasse*; but more important still, gave the impulse out of which sprang the masterpieces of Le Sage, Defoe, Fielding, and Smollett. The third part, which bears the title of 'Suite d'Offray,' was not the work of Scarron. All three were translated into English by Tom Brown, Savage, and others, and an abridgment by Goldsmith was published posthumously. Other works of Scarron's that deserve mention are the comedies, *Don Japhet d'Arménie* and *La Précaution Inutile*; his *Nouvelles Tragiques*, from one of which (*Les Hypocrites*) Molière took the idea of *Tartuffe*; and the poem, *Relation des Parques et des Poètes sur la Mort de Voiture*, prefaced by a characteristically gay description of his own appearance and condition. Few men have had his sufferings, and fewer still his courage—'I hate no man, and could wish all the world had the same feelings for me; I am as blithe as a bird when I have money—and should he much more so were I in health; I am merry enough in company, and am quite happy when I am alone; I bear all my ills pretty patiently.'

The income he derived from his publisher—his 'Marquisat de Quinet'—his pensions, and the fruits of his dedications and his importunities enabled him to enjoy good living and to receive in the Hôtel d'Impunctiosité the visits of the greatest figures of the day in the world of fashion as well as letters. About 1650 he became filled with a desire to visit the islands of America, and actually journeyed as far as Tours in October—'I take my leave of burlesque verse, of comedies and comical romances,' wrote the brave-hearted cripple, 'to go to a happy climate, where there are no affected coxcombs, no canting rascals, no inquisition, no rheumatism to cripple any one, nor no confounded wars to starve me.' But this craze brought him to the strangest adventure of his life. One day a friend brought to his house a beautiful but penniless young girl of fifteen, Françoise d'Aubigné, who had been brought up at Martinique, and whose character remains one of the enigmas of history. The poet was enchanted with her, and in 1652 married her to save her from a convent. In the marriage contract, with characteristic buffoonery, he recognises her as bringing him a dowry of four louis, two large and very expressive eyes, a fine bosom, a pair of beautiful hands, and plenty of intelligence; while he on his part brought her immortality. 'The names of kings' wives die with them,' said he, 'that of the wife of Scarron will live for ever'—a strange prophecy, strangely to be fulfilled in the history of Madame de Maintenon. For eight years she waited on her poor husband with pious care, managed admirably his dubious finances, and brought an unknown decorum and refinement into his Bohemian household. Even his writings henceforward lose their grossness under that gentle influence; although indeed this can hardly be said of the earliest after the marriage, *Don Japhet*, which is prefaced by a dedication to the king, a masterpiece of begging without humiliation—'Sire, I will endeavour to persuade your Majesty it would not be very wrong to assist me a little, for if you did assist me a little I would be more jovial than I am; and if I were more jovial than I am I would write lively comedies; if I wrote lively comedies your Majesty would be amused by them; and if you were amused the money bestowed on me would not be lost. All this leads to such an inevitable conclusion that I

imagine I should be convinced by it if I were a great king instead of being what I am, a poor wretched creature.' Death came at last to relieve the sufferer in October 1660, but he saw it come with anguish; his greatest sorrow, to leave his poor young wife behind in destitution. For a heart beat warmly in that feeble and distorted frame, and in his dying words we feel a penetrating pathos hardly hidden under an effort of irony: 'If there be a hell I have nothing to fear from it, having endured it in this world.' The eight verses of his own epitaph irresistibly touch the heart. Dead, he could lay aside the mask, and confess all that he had borne in silence—'Passer-by, tread lightly here, take care not to awake him, for it is the first night that poor Scarron sleeps.'

There are editions by Bruzen de la Martinière (10 vols. 1737) and by Jaume (2 vols. 1877); of the *Roman Comique*, by Victor Pourmel (1867) and A. France (1881). See Christian's *Étude* (1841); Morillot, *Scarron et le genre burlesque* (1888); André Le Breton, *Le Roman au Dix-Septième Siècle* (1890); books by Boissial (1894), Chardon (1904), and Magne (1905, 1923); and Jusseland's introduction to an edition of Tom Brown's translation of *The Comical Works of Scarron* (1892).

Scattery Island, an islet in the Shannon's estuary, 3 miles SW. of Kilrush, containing a fort, fragments of several small churches, and an ancient round tower 87 feet high. It was a sacred place in early Christianity—St Sennu's retreat in the 6th century.

Scavenger's Daughter. See TORTURE.

Scawfell. See SCAPELL.

Scepticism (Gr. *skeptomai*, 'I consider') strictly denotes that condition in which the mind is before it has arrived at conclusive opinions—when it is still in the act of reflecting, examining, or pondering subjects of thought. Scepticism is therefore the opposite of dogmatism. The notion of 'disbelief' is quite a secondary meaning of the term. Among the Greeks a *skeptikos*, 'sceptic,' was a thoughtful, inquiring person. But inasmuch as the mass of men rush to conclusions with haste, and assert them with far more positiveness than their knowledge warrants, the discerning few of clearer vision are often brought into collision with popular beliefs—more especially in religion, the sphere in which popular beliefs are most numerous, most positive, and most inconsiderate—and are compelled, by the shock given to their reason, to 'doubt,' it may be to 'disbelieve' what is believed and affirmed by the multitude. Thus it is that in common parlance a sceptic has come to mean an infidel, and scepticism infidelity. But the field of thought in which scepticism properly so called exercised itself is not religion but philosophy. In philosophy too the word acquired a meaning different from doubt, or the negation of dogmatism; there was a distinct tendency on the part of those called sceptics to avoid coming to a conclusion one way or another. Philosophical sceptics in all ages and countries have not so much used doubt, like Descartes, as a philosophical instrument; they seem generally to have denied or at least doubted the trustworthiness of the senses as vehicles of absolute truth, and so have destroyed the very possibility of speculation. Pyrrho (q.v.) was the head of the first great school of professed sceptics; the Second Academy under Arcesilaus, and the Third under Carneades, were less thoroughly sceptical. The teaching of the Sophists (q.v.) was also sceptical in temper and tendency. In modern times David Hume represented advanced scepticism in philosophy (as well as in theology); and Kant's opposing philosophy, or a large part of it, has been made the foundation of

sceptical systems. The doctrine of the Relativity of Knowledge (q.v.) taught by Hamilton and Mansel may easily be pushed to a highly sceptical extreme. Comte's positivism is in the metaphysical sphere even dogmatically sceptical; in Secularism (q.v.) there is a scepticism of indifference towards all theological and religious doctrine; while Agnosticism (q.v.) may fairly be described as combining most of the characteristic features of philosophical and theological scepticism.

See the articles referred to above; the histories of philosophy; Green's *Introduction to Hume's works*; Balfour's *Defence of Philosophic Doubt*; and Rev. J. Owen's three works on the Sceptics (1881-93).

Sceptre (Gr. *skēptron*, 'staff'), originally a staff or walking-stick, then in course of time also a weapon of assault and of defence. At a very early period the privilege of carrying an ornamental sceptre came to be connected with the idea of authority and station. Both in the Old Testament and in Homer the most solemn oaths are sworn by the sceptre, and Homer speaks of the sceptre as an attribute of kings, princes, and leaders of tribes. The sceptre was frequently an ivory tresslehorn pierced with gold or silver studs. The sceptre of the kings of Rome, apparently derived from Etruria, and afterwards borne by consuls, victorious generals, and emperors, was of ivory and surmounted by an eagle. The sceptre, which has varied much in form, has kept its place as a symbol of royal authority through the middle ages and down to the present time. The English Sceptre Royal, surmounted by a cross, is 2 feet 9 inches in length, and is of gold, richly adorned with precious stones. This is placed in the sovereign's hand at coronation. St Edward's staff, carried before the sovereigns at coronation, is of beaten gold, 4 feet 7½ inches long, with a foot or pike of steel, and the orb and cross at the top. There are also in the English regalia a king's sceptre with the dove, a queen's sceptre with the cross, the queen's ivory rod (the sceptre of the consort of James II.), and another found in 1814, presumably that of Mary, consort of William III. See REGALIA.

Schadow, a family of Berlin artists, of whom three must be named. (1) JOHANN GOTTFRIED SCHADOW, a sculptor, was born in Berlin on 20th May 1764, received his best training in Rome (1785 to 1788), and was, on his return home, appointed sculptor to the Prussian court, and in 1805 rector (in 1816 director) of the Academy of Arts. He died at Berlin on 27th January 1850. Among his most important works were the quadriga on the Brandenburg gate in Berlin, statues of Frederick the Great for Stettin, Blücher for Rostock, Luther for Wittenberg, numerous busts of great Germans, and monumental tombs to General Taubentzien and Von Arnim. He wrote some books dealing with his art. See his *Briefe und Aufsätze* (1864).—(2) RUDOLF, son of the preceding, born in Rome on 9th July 1786, died there on 31st January 1822, was trained as a sculptor by his father, and, following the example of his brother (see below), renounced Protestantism for Roman Catholicism. His best works were a Spinning-girl, Achilles and Penthesilea, John the Baptist, and Virgin and Child.—(3) FRIEDRICH WILHELM SCHADOW-GODENHAUS, second son of the first-named above, was a painter, one of the 'Nazarene' school, to which belonged Overbeck (q.v.), Schnorr, and Veit. Born in Berlin on 6th September 1789, he proceeded to Rome in 1810, studied there the works of the old masters, came under the influence of Cornelius, Overbeck, and their associates, went over to Roman Catholicism (1814), and executed two frescoes for Bartholdy's villa at Rome. In 1819 he was called to be professor of Painting at the Berlin Academy of Arts,

and in 1826 was appointed to succeed Cornelius as the head of the Düsseldorf school. He gathered round him enthusiastic pupils; indeed his gifts as a teacher were superior to his talents as a painter, although his 'Mignon,' the 'Wise and Foolish Virgins,' 'Heavenly and Earthly Love,' 'Heaven,' 'Purgatory,' and 'Hell' are admirable in their way. In 1859 he resigned the directorship of the Düsseldorf Academy, and on 19th March 1862 died in that town. He wrote *Über den Einflus des Christenthums auf die bildende Kunst* (Düsseldorf, 1843) and an art romance, *Der Moderne Vasari* (1854). See Hübner, *Schadow und seine Schule* (1869).

Schafarik (*Szafarzík*), PAUL JOSEPH, Slavonic philologist and archaeologist (1795-1861). See CZECHOSLOVAKIA (*Literature*).

Schaff, PHILIP (1819-93), Presbyterian theologian, born at Chur in Switzerland, was *privat dozent* in Berlin, when in 1843 he was called to a chair at the German Reformed seminary at Merseburg, Pomm. In 1869 he became professor in the Union Seminary, New York. A founder of the American branch of the Evangelical Alliance, he was president of the American Old Testament Revision Committee. Among his works are a *History of the Christian Church* (enlarged form 1882-94), *The Creeds of Christendom* (1877), *The Person of Christ* (1865), and a *Bible Dictionary* (1880). He also edited *The Religious Encyclopedia*, based on Herzog (1882-84), &c. See Life (1897) by his son, David Schley Schaff.

Schaffhausen, the most northerly canton of Switzerland, is bounded on all sides but the south by Baden. Area, 114 sq. m.; pop. (1870) 37,721; (1900) 41,514; (1920) 50,428, mostly German-speaking Protestants. The chief river is the Rhine, which forms the southern boundary, and within whose basin the canton is wholly included. The surface is hilly, especially in the north and east; of the many rich valleys that slope southward to the Rhine that of the Klettgau is famous for its fertility and for its wines. Agriculture is the principal branch of industry, while the forests prove an important source of revenue. The great council is the governing body; it embraces one representative for every 500 citizens, chosen for four years. The executive is in the hands of a ministry of five persons chosen by the people for four years. The actions of the government are controlled by the obligatory referendum. The canton is simply the territory belonging to the town, which joined the Swiss confederation in 1501.

SCHAFFHAUSEN, the capital of the above canton, is beautifully situated on the right bank of the Rhine, above the celebrated falls, 31 miles by rail WNW. of Constance. Overlooking the town stands the curious castle of Munot (1564-90), and this edifice, the cathedral (12th century), originally church of the Benedictine Abbey of All Saints, the *Imthurnen* (a concert and lecture hall), a library, a business exchange, and a museum are the chief buildings. The town is remarkable for the antique architecture and picturesque appearance of its houses. In the 13th century Schaffhausen was an imperial city. There is a statue to the Swiss historian Johannes von Müller, a native of the place. Pop. 20,000. The falls of Schaffhausen, about 3 miles below the town, form the grandest waterfall in the whole course of the Rhine (q.v.), and provide cheap turbine power for electric and other factories, which turn out iron and other metals, arms, oil, flour, beer, spirits, soap, candles, wool, cotton, and agricultural machines.

Schäffle, ALBERT ERNEST FRIEDRICH (1831-1903), political economist of the historical or evolutionary school, was born at Nürtingen in

Württemberg, studied theology at Tübingen, and, after spending some time on the editorial staff of a newspaper, became professor of Political Economy at Tübingen in 1861, and in 1868 at Vienna. He had sat in the Württemberg diet, and in 1871 was for a short time Austrian minister of commerce. In that year he returned to Stuttgart, devoting himself to literary labours. His chief works are *Die Nationalökonomie* (1861; 3d ed. with a new title, *Das gesellschaftliche System der menschlichen Wirtschaft*, 1873), *Kapitalismus und Sozialismus* (1870), *Quintessenz des Sozialismus* (1874; Eng. trans. 1889), *Grundsätze der Steuerpolitik* (1880)—and that cited at POLITICAL ECONOMY. See his *Aus meinem Leben* (1905).

Schall, JOHANN ADAM VON, a Jesuit missionary to China, was born at Cologne in 1591, entered the Jesuit order in Rome in 1611, and was sent out partly in consequence of his knowledge of mathematics and astronomy to China in 1622. His fame as a scholar led to his being invited to the imperial court at Peking, where he was entrusted with the reformation of the calendar and the direction of the public mathematical school. The Emperor Shun-che, the founder of the Manchu dynasty (1644), showed him great honour and respect. Through this favour Schall obtained an edict for the building of Catholic churches and for the liberty of Christian preaching throughout the empire; and in the space of fourteen years the Jesuit missionaries are said to have made 100,000 converts. On the death of this emperor, however, a change took place; the edict was revoked, and Schall was thrown into prison and sentenced to death. He was afterwards liberated; but he was again imprisoned, and, at the end of a long incarceration, died August 15, 1669. He had acquired a perfect mastery of the Chinese language, in which he compiled numerous treatises upon scientific and religious subjects. A large MS. collection of his Chinese writings, amounting to 14 volumes in 4to, is preserved in the Vatican library. In Latin he wrote a work *On the History of the Jesuit Missions in China* (Vienna, 1655).

See Maillay's *Histoire Générale de la Chine*, and Huc's *Le Christianisme en Chine*.

Schamyl. See SHAMYL.

Scharnhorst, GERHARD JOHANN DAVID VON, the organiser of the Prussian army, was born on 12th November 1756, at Bordenau, the son of a Hanoverian farmer. At twenty he entered the army of Hanover, and he took part in the campaigns in Flanders of the years 1793-95. In 1801 he transferred his services to Prussia and was appointed director of the training-school for Prussian officers. Five years later he was wounded at Austerlitz and taken prisoner at Lübeck, but released in time to be present at the battle of Eylau. In 1807 he began the great work of his life: he was put at the head of the commission for reorganising the armies of Prussia. He reformed the army, introduced the short-service (Krümper) system, and created a better spirit amongst both officers and men. It was principally by means of this new weapon that the great Napoleon was defeated at Leipzig six years later (1813). But before that event took place Scharnhorst was dead; he was wounded at Grossgörschen on 2d May 1813, whilst acting as chief of the staff of the Silesian army, and died on 28th June at Prague.

See *Lives by Lehmann* (2 vols. Leip. 1886-87) and *Klippel* (3 vols. Leip. 1869-71)—the former rather an account of his public work than a biography—and the *Erinnerungen of Von Boyen* (1891).

Scharwenka, XAVER (1850-1924), pianist and composer, was born at Saunter near Posen,

and was trained at Posen and Berlin. After some concert tours as pianist, he opened his own conservatoire in Berlin in 1881. In 1891 he was invited to New York to direct a new conservatoire named after him, but in 1898 he returned to Berlin. Few of his compositions, except some *Polish Dances*, have survived. In 1922 he published an autobiography.—His brother, L. P. SCHARWENKA (1847-1917), was also a composer and teacher.

Schässburg. See SEGESVÅR.

Schaufal, RICHARD, German poet, was born at Brunn in 1874. He entered the Austrian civil service, and eventually became councillor in the Ministry of Justice at Vienna. He has made two collections of his poems (1909 1918, the second including some war poetry), has published many books on culture and aesthetics (*Ein Buch von Tod und Leben*; *Giorgione oder Dialoge über die Kunst*; *Literatur drei Gespräche*; &c.), as well as a characteristic novel *Leben des Herrn Andreas von Baltheiser* (1907), and has translated much of the French symbolist poetry. Schaufal is one of the most important representatives of symbolism in German literature, and, though he never rises in his writings to the highest flights of genius, yet he never loses his cultured lyrical style.

Schaumburg-Lippe, a land of the German Reich, lying between Westphalia and Hanover. Area, 131 sq. m.; pop. (1925) 48,044. Agriculture is the chief occupation, though some coal is extracted. The people are mostly Lutherans. Capital, Bückeburg (pop. 6000). A member of the Lippe (q.v.) family founded the county of Schaumburg in 1640. The head of this branch of the family assumed the princely title in 1807. A republic from 1918, the state adopted its present constitution in 1922.

Scheele, CARL WILHELM, chemist, was born on 19th December 1742, at Stralsund in Pomerania, then belonging to Sweden, and was apprenticed to a chemist at Gothenburg, and was afterwards chemist's assistant at Malmö, Stockholm, Uppsala, and Köping (at the western end of Lake Mälär), and died at Köping, 19th May 1786. His whole life was devoted, with the absorbing passion of the lover of science and of nature, to chemical experiment and investigation. And, although his apparatus was very primitive and his means limited, he made a great number of discoveries of the utmost importance for the advance of chemistry. He discovered hydrofluoric, tartaric, benzoic, arsenious, molybdic, lactic, citric, malic, oxalic, gallic, and other acids. Chlorine, baryta, oxygen (1777), glycerine (1783), and sulphuretted hydrogen gas were all separated by him independently. He obtained the salts of manganese, and showed how manganese colours glass. The green pigment called Scheele's green, the arsenite of copper, derives its name from the chemist who first described it (see GREEN PIGMENTS), as does also the mineral scheelite or tungsten. He demonstrated in 1777 that the atmosphere consists chiefly of two gases, one, empyreal or fire-air (i.e. oxygen), supporting combustion, the other preventing it. This discovery of oxygen was made independently of Priestley's discovery three years before. In 1783 Scheele described prussic acid, which he proved to be the determining cause of the colouring matter in Prussian blue. He was a worker of wonderful accuracy, perseverance, and genius, and worked both analytically and synthetically. His papers were published in English by T. Beddoes (Lond. 1786), there being corresponding Latin, German, French, &c. editions; and in 1892 Baron Nordenskiöld published a number of his unedited letters and papers.

Scheer, REINHOLD VON, German admiral, was born in 1863 at Obernkirchen, Hesse-Nassau. At

the beginning of the Great War he commanded a battle squadron, and in 1916 was appointed commander-in-chief of the German High Sea Fleet, a command which he held at the battle of Jutland. For a short time in 1918 he was chief of the Admiralty staff, and shortly after the Armistice was placed on the retired list. He published *Germany's High Sea Fleet in the Great War* (Eng. trans. 1920). See **TACTICS, WAR (GREAT)**.

Scheffel, JOSEPH VIKTOR VON, German poet, was born at Karlsruhe on 16th February 1826, and was educated at Heidelberg, Munich, and Berlin, to follow the law. But he always had a dislike to this pursuit, and after five years' work at it he gave it up. His interest was fixed upon the life of early and mediæval Germany, and his inclination towards literature was irresistible. As soon as he had shaken off the trammels of routine work, he hurried away to Italy and began to write. His first book, which he never surpassed, was *Der Trompeter von Salzkungen, ein Sang vom Oberrhein* (1854), a tale in verse of the time of the Thirty Years' War, steeped in the spirit of German romance, as fresh in feeling as a May morning, and lightened with sly, genial humour; not the least charming features of the book are its many songs and the humorous reflections of Hiddigeisel the Tom-eat. Scheffel's second book, a prose story of the 10th century, *Ekkehard* (1855), telling how the young monk of Sankt Gallen fell in love with the Duchess of Swabia whilst teaching her to read Virgil, also enjoys extraordinary popularity. In 1867 Scheffel sent out *Gaudefamus*, a collection of songs and ballads, which are known to all German students, and sung everywhere throughout the Fatherland. Yet, curiously enough, Scheffel himself had no ear for music, and is said never to have been present at a concert in his life. His remaining books include two romances—*Huguleo* (1884), a tale of the 5th century, and *Juniperus* (1868), placed in the end of the 12th century, the era of the crusades and the heyday of chivalry—three collections of poems—*Frau Aventiure, Lieder aus Heinrich von Ofterdingens Zeit* (1863); *Bergpsalmen* (1870), the visions of St Wolfgang, bishop of Ratisbon, seen in the solitude of his hermit's hut on the Salzburg Alps; and *Waldeinsamkeit* (1880), a dozen word-landscapes—and three or four short collections of posthumous *Gedichte* (1887-91). After his return from Italy Scheffel settled down in his native town, and died there on 9th April 1886.

See *Lives* by J. Pröls (1887; 1902), by Ruhemann (1886), and Sallwürk (1920); also the *Erinnerungen* by Zernin (1886) and by Dahn (1892).

Scheffer, ARY (1795-1858), painter, was the son of a German painter settled at Dordrecht in Holland, and was born there, studied under Guérin in Paris, lived mostly in France, and began his artistic career as a painter of genre pictures. Under the influence of the Romanticism of the early 19th century he produced numerous pieces illustrative of Goethe's, Byron's, and Dante's works, and also painted several portraits. Shortly after 1835 he turned to religious subjects. His pictures, characterised rather by an excessive sentimentality, have not stood the test of time. See *Memoir* by Mrs Grote (1860).

Scheidemann, PHILIPP, German politician, was born in 1865 at Kassel, was successively a printer, editor of a Socialist paper, member of the Reichstag (1903), and during the Great War leader of the (majority) Social-Democratic party. He was a member of the last imperial ministry of Prince Max of Baden (October 1918), of the provisional government of Ebert and Haase (November 1918), and from February to July 1919 was chan-

cellor of the first duly constituted Republican ministry. He refused to sign the Treaty of Versailles, and resigned. See his *Reminiscences, Der Zusammenbruch* (1920).

Scheldt (Lat. *Scaldis*, Dut. *Schelde*, Fr. *Escaut*), a river that rises in the French dept. of Aisne, flows north past Cambrai and Valenciennes, and, entering Belgium, passes Tournai, Oudenarde, Ghent, Dendermonde, and Antwerp, having received among other tributaries the Lys, Dender, and Rupel. Arrived opposite the island of South Beveland, it divides into two arms. The left or southern, called the Wester Schelde, flows south of the islands of Beveland and Walcheren, and meets the North Sea at Flushing; the northern or right arm, called the Ooster Schelde, passes to the north of the same two islands. The river is navigable to Cambrai, 211 miles from its mouth and 56 from its source. From the middle of the 17th to the end of the 18th century the Dutch monopolised the navigation of the lower Scheldt and levied tolls upon all foreign vessels sailing on its waters. When Belgium was separated from Holland in 1831 the Dutch reimposed slight dues, but abandoned them in 1863, for an indemnity paid in proportion to tonnage by the various nations that used the river. During the Great War, Holland, in virtue of her sovereignty over the lower Scheldt, closed it to the belligerents, but the divided command of the river was the source of much dissatisfaction to both Belgium and Holland. After negotiations a board of control for common management was established (1920), which stipulated that the Scheldt should be free, in event of war, for all nations up to Antwerp.

Schellenberg, a fortified height commanding Donauwörth (q.v.) on the Danube, and the scene of one of the early engagements in the war of the Spanish succession, in which the English took part, 2d July 1704, Marlborough defeating the Bavarians, with severe loss of life to his own troops.

Schelling, FRIEDRICH WILHELM JOSEPH (afterwards von Schelling), was born at Leonberg in Württemberg, 27th January 1775; studied theology and philosophy at Tübingen; then (1796) science and mathematics at Leipzig; began his career as a teacher of philosophy in the university of Jena in 1798 as successor to Fichte, from which time he was, with Fichte and Hegel, one of the pioneers of post-Kantian speculative thought. In 1803 he married Karoline (1763-1809), the divorced wife of A. W. von Schlegel (q.v.). From 1803 to 1808 he was professor at Würzburg; then until 1820 secretary of the Royal Academy of Arts at Munich; again professor at Erlangen until 1827, when he returned to Munich to the new university there; and was finally called in 1841 by Frederick-William IV. to Berlin amid great expectation of results from his long-promised final, positive philosophy. He died at the baths of Ragaz in Switzerland, 20th August 1854.

Schelling's significance consists not in his being the founder of a philosophical system, but in his having by the force of his genius and prolonged fervid activity lived into and through the speculative questions of his day, condensing them into profound intuitions and thoughts which not only excited others to systematic thinking, but entered into the philosophical development as landmarks of speculation. His manifold productions may be grouped around the leading ideas of three distinct periods, the first of which extends from 1797 to 1800, when Schelling was under the influence chiefly of Fichte, and embraces the so-called 'Philosophy of Nature' and 'Transcendental Philosophy'; the second culminates in the 'Philosophy of Identity,'

and falls between 1801 and 1803, Schelling's lights being then Spinoza and Boehme; the third and least valuable of the three represents the growth of what Schelling called his Positive (in opposition to the previous Critical or Negative) Philosophy, and may be traced as far back as 1809, when *The Inquiry into the Nature of Human Freedom* appeared. Schelling began as an adherent of Fichte's principle of the Ego as the supreme principle of philosophy: the Ego alone cannot be explained by anything outside itself; it posits itself and is conditioned only by itself—i.e. in its form and matter coincide; such are the ideas of his first production, *On the Possibility of any Form of Philosophy* (1795). In the next work, *On the Ego as Principle of Philosophy*, Schelling seems to make the transition to the Absolute Ego as the ground of the opposition between the Ego and Non-Ego, and thus arrives at the pantheism characteristic of the idealism of Fichte and Hegel. In the *Letters on Dogmatism and Criticism* (1796-98) he sets at naught Kant's arguments for the limitation of knowledge to phenomena, in laying claim to a 'secret wonderful faculty which dwells in us all' of beholding the transcendental ground of all reality, which he calls 'Intellectual Intuition'—a conception to be associated with the Reason or faculty of ideas of Spinoza and Kant and Plato, and with the intuition of the mystics. This notable doctrine, though resting on some basis of psychological experience (such, for example, as the 'Consensus Gentium' talked of in theistic proof or the 'Faith' of Jacobi), is apt to be either vague or presumptuous; the former as it hardly admits of exact definition, and the latter as it is apt to look like a claim to a private view of truth which may not be enjoyed by everybody.

In the *Philosophy of Nature* writings, and in *The World-Soul* (1797-99), we find Schelling supplementing the Fichtian doctrine of the Ego or Absolute Ego, by showing that the whole of Nature may be regarded as an embodiment of a process by which Spirit tends to rise to a consciousness of itself—that in fact we may supplement Subjective Idealism by an Objective Idealism in which Nature is seen to be the other pole of Spirit, slumbering or petrified intelligence. We might therefore say: 'I is everything, because everything is I.' Because of this affinity with Spirit that Nature has we may, thought Schelling, construct a 'Philosophy of Nature'—i.e. we can say what Nature is prior to actual empirical research—and we find him trying to explain Nature by a logical manipulation of such opposites as Self and Not-Self, attraction and repulsion, and such principles as polarity, excitability, light, &c. The *System of Transcendental Idealism* (1800), one of the most important of Schelling's works, speaks of the two fundamental and complementary sciences, Transcendental Philosophy and Speculative Physics, which together constitute the whole of knowledge; the one starts with the Subjective and shows how the Objective belongs thereto, while the other shows how the Objective must become Subjective. Schelling about this time edited two journals, the one for *Speculative Physics*, and the other (with Hegel) the *Critical Journal of Philosophy*, which not only contain some important articles of his own, but express at a stage of white heat the movement of thought which can only be said to culminate in the stupendous system of Hegel. It is easy to see in the *Transcendental Idealism* the germs of the 'Philosophy of Identity.' If either Spirit or Nature conduct us to the unity which Philosophy seeks, the metaphysical ground of Being may be viewed as a supra-sensuous Identity that is above all difference: the Absolute as the unity of the Ideal and the Real is higher than

either Spirit in itself or Nature in itself, and Spirit Philosophy and Nature Philosophy merge in Identity Philosophy, the theory of the One which is above dualism and multiplicity. Following Spinoza, Schelling teaches (*Method of Academic Study*, 1803; *Bruno*, 1803, &c.) that it is only the imagination and the reflecting Understanding which cause us to separate things or conceive them separately; Reason beholds all things in their totality or oneness; the Absolute is not only the unity of all contradictions, but the unity of unity and itself unendingness. We here see the roots of the Dialectic or Logic of Hegel, who, however, is careful to avoid, as the grave of thought, a mere formal identity (i.e. to say that the Absolute is that which is one with itself is to say practically nothing about it) and to set forth a unity which is concrete (i.e. a unity in which all variety persists and is not lost). Schelling differs though from Spinoza in keeping the process of development strongly to the fore as indeed the truth of the world ('In the beginning was the Act,' in Goethe's words), a most valuable side of his philosophy, linking it through disciples of his with the tremendous development of the historic method in the 19th century; and again in tending to make Spirit the chief factor in the world process. In the Identity Philosophy Schelling repeats a good deal of the Natural Philosophy, and the weakest part of his system (only possible in the infancy of science) is his partly rational and partly fantastical and merely verbal construction of nature in the so-called *a priori* way.

The fact that Schelling could never describe to himself his Absolute save in the most formal way left his mind open to the influence of mystical speculation; he could never think exactly to himself how the finite arose out of its dark, infinite background, a question with which he occupied himself in the *Investigations into the Essence of Human Freedom*. The promised Positive Philosophy which was to advance beyond merely negative or critical philosophy came to be simply the philosophy of Mythology and Revelation. What Schelling objected to in the philosophy of Hegel was its attempt to extract all out of the Idea or Reason; there must be thought be something like Will, or Tendency, or Process to account for the illogical and finite aspect of some things, a fact which turned his mind to Nature as the forefront to Spirit, and connects his philosophy with the strange system of Schopenhauer, which is a pantheism of the Will, as Hegel's philosophy may be called a pantheism of the Idea, and Schelling's of the Spirit. It was in keeping with the mystical character of Schelling's mind that he should look forward to a Johannine church of the future rising over the ruins of Petrinism and Paulinism.

A full account of Schelling will be found in any of the larger histories of Philosophy, such as those of Erdmann (Eng. trans. by Hough, 3 vols. 1889) and Kuno Fischer. Morrell, in his *History of Modern Philosophy*, is largely influenced throughout by Schelling, and gives, of course, an account of him. See also Watson's *Schelling's Transcendental Idealism* (Grigg's Classics, Chicago, 1883); A. Seth (Pringle-Pattison), *Kant to Hegel*; Frantz, *Schellings Positive Philosophie*; Hartmann, *Studien u. Aufsätze*; D. Marheineke, *Criticism of Schelling's Philosophy of Revelation* (1843); Pfleiderer, *Philosophy of Religion*, vol. ii.; works on Schelling by Noack (1859), H. Bucker (1875); and the biographical *Aus Schellings Leben in Briefen*, ed. by Plitt (3 vols. 1870).

Schemnitz (Slovak *Ban Stiavnica*, Magyar *Schemczbánya*), an old and famous mining town of Czechoslovakia, stands in a narrow mountain gorge, 65 miles N. by W. of Budapest. Together with Dölln it has 13,000 inhabitants, mostly Slovaks. The academy for mining and forestry, embracing collections of minerals and a chemical laboratory,

is the principal building; there are also two castles and a pilgrimage church. A highly-esteemed tobacco-pipe is manufactured here and exported to America. The mines have been worked since Roman times, and produce gold and silver, copper and lead. The families of the miners make lace. Tobacco and violin strings are also made.

Schenectady, a city and county-seat of New York, on the Barge Canal and the south bank of the Mohawk River, 15 miles by rail N.W. of Albany. It is the seat of Union College (1795; since 1873, in virtue of the affiliation to it of law and medical schools at Albany, Union University), has some fine public buildings, and contains important electrical and locomotive works, stove-foundries, factories, &c. Schenectady was settled by the Dutch in 1661. In 1690 the place was burnt, sixty inhabitants massacred, and ninety carried off by French and Indians. Pop. (1900) 31,685; (1920) 92,786.

Schenkel, DANIEL (1813-85), born at Dagerlen in Zurich, was appointed professor of Theology at Heidelberg in 1851. In his youth almost orthodox, he became a champion of ecclesiastical liberalism. Among his works were *Das Wesen des Protestantismus* (1846-51), *Der Universberuf* (1855), *Christliche Dogmatik* (1858-59), and *Charakterbild Jesu* (1864), an attempt to construct the human character of Jesus and entirely eliminate the supernatural.

Scherer, EDMOND-HENRI-ADOLPHE, French critic, was born in Paris in 1815, of Swiss and English extraction. During his two years' residence in England with a dissenting minister, the Rev. Thomas Loader of Monmouth, Scherer acquired a knowledge of the English language, which he turned to excellent account in his subsequent career as a literary critic. After studying literature and law in Paris he went in 1836 to Strassburg, where he qualified himself for the ministry of the Protestant Church. Professor of Exegesis in the Oratory at Geneva (1845), he was closely associated with Vinet in his advocacy of a severance between church and state, expounding his views in *La Réformation au XIX^{ème} Siècle*, a journal of which Scherer himself was editor. Gradually he drifted away from his early faith, and in 1850 he was finally expelled from the church. For the next ten years he still lived in Geneva, mainly occupied in religious controversy. In 1860 he left Geneva for Paris, where he at once found ample scope for his powers in literary and political criticism. Besides being a regular contributor to *Le Temps*, he was also correspondent to the *Daily News*. In 1871 he was elected representative for the department of Oise-et-Marne, and attained considerable distinction as a practical politician. He died in Paris, 16th March 1889.

His distinctive character as a critic lies in his combination of the qualities of the trained thinker and scholar with a keen susceptibility to the most diverse products of creative effort. His defects appear in a certain lack of elasticity and flexibility, partly due to his early training and partly to a naturally rigorous cast of mind, which disposes him to undne severity where he cannot sympathise.

See *Edmond Scherer*, par Octave Gréard (1890), and the Introduction by Saintsbury to Scherer's *Essays on English Literature* (1891). Scherer's chief works are *Mélanges de Critique Religieuse; De l'État actuel de l'Église Réformée en France; Alexandre Vinet et ses Écrits; Études Critiques sur la Littérature Contemporaine* (9 vols.); *Mélanges d'Histoire Religieuse; Melchior Grimm*.

Scherzo (Ital., 'jest,' 'aport'), a movement of a lively and sportive character, forming part of a symphony, sonata, or the like. Beethoven developed it out of the minuet.

Scheveningen, an ancient Dutch fishing-village on the North Sea, about two miles from the Hague, with which it is connected by a beautiful avenue through pine woods. It was first visited as a bathing-resort in 1818, and has now become the most fashionable watering-place in Holland. There are numerous villas, hotels, promenades, &c., with a large Kurhaus. Pop. 27,000. Off Scheveningen the Dutch fleet was defeated, and its admiral Tromp killed by the British under Monk on 8-10th August 1653.

Schiaparelli, GIOVANNI VIRGINIO (1835-1910), born at Savigliano, Piedmont, was head of Brera observatory, studied meteors and double stars, and discovered the canals of Mars.

Schickel, RENÉ, German writer, was born at Obernheim in Alsace in 1886, was educated at the Gymnasium and University of Strassburg, and lived first in Paris, then in Berlin. He has published poems, *Der Ritt ins Leben* (3 vols. 1906), and a later volume of selections, *Mein Herz, mein Land*, and many novels, including *Meine Freundin Lo*, *Das Glück*, and *Assis*, the latter dealing with a journey in India. After the Great War Schickel turned his attention to the drama, and produced *Am Glockenturm*, *Menschliche Gedächtnis und Krieg*, *Genfer Reise*, &c. For his vivacity of writing and depth of intellect, he has been called the greatest Alsatian poet since Gottfried von Strassburg. His novel, *Ein Erbe am Rhein* (1926), the first part of a trilogy, has been placed among 20th-century Germany's highest achievements in imagination. He is an exponent of Expressionism (q.v.).

Schiedam, a town in South Holland, on the Schie, 24 miles W. of Rotterdam, and close to the Maas. It is known the world over as the place where Hollands gin is made, but in diminishing quantity. Large numbers of pigs and cattle are led on the refuse grain in the surrounding country. There is a large shipping trade, some shipbuilding, candle-making, and cooperages. Pop. 43,600.

Schichallion. See PERTSHIRE, and MASKE-LYNE.

Schiller, FERDINAND CANNING SCOTT, philosopher, was born in 1864, was educated at Rugby and Balliol, Oxford, taught philosophy at Cornell University, and since 1897 has been a tutor at Corpus Christi College, Oxford. His chief books are *Riddles of the Sphinx* (rev. ed. 1910), *Humanism* (enlarged ed. 1912), *Studies in Humanism* (2d ed. 1912), *Formal Logic* (1912), and *Problems of Belief* (1924). He has associated himself largely with the pragmatism of William James, besides interesting himself in eugenics and psychology. The article PRAGMATISM deals with Schiller's special contribution to the subject.

Schiller, JOHANN CHRISTOPH FRIEDRICH VON, German poet and dramatist, was the son of an army surgeon, a man of deep religious feeling and strict conscientiousness. His mother was a woman of gentle disposition, true humility and piety, and some poetic feeling. Fritz was born at Marbach on the Neckar on 10th November 1759, and inherited the distinguishing traits of both his parents. He was brought up amid the vine-clad hills of Marbach, beneath the ancestral castle and monastery of the Hohenstaufens at Lorch, and at Ludwigsburg, the Versailles of the Dukes of Württemberg. Besides learning Latin and Greek at the grammar-school of Ludwigsburg, Schiller was carefully educated, especially in religious matters, by his father, whose ambition it was to make him a pastor. But destiny in the person of Duke Carl Eugen decreed otherwise. This Württembergian imitator of the 'Grand Monarch,' who set up to be the father of his people, established in

1773 a school at his castle of the Solitude, near Ludwigsburg, for the purpose of training army officers and servants for the public service. Captain Schiller, who was at that date superintendent of the ducal forests and gardens around the Solitude, was given to understand that the duke wished to enrol his clever son Fritz amongst the first pupils of his new institution. Accordingly the boy turned to law instead of to theology; and at the ducal school (moved to Stuttgart in 1775) was kept under a rigid discipline, partly military, partly monastic. About 1776 Schiller, tired of law, which he never liked, threw it up for medicine, which he liked very little better. It was not long after this that, principally through reading Klopstock's *Messias*, he became conscious of his own poetic powers. From the first he conceived a decided fancy for tragedy; and now, instead of studying medicine, he spent most of his time in reading and writing poetry and tragedies, although both occupations were strictly forbidden by the duke. In philosophy also he took a more than ordinary interest, and this taste remained with him to the end of his days. The duke was very proud of his clever protégé, and on 14th December 1779, in the presence of Goethe and Duke Carl August of Weimar, was delighted to bestow upon him three medals for excellence in his medical studies; for Schiller had at last worked hard to qualify himself for leaving the Carl's School, and so becoming master of himself.

Exactly one year after Goethe's visit Schiller left school, and was appointed surgeon to a Württemberg regiment. One month later (13th January 1782) his play *Die Rauber*, begun in 1777, was put on the stage at Mannheim. People took their seats at noon, five hours before the performance began, and the piece made a tremendous sensation—being full of the revolutionary sentiments with which the air was charged previous to the outbreak of the French Revolution. Young Schiller had breathed the spirit of such 'storm and stress' productions as Goethe's *Götz*, and the ideas of the eccentric C. F. D. Schubart; moreover he had drunk deeply at the wells of Plutarch's hero-worship and Rousseau's overwrought sentimentalism. The play itself, however, in spite of the gravest faults—gross crudities, improbabilities, exaggerated and unreal sentiment, inflated and bombastic diction—literally throbbed with energy and passion, and contained many passages of remarkable tragic force. Schiller himself was present at the performance; but because he quitted Stuttgart a second time without his ducal leave Carl Eugen had the aspiring dramatist arrested, and on his release forbade him both to write plays and to leave Württemberg. This treatment Schiller's pride, as writer and as man, would not brook; so on the night of 22d September he fled from the capital in disguise, and under an assumed name (Dr Ritter). He lay concealed at Mannheim and at Oggersheim, and latterly on Frau von Wolzogen's estate of Bauerbach near Meiningen. In that quiet retreat he finished two more plays, *Die Verschwörung des Fiesco zu Genua* and *Kabale und Liebe*. The structural idea of the former, Schiller's first historical play, printed in 1783, is that of nearly all his historical works, a revolt against some constituted authority that has degenerated into tyranny and become an enemy of freedom. The latter (1783) is a protest, dramatically a more successful work than *Fiesco*, against the tyrannies of social convenience, involving an attack upon the court life of the typical German ruler of the epoch.

On 1st September Schiller was appointed dramatist to the Mannheim theatre, and thought he had reached his port. But at the end of the year the engagement was not renewed; neither intendant,

nor dramatist, nor actors were satisfied one with another. Thus Schiller was again thrown on his own resources; and from the time he left Stuttgart until he settled in Weimar he was always in debt and always struggling with narrow means. One of his plans of self-support was the issue of a sort of theatrical journal, *Die Rheinische Thalia*, begun in November 1784, and written almost entirely by his own hand. In this journal were first printed most of his *Don Carlos*, many of his best poems (e.g. *An die Freude*), and the stories *Verbrecher aus Verlorener Ehre* and *Der Geisterseher*. In 1785 he resolved to depart from Mannheim, and to accept a warm invitation from a circle of admirers in Leipzig, which included, he found, Göschen the publisher (grandfather of the English statesman) and Körner, father of the poet.

Schiller had not been without his love affairs: he had known the pangs of jealousy in connection with Frau von Wolzogen's daughter, he had paid suit to Margareta Schwann, the publisher's daughter in Mannheim, and he had been half fascinated by Charlotte von Kalb, perhaps the most remarkable woman of her generation in Germany. At Dresden, where Körner was living, Schiller found the rest he so much needed, rest from emotional excitement and rest from pecuniary worries. And this rest, which he owed in great part to Körner's generosity, he turned to good account. He finished *Don Carlos* (1787), which may be called his first mature play, in that the enthusiasm is more chastened, the language more sober and disciplined, the plot better elaborated, and the knowledge much riper. Nevertheless it suffers artistically from its excessive length, from its inherent lack of unity, and more especially from the shifting of the interest from Carlos to the Marquis Posa. The play was written in blank verse, as being more appropriate to the dignity of the subject; and besides embodying Schiller's ideas of a perfect political society, it presents a most noble type of the true friend of man in Posa. From the day he first saw Körner he shared with him nearly all his thoughts, and continued to do so after he left Dresden and became intimate with Wilhelm von Humboldt and Goethe. Amongst the finest fruits of his discussions with Körner and his circle are the poems *An die Freude* and *Die Kunstler*. Under the stimulus of the same society he went back to his old love philosophy, and at the same time began to study history in a serious and systematic way. After two years in Dresden something of the old restlessness took possession of him again, caused in part by another unhappy love affair (with Henriette von Arnim), and he thought to allay it by a visit to Weimar and elsewhere. But of Weimar and its court circles the truth-loving poet soon grew tired—Goethe and Duke Carl August were both absent at the time. Nevertheless he stayed on awhile, finding society in Charlotte von Kalb, in Herder, and certain of the professors at Jena near by. One of these, Reinhold (Wieland's son-in-law), brought Kant to his notice; and Schiller steeped himself in the thoughts of the Königsberg recluse with his usual ardour, though he greatly modified Kant's system ere he adapted it for his own use. About the same time he met his future wife, Charlotte von Lengefeld; and, getting some hints of a possible chair at Jena, he resolutely bent his mind to the writing of a work of more practical value, and began his history of the revolt of the Netherlands. In the end of 1788 he was appointed to a professorship at Jena, and, being further granted a small pension by the Duke of Saxe-Weimar, he married Lotte von Lengefeld. In order to meet the responsibilities entailed by these changes Schiller worked terribly hard, so hard in fact that he eventually broke down his health.

Besides lecturing, he wrote a number of minor papers and the greater work, the history of the Thirty Years' War. These productions are not of course the outcome of a prolonged or exhaustive course of special studies; but they rank high amongst German historical writings by virtue of their great merits of style, the warm human interest the writer has breathed into them, and the broad philosophic ideas that form their life and substance.

Towards the end of the year 1792 Schiller was agreeably surprised by the offer, brought about chiefly by his admirer, the Danish poet Baggesen, of a free gift of 3000 gulden from the Duke of Augustenborg and his friend Count Schimmelmann. The first use the now invalid poet made of his freedom was to finish the Thirty Years' War, and his next to pay a visit to his old father and mother, whom he had not seen for eleven years. In the year of this visit (1793) he began the *Briefe über die ästhetische Erziehung des Menschen*, letters of noble and weighty import concerning the function of art as the supreme educative agent. At this period, in the irony of circumstances, it came into the heads of the French revolutionists to nominate Schiller (M. Gille) an honorary member of the republic, a distinction which, although himself a man of democratic sentiments, he spurned with horror on learning of the execution of the king. The diploma of citizenship took five years to reach him (1798).

The year 1794 is in some respect the most important in the whole course of Schiller's life: he made the acquaintance of Fichte, he formed an intimacy with Wilhelm von Humboldt, and began his wonderful friendship with Goethe. He was introduced to the great poet at his future mother-in-law's house in the summer of 1788; but for a while they were both distant and reserved, and it was only in the course of a chance conversation at Jena in the summer of 1794 that they discovered common ground of sympathy. The ice once broken, however, they soon drew together; the dreamer and idealist and the man of universal human interests had both worked their way from entirely opposite starting-points to pretty nearly the same conclusions. Both regarded art as the crowning-stone of human culture, as in fact the best practical religion, and both thought and wrote in the spirit of that conviction. The year 1794 is marked in Schiller's career by two other events: he composed the essay *Über Naïve und Sentimentale Dichtung*, in which the respective characters of ancient (classic) and modern poetry were for the first time clearly defined and discriminated; and he started the magazine *Die Horen*, which died after a precarious existence of three years. But it gave birth to the much more celebrated *Xenien* (1797), a collection of satirical epigrams, written by Schiller and Goethe conjointly, and aimed at all who, in their estimation, did not pay fit and proper reverence to Art, and its object Beauty. Schiller's intercourse with Goethe had reawakened his poetic instincts, and he once more began to write poems, at first pieces of a reflective and lyric character, principally for his annual *Der Muses Almanach* (another bread-winning project), such as *Die Macht des Gesanges*, *Die Ideale*, *Wurde der Frauen*, *Der Spaziergang*, and so forth, and later, mostly in his garden-house at Jena during the years 1797 and 1798, the matchless ballads (*Kranke des Ibykus*, *Der Handschuh*, *Der Teucher*, *Ritter Toggenburg*, &c.) that in the estimation of many constitute his principal contribution to literature, and that certainly make him the favourite beyond all other poets of the German people. And, under the same stimulus, he went back to the drama, and spent many a long night on the finishing of *Wallen-*

stein (1798-99), in spite of the fact that every hour's writing cost him several hours' suffering. This play (embracing the trilogy *Wallenstein's Lager*, *Die Piccolomini*, and *Wallenstein's Tod*), which Carlyle declares to have been 'the greatest dramatic work of which the 18th century can boast,' is in every way a remarkable advance on *Don Carlos*. It is built on a wider and truer estimate of human nature, displays a juster conception of the limits and possibilities of dramatic composition, and attains a happier, loftier harmony of the poetic and dramatic ideals; and, especially on account of the magnitude and masterly arrangement of the action, the character of Wallenstein, and the pathetic love-story of Max Piccolomini and Thekla, ranks as one of the greatest, if not the very greatest, of all plays in German literature.

In 1799 Schiller settled in Weimar—he had never lectured since 1793—in order to be nearer the theatre and close to Goethe, whom he zealously supported in his efforts to elevate the German stage into an influential engine of culture. In quick succession he finished *Maria Stuart* (1800), *Die Jungfrau von Orléans* (1801), *Die Braut von Messina* (1803), and *Wilhelm Tell* (1804). The first named, whilst not exactly answering the expectations of the English reader, is nevertheless an admirable drama. Mary, the heroine, is represented as an erring, but repentant and lovable woman, whose character shines out all the more beautiful from contrast with her cold and selfish cousin, Elizabeth; and the play contains several fine passages, descriptive and dramatic. *Die Jungfrau* is artistically one of Schiller's most successful performances; Joan of Arc, the principal character, is drawn as a lovely and innocent maiden inspired with the spirit of the prophetic—a deeply religious and ideally beautiful conception well carried out. *Die Braut von Messina* was confessedly an experiment, and, it is universally admitted, an unsuccessful experiment, at combining the ancient and the modern ideals of dramatic excellence, more especially by the introduction of the chloans as the principal supporter of the action. *Tell*, however, is a noble piece of work, in spite of some technical defects (principally the lack of a central character and of a progressive concentration of the dramatic interest). All the *dramatis persone* are thoroughly human and are cleverly put before us, and there are many fine descriptions of Swiss landscapes; but the finest thing of all is the unquenchable spirit of freedom that pulses in every line. This was the last drama Schiller lived to finish, though he left others in various stages of completion, *Warbeck* and *Demetrius* being the most advanced. His health, long enfeebled, finally and suddenly broke down; he died on the 9th May 1805, still a comparatively young man, in the prime of his intellectual activity.

Schiller's life was one long struggle against pecuniary difficulties, greatly aggravated at times by the most ungenial surroundings, and latterly by ill-health. Yet through all he remained true to himself and to his high calling. He pressed ever strenuously forward along the path of knowledge and self-culture, and his literary career is an advance from crude elemental strength to finished and matured art. Personally, in spite of the drawbacks and hindrances of his outward situation, his character and conduct were of the noblest: he made it his constant end, deliberately chosen, to try and carry out in his own daily life the loftiest ideals he believed in, and strove to 'live like a man whom the world would be sorry to lose.' The key to his speculative ideas, especially with respect to art, is contained in the high and reverential regard he paid to moral beauty. That is the chief cornerstone of his æsthetic creed and of his principles

of action. He had an enthusiastic admiration for what is noble and grand and magnificent, and this passion enters into the structure and substance of nearly all his writings. Two other great qualities ring through his works, an incorruptible love of truth and a lofty spirit of freedom. His poetic strength lay in a peculiar blending of moral and intellectual force. As a lyric poet he can hardly be accounted as of the first rank; he lacked not only the spontaneity but also the immediate insight and sympathy with the actual world, and the living men and women in it, that in so eminent a degree distinguished his greater friend and contemporary Goethe. As a dramatist, however, he undoubtedly stands first of the Germans, and must justly take a high rank amongst the dramatic writers of the world.

Standard complete editions are those of Goedeke (17 vols. 1867-76), Kurz (9 vols. 1868-69), and Boxberger (8 vols. 1882). The older biographies, the best of which was that of Pallaske (1859), have been superseded by the works of R. Wetzsch (1885 *et seq.*), Otto Brahm (1888 *et seq.*), Jakob Minor (1890 *et seq.*), and K. Berger (1905 *et seq.*). See the Life by O. Harraack (1905), books on Schiller's philosophy by Überweg (1884) and Fischer (1891), on his aesthetics by Montargis (1890), and on his poetry by Basch (1902), the last two being in French. See also Hecker and Petersen, *Schiller's Persönlichkeit* (1904-09), and Walter von Molo's *Schiller Roman* (1913-15) forming a trilogy, more a biography vivified by imagination than a novel. Schiller's *Briefe* (1846) and his Correspondence with Goethe, Körner, W. von Humboldt, Schlegel, Fichte, his wife and her sister contain abundance of biographical matter. In English there are Lives by Carlyle (1825), Bulwer-Lytton (1844), Nevins (1889), and Lee (1905), and various translations, including versions of poems by Bulwer-Lytton and Arnold-Foster, and Coleridge's *Prophets and Walden's Death*. See also Robertson, *Schiller after a Hundred Years* (1905); and Rea, *Schiller's Plays in England* (1906).

Schilling, JOHANNES, German sculptor, was born at Mittweida in Saxony, on 23d June 1828, and was trained in Dresden and Berlin. In 1853 he went to Italy, having won a three years' travelling scholarship. In 1868-1906 he was a professor of the Academy of Fine Art in Dresden, where he had been settled since his return from Italy. His first great work was the four groups of the Seasons for Dresden; for that city he also executed monuments of Rietschel the sculptor and King John of Saxony, and the colossal Dionysus and Ariadne in bronze for the Royal theatre. His masterpiece is the national monument of Germania on the Niederwald (q.v.), commemorative of the war of 1870-71. Besides numbers of frescoes and similar ornamental works, he also turned out monuments of Schiller (for Vienna) and the Emperor Maximilian (for Trieste), and a war memorial for Hamburg. He died, blind, in 1910.

Schimmelpenninck, MARY ANN, was born in Staffordshire, 25th November 1788, the daughter of a Quaker manufacturer named Galton. After her marriage in 1805 to Mr Lambert Schimmelpenninck, she lived at or near Bristol; in 1816 joined the Moravian body; and, having suffered from paralysis since 1837, died at Clifton in August 1856. Her nine works, published between 1813 and 1860, include two on Port Royal, a *Theory of Beauty*, *Sacred Musings*, and an *Autobiography*.

Schinkel, KARL FRIEDRICH, a German architect, was born at Neuruppin in Brandenburg, March 13, 1781, and studied the principles of drawing and design at Berlin. In May 1811 he was elected a member of, and in 1820 a professor at, the Berlin Royal Academy. He died October 9, 1841. The designs to which he chiefly owes his reputation are those of the Museum, the Royal Guard-house, the Memorial of the War of Liberation, the New

Theatre, the New Potsdam Gate, the Observatory, the Artillery and Engineers' School, all in Berlin, the Casino in Potsdam, another at Glienicke near Potsdam, and a great number of castles, country-houses, churches, and public buildings. His designs are classic in feeling, noble, harmonious, and dignified. He also excelled as a painter, and as a designer of monuments and of furniture. His designs and sketches were published in *Sammlung architektonischer Entwürfe* (174 plates, 1873), *Grundlage der höheren Baukunst* (25 plates, 1873), *Grundlage der praktischen Baukunst* (2 vols. 1835), and *Sammlung von Mobelentwürfen* (16 plates, 1852). See Life by Kugler (1842), by Quast (1866), and by Dohme (1882).

Schinus, a genus of trees and shrubs of the family Anacardiaceæ, natives of South America. The leaves so abound in a resinous or turpentine like fluid that upon the least swelling of the other portions of the leaf by moisture it is discharged from the sacs which contain it. Thus they fill the air with fragrance after rain, or if thrown into water start and jump about as if alive, discharging jets of this peculiar fluid. A sort of honey and also a kind of vinegar is made by the Peruvians of the red berries of *Schinus Molle* (Peruvian mastic; also called False Pepper-tree, though not akin to the peppers), and they also make a vinous drink from it by boiling. A resinous gum exudes from the stem which is of the nature of mastic. The fresh bark of *S. terebinthifolius* is employed by the Brazilians to coat newly-made ropes with, to which it gives a very durable dark-brown covering. It is said to be dangerous to sleep under its shade, causing painful swellings.

Schipka. See SHIPKA.

Schipperke (Flemish, 'little skipper'), the name of a breed of dogs belonging to the same group as the Eskimo and Pomeranian dogs, but with almost no tail. They are favorites of the Belgian barges, and from them have derived their name.

Schism, ecclesiastical division in a church or separation from a church; as also the tendency to promote such division. The Great Schism or Greek Schism is the separation of the Greek Church (q.v.) from the Latin: the temporary Western Schism is dealt with at ANTIPOPE, POPE.

Schist (Gr. *schistos*, 'split') is a term properly applied to crystalline rocks with a foliated structure (see FOLIATION), as mica schist, hornblende-schist, &c. Indurated clay-rocks with a fissile structure are sometimes erroneously described as schists. For the schistose rocks, see PETROGRAPHY and GEOLOGY.

Schizomycetes ('fission-fungi'), a botanical term for Bacteria. It refers to their commonest mode of reproduction—by transverse division. The term Schizophyte is also synonymous with Bacteria. The advantage of the term Schizomycetes is its harmony with similar terms—Sacharomycetes, Zygomycetes, Ascomycetes, &c.—applied to other sets of fungoid plants. See BACTERIA, and Bergey's *Manual of Determinative Bacteriology* (Baltimore, 1923).

Schlaf, JOHANNES, German novelist and dramatist, was born in 1862 at Querfurt, Prussian Saxony, but since 1904 has lived in Weimar. With Holz (q.v.) he published a collection of short stories, *Papa Hamlet* (1889), but thereafter wrote alone, turning to a kind of mystic symbolism in his prose lyrics such as *Frühling*, then to 'intimate psychological' drama such as *Die Feindlichen*, then to a series of naturalist novels, including *Der Kleine*, *Am toten Punkt*, and collections of short stories, *Tanten Mohnhaupt* and *Miele*. His *Fall Nietzsche, eine Überwindung* is remarkable.

Schlagintweit, the name of five brothers who all distinguished themselves as travellers or writers on sciences allied to geography. Three of them—**HERMANN VON SCHLAGINTWEIT**, born at Munich on 13th May 1826; **ADOLF**, born at Munich 9th January 1829; and **ROBERT**, born on 27th October 1833—worked for the most part in company, and in the same departments of inquiry. Hermann and Adolf first made themselves known as investigators of the physical geography of the Alps, through two books—*Untersuchungen über die physikalische Geographie der Alpen* (1850) and continuation, *Neue Untersuchungen* (1854). Shortly after the publication of the last named Wilhelm von Humboldt got them, along with Robert, recommended to the British East India Company who sent them out to India to make observation on terrestrial magnetism, to measure mountain altitudes, and carry on meteorological and geognostic investigations. They spent nearly two years and a half in executing their commission, and in the course of it traversed great part of the Deccan and crossed the main chains of the Himalayas, and penetrated into Tibet. Hermann also made his way alone into Sikkin and Assam, and then in company with Robert explored parts of Ladakh and crossed, the first of all Europeans, the Kuen Lun Mountains, for which feat Hermann was in later years nicknamed 'Sakunlinski.' Adolf in the meantime examined the geological structure of the Nilgiris in the south, explored parts of Balti in western Tibet, and in the summer of 1857 crossed the Karakorum and Kuen-Lun Mountains and reached Yarkand; there, however, he was seized by Yakub Beg, emir of East Turkestan, and put to death on 26th August. Hermann on his return to Europe settled down to private life, and gave his energies chiefly to the publication of scientific papers. He died at Munich on 19th January 1882. Robert was in 1863 appointed professor of Geography at Giessen, where he died on 6th June 1885. The Schlagintweits' travels in India are recorded in their *Results of a Scientific Mission to India and High Asia* (4 vols. Leip. 1860-66). During two long journeys through the United States in 1869 and 1880, Robert gathered materials for works on the Pacific railways (1870, 1884, 1886), California (1871), the Mormons (1877), &c.

A fourth brother, **EDUARD**, born on 23d March 1831, took part in the Spanish invasion of Morocco of 1859-60 and wrote an account of it. He was killed in the battle of Kissingen, fighting in the Bavarian army, on 10th July 1866. **EMIL**, the fifth brother, born 7th July 1835, chose law for his calling, and the study of Tibetan and Indian languages for his amusement during leisure hours. He wrote *Buddhism in Tibet* (1860), *Die Könige von Tibet* (1865), *Die Gottesurteile der Indier* (1866), and other books, and died 29th October 1904.

Schlangenbad, one of the best-known spas of Germany, in the Rheingau district, stands in a beautiful wooded valley of the Taunus Mountains, 5 miles W. of Wiesbaden. The water (82°-90° F.) is of the character called 'indifferent,' is used for the most part externally, in baths, and is helpful in nervous diseases, for women's complaints, and for purifying the skin. The place gets its name from a harmless snake (*Coluber flavescens*) which is found there.

Schlegel, **AUGUST WILHELM VON**, German critic, poet, and translator, was born at Hanover on 8th September 1767, and began to study theology at Göttingen, but, like his younger brother, Friedrich (see below), soon turned to literature, writing poems for two magazines edited by the poet Bürger, and later for Schiller's *Horen*, and contributing to the *Göttinger Gelehrte Anzeigen*

and other periodicals. In 1796 he settled in Jena, and in 1796 married a widow lady, Caroline Böhmer (1763-1809), the clever, restless daughter of Professor Michaelis, who separated from him in 1803, and at once married Schelling. In 1798 Schlegel was appointed professor of Literature and Fine Art in that university; and the years 1801-4 he spent in Berlin, lecturing on the subjects he had taught at Jena. The greater part of the following fourteen years he lived in the house of Madame de Staël at Coppet on the Lake of Geneva; the chief incidents that mark this period of his life were the delivery of *Lectures on Dramatic Art and Literature* (Eng. trans. 1815) at Vienna in 1808, and his officiating as secretary to the Crown-prince of Sweden during the war of liberation (1813-14). In 1818 he was appointed professor of Literature in the university of Bonn, a post he filled down to his death there on 12th May 1845. He had already, years before going to Bonn, done what has proved to be his best work: gifted with considerable feeling for poetic form and much fine taste, he translated into German verse most of the works of Shakespeare, and followed up the success he thereby achieved by publishing admirable translations of Dante, Calderon, Cervantes, Camoens, and other foreign masters of literature. The translation of Shakespeare, afterwards revised and continued by Tieck, is still the classic German version. Along with his brother Friedrich he enjoyed great influence throughout Germany as one of the most active leaders of the Romantic movement, his critical papers in *Das Athenaeum* and in the volume of *Charakteristiken und Kritiken* (1801) being greatly valued in their day. In Bonn he devoted his attention principally to Indian studies, and issued editions of the *Bhagavad-Gita* and the *Ramayana*. Heine attended his lectures at Bonn, and learned from him many of the secrets of poetic workmanship: for A. W. Schlegel's own poems, feebly and cold as they are, show no little finish as to form. Heine's picture of the vain old dictator of letters coming to lecture to his class is worth noting: 'He wore kid gloves and was dressed after the latest Paris fashion; he still had about him the perfume of elegant society and *eau de ville fleurs*; he was the *beau-ideal* of elegance and politeness, and when he spoke of the English Lord of the Treasury he always began with the words "My friend." Beside him stood his servant, dressed in the grand livery of the noble house of Schlegel; his business was to snuff the wax candles in the silver candlesticks that stood, along with a glass of sugared water, on the desk before him, he "genius of the age." His inordinate self-esteem, and the unwarranted influence he enjoyed, led him to pass severe censure upon the literary work of men like Schiller, Wieland, and Kotzebue, and involved him in unseemly polemics. Apart from this feature, his judgment as a critic in matters of pure literary taste makes his lectures still worthy of consideration, especially the set already named and another series, *Ueber Theorie und Geschichte der bildenden Künste*, delivered at Berlin in 1827. His writings were published in three separate collections—*Sämmtliche Werke* (12 vols. Leip. 1846-47), *Oeuvres écrites en Français* (3 vols. 1846), and *Opuscula quæ Latine scripta sicut* (1848).

See the books quoted under **FRIEDRICH SCHLEGEL**; the letters of his first wife, edited by Waitz under the title *Caroline* (3 vols. 1871-82); and Mrs Alfred Sidgwick's *Caroline Schlegel and her Friends* (1889).

Schlegel, **FRIEDRICH VON**, German critic and writer, was born at Hanover on 10th March 1772. After receiving a classical education at Göttingen and Leipzig, he took to his pen for a livelihood. He abducted the wife of the Jewish merchant Veit

(a daughter of Moses Mendelssohn and mother of Veit the religious painter), thus putting into practice views as to free love which he enounced in a notorious romance, *Lucinde*. He then joined his brother August Wilhelm at Jena, and along with him wrote and edited the journal *Das Athenaeum*, in which they laid down the characteristic principles or features of Romanticism (q.v.). His zeal for these principles was so strong that he has ever been accounted the head of the Romantic school. With him too Friedrich wrote *Charakteristiken und Kritiken* (1801), a set of longer critical essays, which gave a real stimulus to good work in German literature and contain some of both brothers' best writing. Friedrich Schlegel at length sought relief for his romantic yearnings, and refuge from the harsh realities of actual life, by becoming a faithful son of the Roman Catholic Church. From 1808 down to his death, which occurred during a lecture-tour at Dresden on 11th January 1829, he was employed in the public service of Austria. It was he who penned the proclamations of that empire against Napoleon in 1809. The best known of his books, at least in Britain, are lectures on the *Philosophy of History*, first delivered at Vienna in 1827 (Eng. trans. 1835), and *History of Literature*, delivered at Vienna in 1814 (Eng. trans. 1859); both are clever, but one-sided, the Roman Catholic tendencies of the writer being too strongly pronounced. There are also English versions of his *Philosophy of Life* (1847) and *Lectures on Modern History* (1849). The book the Germans esteem most highly of his is *Ueber Sprache und Weisheit der Indier* (1808), which was a pioneer for the study of Sanskrit in Europe. The best edition of his *Sämmtliche Werke* is Feuchterleben's (15 vols. Vienna, 1846).

See his *Briefe an A. W. Schlegel* (1889); Haym, *Die Romantische Schule* (Berlin, 1869); G. Brandes, *Den Romantische Skole i Tyskland* (Copenhagen, 1873); and J. W. Scholl, *Friedrich Schlegel und Goethe* (1906).

Schleicher, AUGUST, philologist, was born at Meiningen on 19th February 1821, studied at Leipzig, Tübingen, and Bonn, and began to lecture on comparative philology at the last-named university in 1846. Four years later he was called to the chair of Slavonic Languages at Prague. From 1857 to 1868 he lived at Jena as an honorary professor; and there he died on 6th December 1868. With him the comparative study of the Indo-Germanic languages took a decided step forward. In his *Kompendium der vergleichenden Grammatik der indogermanischen Sprachen* (1861; 4th ed. 1876; Eng. trans. 1874-77) he showed clearly the relations of the members of the group, not only one to another, but of each to the original parent language, which he made a gallant attempt to reconstruct, and laid down the phonetic laws that had governed their respective developments. Schleicher did first-rate service also in advancing the scientific study of the Slavonic family of tongues and the Lithuanian language; for instance, in the *Handbuch der litauischen Sprache* (1857). Further labours were embodied in *Die Sprachen Europas* (1850), *Die deutsche Sprache* (1860; 5th ed. 1888), *Indogermanische Christomathie* (1869), and *Litauische Märchen und Lieder* (1857). There is a Memoir by Lefmann (1870).

Schleiden, MATTHIAS JAKOB, botanist, was born at Hamburg, 5th April 1804, studied law at Heidelberg, practised at Hamburg as advocate, but in 1833 went to Göttingen and devoted himself to the study of physiology and botany. In 1839 he was called to the chair of Botany at Jena, and in 1863 at Dorpat. In 1866 he retired. He died at Frankfurt, 23d June 1881. He contributed greatly to establish the cell-theory (see CELL); and of

his numerous works, including two collections of poems, books on materialism, the sense of sight, the age of man, a *Life of Linnaeus*, &c., the most important is his *Grundzüge der wissenschaftlichen Botanik* (1842-43; Eng. trans. *Principles of Scientific Botany*, 1849). See BOTANY.

Schleiermacher, FRIEDRICH ERNST DANIEL, was the founder of that modern theology which seeks to understand Christianity without doing despite to the reasonable convictions of the human mind. What marked him out as reformer was first and foremost his mental constitution, in which a profoundly religious temperament was happily blended with an acute intelligence, and an unhesitating independence of thought and feeling with an exceptional susceptibility to the most various impressions from without. Then he was fortunate in having his various gifts developed by the course of his education and the experiences of his life.

He was born on the 21st November 1768 at Breslau, the son of an army chaplain belonging to the Reformed confession. The pious atmosphere of his home awakened vivid religious feelings in the boy, which attained fuller growth at the Moravian educational institutes of Niesky and Barby, where he studied from 1783 till 1787. But deep as was the impression made upon him by the godliness of social life amongst the brethren, the narrow and rigid dogmatic form of religion as taught by them was simply intolerable to the eager mind of Schleiermacher, already leavened by the wisdom of classical antiquity; and he felt that he could no longer profess this faith without a lie against his own nature. There was a painful conflict of opinion between him and his rigorously orthodox father ere the son forsook the theological seminary of Barby to study philosophy and theology at Halle. Of the philosophers it was mainly Plato, Spinoza, and Leibniz, and afterwards also Kant, Fichte, and Schelling, who made a permanent impression on him and moulded his mental development. A powerful influence was also exerted from 1797 onwards by the intimacy into which, now a preacher in Berlin, he was drawn with the devotees of Romanticism (q.v.). He thoroughly sympathised with that cultus of personal feeling and that contempt for mere intellectual *Aufklärung* which the romanticists carried to an extreme; but he was saved from the excesses of the romanticists by the anchor which his character had found in personal piety, and by the scientific prudence and breadth that came of his constant study of philosophy, ancient and modern. To this first sojourn in Berlin belong the earliest of those publications which made Schleiermacher known to the learned world: the *Reden über Religion* (1799), the *Monologen* (1800), and the ethical work, the *Grundlinien einer Kritik der bisherigen Sittenlehre* (1803). In these he expounded in scientific form that hostility to the traditional moral philosophy and the Kantian ethic of the categorical imperative to which he had already (1801) given audacious expression in the 'Confidential Letters on Schlegel's *Lucinde*,' where he attempted a defence of the notorious romance of his friend Friedrich Schlegel. A more valuable undertaking was the translation of Plato, which the two friends set about jointly, but which was ultimately carried through in 1804-10 by Schleiermacher alone. This work, epoch-making for the comprehension of Plato's philosophy, was in great part the fruit of the involuntary illness imposed upon the translator by Napoleon, when, in 1806 he closed the university of Halle, at which since 1804 Schleiermacher had been extra-ordinary professor. Returning to Berlin, he entered into close relations with Stein and Humboldt, with the philosopher Fichte, and with other patriots; and he took an active share in all the efforts which were

being made to bring about the moral regeneration and the political restoration of the German Fatherland, especially of Prussia. One scheme with this aim was the establishment of the new Frederick-William university of Berlin, in which Schleiermacher took part; and in the theological faculty of this university he became professor in 1810. The fame of his academic lectures on all branches of theology and philosophy attracted yearly increasing crowds of enthusiastic students; and as preacher at the *Dreifaltigkeitskirche* he exercised a profound religious influence by his sermons, both on hearers and readers. Equally influential were his labours in the sphere of church politics; he was the soul of the movement which led to the union in 1817 of the Lutheran and Reformed Churches in Prussia; and it was not his fault that his far-sighted proposals for the preparation of a new constitution and forms of ritual suited to the wants of the united church were not adopted. His resolute bearing in these controversies was the more to his honour, inasmuch as it made him so unpopular with the government that for years he ran the risk of losing his university chair.

Yet all these public labours—some of them trying and ungrateful—could not prevent the indefatigable scholar from devoting concentrated energy to the advancement of learning. The outcome of these studies was on the one hand short essays which were published in the transactions of the Berlin Academy; and on the other the theological works *Die Weihnachtsgeschichte* (1806); a critical treatise on the first epistle to Timothy (1807); *Kurze Darstellung des theologischen Studiums* (1811); and finally his most important work, *Der christliche Glaube nach den Grundsätzen der Evangelischen Kirche im Zusammenhang dargestellt* (1821). He died 12th February 1834; and after his death friends published several other works from his manuscripts or from notes of his lectures taken by students. Of these the most important are *Die christliche Sitte* (1843), *Leben Jesu*, Sermons, a work on Dialectic, and a sketch of a system of Ethics. A collection of letters, of great importance for understanding Schleiermacher's very singular personality, was edited by Dilthey in four volumes (1860-64), and in 1910 Bann and Bane published a selection from his works in four volumes. A multitude of larger and smaller books and articles dealing with the man and his work appeared on occasion of the centenary of his birth, 1868. In 1825 Thirlwall published a translation of his *Essay on St Luke*; his *Introduction to Plato's Dialogues* was translated into English by Dolson in 1836; and a volume of *Selected Sermons* was issued in England in 1890.

Schleiermacher has been for theology what Kant was for philosophy. Kant submitted the theoretical and practical reason to a critical analysis, in order to distinguish the primordial and perennial laws of thought and will from the ever-changing sensations which supply the materials of experience. In like manner Schleiermacher undertook a critical analysis of religion, in order to discover what in it was the original essence and what were the derivative forms. Dogma, he taught, is not religion, but a statement about religion which is the product of reflection; religion itself is feeling, the immediate sense of our dependence on the divine source of all things, on God. But devout feeling, though the inmost part of individual life, is not itself merely individual; the individual man is conditioned by the community he belongs to, and the mode in which that community experiences the religious emotion, in a manner common to its members, rests on and is conditioned by the historical and fundamental fact of the establishment of the community. In

this fact we may recognise a 'revelation,' inasmuch as a creative religious personality communicates to others its own peculiar religious feeling, its consciousness of God. Every historical religion rests in this sense on a revelation, on the communication of the original religious life of creative personalities, such as could not be thought out *a priori* or deduced from universal truths. This is especially true of Christianity, which is peculiarly a *positive* religion, one to be realised through experience, inasmuch as it has for its very centre the relation to the historical person of Jesus Christ as the redeemer; and by this fact all statements of doctrine as to God and the world and mankind must be regulated. The Christian church recognises that it has received 'Redemption'—liberation and strengthening of the consciousness of God heretofore trammelled by nature—as the influence of the person of Christ, and that it continues to receive the same by means of the spirit of the church, which has proceeded from Christ. From this experience the church is led upwards to its cause in the person of Christ, and for that reason believes in the typical perfection of Christ; this distinguishes Christ from all other men, yet without abrogating his true humanity. Similarly our faith in Christ rests only on that quickening of the pious disposition which we experience through and from him, and which in a sense is common to us with him. But this faith is independent of all historical reports of miraculous events that took place in him or by him. It is not because of the Bible and its miracles that we believe in Christ; it is because of Christ, whose influence we experience in our consciousness of redemption, that we believe in the Bible. That is, we ascribe to the Bible a normative dignity, as containing a substantially true picture of Christ; while it must not, however, prevent us from submitting its story in detail to the same critical tests as we apply to all historical traditions whatsoever. Schleiermacher did not expressly deny all miracle; but he laid down the general principle that it is not to the advantage of piety to hold, in the case of any single events, that their connection with the order of nature is interrupted by their dependence upon God. His general conception of the relation of God to the world, of the mutual correspondence of the infinite with the many finite causes (which approximates very closely to Spinoza's view), excludes the possibility of miracles in the fully supernaturalistic sense of the word. In this reference Schleiermacher has avoided and superseded alike supra-naturalism and rationalism, by emphasising Christian experience, and insisting on the historical character of the Christian religion in the person and influence of Christ. He has interpenetrated theology with philosophical idealism by taking as its basis the human self-consciousness. On the other hand, he set philosophy free from the unhistorical individualism and rationalism which had clung to it even in Kant's hands by widening the religious and ethical consciousness into the social consciousness of the community; in the common consciousness of ethical beings he discovered reason historically developing itself, and saw in the individual reason no more than the special form of manifestation, the organ which is but its servant. By means of his dogmatics and his ethics Schleiermacher did more than any other thinker to solve the great problem—the reconciliation of the individual with the community, of private conscience with the claims of historical tradition.

Munro (1903) and W. B. Selbie (1913).

Schleswig. See SLESWICK.

Schlettstadt, a town of Lower Alsace (Bas Rhin), on the left bank of the Ill, 27 miles by rail SSW. of Strasburg. It manufactures wire-gauze. In the 13th century it was made a free imperial town, and in the 15th was chosen by Agricola as the seat of a higher school that greatly helped to foster humanistic studies; Erasmus was a pupil. In 1634 the town became French; it was fortified by Vauban in 1676. The Germans, after capturing the town in 1870, razed the fortifications. Here Martin Bucer (q.v.), the Reformer, was born. The French call the town *Sélestat*, or *Schlestadt*. Pop. 10,000.

Schliemann, HEINRICH, the excavator of the sites of Troy and Mycenæ, was a native of Mecklenburg-Schwerin, born at Neubuckow on 6th January 1822. Whilst working in a merchant's office and afterwards trading on his own account in St Petersburg, he acquired a knowledge of the principal languages of modern Europe and of ancient Greek. Having in the meantime become possessed of a large fortune, he began in 1870 to explore and excavate at his own cost the ruins of Hisarlik in the Troad (Asia Minor), and continued the work for twelve years. Schliemann maintained that it was the site of ancient Troy (q.v.). For carrying off, contrary to his agreement with the Turkish government, all the spoils he unearthed, he was compelled, through a judgment of the Greek courts, to pay the Ottoman Porte the sum of £2000. But he retained possession of his collections, and in 1882 presented them to the German nation; they are now preserved in the Ethnological Museum at Berlin. In 1876 Schliemann commenced, in like manner, to excavate the site of ancient Mycenæ in Greece; and there he discovered invaluable treasures (now in the Polytechnic at Athens), and exposed buildings of great antiquity and interest (see MYCENÆ). He also carried on explorations in the island of Ithaca (1869 and 1878), at Orchomenus (1881-82), and at Tiryns (1884-85). The results of his labours are described in the monographs on *Mykenæ* (1877; Eng. trans. 1877); *Ilios*, with an autobiography of the author, and notes, &c. by Professors Virchow and Max-Müller (1880; Eng. trans. 1880); *Orchomenos* (1881); *Troja* (1883; Eng. trans. 1883); *Tiryns* (1886; Eng. trans. 1886); and *Bericht über die Ausgrabungen in Troja im Jahre 1890* (1891). He wrote also *Ithaka, der Peloponnes, und Troja* (1869); *Trojanische Alterthümer* (1874); and *Reise in der Troad* (1881). Schliemann died at Naples on 27th December 1890, and was buried at Athens. See Dr Schuchhardt's *Schliemann's Ausgrabungen* (1890; Eng. trans. 1891), and his own *Selbstbiographie* (1891).

Schlösser, FRIEDRICH CHRISTOPH, a German historian, born at Jever in Oldenburg, 17th November 1776, was educated at Göttingen, and, after spending many years as a private tutor and academic teacher, was (1819) called to Heidelberg as professor of History, and died there, 23d September 1861. Schlösser's ideal of the historian's art was ethical: he wrote neither from the literary standpoint, nor yet from the critical, but from the moral. Yet he is not uncritical; for he exercised the critical intelligence of a widely-read historian with a stern love of truth. His books had great influence with the middle classes of Germany. There are German Lives by Gervinus (1861) and O. Lorenz (1878).

Schlüsselburg, a town and prison-fortress of Russia, the fortress being on a rocky islet in the Neva where it issues from Lake Ladoga, and the town on the right bank of the river. Here the de-throned Tsar Ivan VI. was murdered by authority,

after twenty-three years' imprisonment in this and other fortresses.

Schmalkalden, an old town of Hesse-Nassau, Prussia, stands 19 miles SW. of Gotha, is surrounded with double walls, contains the town-house in which the historic 'articles' were signed. There are saline baths. Pop. 10,000. It is the birthplace of Karl Wilhelm (1815-73), composer of 'Die Wacht am Rhein.'

LEAGUE OF SCHMALKALD, a defensive alliance concluded at Schmalkalden on 4th April 1531 between nine Protestant princes and eleven imperial cities, with whom other princes and imperial cities subsequently made common cause. The Elector of Saxony and the Landgrave of Hesse were appointed chiefs of the league. The object of this formidable alliance, which included nearly all the Protestant states from Denmark to Switzerland, was the common defence of the religion and political freedom of the Protestants against the Emperor Charles V. and the Catholic states. The confederation was consolidated by the *Articles of Schmalkald*, drawn up by Luther at Wittenberg in 1536. A conflict was of course inevitable. In the war of Schmalkald that ensued (1546) when the emperor got leisure to turn his attention to the matter the strength of the Protestants was crippled and dissipated by jealousies, but especially by the defection of Duke Maurice of Saxony, so that in the battle of Muhlberg (24th April 1547) the Elector of Saxony (the head of the elder branch of the Saxon house, Duke Maurice being the head of the younger branch), Philip of Hesse, and other Protestant chiefs were taken prisoners and their army routed. This caused the league to break up. The Protestant cause was, however, revived five years later by Duke Maurice, who had in the meantime been made Elector instead of his unfortunate kinsman, and who in 1552 returned to his old allegiance to Luther's teaching.

Schmiedel, PAUL WILHELM, born near Dresden in 1851, studied at Leipzig and Jena, taught at Jena, and became professor of New Testament studies at Zurich in 1893. An 'advanced' theologian, he wrote on many of the New Testament books, especially the Gospel of St John and the Apocalypse, and on the person of Jesus (*Jesus in Modern Criticism*, 1907). He re-edited Winer's Grammar of New Testament Greek, and contributed to many of the important theological serials and encyclopedias.

Schmitz, LEONHARD (1807-90), studied at the university of Bonn. His translations of Niebuhr and his own manuals of ancient history gave him standing in England, where he settled. He edited the *Classical Museum* for some years, and was a large contributor to the *Penny Cyclopædia* and Smith's *Dictionaries of Greek and Roman Antiquities*, of *Biography and Mythology*, and of *Geography*. He translated Zumpt's *Latin Grammar*, and edited a popular series of Latin class-books for W. & R. Chambers. In 1846 he became Rector of Edinburgh High School, and in 1866 head of the International College at Isleworth.

Schnapper, or SNAPPER, a highly-esteemed food-fish of the Sea-bream family, frequenting rocky shoals on the coasts of southern Australia and of New Zealand. Old examples have a fleshy nose and a bony protuberance behind the head.

Schneeberg, a town of west Saxony, 20 miles SW. of Chemnitz, producing lace, embroidery, and a kind of snuff made of aromatic herbs, reputed as a remedy for cold in the head.

Schneekoppe, the highest point (5260 feet) of the Kiesengebirge (q.v.).

Schneidemühl, capital of the Grenzmark in Prussia, 150 miles NE. of Berlin, with important glass and other manufactures, a deaf and dumb asylum, a catholic seminary, and a population of 38,000.

Schneidewin, FRIEDRICH WILHELM (1810-56), classical scholar, born at Helmstedt, and was educated at Göttingen, where he became professor in 1837. He edited a delectus of Greek poetry, wrote on the Greek lyric poets; but his great works were editions of Martial and Sophocles.

Schnitzer, EDUARD, better known as **EMIN PASHA**, was born of Jewish parents at Oppeln in Silesia, on the 28th of March 1840, and removed two years later to Neisse. He studied medicine at Breslau and Berlin. He settled in practice in Turkey, and had till 1873 an appointment at Scutari. He gained an intimate acquaintance with Armenia, Syria, and Arabia, and adopted the name of Emin and the habits and customs of the Turks. In 1876 he entered the Egyptian medical service as Dr Emin Effendi, and was appointed by Gordon Pasha chief medical officer of the Equatorial Province, and in 1878 its governor, which position he held until the arrival of Stanley's expedition in 1889. In 1879 he was raised to the rank of Bey, in 1887 to that of Pasha. In December 1889 Emin Pasha arrived at Zanzibar with Stanley. He met with an accident there from which he nearly lost his life, but instead of going back to Europe entered the service of the German government, and returned at the head of a large expedition to central Africa. He was energetic in extending the German sphere of influence, made favourable treaties with native chiefs, and founded German stations on Lake Victoria; besides sending large zoological and ethnographical collections to Berlin. But he never regained his old influence, and seems, defeated in his hopes, to have been marching for the west coast when, apparently on the 23d October 1892, he was slain by the Arabs at Kinenia, 100 miles E. of Stanley Falls.

An extraordinary linguist, a skilful medical man, an able administrator, cut off from all communication with the outside world, he maintained his position single-handed at the farthest outpost of civilisation. Emin gained a wonderful insight into the habits and customs of his people, and added enormously to our anthropological knowledge. His meteorological investigations made Lado the standard of reference for all barometrical observations in East Equatorial Africa. His route surveys extend over more than 4000 miles, and he made a triangulation survey of the country from Lakes Victoria and Albert in the south to Lado in the north, to the river Djur in the north-west, to Mombutta and the river Welle in the south-west. Between 1878 and 1883 eleven geographical papers of extreme value were published by him in *Petermann's Mittheilungen*. An intelligent and painstaking collector, he elucidated the distribution of the flora and fauna of central Africa, made valuable collections and cultivation experiments. He collected numerous and valuable vocabularies.

Emin Pasha was no military genius, but he proved himself to be an enlightened ruler, and managed to abolish slave-dealing throughout his province. He constantly endeavoured to civilise the people committed to his charge, and in this he succeeded to a very large extent.

See Stuhlmann, *Mit Emin Pasha ins Herz von Afrika* (1894); Vita Hassan, *Die Wahrheit über Emin Pasha* (1893); *Emin Pasha in Central Africa: his Letters and Journals* (trans. by Mrs Felkin, 1888); Stanley, *In Darkest Africa* (1890); Casati, *Ten Years in Equatoria with Emin Pasha* (trans. 1891); and the standard Life

by G. Schweitzer, *Emin Pasha: his Life and Work* (trans. 1898).

Schnitzler, ARTHUR, German writer, was born 15th May 1862 in Vienna, a physician's son, and himself graduated in medicine in 1885. From *Anatol* (1892; adapted in English by Granville Barker) and *Liebele* (1896) on he wrote many one-act plays and some longer ones, depicting the frivolous society of Vienna in light yet brilliant satirical verse. Of later plays *Der grüne Kakadu*, *Professor Bernhardt*, *Fink und Fliederbusch*, *Die Schwestern* deserve separate mention. Besides comedy of manners, Dr Schnitzler has been successful in the novel and tale, as in *Der Weg ins Freie*.

Schnorr von Carolsfeld, BARON JULIUS, painter, was born at Leipzig on 26th March 1794, and was trained as a painter by his father (likewise an artist) and at the Vienna Academy. In Vienna he became associated with the German school of Cornelius, Overbeck, Schadow, and Veit, who went back for their inspiration to the old masters anterior to the days of Raphael, and in 1818 he followed them to Rome. But though he agreed with them in principle, he avoided their extremes, and was the only one of them who remained a Protestant. For the walls of the Villa Massimo at Rome he executed, as his share of the work, nearly two dozen frescoes from Ariosto's *Orlando* (1820-29). The year after the completion of this labour he was called by King Louis of Bavaria to fill the chair of Historical Painting in the Academy of Munich, and was besides commissioned to paint for the king's new palace and other royal apartments a series of frescoes illustrative of the *Nibelungenlied* and of the lives of Charlemagne, Frederick Barbarossa, and Rudolph of Hapsburg. In 1846 he accepted the appointment of professor at the Fine Art Academy in Dresden, coupled with the directorship of the royal picture-gallery. Schnorr's designs for 180 pictures to illustrate the narratives of the Bible (*Bible Pictures*, Lond. 1860) are accounted by many authorities the best things he did. The illustrations for Cotta's great edition of the *Nibelungen Not* were also designed by him; and his skill as a draughtsman and designer are further exhibited in stained-glass windows in St Paul's Cathedral, London, and in Glasgow Cathedral. Amongst his representative enamel-pictures may be quoted the 'Marriage at Cana,' 'Jacob and Rachel,' 'Three Christian and Three Heathen Knights of Ariosto,' 'Ruth in Boaz's Wheat-field,' 'Christ Bearing the Cross,' 'Siegfried and Kriemhild,' and 'Luther at Worms.' His best qualities are balance of arrangement, freedom of design, and vivacity, together with many happy inspirations; in fact, he had too many ideas, and did not give himself time to mature them properly. Besides, his work is frequently too decorative in effect, and the figures lack individuality and dignity. Schnorr died in Dresden, 24th May 1872.

Scholasticism. The term scholasticism specially designates the aims, methods, and products of thought which constitute the main endeavour of the intellectual life of the middle ages. As under the names of its leading representatives special accounts have been given of their distinctive teaching, it will here be sufficient to indicate the conditions from which scholasticism arose, the general course of its history, and the causes that wrought its decay. In the case of no other great development of human thought can we mark with such precision its beginning, process, and end.

It was with the reign of Charlemagne (died 814) that the start was fairly made towards a new

civilisation with the Christian religion and theology for its basis, and with a character and aim of its own essentially distinct from the civilisation of antiquity which had died with the ruin of the empire of Rome. In the political confusions that followed the dismemberment of the Carolingian empire much was lost that had been recently gained, yet the tradition was never again lost of those ideals of a higher culture inaugurated in the schools founded by Charlemagne. In John Scotus Erigena (died 875) we have the first great thinker of the early middle ages. As he drew his inspiration from Plato rather than from Aristotle, however, and as his methods are not those of the schoolmen proper, he does not in strictness belong to the scholastic philosophy. It is by his translation of the writings of the Pseudo-Dionysius, a work which exercised the profoundest influence on the religious life of the middle ages, that he holds his place among the thinkers who have determined the development of Christian Europe. In the 10th century the tradition of higher studies was represented by one who, though also not a schoolman, cannot be passed over in any history of the origins of the new civilisation. By his great school at Rheims, Gerbert, afterwards Pope Sylvester II. (died 1003), kept alive in France that intellectual eagerness which it had mainly owed to the genius of Charlemagne, and which eventually justified the saying of the middle ages—'To the Germans the empire, to the Italians the pope, to France studies!'

During the 11th century western Europe grew to a clearer consciousness of the aims it had to follow in the development of the ideas on which the Christian society must be based. Till the year 1000 all endeavour had been paralysed by the belief that with that year God's account with men must close. As the dreaded hour was left behind, however, the sense of relief and gratitude showed itself in a quickened life in every field of human activity. The first crusade (1096) is conclusive proof that the church now confidently reckoned on a renewed term of terrestrial existence, and that it felt the duty of signalling the unexpected respite. In the sphere of thought, also, that movement now begun which, in spite of its fatigues and eventual stultification, had for its essential aim the reasoned account of the ideas on which the new order was founded. In this endeavour there were initial conditions which at once determined the nature and direction of men's reasonings and vitiated at the source the value of their results. It is the essential distinction between the schoolmen and the thinkers of antiquity that the former were not left free to question the subject-matter on which their ingenuity was expended. Of all ultimate questions the church provided a solution ready to hand and beyond appeal. The liberty to choose or reject that solution would have nullified the very principle of the church's existence. Moreover, the intellectual life of the middle ages directly proceeded from the organisation of the church, and individual thinkers were but the organs of its doctrine and tradition. The medieval university was as essentially a religious institution as a monastery or a cathedral, and its members held their place solely on condition of their acceptance of the church's standard of faith. But it was exclusively in the universities that intellectual life was then possible. With their thought thus fettered in its fundamental process, a natural development, following every indication of truth to its legitimate conclusion, could not be looked for in the schoolmen. The most daring conclusion they could reach was to question whether the teaching of the church could be made good to the mind by any process of merely human reasoning. Uniformity of method, and futile distinctions or

petrifying routine, were thus the inevitable outcome of the medieval philosophy.

According to the statement of Victor Cousin, now generally accepted as true, the fundamental problem of scholasticism had its first suggestion in a remark of Porphyry (died 304) regarding the difficulty of settling the question whether *genera* and *species* have a real objective existence or are merely abstractions of the mind. Put in as simple language as its nature admits, the problem is this: Is there or is there not an objective reality corresponding to our general notion, say of *man*, *horse*, *flower*, &c.? Those who answered the question in the affirmative came to be known as *realists*, their opponents as *nominalists*. Trifling as the question may appear in itself, for the schoolmen it lay at the root of every attempt to render account to human reason of divinely revealed truth. An abstract question assumed vital importance when the disputants saw behind it the doctrines of the Trinity, the Incarnation, the Immaculate Conception, and the nature and existence of angels. It was especially in its bearing on the doctrine of the Trinity that the question of Nominalism *versus* Realism for more than four centuries exercised the keenest intellects the world has perhaps seen. It was the contention of the Realists that on the principle of Nominalism (q.v.) the doctrine of the Trinity was irrational and inconceivable. Grant, they argued, that our general notions have objective reality, then, just as from the totality of men we have an objective unity in the notion *man*, so from the Divine Trinity of Persons we can conceive a Divine Unity of Substance. On the other hand, if general notions be mere names, the doctrine of the Trinity in Unity is absurd on the face of it. Of the two theories it was Realism which had the approval of the church, and which was associated with the pious feeling of the middle ages. Till its final triumph in William of Ockham Nominalism had to fight for its existence against the main current of the religious and speculative tendency of the medieval church. The history of scholasticism is in large degree the history of the varying fortunes of these two rival theories and their rival champions.

An event of the first importance divides this history into two periods so distinctly marked that they have come to be known as the periods of the earlier and the later scholasticism. This event was the introduction into the Christian schools through the medium of the Arabian commentators (chiefly Avicenna and Averroes) of the writings of Aristotle on natural science, metaphysics, and ethics. Till the beginning of the 13th century Aristotle had been known to the schoolmen only by his writings on logic. From the knowledge of Aristotle's complete work, therefore, they received an impulse which led the way to bolder speculation, and gave birth to questionings that stirred the deepest consciousness of the later middle age. On the one hand, the new Aristotle ministered to the intellectual want of the time in supplying the material it needed to exercise those faculties which had been so assiduously trained by Aristotle's own dialectic. But Aristotle was a pagan, and many points in his teaching ran counter to Christian doctrine. To give him that place in the schools which many now wished would be a standing menace to the authority of the church. From the first appearance of the new writings, therefore, Rome steadily set its face against the 'Grecian Doctor,' and in a succession of anathemas forbade certain parts of his writings to be used in the universities. In the relation of thinkers to Aristotle we have thus the distinction between the earlier and the later scholasticism. Of the first period the great names are Roscellinus, Anselm,

William of Champeaux, Abelard, and Peter Lombard; of the second, Albertus Magnus, Alexander of Hales, Thomas Aquinas, Duns Scotus, William of Ockham, and Jean Gerson.

The name of Anselm (1033-1109) is chiefly remembered in connection with his attempt to prove the existence of God from the innate idea which he supposed to be common to all mankind. His place in the line of the schoolmen, however, is not due to this argument, famous as it is in the history of thought. It was in his controversy with his contemporary Roscellinus (born near Soissons about 1050) on the burning question of universals that he entered the peculiar domain of scholasticism. Though not the first to renew the old controversy, Roscellinus, by the notoriety which he gave to it, may be regarded as the founder of the scholastic philosophy. With a skill and success that alarmed the authorities of the church he argued for the theory of Nominalism, Anselm taking up the contrary position with equal subtlety and persistence. It proves the importance assigned to the question at issue that in 1092 a council held at Soissons condemned the teaching of Roscellinus as implicitly involving the negation of the doctrine of the Trinity. As Roscellinus was the founder of Nominalism, William of Champeaux (1070-1122), the head of a famous school of logic in Paris, was the founder of Realism. It was in refuting his teaching that his pupil Abelard (1079-1142) gained the first triumphs of his extraordinary career. In Abelard we have the boldest thinker and one of the most striking figures in the history of the middle ages. His celebrated pamphlet *Sic et Non* was a manifesto of rationalism, which sent a shudder through the conservatism of the time. Selecting 158 points of Christian doctrine he arrayed the opinions of the most revered authorities on each. Presented in this startling fashion, the opinions of St Paul, Augustine, Gregory, Jerome, Athanasius, and others were seen to be so essentially self-contradictory that no doctrine was left on which an intelligent believer could rest. On the main question of the schools he rejected the orthodox Realism, and adopted an eclectic theory which was neither Realism nor Nominalism, but a middle position between each. A thinker like Abelard striking at the very root of the Christian tradition could not in the reason of things be tolerated by the church; and by a great assembly at Sens in 1140, and afterwards at Rome, his writings were ordered to be burned and himself prohibited from teaching. But the spirit of Abelard was never completely exorcised during the subsequent centuries, and he has always been regarded as the brilliant precursor of the modern time. By his 'Four Books of Sentences' (i.e. right rules) Peter Lombard (c. 1100-60), a pupil of Abelard, came to hold a place in the history of scholasticism hardly second to any other thinker. The object of his book was to be the antidote of *Sic et Non*; and in a different spirit from Abelard the Lombard brought together the opinions of the Latin fathers Augustine, Ambrose, and Hilary, as also of Cassiodorus. To each article he annexed a series of 'Distinctions,' in which he sought to define more precisely the doctrine under consideration. Though conceived in a spirit of orthodoxy, the 'Sentences' did not escape the leaven of Abelard's scepticism. Regarded with suspicion on its first appearance, it yet became the great text-book of the universities to the close of the middle ages, and was itself made the subject of interminable commentaries by subsequent schoolmen.

In the second period of scholasticism larger interests and more various problems quickened the speculations of the successive thinkers. During the 13th and 14th centuries the rivalries of the two

mendicant orders, the Dominicans and the Franciscans, divided the schools, and introduced a polemical element into philosophical discussion unknown in a similar degree to the earlier period. Generally the Franciscans, as the body of democratic origin, counted in their ranks the bolder thinkers among the schoolmen. Thus, Roger Bacon, Duns Scotus, William of Ockham were Franciscans, Albertus Magnus and Thomas Aquinas Dominicans. The new Aristotle was the battle-ground of the two rival camps of thinkers, and specially the Aristotelian doctrine of the soul. As that doctrine had been expounded by the Arabian commentator Averroes, it involved the negation of the Christian doctrine of the resurrection and of the immortality of the soul. It is mainly by their attitude towards Averroes that we distinguish the different tendencies of the schoolmen of the 13th and 14th centuries.

An eclectic in his view of universals, Albertus Magnus (1193-1280) accepted Aristotle through the commentator Avicenna in preference to Averroes. The task of the later schoolmen was to harmonise the newly-received teaching of Aristotle with the doctrines of the church, and Albert was the first to bring together the materials for the furthering of this end. To effect this harmony was the life's endeavour of the most constructive mind of all the schoolmen, Thomas Aquinas (c. 1226-74). In his *Summa Theologiae* Aquinas sought to supply a complete repertory of human thought on all subjects touching religion and philosophy, the fundamental principle of his work being that as faith and reason have two distinct spheres, neither can conflict with the other. On the subject of universals he was an eclectic like his master Albertus. Even Aquinas did not escape the charge of heresy, and through the efforts of the Franciscans his teaching on the nature of the soul was formally condemned by the church. Eventually, however, he came to hold the first place as the oracle of divine and human wisdom, so that a pope could say of him that 'the articles of Thomas were so many miracles.' What Aquinas was to the Dominicans Duns Scotus (c. 1265-1308) was to the Franciscans. Roger Bacon (c. 1214-94), also a Franciscan, holds a place apart from the other thinkers of the middle ages by his contempt for the studies of the schoolmen. The introduction into the western schools of what is known as the Byzantine logic by Petrus Hispanus (1226-77) is a turning-point in the history of the scholastic philosophy. Through its influence logic in the teaching of Duns Scotus and William of Ockham assumed an importance which had the most disastrous results on the entire scholastic system. With an æmulum which gained for him the title of 'The Subtle Doctor,' Duns applied the new logic to the main position of Aquinas that reason and revelation are two distinct sources of knowledge, and sought to prove that there is, in truth, no knowledge apart from the Christian teaching. On the question of universals he shows all his subtlety, but his position is virtually that of Aquinas himself. It was in the hands of William of Ockham (c. 1270-1349), a pupil of Duns Scotus, that the scholastic philosophy assumed a form which speedily led to its disintegration. By his triumphant demonstration of the theory of Nominalism scholasticism ceased to have a reason for its existence, and the foundation was laid for that method of experiment and induction which was the outcome of the long travail of the schools of the middle ages. With Ockham closes the line of the great schoolmen; and of the thinkers who followed him Jean Gerson (1363-1429) alone deserves to be mentioned as one of the representative figures of the later scholasticism. In certain of the great universities, indeed, the scholastic methods continued to

prevail long after a better way had been opened up for the freer development of the human spirit. In the university of Paris scholasticism held its place into the 17th century; and in Spain, till comparatively recent years, it was still the only philosophy that could be learned by her students. By the close of the 15th century, however, scholasticism was dead as a vital phase of human thought. In itself it was an exhausted movement, and the revival of antiquity and the religious reformation of the 16th century supplied a fresh stream of ideas, which opened up a larger scope of the possible development of humanity.

It was natural that the humanists and the reformers should do their utmost to discredit the system from which they were seeking to emancipate their contemporaries; and so effectually did they do their work that not till within recent years has scholasticism been thought worthy of a serious attempt to understand it. At present the tendency is to recognise in it for its own time and place a perfectly rational system, yielding healthy exercise to the best minds of the middle ages. The ridicule of the humanists is seen to be true only of its later phases. While, therefore, from the very conditions of its origin and growth, scholasticism was debarred from that free and direct questioning of things which is the distinctive characteristic of ancient and modern times, it nevertheless, as in Dante and Thomas Aquinas, produced certain types of thought and feeling which could have sprung from no other system, and for the absence of which the world would have been emphatically the poorer.

See the general histories of Philosophy (q.v.); the histories of mediæval philosophy by Stœckl (1861-67), Baumker (1909), and Doussan (1915) in German, and by Hauréau (1872-80), Picavet (1901), and de Wulf (trans. 1926) in French; see also Townsend, *Great Schoolmen* (1881); Poole, *Illustrations of the History of Mediæval Thought* (1884); Littlehain, *Political Theory of the Schoolmen* (1896); Ihekahy, *Scholasticism* (1900); Taylor, *The Mediæval Mind* (1911-14); and the contribution of Little to *Mediæval France* (ed. Tilley, 1922). See also the separate articles on the different schoolmen and mediæval philosophers, with the books cited there.

Scholiasts, ancient grammarians, for the most part anonymous and known only by their short annotations written on the margins of the MSS. of the ancient classics, Greek and Roman. These remarks concern the language more frequently than the substance, and are sometimes feeble and pedantic, but often tend to elucidate the text or even critically amend it. The earliest scholiasts were those of the Alexandrian School (q.v.); many are as late as the Byzantine period. A Gloss (q.v.) was one of the merely verbal scholia.

Scholten, JAN HENDRIK (1811-84), the chief of the modern school of Dutch critical theologians, was born at Vleuten near Utrecht. He studied for the church at Utrecht, and became in 1840 professor of Theology at Franeker, in 1843 extraordinary, and in 1845 ordinary professor at Leyden, where he died 10th April 1885, four years after his retirement. His writings were either in Dutch or Latin, but French and German translations carried them far beyond their country. The chief were *Principles of the Theology of the Reformed Church* (2 vols. 1848-50), *Historical and Critical Introduction to the New Testament* (1853), *A Critical Study of the Gospel of John* (1864), *The Oldest Witnesses to the Writings of the New Testament* (1866), *The Oldest Gospel* (1868), and *The Pauline Gospel* (1870). The school of which he was the most conspicuous leader eliminates the supernatural element from Christianity, evolving the religion from the religious consciousness of Jesus.

Scholten gave an interesting sketch of his own religious development in his *Afcheidrade bij het Neerleggen van het Hooglerersambt* (1881). See also Kuennen's *Levensbericht*, with a complete list of his writings (1885).

Schomberg, FREDERICK HERMANN, DUKE OF, was born about 1615 of an ancient house taking its name from its castle of Schönburg on the Rhine, and fought against the Imperialists in the Thirty Years' War. Entering the French service in 1650, he conducted a successful campaign in Spain, was naturalised in France, and, though a Protestant, obtained a marshal's baton in 1675. On the revocation of the Edict of Nantes in 1685, after some unimportant work done for the House of Brandenburg and the Elector Palatine, he accepted the post of second in command under the Prince of Orange in the English expedition. The new king made him K.G., duke, and master of the ordnance, and gave him command of the army in Ireland in 1689. Wintering in Ulster, he joined William III. in 1690, and fought and fell in the battle of the Boyne (1st July). His son Meinhart commanded the right wing, and was made Duke of Leinster. But in the war of the Spanish succession he was recalled as inefficient for his command, and died childless in 1709, the title dying with him. The fourth Marquis of Lothian married a granddaughter of the first Duke of Schomberg.

Schomburgk, SIR ROBERT HERMANN, a traveller, was born at Freiburg in Prussian Saxony, June 5, 1804. He was trained for the mercantile profession, and went out to the United States in 1829, but in the following year he removed to Aneгада, one of the Virgin Isles. Having surveyed the island and laid a report before the Royal Geographical Society, he was charged by that body to lead an exploring expedition to British Guiana in 1835. This enterprise, which was surrounded with formidable difficulties, he satisfactorily achieved, and from time to time laid the results of his investigations before the society, in whose *Journal* they were regularly published. It was during this exploration, and while he was ascending the Berbice River, that he discovered, January 1, 1837, the magnificent aquatic plant, the *Victoria regia* (q.v.), described in his *Description of British Guiana* (Lond. 1840), and his magnificent *Views in the Interior of Guiana* (folio, 1841). In 1840 he returned to Guiana to survey the colony for government, and to draw the long controverted 'Schomburgk-line' as a provisional boundary with Venezuela (q.v.) and Brazil, and was knighted. He was accompanied by his brother Richard, whose *Reisen in Britisch-Guiana, 1840-44* (Leip. 1847-48) embody the results of this expedition. In 1847 the former published an excellent and elaborate *History of Barbadoes*, and in the following year departed for San Domingo, whither he had been accredited as British consul and representative. In this new sphere he continued to pursue his geographical and scientific researches, the results of which he communicated to the Geographical Society till 1853. In 1857 he was appointed British representative to the Siamese court, but returned to Europe ill in 1864, and died 11th March 1865 at Schöneberg near Berlin.

Schönbein, CHRISTIAN FRIEDRICH, chemist, was born at Metzingen in Württemberg, 18th October 1799, studied natural science at Tübingen and Erlangen, and visited England in 1826, and after that Paris. In 1828 he was called to a chair in the university of Basel. In 1839 he discovered *Ozone* (q.v.), and he invented *Gum-cotton* (q.v.) in 1845, obtaining from it by solution in ether the material called Collodion (q.v.). In his later years he confined himself chiefly to experiments

with oxygen. Of his works the chief are *Das Verhalten des Eisens zum Sauerstoff* (Basel, 1837), *Beiträge zur physikalischen Chemie* (1844), *Ueber die Erzeugung des Ozons* (1844), *Ueber die Verbrennung der Körper in atmosphärischer Luft* (1845). He died on 29th August 1868. See *Lives by Hagenbach* (1869), and *Stahlbaum and Schner* (1901).

Schönberg, ARNOLD, a striking Austrian composer, born in Vienna, 13th September 1874, was largely self-taught in music; he has resided mostly in Berlin and Mödling, near Vienna. His earlier compositions are either late Wagnerian, such as the sextet *Verklärte Nacht* (1899) and the *Gurrelieder* (1900), or severely contrapuntal, such as the *Kammersinfonie* (1906) and the two string quartets (1905, 1907). His later works—*Three Piano Pieces* (1909), *Pierrot Lunaire*, a series of twenty-one short songs (1912), the monodrama *Erwartung*, the quintet (1925) are characterised by the development of principles of atonality, where each of the twelve notes of the octave is considered of equal importance, and the different relations of tonic, dominant, &c. are eliminated. Schönberg published a *Harmonielehre* (1911; rev. ed. 1922). See the Study by Wellesz (1921; trans. 1924).

Schönbrunn, a palace in the outskirts of Vienna, was the summer residence of the imperial family. It was built by Maria Theresa in 1744, and has attached to it a zoological and a botanical garden. The treaty of Vienna was signed within.

Schönebeck, a town of Prussia, 9 miles by rail south of Magdeburg, on the left bank of the Elbe. Great quantities of salt are made, and there are manufactures of machinery, chemicals, starch, &c. Pop. 21,400.

Schöneberg, a town of Prussia, now incorporated in Berlin.

Schönherr, KARL, dramatist, novelist, and poet, was born at Avans in Tirol in 1868, and for some years practised as a doctor in Vienna. His career as a dramatist has been very successful, his best known plays being *Der Bildschnitzer* (1900), *Erde* (1907), *Glaube und Heimat* (1910; perhaps his most powerful effort), *Der Weibsträufel* (1915), and *Der Kampf* (1920). Schönherr has never lost the robust directness and elemental simplicity of his early peasant environment. He has published some dialect poetry, while one of his novels, *Aus meinem Werkbuch*, is partly autobiographical.

Schönlein, JOHANN LUKAS, professor of medicine, was born at Bamberg on 30th November 1793, studied medicine at Landshtut, Würzburg, Jena, and Göttingen, and began to lecture at Würzburg in 1819. In the following year he was appointed professor of Clinics and Therapeutics there; in 1833 he removed to a similar chair at Zürich; and in 1839 he was called to Berlin to be professor of Pathology and Therapeutics, and to preside over the clinical instruction given in the Charité hospital. He retired in 1859, and died at Bamberg on 23d January 1864. His principal merit is that he introduced into Germany the exact methods of study which were in vogue in England and France, and thus founded what was called the Natural History School of Würzburg (see MEDICINE). See *Life by Rothlauf* (1874).

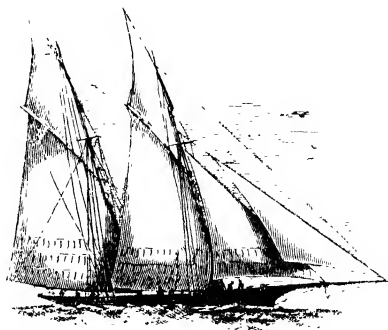

Schoodic Lakes (pron. SKOODIK), a group of twelve lakes in the east of Maine, U.S., drained by the Schoodic, or west branch of the St Croix.

Schoolcraft, HENRY ROWE, American ethnologist, was born in New York state, 28th March 1793, studied at Union College, and in 1817-18 visited the mining region west of the Mississippi,

afterwards publishing a *Journal* (1819; revised 1853). He also published a narrative of General Cass's exploring expedition to Lake Superior and the Upper Mississippi (1820), of which he was geologist. In 1822 he became Indian agent for the tribes about the lakes, and in 1823 he married the granddaughter of an Ojibway chief, who had been educated in Europe. From 1828 to 1832 he was an active member of the legislature of Michigan territory, and founded its Historical Society, and the Algic Society of Detroit. In 1832 he commanded an expedition which discovered the sources of the Mississippi (*Narrative*, 1834). While superintendent and disbursing agent for the Indians, he negotiated treaties by which the government acquired lands to the extent of 16,000,000 acres. In 1845 he collected the statistics of the Six Nations (*Notes on the Iroquois*, &c. 1848). In 1847 congress authorised him to gather, collate, and edit all accessible information relating to the Indians. The result is to be found in his *Historical and Statistical Information respecting the History, Condition, and Prospects of the Indian Tribes of the United States* (5 vols. 1851-55, published by congress at a cost of nearly \$30,000 per vol., with over 300 illustrations; a sixth was added by Schoolcraft in 1857). His numerous other works include many poems, a *Life of Cass*, *Algic Researches* (1839), *The Red Race of America* (1847), *Thirty Years with the Indian Tribes* (1851), *The Indian in his Wigwam*, &c. He died 10th December 1864.

Schools. See EDUCATION, ARMY, MILITARY SCHOOLS, ART, CHRISTIAN BROTHERS, CHRISTIAN SCHOOLS (BROTHERS OF); the articles on the great English public schools; and for the Schoolmen, SCHOLASTICISM.

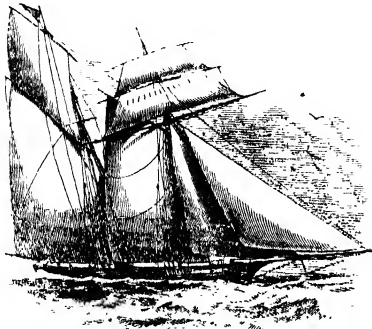

Schooner. A swift vessel, originally with two masts, though now frequently with a greater number. The schooner proper is supposed to have been introduced at the beginning of the 18th century, and was rigged 'fore-and-aft' fashion,

Fore-and-aft Rigged Schooner.

but 'topsail schooners' are very common. In the former, both foremast and mainmast are rigged like a cutter, with fore-and-aft sails. In the latter the foremast usually carries square topsail and topgallant sails. Topsail schooners, though carrying no square foresail, have a sail on a yard for running free which is set 'flying,' that is, hoisted from the deck. On a wind the fore-and-aft rig has a great advantage; but before the wind the 'squaresails' are superior. The schooner is a favourite type for the larger class of yachts, and before the introduction of steam was employed much in the packet service.

Schooners are still employed in the merchant service for running small cargoes and for coast-

Topmast Schooner.

trading. They are easily managed by a small crew. See SAIL, YACHT.

Schopenhauer. ARTHUR, the founder of systematic modern Pessimism (q.v.), was born at Danzig, 22d February 1788. His father was a banker; his mother, Johanna Trosina (1766-1838), wrote twenty-four volumes of novels and novelettes, and on her husband's death settled in 1806 at Weimar, where she saw much of Goethe. Schopenhauer, after resigning the business career for which his father had trained him by travel and residence in foreign countries (France, England), acquired a classical education at the schools of Gotha and Weimar; and having after his father's death inherited a patrimony of £150 a year, entered the university of Göttingen in 1809, heard later Fichte and Schlegelmacher, and devoted much attention to physical and medical science in Berlin. He graduated at Jena with his first work, *On the Fourfold Root of the Principle of Sufficient Reason*, a treatise in which he seeks to classify the principles which determine respectively the provinces of Physics, Logic, Mathematics, and Ethics. Schopenhauer's philosophy, although not devoid of elements of objective value, is a perfect expression of his most unique personality, and cannot be fully understood save in connection with his character. He inherited from his father an unbreakable energy of character (some friends of his youth called him a *Jupiter Tonans*) and cosmopolitan, freethinking sympathies, and from his mother a brilliant polish of mind and facility of literary expression. His mind was not formed by years of patient acquisition but by the society of his seniors and by a congeries of vivid sights and experiences of travel, and retained to the end its habit of seizing at a conclusion through the force of intuition or apprehension rather than of reasoning. Inner discord was the keynote of his life in that in him the subjective and the objective, feeling and reason, were in perpetual conflict; he believed the tendency of life to be to separate more and more the heart and the head. His disposition was heavy and severe, dark, mistrustful and suspicious, preventing him from entering into permanent trustful relations with men or women: his mother desired him to live apart from her after the death of her husband, and he could hardly think seriously of marriage as he saw only in woman a wayward, mindless animal—ugly too he said—existing solely for the propagation of the species, an end which perpetuated the woe of the world. Lastly he

believed that he had brought to the birth a philosophy which made himself the successor of Socrates, since whose time nothing had been done in philosophy save Kant's undoing of the mass of traditional error; and he saw himself and his thinking passed over until he was sixty, and what he regarded as fatuous ravings (the Fichte-Schelling-Hegel philosophy) praised as the highest wisdom, so that he was tempted to believe there was a conspiracy of professors of philosophy against him and his truth. The cardinal articles of his philosophical creed, which he seized as it were by intuition early in life, were: first, Idealism (Idealism is of course more likely to lead to Pessimism than Realism, as it believes the world to be illusory)—Subjective Idealism—i.e. that the world is my idea, a mere phantasmagoria of my brain, and therefore in itself nothing; secondly, that the way of knowledge or speculation to the centre of things, to the 'thing-in-itself,' was demolished for ever by the immortal criticism of Kant (it simply galled him to fury to hear Schelling talking of *knowing* God by '*Intellectual Intuition*'); and thirdly, that there was accessible to the mind, to the intuition of genius, the contemplation of the Platonic ideas—that is, the ideas of Art, the only knowledge not subservient to the Will and to the needs of practical life.

His own contribution to the sum of human knowledge, as he thought, was the truth that Will, the active side of our nature, or Impulse, was the key to the one thing we did know directly and from the inside—i.e. the self (all else of course we know from without and through the self), and therefore the key to the understanding of all things from the atom up through plants and animals to the starry systems. His philosophy thus is, as he puts it, that the world is through and through Will, and also (but secondarily) through and through Idea: Will is the creative, the primary, while Idea is the secondary, the receptive factor in things—a mere offshoot from the brain. There is thus a pronounced Materialistic side to Schopenhauer's philosophy which is inconsistent with his Idealism; he always taught too the descent of man from some lower form of life—the basis of his theory that what animals wanted from man was not compassion but justice and equality, although of course as a metaphysician he deprecates a natural as opposed to a philosophical explanation of the world. Time, as he said, is only in us a form of our thought; and Schopenhauer had no sense for history. His chief book, *The World as Will and Idea* (1819), expounds in four books the Logic, the Metaphysic, the Aesthetic, and the Ethic of his view; it teaches a pantheism of the Will (Panthelism), and defends the extension of the word Will as blind irresistible energy or impulse (it is essential to remember the irrationality of the Will in Schopenhauer) to include all processes from attraction and gravitation to motivation, which last is simply 'causality seen from within.' He collected in the *Will in Nature* what he deemed the scientific confirmations of his doctrine. The first need of praise which fell to him was the crowning by the Norwegian Academy in 1839 of his prize essay on the *Freedom of the Will*, in which he defends the phenomenal necessity or determinism of the Will and its supra-sensible freedom. His ethical theory rests on sympathy, the treatment of self and others as not two or many but as one and the same, as both the manifestation of the All-Will which rises to a feeling of hunger in the stomach, gnawing in the teeth, thinking in the brain, &c. Sympathy, however, is only a 'civic virtue'; the highest virtue is asceticism, the denial of the Will to live, in which the Intellect through contemplation of the idea of Art frees itself from desire and willing and pierces the 'Veil of Maya'

(Illusion) which hides from us the supra-sensible, and the Will is reduced to its original state of quiescence or potency. Remove the Will from life and there is no more: 'before us there is certainly Nothing.' Schopenhauer preferred Buddhism and Mysticism and Anchoretic Christianity to the reigning forms of religion and to Rationalistic Theism. He gave out his occasional papers in the *Pureza* and *Paralipomena* (1851), which more than the other works express the man himself, illustrate the eloquence of his pen, and perhaps have led people to his shrine who know next to nothing of his strict theory. In an appendix to *The World as Will and Idea* he criticises the Kantian theory of knowledge as laying too much weight on the Reflective or Indirect Method as opposed to the Intuitive or Direct. His essay on *Seeing and Colours* (1816) contains practically Goethe's theory of colours; Goethe had been pleased to get Schopenhauer's help in his optical researches, and had predicted for Schopenhauer a hearing in the world. From Weimar and university circles Schopenhauer had gone to Dresden (1814-18) for the writing of *The World as Will and Idea*; thence he had gone to Italy; his unsuccessful attempt as lecturer in Berlin University was made in 1820. Of two lawsuits one concerning money matters was settled in his favour through his own legal acumen; the other ended in his having to pay £9 a year to a seamstress as compensation for injuries received by her when the irate philosopher ejected her with violence from his rooms as an intruder. After renewed travel and residence in the south he finally in 1831 left Berlin for Frankfurt-on-the-Main, where he chose to live as an isolated thinker until his death there, 21st September 1860. Franenstädt, his literary executor, was the chief of his 'evangelists' and 'apostles'—as he called the most enthusiastic of his admirers.

The complete works of Schopenhauer were edited by Frauenstädt (6 vols. with introduction, 1876), who also edited his Letters (1854) and published a *Schopenhauer Lexikon* (1871). There is an English translation of *The World as Will and Idea*, by Lord Haldane and Kemp (1882-86), and of the *Fourfold Root and Will in Nature* (1888); B. Saunders made several translations from the *Pureza*, with introductions, and wrote a separate Essay (1901); a volume of *Selected Essays*, by E. B. Bax, appeared in 1891, and another selection, *The Wisdom of Schopenhauer*, by W. Jekyll in 1911. One of the most important German Lives is by Gwinner (1862), but there are others by Haym (1864), Meyer (1872), and Volkelt (1907). In English there are Lives by Zimmerman (1876), Wallace (1890), and Whittaker (1909), and a study by Caldwell (1896). In French there are books by Ruyssen (1911) and Seillière (1911). See PESSIMISM, and the works cited there.

Schorl-rock, a compound of quartz and schorl or black Tourmaline (q.v.). It may be fine or coarse grained. Sometimes it consists principally of quartz with prisms of schorl scattered irregularly through it; at other times it may be so fine grained as to form a blackish-gray mass in which the naked eye cannot distinguish the separate ingredients. The rock occurs associated with granite and the crystalline schists.

Schottische (a Frenchified form of the German word for *Scottish*), a somewhat fanciful name given to a slow dance in ¾ time.

Schouwen, an island of Holland, in the province of Zeeland, with an area of 62 sq. m. Chief town, Zierikzee.

Schrader, EBERHARD (1836-1908), a learned Assyriologist, was born at Brunswick, studied at Göttingen, where his bent towards oriental studies was confirmed by Ewald, and became ordinary professor of Theology at Zurich in 1863, Giessen in

1870, and Jena in 1873. In 1875 he obeyed a call from Berlin to the chair of Oriental Languages, with a seat in the Academy of Sciences.

His earliest books were devoted to Old Testament criticism—*Studien zur Kritik und Erklärung der biblischen Urgeschichte* (1863), and a fresh edition—the eighth—of *De Wette's Einleitung* (1869). Turning next to Assyriology, he quickly placed himself at the head of German scholars by an unrivalled combination of wide erudition and critical sagacity. His books are *Die Assyrisch-Babylonischen Keilschriften* (1872); *Die Keilschriften und das Alte Testament* (1872; 2d ed. 1883; Eng. trans. 2 vols. 1885-86); *Die Höhlenfahrt der Istar* (1874); *Keilschriften und Geschichtsforschung* (1878), in which he combats in masterly fashion the attack of the historian Gutschmid on the method and result of work in the cuneiform inscriptions; and *Zur Frage nach dem Ursprung der Babylon. Kultur* (1884). There is a translation by F. B. Jevons of his important *Prehistoric Antiquities of the Aryan Peoples* (1890).

Schreiner, OLIVE (1859-1920), a gifted South African authoress, daughter of a Lutheran clergyman at Capetown, who started the conventional English world of letters in 1883 by *The Story of an African Farm*: a Novel. By Ralph Iron, a description in simple yet forcible style of rough life on a Boer farm, and of the spiritual problems that rend an inquiring soul. *Dreams* (1890), a group of spiritual allegories, was followed by *Dream Life and Real Life* (1893), *Trooper Peter Halket of Mashonaland* (1897), and *Women and Labour* (1911). She opposed the policy of Rhodes, and during the war of 1899-1901 was an active pro-Boer. Her husband, Mr Cronwright-Schreiner, wrote her life (1924) and edited her letters (1924) and her unfinished novel *From Man to Man* (1926).

Schreker, FRANZ, Austrian composer, was born at Monaco in 1878. In 1911 he founded the Philharmonic Choir in Vienna, becoming its first conductor, and in 1920 he was appointed director of the Berlin High School of Music. His principal works—the operas *Der Ferne Klang* (1912), *Das Spielwerk und die Prinzessin* (1913), *Die Gezeichneten* (1918), and *Der Schatzgräber* (1920), and the Chamber Symphony (1923)—are characterised by a certain eroticism, a thickness of texture, a love of colour, and rather a daring choice of subjects.

Schrevelius, CORNELIUS, born at Haarlem in 1615, became in 1642 rector of the university of Leyden, and died 11th September 1664. He was a laborious and erudite man, but possessed little critical discernment. His most notable performance was a *Lexicon Graeco-Latinum et Latino-Graecum* (Leyden, 1654), of which there have been innumerable editions. He also excelled between 1648 and 1665 many *variorum* editions of the classics—Juvenal, Hesiod, Terence, Virgil, Horace, Homer, Martial, Lucan, Cicero, Ovid, and Claudian.

Schubart, CHRISTIAN DANIEL, poet, was born 13th April 1739 at Sontheim in Swabia, and studied theology, afterwards becoming schoolmaster and organist, first at Geisslingen and then at Ludwigsburg. But he wrote satirical poems and spoke unadvisedly, lost his post, and then led a wandering life in various cities and countries, giving poetical readings and piano performances. He got into difficulty in Austrian territory near Ulm, was enticed back to Württemberg by the prince, whom he had greatly irritated by a stinging epigram, was carried to the fortress-prison of Hohen-Asperg (1777), and there pined for ten years. Then he was set free by intervention of the Prussian court, and straightway appointed court musician and theatre-director at Stuttgart to the same prince who had kept him all these years in prison. But he was utterly broken in health, and died 10th October 1791. His poetry is very unequal in value;

he was an effective satirist of abuses in church and state, and some of his patriotic pieces, odes and hymns, have real poetic worth; but he is chiefly remembered for his tragic fate, and for the influence his work exercised on Schiller. His *Gesammelte Schriften* (including essays and newspaper articles) fill 8 volumes.

See the autobiographical *Schuberts Leben* (1793), and monographs on the man by D. F. Strauss (1849), Hauff (1885), and Nägele (1888).

Schubert, FRANZ PETER, the celebrated composer, was born in Vienna on January 31, 1797. His father, who came of a Moravian peasant stock, had settled some years previously as a school-master in a district of the city called the Lichtenthal; his mother before her marriage had been a cook. Their two elder sons, Ignaz and Ferdinand, adopted the father's calling. Franz's musical gifts very early declared themselves. At first he was taught the violin by his father, and the piano-forte by his brother Ignaz; but he very soon outstripped their powers of instruction. His training was therefore entrusted to Holzer, organist of the parish church, whose raptures over the boy's talents were a poor substitute for the conscientious care which they demanded. Before he was eleven years of age young Schubert was leading soprano in the Lichtenthal choir, whence he was soon transferred to the Konvikt or choristers' school of the Court-chapel. Franz at once took his place as one of the violin-players in the school band, where he soon became leader. The constant practice thus afforded him was doubtless an inestimable advantage, though it must always be regretted that his theoretical training was practically left to take care of itself; for Ruzicka, the music master at the Konvikt, seems to have taken much the same line with Schubert as Holzer had done before him. The circumstances of the school were not favourable to study. The boys were allowed to go hungry, and in winter without fire, so that even practice was carried on under difficulties. But Schubert's thirst for composition triumphed over all such obstacles, and in its endeavour to be satisfied interfered seriously with his progress in the ordinary curriculum. He made many friends at this time, for his schoolfellows were all proud of his gifts and were delighted to take part in the performance of his compositions; while in Spann, one of the senior choristers, he found a benefactor who kept him supplied with music-paper, a luxury beyond the reach of his own very slender resources. During the five years thus spent Schubert tried his hand at almost every kind of composition, the work which marks the completion of this period being a symphony in D (October 28, 1813).

On his departure from the Konvikt he became an under-teacher in his father's school in order to avoid the conscription. Even at this early date he wrote some of his most enduring compositions. Of these may be mentioned that immortal song the *Erl King*, truly marvellous as the work of a youth of eighteen, and the Mass in F, first performed by the Lichtenthal choir under the direction of the composer. Among those who congratulated him on this occasion was Salieri, under whose guidance his more recent studies had been made. Schubert's delivery from the drudgery of his father's school was brought about by Franz von Schober, a young man of his own age, who had met with some of his songs, and who, on coming to the university of Vienna, lost no time in finding out the composer. As soon as he became aware of Schubert's anomalous position, he proposed that he should share his lodging and be free to devote himself entirely to his art. Franz fell in with the arrangement, which, however,

was put an end to by the interference of Schober's brother after a few months, when Schubert was doubtless laid under a similar obligation to other friends; for, with the exception of £4 paid to him for a cantata written for a Herr Watteroth, his work as yet had brought him in nothing. His short residence with Schober was marked by an event which had a lasting influence on his career—his acquaintance with Vogl, the eminent singer and actor, who very soon appreciated his genius, and became his firm and most valued friend. Vogl's fine literary taste enabled him to curb that omnivorous instinct of Schubert's which impelled him to lavish his treasures of melody on words altogether unworthy of them. To him also Schubert owed the recognition (inadequate as it was) of his talents by the Viennese, for Vogl constantly sang his songs at the houses of people of influence in the first instance, and eventually in public.

In 1818 Schubert became teacher of music in the family of Count Johann Esterházy at his country seat at Zélessz, in Hungary, where he passed several months, finding in the beauty of his surroundings a new stimulus to composition. The end of the year, however, saw him back in Vienna and installed in lodgings with the poet Mayrhofer. The two would often work together in the same room, the one writing verses which the other as rapidly set to music. On February 28, 1819, Schubert was first brought before the public as a composer by the performance of one of his songs, the *Schäfers Klagefiel*, at a concert in Vienna. In the summer he made an extended tour with Vogl, and found time to compose, during a halt at Steyr, his well-known pianoforte quintett (op. 114). His comic operetta, the *Zwillingsbrüder*, finished 19th January 1819, was produced at the Kärnthnerthor theatre on June 14, 1820, and two months later came the first performance of the *Zauberharfe* at the Theater-an-der-Wien. His appearance in print was delayed until April 1821, when his old schoolfellow Leopold Sonnleithner and another friend named Gynnich had the *Erl King* engraved at their own cost. But as Schubert's songs began to be heard more frequently the enthusiasm with which they were received at length overcame the hesitation of publishers in accepting his MSS. As many as twenty songs were issued in eight months, but unfortunately no permanent pecuniary benefit was secured to the composer. In 1822 Schubert completed his opera *Alfonso and Estrella*, the libretto of which was furnished by Schober. It was rehearsed at Gratz, but was not brought to performance during the composer's lifetime. Liszt produced it at Weimar in 1854; but it did not meet with any real success until March 1881, when with a new libretto and considerable curtailment it was produced at Carlsruhe. To 1822 belong also the two movements of the unfinished symphony in B minor, in which for the first time in his orchestral writings Schubert displays a complete individuality. His first acquaintance with Weber and his formal introduction to Beethoven are also noteworthy among the events of this year.

During 1823 Schubert devoted much attention to dramatic music, writing with great rapidity the three-act opera of *Fierabras*; but to himself these labours resulted only in intense disappointment and depression, although we owe to his efforts in this direction the beautiful *Rosamunde* music, the orchestral parts of which were discovered at Vienna in 1867 by Sir George Grove in a cupboard where they had remained untouched for forty-four years. A second long stay with the Esterházys at Zélessz restored Schubert from his state of extreme dejection, the visit being marked by the composition of many important works, including some pianoforte

duets written for his two pupils, the daughters of Count Esterházy. Of these the best known is probably the *Divertissement à la Hongroise*, inspired by Hungarian airs which Schubert heard sing by a servant as he passed the door of the kitchen. The summer of 1825 was devoted to a pleasure tour with Vogl, the two friends delighting every one with their performance of Schubert's new songs from Walter Scott's *Lady of the Lake*, to which he referred when he wrote 'The way in which Vogl sings and I accompany, so that for the moment we appear to be one, is something quite new and unexpected to these good people.' And yet the seven songs which proved so successful were sold on his return to Vienna for the paltry sum of £20!

The compositions of 1826 included a quartett in D minor and the pianoforte sonata in G, usually known as the *Fantasia*. One of Schubert's happiest inspirations, the song *Hark! Hark! the lark*, came suddenly upon him as he sat in a beer-garden one Sunday afternoon in July; his other Shakespearean songs, *Who is Sylvia?* and the 'drinking song' in *Antony and Cleopatra*, being also attributable to this date. In the autumn he missed a probable appointment as director of the music at the Court Theatre of Vienna through his refusal to alter certain pieces which he had composed as a test of his fitness for the post. Some months later Schubert's songs were brought under the notice of Beethoven. They were put into his hands during his last illness by his devoted attendant Schindler, who had Schubert's welfare much at heart. The perusal of them was a revelation to him, and drew from him the exclamation: 'Truly Schubert has the divine fire!' A recurrence of his malady prevented his acquaintance with Schubert's other works, but he often spoke of him and foretold the stir which he was destined to make in the musical world. During these days Schubert twice visited the man whom of all others he admired, and, when the end had come, was one of the torch-bearers at Beethoven's funeral.

In 1827 Schubert was elected a member of the representative body of the Musical Society of Vienna, an honour which he greatly appreciated, while his prospects were further brightened by advantageous proposals from foreign publishers, the best possible proof of his growing reputation. He was thus spurred on to surpass his former achievements in the composition of his noblest symphony (No. 9 in C), begun in March 1828, and if possible more characteristic of him than the earlier one in B minor. His rate of production during this his last year was truly prodigious, for besides the symphony he wrote his Mass in E flat, the oratorio *Miriam's War-song*, the string quintett in C, and three pianoforte sonatas. He also composed several songs, the words of which his friend Schindler had found among Beethoven's papers. One of these, *Die Taubenpost*, is dated October 1828, and is probably the last piece written by Schubert. He gave his first and, as it proved, his only concert in the hall of the Musik-Verein at Vienna on the evening of March 26. The venture was extremely successful, so that for the time being the needy composer was placed beyond want, although he had to abandon his usual summer excursion on account of his poverty, which must indeed have been extreme, since he was driven to dispose of some of his finest songs for a few pence apiece.

At the end of August he took up his abode with his brother Ferdinand in a new house in the suburb of Neue Wieden, but the change seems to have had a bad effect upon his already weak state of health. He recovered sufficiently to join some friends in a short walking tour; but his illness soon returned, bringing with it complete loss of appetite. Yet he was as active as ever, both in

body and in mind. He walked much, and talked of his plans for a proposed new opera, *Graf von Gleichen*. He was able to go to hear Beethoven's quartett in C sharp minor, which greatly moved him, and to attend the first performance of a Requiem composed by Ferdinand Schubert. At the same time a study of Handel's scores caused him to reflect upon his own deficiencies in counterpoint, and to determine to remedy them by a course of lessons with Sechter, the best-known authority on the subject. The dates of the lessons were fixed and the text-book chosen. But Schubert's time for work was now over. On November 11 he wrote to Schöber telling him that for eleven days he had taken neither food nor drink, and asking for some of Cooper's novels to read. A few days later he became delirious and was found to be suffering from an attack of typhus fever, to which he succumbed on Wednesday, November 19, 1828, in the thirty-second year of his age. In accordance with his latest wish his remains were buried near Beethoven's grave in the cemetery of Währing; they were reinterred in the central cemetery of Vienna on September 23, 1888.

Among composers Schubert is remarkable for the apparently ceaseless impulse to compose which possessed him; and, as a consequence, for the vast and, considering the shortness of his life, almost incredible quantity of music with which he has enriched the world. He is still more renowned for the absolute spontaneity of his writings and for the poetic spirit with which he has imbued them. But his special and peculiar evidence lies in the department of song-writing, in which he reached the highest limit of excellence, the earliest of his lyrical productions attaining perfectly mature examples of artistic musical form applied to song. In other branches of composition the deficiencies of his theoretical training are often evident, but here his instincts were never at fault. There were occasions when the torrent of inspiration rushed upon him with irresistible force. At such times the recitation or perusal of a poem seemed to touch some hidden spring in him, and in a few moments he had wedded it to music in such perfect accord with the words that the finest poems of the greatest poets were by his means not so much enhanced as transcended. His usual custom, however, was to write steadily for a long time every morning; and he would sometimes compose six or seven songs in his best manner in less than an hour. But the lyrical spirit was by no means confined to his songs; it found a way into his instrumental works, which reveal

wonderful prodigality of ideas, although comparatively little learning is displayed in turning them to account. In his orchestral writings Schubert is celebrated for extraordinary delicacy in his method of instrumentation, especially in his treatment of the wood-wind; and this is the more remarkable from the fact of his never having heard the effect of his very finest passages—for some of his noblest pieces were not performed until long after his death. He rarely altered anything he had written, and could never understand the immense pains taken by Beethoven in perfecting his scores. Schubert wrote as one impelled by an urgent necessity to relieve his mind of ideas, which in his case were sometimes forgotten as soon as they were committed to paper—a fact which will be the more readily appreciated when it is remembered that, although his years were fewer than those of any other master of the first rank, he composed more than 500 songs, ten symphonies (including two left unfinished), six masses, a host of sonatas and other works for the pianoforte, a number of string quartetts (those in minor and D minor being especially fine), as

well as several operas, cantatas, and overtures. Schubert's personal character was extremely modest and retiring; hence perhaps, to some extent, his failure to obtain any permanent appointment by which he might have been delivered from that sadly precarious mode of existence which doubtless hastened his end. His sweetness and amiability of disposition endeared him to every one, while he was generous to a fault. The insignificance of his appearance gave no token of the genius it concealed; his friend Lachner describes him as 'looking like a cabman.'

See Grove's article, revised by Hadow, in Grove's *Dictionary of Music*; Laves by Hellborn (1866), Frost (1881), Duncan (1905), and Dahms (1912); works on Schubert's songs by Risse (in German, 1872), and de Curzon (in French, 1900).

Schulze-Delitzsch, HERMANN, founder of the people's banks of Germany, was born on 29th August 1808, at Delitzsch, a small town of Prussian Saxony. He was educated to follow the law, at Leipzig and at Halle, and entered the public service of Prussia; but in 1841 he settled down in his native town as patrimonial judge (a kind of estate manager discharging also judicial and administrative functions), and thenceforward devoted his life to the better economic education of the small farmers and operatives amongst whom he lived. When the National Assembly was called together in Berlin in 1848 Schulze-Delitzsch, who represented his native town, was chosen chairman of a commission to inquire into the distress prevailing amongst the labouring and artisan classes; and two years later, for protesting that it was unjust to tax the people when their representatives were not allowed to deliberate together, he was tried on a charge of treason, but was acquitted. On his return to Delitzsch he started the first people's bank. In these institutions the subscribers, all contributors of small sums, received credit and dividends in proportion of their savings; the joint credit of the association was used for borrowing money; and the banks were managed by a board of the subscribers. By 1859 there were already more than two hundred of these banks in the central districts of Germany; and in that same year, at a congress which met at Halle, these were united under one organisation, with Schulze-Delitzsch as manager. The system was introduced with great success into Austria, Italy, Belgium, and Russia; and when its deviser and founder died, on 29th April 1883, at Potsdam, there were in Germany alone 3500 branches, having twelve million members, with a share capital of £10,000,000 and deposits to more than twice that sum. In 1861 he again took his seat in parliament, joining the Progressist party and labouring for constitutional reform. When Lassalle began to agitate for state loans to productive associations he found Schulze-Delitzsch, a firm believer in self-help, writing and speaking in opposition to him. 'He who preaches to the people self-help, self-responsibility, self-reliance as the condition of their economic independence and political freedom must in the first place practise these principles in his own life,' such was the social creed he lived by. And when the members of his party wished to make him a gift of £7000 in recognition of his disinterested labours in behalf of social reform, they could only prevail upon him to accept £1000 for himself; the rest he set aside for the payment of men who should promote the cause of social reform. An account of his system of people's banks is contained in *Forschungs- und Kredit-Vereine als Volksbanken* (5th ed. 1876); besides this he wrote *Die Entwicklung des Genossenschaftswesens* (1870) and other books on co-operation.

See the Life of him by Bernstein (1879), the article CO-OPERATION, and books there cited.

Schumann, ROBERT, the great apostle of the Romantic school in music, was born at Zwickau in Saxony, 8th June 1810. His father was a man of a distinctly artistic turn of mind, and until his death in 1826 Robert had every encouragement to indulge any taste he had for music. No very decided manifestation, however, was apparent until Schumann's mother and guardian had to face a most unwelcome desire on the part of the young man, who should have been pursuing his law studies. His mother was sorely troubled, and sought advice from Frederick Wieck, the eminent pianoforte teacher. His answer favoured Schumann's ardent ambition, and at the age of twenty-one, after a desultory course of law and philosophy, a good deal of observant travel in Germany, Switzerland, and Italy, and a thorough course of Jean Paul Richter, Schumann began to qualify himself for his great mission, and settled down in Leipzig as an ardent student of music under Wieck. In his haste to become perfect in his art he defeated his own ends; for, not content with arduous practising, he had recourse to mechanical means for improving the power of his hands—one of them so violent that he permanently disabled the third finger of his right hand. He turned perforce to composition, and his misfortune has proved our gain. In 1832 Clara Wieck, his teacher's daughter, who though only thirteen years of age was already an accomplished pianist, made a deep impression on Schumann, which later developed into a still deeper and a mutual feeling.

In 1833 his first important pianoforte compositions were published (*Toccata*, &c.), and in the following year his overflowing energy conceived the idea of a new musical paper, and inspired three friends with the same enthusiasm for art criticism as he had himself. As editor of this *Neue Zeitschrift für Musik* for more than ten years he contributed many essays, some very fantastic, some of inestimable value, and all showing strong imaginative and poetical powers. His critiques on young composers are particularly interesting for their keen critical acumen, their frank admission and fearless proclamation of any good quality in any artist however young or unknown, and their generous encouragement of all earnest workers. For an account of Schumann's charming idea of an imaginary society, the *Davidbündler*, reference must be made to a more detailed notice of his life.

From the year 1836 his genius for composing asserted itself more and more, and it is very interesting to notice how it seems to have turned deliberately and methodically from one branch of composition to another. His greatest pianoforte works were written between 1836 and 1839 (*Fantasia*, *Noctetten*, *Kinder-scenen*, *Kreisleriana*, *Humoreske*, *Faschingsschwauk*, &c.). The reception of these works was on the whole very encouraging, and against the neglect of some authorities, and the adverse criticism of others, Schumann had the support of such as Liszt and Moscheles.

In 1835 Mendelssohn came to Leipzig filled with the energy and enthusiasm which in a few years raised Leipzig to the dignity of the most important musical centre in Germany. Schumann with ready and generous appreciation at once fell down and worshipped. 'I look up to Mendelssohn as to a high mountain peak,' he wrote. He accepted a professorship in the new Conservatorium, but he was eminently unfitted for such work, and in a short time he resigned the appointment. In 1836 a visit to Vienna yielded important though indirect results. Interested as he was in Franz Schubert's writings, he made thorough investigations for possible MSS., and was rewarded with the score of the C major symphony, which he forwarded to Mendelssohn in Leipzig, and it was performed there

for the first time eight years after the composer's death. At length in 1840, in spite of Wieck's opposition, he married his daughter Clara Josephine (born 13th September 1819). And as the time of trial had inspired some of his most tender works, notably many songs, so the perfect happiness of the next few years gave his compositions an impulse to a richer, fuller style, characterised by more repose. In the following year he turned his attention to instrumental work, and rapidly produced three symphonies and the romantic concerto in A minor. Chamber music next claimed his attention, and the three beautiful quartets prepared the way for what is probably the most widely popular, as it is one of the most perfect, of all Schumann's concert pieces—the *Quintet* for pianoforte and strings. The pianoforte *Quartet* belongs to the same year (1842). In 1843, the last year of his residence in Leipzig, he produced two important choral works, *Paradise and the Peri*, which met with great success, and scenes from *Faust*. But the insidious disease which had been working in his brain since early youth, and which bereft him of reason before his death, broke out now in unmistakable symptoms, and in order to comply with medical advice he left the exciting musical life of Leipzig and settled in Dresden. For more than two years the state of his health gave his friends great anxiety, but in 1847 the clouds lifted—only, alas, to gather for the last dark years. From 1848 to 1850 works of all kinds appeared in rapid succession—*Genoëva* (his only opera), incidental music to Byron's *Manfred*, songs, and much instrumental solo and concerted music.

In 1850 Schumann was invited to succeed Dr. Hiller as musical director in Düsseldorf—a post for which he was as unfitted as he had proved for the professorship in Leipzig. He had none of the qualities necessary in a conductor—concentration of attention, prompt decision, resonance; and on one occasion in a fit of absent-mindedness went on beating time after the piece had concluded. Much desultory work, some remarkably fine, some only grand fragments, some never getting beyond ambitious design, belongs to the years in Düsseldorf (1850-54); but it became ever more and more evident that he must retire from his post as a conductor, and this, naturally enough, he could not be induced to consider necessary. Hence arose ill-feeling and unpleasantness. In 1851 his former ailment broke out anew, and his eccentricity gradually grew more marked. He was subject to most curious delusions, and devoted himself largely to the art of table-turning and spiritualism. One famous delusion was that the spirits of Schubert and Mendelssohn visited him; and once he jumped up during the night to note down a theme given him, as he imagined, by Schubert—the unfinished Variations on which were his last work. In February 1854, during an attack of extreme depression, he threw himself into the Rhine, but was rescued by boatmen. Insanity had asserted its sway, and Schumann spent the last two years of his life in a private asylum near Bonn, where he died in his wife's arms, July 29, 1856, aged only forty-six.

The characteristics of Schumann's compositions are great originality and fertility in subjects and themes, freshness, force, and piquancy in rhythm, and a wealth and resource in harmony which places him among composers not far from Bach himself. Those works which are cast in certain forms, as sonatas, symphonies, &c., do not always follow the recognised canon, but the exuberance of what is generally self-contained and restrained fancy maintains such unflagging vivacity and interest that the analytical faculty is often quite disarmed. Among

writers of songs and ballads he is second to none. The extreme originality and unconventionality of his work account for a tardy appreciation, but he has won a secure place now among the great composers. His talented and devoted wife laboured incessantly to obtain a hearing for his pianoforte compositions, and she lived to see her labours crowned with success. After his death she taught at the Frankfort Conservatoire, and played in the chief cities of Europe—her visit to London in 1886 was a splendid success. She died 20th May 1896.

Other biographies and criticisms will be found in Wasielewski's *Robert Schumann* (Dresden, 1858; 3d ed. Bonn, 1880; Eng. trans. 1878), the work of an intimate friend and a long recognised authority; Dr Spitta's admirable article in Grove's *Dictionary of Music*; Reissman's *Life and Works of Robert Schumann* (Eng. trans. 1886); *Life of Schumann told in his Letters* (trans. from the German by May Herbert, 2 vols. 1890); shorter Lives by Fuller-Maitland (1884), Annie W. Paterson (1903) and Herbert Bedford (1925); the study by Camille Maclair; and V. E. Wolff, *Schumann's Lieder*. The authoritative *Life of Schumann* by Prof. Niecks (ed. Christina Niecks, 1925) unfortunately lacks his final revision. See also Berthold Litzmann, *Clara Schumann* (3 vols. 1903-9) and Florence May, *The Girlhood of Clara Schumann*.

Schürer, EMIL, a learned biblical scholar, was born at Augsburg, 21 May 1844, studied at Erlangen, Berlin, and Heidelberg, became professor at Leipzig, Giessen, Kiel, and, from 1895, at Göttingen. He edited the *Theologische Literaturzeitung* from its commencement in 1876, after 1881 with Harnack. He died 30th April 1910. His chief books are *Schleiermacher's Religionsbegriff* (1868); *De Controversiis paschalibus* (1869); and the *Lehrbuch der neuesten Zeitgeschichte* (1874), re-issued (2 vols. 1886-90) as *Geschichte des jüdischen Volkes zur Zeit Christi*, and in its 3d ed. (3 vols., 1901-2) a standard work, translated into English and other tongues.

Schurz, CARL, born near Cologne, 2d March 1820, entered Bonn University in 1846, joined Kinkel (q.v.) in the revolutionary movement of 1848-49, and next year returned from Switzerland and effected his master's escape. In 1852 he passed to the United States, where he speedily engaged in politics, lectured, practised law, and as major-general of volunteers took part in several battles during the Civil war. Journalism next engaged his attention till in 1869 he was elected to the United States senate. In 1877-81 he was Secretary of the Interior, returned to editing, published lives of Henry Clay and Lincoln, and promoted Civil Service reform. He died in May 1906. See his *Reminiscences* (1909).

Schütz, HEINRICH (1585-1672), German composer, was chapel-master at Dresden from 1615, with a few interruptions, till his death. His settings of the *Passions* after the four evangelists, the oratorio *The Resurrection*, and other sacred works are very beautiful, while his opera, *Dafoe*, is regarded as the first German opera. Schütz is important as embodying the conflict between the old polyphonic and vocal music, and the new harmonic and instrumental music of the Italian Renaissance.

Schuyler, PHILIP JOHN, a leader of the American Revolution, was born at Albany, 22d November 1733, raised a company and fought at Lake George in 1755, and rendered other services during the French and Indian War. He was a member of the colonial assembly from 1768, and was a delegate to the Continental congress of 1775, which appointed him one of the first four major-generals. Washington gave him the northern department of New York, and he was preparing to invade Canada when ill-health compelled him to hand the command over to General Montgomery. He still

retained a general direction of affairs from Albany, but jealousies and complaints, especially from Gates, rendered his work both hard and disagreeable, and in 1779, after a congressional committee had acquitted him honourably of all charges, he resigned. He would not again accept a command, although he remained one of Washington's closest friends and advisers. Besides acting as commissioner for Indian affairs, and making treaties with the Six Nations, he sat in congress from 1777 to 1781, and was a state senator for thirteen years between 1780 and 1797, a United States senator in 1789-91 and 1797-98, and surveyor-general of the state from 1782. With Hamilton (who married a daughter) and John Jay he shared the leadership of the Federal party in New York; and he aided in preparing the state's code of laws. He died at Albany, 18th November 1804. See the Life by B. J. Lossing (enlarged ed. 2 vols. 1872), and G. W. Schuyler's *Philip Schuyler and his Family* (2 vols. New York, 1888).

Schuykill (pron. *Skoollkill*), a river of Pennsylvania, which rises in the coal region, near Pottsville, and, flowing 130 miles south-east, past Reading and Norristown, empties into the river Delaware at the southern limit of Philadelphia. This city is built on both sides of the river, and formerly drew its water-supply from it. Coal-barges ascend the river by dams and locks.

Schwabach, or LANGENSCHWABACH, a spa of Germany, 8 miles W. by N. of Wiesbaden, has eight springs impregnated with iron and carbonic acid gas, the water of which is efficacious in female complaints, poor blood, and muscular weakness.

Schwann, THEODORE, naturalist and founder of the cell-theory, was born 7th December 1810 at Nuss in Rheinland, studied at Bonn, Würzburg, and Berlin, and became assistant to Johannes Müller. In 1838 he became professor of Anatomy at Louvain, in 1848 at Liège, where he also lectured on physiology. He died at Cologne, 14th January 1882. He made many discoveries on digestion, muscular structure, contractility of the arteries, and the nervous system; but his chief contributions to science, practically establishing the cell-theory, are found in his classic *Microscopic Investigations on the Accordance in the Structure of Plants and Animals* (1839; Eng. trans. 1847), the main ideas of which are explained at CELL.

Schwanthaler, LUDWIG MICHAEL, a German sculptor, was born on 26th August 1802, at Munich, the descendant of an old family of Tyrolese sculptors, and was trained in the Munich Academy of Art and in his father's workshop. After a visit to Rome he set up a studio at Munich, and, being brought under the notice of King Louis, was charged to execute for the Glyptothek several bas-reliefs and figures. In 1832 he revisited Rome, for the purpose of preparing models for the national monument of Valhalla and the Pinakothek. On his return to Munich (1834) he began his bas-reliefs and sculptures for the Königsbau. In 1835 he was appointed professor at the Munich Academy. The number of his works is singularly great, while their excellence places him in the first rank of German sculptors. Yet, spite of his power of design, he is somewhat conventional in his conception; and his influence on art has not been all for good. The multitude of his commissions is responsible for a good deal of work being left to his assistants, and for the lack of careful finish such work shows. Among his remaining efforts may be mentioned two groups for the gable ends of the Valhalla, the colossal statue of Bavaria, 60 feet high, that stands in front of the Temple of Fame, statues of Goethe, Jean Paul Richter, and Mozart, of Venus, Diana, Apollo, Bacchus, &c., and many

others, both groups and single figures. He died on 28th November 1848, leaving his models to the nation.

Schwarz, BERTHOLD. See GUNPOWDER.

Schwarzburg, an old princely family of Germany, which traces its descent from a Thuringian count, Günther, whom St. Boniface converted to Christianity. The first to adopt the title of Schwarzburg was Count Sizzo IV., early in the 12th century. Count Günther XXXIX., who introduced the reformation into his states, was the common ancestor of the two lines of the Schwarzburg family: his son Johann Günther founded the line of Schwarzburg-Sondershausen, and Albert that of Schwarzburg-Rudolstadt.

SCHWARZBURG-RUDOLSTADT and SCHWARZBURG-SÖNDERSHAUSEN, two former sovereign principalities of Germany, situated partly in the Thuringerwald and partly in Prussian Saxony, and since 1919 forming part of the republican state of Thuringia (*Bundstaat Thüringen*). In the Saxon portion (where is found the Kyffhäuser, the mountain under which, according to the legend, Frederick Barbarossa sleeps) agriculture is the mainstay of the people; in the Thuringerwald, manufacturing industry (porcelain, glass, machinery, mathematical instruments, &c.), mining, forestry, and grazing. Education stands at a high level. The chief towns are Rudolstadt (14,887) and Sondershausen (9122). In 1922 a new division of the territories was made (see THURINGIA).

Schwarzenberg, a princely family of Germany, the head of which was raised (1429) by the Emperor Sigismund to the dignity of Baron of the Empire. Three of this family have acquired a European reputation. ADAM, Count of Schwarzenberg, who was born in 1584, became (1619) prime-minister and adviser of George William, Elector of Brandenburg. He was all-powerful during the Thirty Years' War, and brought down terrible calamities on Brandenburg by his obstinate refusal to join the Protestant union and his firm adherence to a policy of neutrality. He died 14th March 1641, shortly after the death of his master.—KARL PHILIPP, Prince of Schwarzenberg, won distinction as an Austrian field-marshal during the Napoleonic wars. He was born at Vienna, 15th April 1771, and first served against the Turks. In the war against the French republic he fought with especial honour at the battles of Cateau-Cambrésis (1794), Würzburg (1796), and Hohenlinden (1800), and reached the grade of lieutenant-field-marshal. He was under the orders of Mack in the campaign of 1805; and, when he saw that Ulm was lost, he cut his way through the French army and retired to Eger. He was ambassador at the Russian court in 1808 by the express wish of the Emperor Alexander, fought at Wagram in 1809, and conducted the negotiations for the marriage between Napoleon and Maria Louisa. In this capacity and as ambassador at Paris he so far gained the esteem of Napoleon that the latter expressly demanded him as general-in-chief of the Austrian contingent which was sent to aid France in the invasion of Russia in 1812. Schwarzenberg passed the Bug and achieved some slight successes, but was driven into the 'duchy of Warsaw,' where, acting on secret instructions from Napoleon he took up a position at Pultusk and remained inactive. In the following year he was appointed to the command of the Austrian army of observation in Bohemia; and when Austria joined the allied powers he became generalissimo of the united armies, was defeated by Napoleon at Dresden, and was late at Leipzig. In 1814 he helped to occupy Paris. He died of apoplexy at Leipzig, 15th October 1820. Although a bold and skilful leader of cavalry, as a general

he was a pedant. See *Life* by Prokesch-Osten (new ed. 1861).—His nephew, **FELIX LUDWIG JOHANN FRIEDRICH**, born 2d October 1800, was sent on a diplomatic mission to London in 1826, but became involved with Lady Ellenborough in a divorce case, was ambassador at Naples in 1846, distinguished himself in the Italian campaign of 1848, was placed at the head of affairs at Vienna, called in the aid of the Russians against Hungary, and pursued a bold absolutist policy, his object being to make Austria supreme amongst the German states. He died at Vienna, 5th April 1852. See *Life* by Berger (Leip. 1853).

Schwarzwald. See **BLACK FOREST**.

Schwatka, **FREDERICK**, Arctic explorer, was born at Galea, Illinois, 29th September 1849, graduated at West Point in 1871, and served as a lieutenant of cavalry on the frontier till 1877, meanwhile being also admitted to the Nebraska bar and taking a medical degree in New York. In 1878-80 he commanded an expedition to King William's Land which discovered and buried the skeletons of several of Sir John Franklin's party, and gathered information which filled up all gaps in the narratives of Rae and McClintock, besides performing a notable sledge-journey of 3251 miles. After exploring the course of the Yukon in Alaska, in 1884 he resigned his commission. In 1886 he commanded the *New York Times* Alaskan expedition, and ascended Mount St Elias to a height of 7200 feet; and in 1891 he led another party to Alaska which opened up some 700 miles of new country in the same quarter. In 1899 he had led an expedition, for the journal *America*, into Chihuahua, in Northern Mexico. He died 3d November 1892. He published *Along Alaska's Great River* (1885), *Nimrod in the North* (1885), *The Children of the Cold* (1886). See also *Schwatka's Search*, by W. H. Gilder (1881).

Schwedt, a town of Pommern, in the province of Brandenburg, on the Oder, 28 miles SSW. of Stettin, with wood-sawing, lime-burning, and tobacco industries. It was the residence of the margraves of Brandenburg-Schwedt from 1689 to 1788, and was entirely rebuilt after a fire in 1684.

Schwegler, **ALBERT**, theologian and philosopher, born at Michelbach in Württemberg, 10th February 1819. He studied theology at Tübingen, and was profoundly influenced by the writings of Hegel, Strauss, and especially Baur. His striking treatise on Montanism (1841) and many contributions to Zeller's *Theologische Jahrbücher* brought him into collision with the church authorities in Württemberg, and caused him to abandon the clerical calling. In 1843 he started the *Jahrbücher der Gegenwart*, and habilitated as *privat-docent* in philosophy and classical philology at Tübingen, where in 1848 he became extra-ordinary professor of Classical Philology, later ordinary professor of History, and died 5th January 1857.

Besides theological works he was author of a translation with commentary of Aristotle's *Metaphysics* (4 vols. 1847-48); the *Geschichte der Philosophie* (1848; Eng. trans. by Dr Hutcheson Stirling, 1872), a masterly sketch; and the posthumous *Geschichte der Griech. Philosophie* (ed. by Köstlin, 1859), in which he broke away from his earlier Hegelianism. He left unfinished a *Röm. Geschichte* (3 vols. 1853-58; continued by Gasson).

Schweidnitz, a town of Lower Silesia, 36 miles by rail SW. of Breslau. Woollen and linen goods, agricultural implements, gloves, needles, pottery, and numerous other articles are manufactured. The beer has been celebrated since the 16th century. Considerable quantities of flax and beet-root are grown in the neighbourhood. Between 1641 and 1807 Schweidnitz was besieged and taken six times, the last time by the French, after which

the defences were in great part destroyed. Pop. 27,000.

Schweinfurt, an ancient and long an imperial free city in the north-west of Bavaria, on the Main, 28 miles NE. of Würzburg by rail. It contains a beautiful market-place, in which important cattle and wool markets are held. Wine-growing, sugar-refining, and manufactures of chemicals, paper, bells, dyeing materials, as white-lead, ultramarine, Schweinfurt green, &c., and numerous other articles are carried on. Ruckert, the poet, was born here; and a monument was erected in 1890. Pop. 32,000.

Schweinfurth, **GEORG AUGUST**, a German traveller in Africa, was born in Riga, 29th December 1836. He studied at Heidelberg, Munich, and Berlin, making botany his speciality. In 1864 he made a journey by the Nile and the Red Sea to Abyssinia. In 1869, by the aid of a grant from the Humboldt Society of Berlin, he again started

Khartum, whence he made his way into the interior in the company of ivory traders, passed through the regions inhabited by the Bongo, Dinka, Niam-Niam, Madi, and Mombutu peoples, and discovered the Welle. He returned in 1871, and in 1874 published his travels, an English translation, *The Heart of Africa*, appearing the same year (new edition in 1918 with much new material). Between 1874 and 1883 he explored various districts of Egypt, especially their botany. In 1880 he was appointed director of all the Egyptian museums, &c. in Cairo. In 1891-94 he made botanical expeditions to Erythraea. He died 20th September 1925. He published *Artes Africanae* (Leip. and Lond. 1875) and numerous papers in periodicals, &c.

Schweitzer, **ALBERT**, German philosopher, theologian, and musician, born at Colmar, 14th January 1875, studied philosophy and theology at the universities of Strasbourg, Paris, and Berlin. He is a well-known organist and authority on the music of Bach. He graduated in medicine in 1913 specially to do medical missionary work (1913-17) in Equatorial Africa in connection with the denominational Paris Evangelical Mission. His literary works include *The Quest of the Historical Jesus* (1906), *Life of J. S. Bach* (1908), *Paul and his Interpreters* (1912), *On the Edge of the Primeval Forest* (1922), *The Philosophy of Civilization* (1923), and *Memoirs of Childhood and Youth* (1924). Most of his books have been translated into numerous European languages.

Schwenkfeld, **CASPAR VON**, founder of a Protestant sect, was born of noble family in 1490 at Ossig near Liegnitz in Lower Silesia, studied two years at Cologne and elsewhere, and, before retiring into private life in 1521 to a constant study of the Scriptures, served at various courts with Duke Charles of Münsterberg, and as aulic counsellor with Duke Frederick II. of Liegnitz. He became acquainted with the views of John Huss, from his youth up had been a student of Tauler, and was permanently won over to the Reformation by the noble courage of Luther at Worms. About 1525 he openly declared for Luther, and went to Wittenberg to converse with him, but found his views widely divergent on baptism and the eucharist. Still further, he found himself unable to accept any confessions of faith except such as followed closely the letter of Scripture, and in his profound conviction that the new movement should proceed *from within* outwards, and not *from without* inwards, he disagreed with the Lutherans in their policy of linking the Reformed Church with the state, instead of waiting passively for the direct guidance of the Holy Spirit, the sole fountain of sanctification. Schwenkfeld did not himself

partake of the Lord's Supper, although he did not forbid it to others, for he held that there could be no right participation without the exclusion of unbelievers, and that the true Lord's Supper is kept through faith inwardly in the soul as often as a man receives *divine sweetness in Christ*. He did not approve of infant baptism, yet without admitting the Baptist view of the importance of the baptism of adults. His views coincide with those of George Fox in the doctrine of the Inward Light, the Immediate Revelation, and the inability of mere outward bodily acts, such as partaking of the Lord's Supper or baptism, to give the inward and spiritual reality and power of the Lord's 'body' and 'blood,' or that of the spiritual 'washing of regeneration.' Schwenkfeld's views in that intolerant time brought him the hatred of Lutherans and Catholics alike. The influence of the Emperor Ferdinand forced the Duke of Liegnitz to banish him in 1529, and he thereafter travelled to Ulm, Augsburg, Nurnberg, and Strasburg, everywhere gaining disciples. Luther fiercely denounced him, and many untrue charges were brought against him by others, but all the violence of his antagonists the much-enduring man received with saintly patience. He died at Ulm, 10th December 1561. Schwenkfeld wrote ninety distinct works, most of which were burned, if not answered, by both Protestants and Catholics. One of the most important was his *Bekandtniss und Rechenhaft von den Hauptpunkten des Christlichen Glaubens* (1547). By means of personal teaching and his books a group of earnest disciples more than 4000 strong was formed all over Germany, but mostly in Swabia and Silesia, who separated themselves under the name of Confessors, or Followers of the Glory of Christ. They were persecuted in Silesia in his lifetime, and many emigrated to Holland, some to England. The Jesuit mission established in Silesia in 1719 persecuted the remnant still further, and some joined the Protestant churches, some fled to Saxony, where they were protected by Count Zinzendorf. In 1734 forty families emigrated to England, and finally thence to Pennsylvania, where, as Schwenkfeldians, they have maintained a distinct existence to this day.

See H. W. Erdkamp, *Geschichte der protestantischen Sekten im Zeitalter der Reformation* (Hamburg, 1848); Kadelbach, *Geschichte Schwenkfelds und der Schwenkfeldbener* (Lauban, 1861); and Hoffmann, *Kaspar Schwenkfeld's Leben und Lehren* (1897).

Schwerin, capital of the German republic of Mecklenburg-Schwerin, is agreeably situated on the west shore of the Lake of Schwerin (14 miles in length and 3 broad), with smaller lakes behind it. It is surrounded with suburbs and contains the former grand-duke's castle (1845-58), partly burned in 1913, a Renaissance structure; the cathedral (1365-1430), with interesting monuments and stained glass; an arsenal; a museum and picture-gallery. It manufactures lacquered wares, machinery, cloth, &c. Pop. 45,000.

Schwyz, a canton of Switzerland, touches in the north the Lake of Zurich, and in the west the Lakes of Zug and Lucerne. Area, 351 sq. m.; pop. 60,000, nearly all German-speaking and Roman Catholics. The surface is mountainous, rising to 7494 feet, and in Kinzigkalm on the border to 9052 feet. Cattle-breeding and the keeping of swine, goats, and sheep are the principal occupations, though cotton and silk are both spun and woven, and much fruit is grown, Schwyz *Kirschweisser* being in great demand. The celebrated monastery of Einsiedeln (q.v.) attracts large numbers of pilgrims, and the Rigi (q.v.) vast numbers of tourists in the summer. Schwyz, one of the three original cantons of the Swiss Confederation (1291,

the others being Uri and Unterwalden), and also one of the Four Forest Cantons, has supplied the name to the whole country of which it forms a part. The people govern themselves through a grand council, consisting of one representative for every 600 citizens, and an executive of seven members chosen by the council from its own body; all these rulers are elected for four years. Schwyz, the capital, is picturesquely situated 26 miles by rail east of Lucerne, and has a Rathaus decorated with frescoes. Pop. 8000.

Sciaccia (anc. *Therma Selimintina*), a seaport on the south coast of Sicily, stands on a bold cliff 30 miles NW. of Girgenti, has an 11th-century cathedral, the ruined castles of the Lunas and the Porollos (between whom there existed a terrible feud), an old palace of the Saracen governors (now a convent), and hot sulphurous and saline springs half-way up the adjacent Monte San Calogero, with caves that have been used as steam baths since Phœnician times. Off the coast very productive coral banks were discovered in 1875-80. Tommaso Fazello (1498-1570) the father of Sicilian history, was born here. Pop. (1921) 25,630.

Sciatica is the term given to neuritis of the great sciatic nerve, the largest in the body, which passes down the back of the thigh. It is characterised by irregular pains about the hip, especially between the great trochanter of the thigh-bone and the bony process on which the body rests when sitting, spreading into neighbouring parts, and running down the back of the thigh to the leg and foot; or the pains may occupy only isolated parts, as the knee-joint, the calf of the leg, or the sole of the foot. It generally differs from the most typical forms of Neuralgia (q.v.) in that the pain, though subject to severe exacerbations, is constantly present. The nerve usually becomes very tender to touch, either at isolated points or throughout; and, in severe and prolonged cases, diminution of sensation in the area of distribution of the nerve, and wasting of the muscles of the limb, are apt to occur. It is sometimes dependent on a gouty condition of the system; but more frequently can be traced to some definite exposure to cold or wet, or to chronic constipation. It is often a very obstinate disease: the treatment must be conducted on the same lines as that of other forms of neuritis. Here Acupuncture (q.v.) and injection of saline solution, novocain, &c., into the nerve are specially valuable. In intractable cases *nerve-stretching*—i.e. cutting down upon the trunk of the nerve, and forcibly pulling upon it—has often been successful where all other measures have failed to cure. The same result may sometimes be obtained by forcibly bending the thigh up towards the abdomen.

Siceli, a town in the south-east corner of Sicily, 50 miles SW. of Syracuse by rail, with some cloth-weaving and cheese-making. Pop. (1921) 23,953.

Science. From early life everyone is interacting with his environment, and this both natural and human; and thus is becoming acquainted with it in the concrete, and with some understanding as well. Wonder early awakens, curiosity develops, and observation may thus become habitual; even reflection also; while from child's play to most developed occupations, both experience and reasoned activity increase. We all thus acquire some knowledge of surrounding nature and civilisation, with material for thought accordingly; and in the measure in which this discloses some uniformity amid the variety of nature, something of order in the multifarious details of life and work, we have made our beginnings of the respective sciences. Ideas spread, and are passed on by tradition; though often uncritically, and so

tending to loss or confusion, as well as gain. In short, science begins with observation; its 'common sense' advances to reflective thought, seeking to understand and interpret the given phenomena. Yet our explanations need verification, by observation anew, and by experimental tests so far as may be, since otherwise the possibilities of error are manifold.

Primitive folk, as gatherers and fishers, were thus necessarily much of naturalists, and even something of herbalists and physicians. They prepared for physical sciences with their increasing mastery of flint and fire; and further, through their quests of metals, from gold to copper and tin for bronze, and thence made progress through the iron age towards the active science of later times. And since the prime use of language and its main development have obviously been in speaking of our human affairs, past, present, or possible, what we now call the social sciences—history and biography, economics, &c.—must similarly be remotely prehistoric in their earliest origins. The daily and nightly marvel of the heavenly bodies, yet their cyclic regularities of appearance and succession, not only initiated astronomy, but first raised it to scientific rank; the more with its observations of movements in time and space reinforced by human and terrestrial measurements and numberings, the beginnings of mathematics. Primitive reckonings by lunar months were thus surpassed by the great discovery of the solar year; and its services in anticipating the seasons, invaluable for agriculture especially, raised astronomers to priestly guidance of early societies, as testified by the stone circles of the neolithic past, as well as by the temple-observatories of Egypt and Babylon. No doubt all this with priestly conservatism as well, and with astrologic developments more than astronomical: yet these evoked observations and reflection, indeed until comparatively recent times. It is the great service of Greek astronomers to have developed their science towards cosmic clearness, and for its intellectual interest, in substantial freedom from dubious human applications; and thus not only up to the Ptolemaic system, but even to forecasts of the Copernican. The Greeks also developed for us the fundamentals of mathematics, as not only for arithmetic and geometry, but even to conic sections, though these had to wait many centuries for their astronomical applications. Again the torments of diseases, the quests of remedies, the mysteries of birth and of death, with the various practices of burial also, have aroused reflection; and with contributions, through the medical and surgical arts, towards the beginnings of physiology, pathology, and anatomy, and of botany and zoology as well. Yet truly scientific observation and thought in medicine substantially date for us from the Greek physician Hippocrates; and zoology, botany, embryology, &c. from Aristotle. Indeed, each of these founders in his own way anticipated much of that general study of life we now call biology. The advancing archaeology and history of ancient civilisations—those of Egypt and Babylonia especially, but also of China and India—are yielding frequent evidence of scientific and medical knowledge; and the Greeks acquired much from their neighbours and their past; yet none the less we have to recognise them as substantially initiating the orderly study and presentment of each and all our modern sciences, as their very names indeed testify—logic and mathematics, astronomy, mechanics and physics, zoology and botany, and even history, economics, and ethics. All these were included, albeit at first too simply, within the comprehensive purview of philosophy; and this especially within the encyclopedic mind of Aristotle. The history

of science, so fundamental to adequate appreciation of each and all its fields, is thus essentially of the development, or renewal, of Greek initiatives. Main results of these were further systematised in Hellenistic times, as at Alexandria especially. They too much subsided in Roman days, and more throughout the barbaric invasions, and with but very imperfect recovery in the middle ages. Amid the freer inquiries of the Renaissance, the renaissance sciences had struggles and difficulties, indeed still scarcely ended; yet the four past centuries have increasingly produced initiatives and endeavours worthy of the best days of Greece, and still accelerating in the current century. To trace such varied histories is beyond these limits: but see articles on GREECE, ROME, MIDDLE AGES, RENAISSANCE, &c.; also ASTRONOMY, MATHEMATICS, MECHANICS, PHYSICS, CHEMISTRY, PHYSICAL CHEMISTRY, GEOLOGY, ZOOLOGY, BOTANY, BIOLOGY; likewise GEOGRAPHY, HISTORY, BIOGRAPHY, ARCHAEOLOGY, ANTHROPOLOGY, ETHNOLOGY, POLITICAL ECONOMY, and SOCIOLOGY; also LOGIC, AESTHETICS, PSYCHOLOGY, ETHICS.

Leaving the outlines, generalisations, and methods of each science to the above articles and their sub-references, the question next arises of their correlation and classification towards a unified view of science as a whole, and throughout the range of nature and discourse. This inquiry again comes down from Greek philosophy and science; and it is traceable through medieval endeavours—as so notably by Aquinas as philosopher and Roger Bacon as scientist—to the Renaissance, with Descombes and Francis Bacon as its illustrious types. Stirred by the encyclopedic movement of the 18th century, and the varied industrial, political, and social changes which followed it, there came the completion of the series of main sciences by the founding of Sociology by Comte. This was essentially based upon his 'law of three states' (see SOCIOLOGY) and his serial classification of the sciences (and claim for education accordingly), as from mathematics, through astronomy, physics, and chemistry, to biology (including psychology), and all as leading up to the social science in its various fields. He also showed the necessity of the essentials of all these, in harmony with ethics, for the adequate conduct of life—industrial, social, political, and even moral and religious.

Despite Herbert Spencer's criticisms, his best work substantially followed on these lines; and subsequent writers have scarcely modified them. Each science, however, has now so multifarious a subdivision of labour into specialised fields, each with a copious and increasing literature of its own, that many of their productive workers practically despair of the co-ordination of knowledge, as beyond our human powers. This indeed is an old story; for even the 13th-century alchemist, Basil Valentine, quaintly says, 'the shortness of life maketh it impossible for one man thoroughly to learn antimony, in which every day something of new is discovered'; and if for 'antimony' we now read 'radium,' this saying may again seem more convincing than ever. Yet to this, Leibniz, the most comprehensive mind of Newton's century, provided the needed reciprocal assurance: 'I perceive that the more a science advances, the more it concentrates into little books.' Continued evidences of this generalising progress of the sciences are not far to seek. Thus in the last century witness the unification of the mechanical and physical sciences through the doctrine of energy; the illumination of chemical thought by Mendeleeff's law, by the introduction of spectroscopy, &c.; and again for biological science, with the cell-theory, the germ-theory, &c.; and above all, for it, and for other sciences also, with the

doctrine of Evolution. So, too, in the first generation of this century we have had the rise and advance of radiology, with its revolution in our physical and chemical conceptions; and next, Einstein's at first so perplexing doctrine of relativity, with its even further-reaching range and significance. After these, indeed, it has seemed as if each and every science were again in the melting-pot; yet is not that a symbol of purification for each, and of fresh combination for all? Such unifications are thus ever coming into view, and for concrete knowledge and abstract thought together. The task of science, concretely viewed, is to prepare a general cosmography; within which the heavenly bodies, the whole earth—with its rocks and minerals, its plant and animal life, and its human types and communities as well—have all to be observed, analysed, and classified as far as may be. Yet all this in no mere static enumeration nor museum presentment, but in their movement and life, their interrelations of actions and reactions accordingly. We are thus ever searching more deeply into the rationale of phenomena. Astronomy advances, not simply with deeper telescopic penetration, into its ever-extending universe; it is also rendering this more intelligible mathematically, and even physically and chemically as well. As geological surveys and maps spread over the globe, the play of physical forces is increasingly explaining them; witness the many clarifying theories, as of recurrent glacial ages, of volcanic and earthquake action, of earth upheavals, thrusts and subsidences, and even of the drift of continents. And the more our fossil collections increase, the more they set before us life's histories in their courses of evolution. Biology is in unifying flux—its sub-sciences are coming together, and into a new harmony with psychology, since mind and body are becoming viewed as in evolution together. Archaeology and anthropology are elucidating man's sub-human origins and his early past; and even illuminating the evolution of civilisations from simplest surviving peoples to long lost or too imperfectly known cultures, and again to our own contemporary ways of life and even types of mind. The biological, psychological, and social sciences, despite all those complexities and intricacies which prevent them from attaining the demonstrative lucidity of mathematics and physics, are thus bringing their long separate and detailed advances towards harmony, and into a vision of life in its creative evolution. This utilises all that the preliminary sciences have been yielding since Descartes's times, yet is also becoming liberated from their too simply mechanistic interpretations; and, with its own more vital and psychologic conceptions, it even shows beginnings towards harmonising these physical advances in imagery less traditionally material, and more energetic and dynamic.

Thus, what subjects have longer seemed less on speaking terms than geography and philosophy?—geography with its naively concrete and mundane explorations, descriptions, and mappings; and philosophy with its lofty abstractions, as from the good, beautiful, and true of Plato to the manifold thought-systems which have succeeded his, and which still range from frankest materialisms—stopped short at the Unknowable, to idealisms and transcendentalisms—pressing forward towards the Absolute. Yet since evolution becomes more and more discernible throughout this everyday world, our cosmography—physical, organic, and human alike—is now becoming a rational cosmogony, in which all the sciences have their part. Such a comprehensive conception of evolution extending throughout the universe of nature and humanity is thus at once philosophic and scientific, since unifying our studies of nature and life with our best thought. If so, we can no

longer think of cosmography and philosophy as at contrasted poles of thought, but as combined throughout its single sphere, in fact as cosmosophy; so that even terms like 'geosophy' and 'biosophy' are also needed to express this dual parentage, scientific and philosophic, in harmonious union. Again, nature and life are alike rich in beauty; the sciences are ever advancing in the discovery and enjoyment of truth; and the broadening and deepening anew of life we thus attain, despite all struggles, arrests, and deteriorations, exhibits above all the increasing dominance of species-regarding and life-regarding processes over simply individual and utilitarian functionings; at briefest, then, the triumph of love over hunger, of altruism over egoism; and thus a predominant evolution of the good. In short, evolutionary science is Platonist as well as Aristotelian. Hence philosophy at its best, with its increasing quest of widest and deepest truth—and even religion at best also, with its endeavours to advance and express goodness and love in their ideal unison with truth and beauty at their highest—have alike nothing to fear from science. Its at times seeming destructive criticisms are indeed increasingly acknowledged as often of service to religion towards liberation from burdens of tradition and misunderstandings delaying its vital fulfilment.

Yet this view of science as it tends to be is too optimistic for science as it yet is. Admission must candidly be made that the advances of the physical sciences—say rather of their applications, as in the unparalleled progress of our industrial age, and also towards its destructive activities of war—have had tragic consequences, and these still far from ended. The explanation of these is not far to seek; it lies fundamentally in the ascending order of knowledge, with its increasing complexities, so that the mathematical and physical sciences, as relatively simplest, are as yet by far the most developed and applied. With these sciences we can and do have their ever-increasing applications in material developments, manufactures, transports, and communications, and for peace and war alike; also in business, exchanges, and pecuniary interests concerned with all these. Thus arise tensions, rivalries, and struggles, which oscillate between internal social stifles and external wars; while for these latter especially, the applications of the physical sciences are more and more destructively potent. Hence the frequent dread of science, sometimes even to despair. Yet it is this incompleteness of science which is dangerous. Given mathematics, with its conceptions of movement, time, space, and number, and the physical sciences, thus intellectually reinforced for their increasing mastery of the matters and energies of the inorganic world, these cannot yield more than a mechanistic view of life and society. Hence, if such range of science and its philosophy be final, there is no escape from more rigorous acceptance and more unanswering application of them than ever; and with fullest pessimism accordingly. But if the sciences of life and mind, of society and morals, be emancipating themselves, as above noted, from this mechanistic domination, and entering on a fresh period of synthetic progress, the whole perspective of science and its philosophy must also change, to an evolutionary view, demonstrably melioristic. For as man must ever strive to put his knowledge to practice and service, and thus has been applying his mechanistic knowledge to the full, so also he cannot but consider and attempt the application of the higher and complex humanistic sciences, the more since now in their turn also advancing towards clearness. The social and moral sciences, as they progress, are thus assured of

They sheltered Prince Charles in 1645 before he fled to Jersey (Clarendon here began his History), and Cromwell's Tower on Tresco was set up by the parliamentary forces. In 1834 they were leased to Augustus John Smith, a radical reformer, although somewhat of an autocrat, the best friend the islanders have ever had. He made Tresco his home for thirty-eight years, and his tropical gardens there are unique in northern Europe. He built churches and schools, suppressed smuggling, encouraged agriculture, and forbade overcrowded holdings. In 1921 the current lease was surrendered by the family.

The climate is mild, but necessarily damp, and the weather is changeable and frequently stormy; but the temperature is extremely equable, averaging 57° F. in summer and 47° F. in winter. The leading natural features of the scenery are the fantastically weathered rocks and rock-basins and the bold coast-lines. There are remains of stone circles; and a perfect kistvaen (containing human bones showing traces of fire action) was opened upon Samson in 1862. Tresco Abbey and its gardens are considered the leading objects of interest for the tourist. No part of the islands is more than 160 feet above sea-level. The highest points are the 'Telegraph' on St Mary's, and St Martin's Head, which has had a daymark since 1683. There has been a lighthouse on Bishop Rock since 1858, and on Round Island since 1887, and on St Agnes from 1630 to 1911, when it was superseded by one at Peninnis Head on St Mary's. Hugh Town on St Mary's, from which a panoramic view of the whole group can be obtained, is the only town on the islands. There is good anchorage in the roadstead. Many of the islands, especially Annet, abound with sea fowl.

Wrecks used to be very numerous and were a fruitful source of wealth. One of the most famous was that of three ships of Sir Cloudesley Shovel's fleet in 1707, when 2000 men, including the admiral, were drowned. Farming is practised, and early potatoes and broccoli are exported; but the principal industry now is the cultivation of narcissus and lilies between the months of December and May. Nearly all the available acreage is occupied with bulbs. Large cargoes of mackerel are sent to the mainland, but the fishing-boats belong to Penzance and the east coast.

Scimitar, an oriental sabre. See SWORD.

Scinde. See SIND, SINDHIA.

Skink. See SKINK.

Scintillation, or twinkling of the stars, is a familiar phenomenon to all who have directed their attention to the firmament above us. Under ordinary atmospheric conditions this flickering is possessed only by the so-called fixed stars (see STARS). A planet shines steadily and by this mark can readily be picked out. When near the horizon, however, planets have been observed to scintillate slightly; while stars at low altitudes invariably twinkle more vigorously than stars overhead. This at once points to the atmosphere as an important factor, since the phenomenon is more pronounced when the light has to traverse a greater depth of air. Again, when viewed through sufficiently large telescopes stars cease twinkling altogether. The action of the telescope is to concentrate upon the eye a much larger pencil of rays than could naturally enter it. Instead of one slender ray the eye receives the integral effect of a great number of rays, whose individual features are lost in the general average. In the case of a planet, again, the rays which fall upon the retina converge from all parts of a disc of sensible size; and in the integral effect of this pencil the individual features of the component rays are lost. But

a star is so far distant as to be virtually a point of light. In this case we have an excessively slender ray infinitely narrow compared even to the small pencil of light that comes to us from a planet. The vicissitudes of refraction which a star-ray experiences in passing through the infinitely irregular variations of density, temperature, and humidity in our atmosphere characterise its integral effect on our retina, and the result is twinkling. The exquisite chromatic effects that accompany the twinkling of a bright star like Sirius are fully accounted for in terms of this general explanation. It is possible indeed by separating the images of a star produced in the two eyes to observe two different scintillations at one and the same time. Scintillation may thus be said to depend on three factors: (1) The vast distance even of the nearest stars reducing the largest of them to mere points of light; (2) the ever-changing variableness in condition of the atmosphere through which the light must come to us; (3) the smallness of aperture of our eye, which receives an almost ideal single ray of light.

Scio. See CHIOS.

Scioppius (Latinised form of *Schoppe*), KASPAR, a classical scholar and controversy-dialist, was born at Neumarkt in the Palatinate, 27th May 1576, and studied at Heidelberg, Altdorf, and Ingolstadt. Whilst on a visit to Prague in 1598 he abjured Protestantism and became a Roman Catholic. Henceforth his career is a series of fierce onslaughts on his former co-religionists, on the old Latin writers, and on all who enjoyed a reputation in the world. He was honoured with the title of a count of Spain, and was made a pensioner of the Vatican. Amongst the first to feel his venom was Scaliger (q.v.), against whom in 1606 he launched *Seditior Hypobolimeus*. Sent in 1608 by the court of Rome to the diet of Ratisbon for the purpose of observing the religious condition of Germany, he published numerous pamphlets against the Protestants, recommending the Catholic powers to use every means for their extermination. Shortly afterwards he fired off several venomous libels against James I. of England. For this the servants of Lord Digby, ambassador in Madrid, gave him a sound cudgelling in that city in 1614. Scioippius fled from Spain to Ingolstadt, where he issued his *Legatus Lubro* (1615) against the ambassador. In 1618 he went to Milan, where he resided for the next twelve years, devoting himself partly to philological studies and partly to theological warfare. He died at Padua, 19th November 1649, the reviler of all respectable parties, loved by none, but also feared by none. Scioippius was a prodigious scholar, and might have rivalled Scaliger himself in reputation, as he did in learning, had it not been for the infirmities of his temper and judgment. His most important work is *Grammatica Philosophica* (1628); next in value come *Verisimilium Libri Quatuor* (1596), *Suspectæ Lectiones* (1597), *De Arte Critica* (1597), *Observationes Lingue Latine* (1609), *Puriora Literaria* (1628), and *De Scholarum et Studiorum Ratione* (1636).

Scioto, a beautiful river of Ohio, rises in the north-west portion of the state, and flows east and then south, past Columbus and Chillicothe, to its junction at Portsmouth with the river Ohio. It is nearly 300 miles long, and from its mouth to Columbus feeds the Ohio and Erie Canal.

Scipio, PUBLIUS CORNELIUS, surnamed AFRICANUS MAJOR, one of the most famous soldiers of ancient Rome, was born in 237 B.C. He took part in the disastrous battle of the Ticinus (218), where he saved his father's life, and later at the Trebia

and the fatal field of Cannæ. In 212 he was elected ædile, though not yet of legal age, and in 210 was specially selected by acclamation of the people as a general extraordinary for Spain. His noble beauty and personal charm proved irresistible, but in this gracious and self-reliant youth of twenty-seven the people had found a hero and the state a saviour. His arrival gave a new turn to the war. By a bold and sudden march he captured *Nova Carthago*, the stronghold of the Carthaginians, and his courtesy soon won over many of the native chiefs. He checked Hasdrubal, but failed to prevent him from crossing the Pyrenees to the assistance of Hannibal. In 207 he won a decisive victory over the other Hasdrubal (son of Gisgo) and Mago, which gave him the whole of Spain. Soon after he returned to Rome, where he was elected consul (205) though he had not yet filled the office of prætor. His favourite plan to transfer the war to Africa was opposed by a party in the senate; but the popular enthusiasm for the name of Scipio proved too strong, and in 204 he sailed from Lilybæum, in Sicily, with 30,000 men, and landed on the coast near Utica. His successes against Syphax and their own armies compelled the Carthaginians to recall Hannibal from Italy—the very object Scipio had laboured to achieve. After some abortive efforts at reconciliation the great struggle between Rome and Carthage, between Scipio and Hannibal, was terminated by the battle fought near Zama, 19th October 202, in which the Carthaginian troops were routed with immense slaughter. Hannibal advised his countrymen to abandon what had now become a hopeless and ruinous contest, and his advice was taken. The noble magnanimity of Scipio's character made submission the more easy; and peace was concluded in the following year, when the conqueror returned to Rome to enjoy a triumph. The surname of Africanus was conferred on him, and so extravagant was the popular gratitude that it was proposed to make him consul and dictator for life, honours which would have been the destruction of the constitution, but which Scipio was either wise enough or magnanimous enough to refuse. In 190, in order to give him his aid, he served as legate under his brother Lucius in the war with Antiochus, and crushed his power in the great victory of Magnesia. But after their triumphant return a prosecution was raised against Lucius for allowing himself to be bribed by Antiochus, the colour being the too lenient terms he had been granted. Lucius was declared guilty by the senate; his property was confiscated, and he himself would have been thrown into prison had not Africanus forcibly rescued him from the hands of the officers of justice. In 185 Scipio was himself accused by the tribune M. Nevius; but, instead of refuting the charges brought against him, he delivered, on the first day of his trial, a eulogy on his own achievements, and opened the second day by reminding the citizens that it was the anniversary of the battle of Zama, and therefore a time to return thanks to the immortal gods, and to pray for other citizens like himself. The people followed him to the Capitol in a fever of excitement, and the prosecution was at an end. But Scipio felt that popular enthusiasm was uncertain, that the power of the oligarchy was irresistible, that its hatred of him was unappeasable, and that his day was over. He retired to his country-seat at Liternum, in Campania, where he spent the remainder of his life, and where he died about 183. His wife was daughter to the Æmilii Paulus who fell at Cannæ; his daughter was Cornelia, mother of the Gracchi. Scipio Africanus is commonly regarded as the greatest Roman general before Julius Cæsar; and certainly in the brilliancy of his gifts and

accomplishments he was unsurpassed; but if his career be strictly examined it will be found that he owed as much to fortune as to genius. No doubt he won splendid successes, and made the most of his great advantages. Yet his fondness for sounding titles and lavish display, his nepotism, his corruption of the public spirit by largesses, and his assumption of personal superiority to the common law were influences distinctly harmful to the state. His beauty, bravery, and courtesy, his proud yet pious belief that the gods favoured him with their inspiration, won him the love and reverence of soldiers and of women; and his magnanimity towards his fallen foe, who flitted about the eastern courts in dreary exile, is a bright feature in his character, and nobly distinguishes him from the cruel-hearted oligarchs of the senate.

See Laïe by B. H. L. Hart, *A Greater than Napoleon* (1926).

Scipio Æmilianus, PUBLIUS CORNELIUS, surnamed AFRICANUS MINOR, born 185 B.C., was a younger son of that Lucius Æmilii Paulus who conquered Macedon, but was adopted by his kinsman, Publius Scipio, son of the great Scipio Africanus. He accompanied his father on his expedition against Macedon, and fought by his side at Pydna (168). In Greece he made the acquaintance of Polybius the historian, who afterwards became one of his most valued friends. In 151 he went to Spain as military tribune under the consul Lucius Lucullus, and two years later began the third and last Punic war, which mainly consisted in the siege of Carthage. Scipio still held the subordinate position of military tribune; but the incapacity of the consuls, M. Manilius and L. Calpurnius Piso, (149-148), and the brilliant manner in which he rectified their blunders, drew all eyes to him. The favourite both of the Roman army and the Roman people, Scipio was at length in 147, when only a candidate for the ædileship, elected consul by an extraordinary decree of the Comitia, and invested with supreme command. Even the aged Cato, who was not liberal with his praise, marked his opinion of the relative worth of the young Scipio and his comrades by quoting the Homeric line, 'He only is a living man; the rest are gliding shades.' The story of the siege of Carthage, the despairing heroism of its inhabitants, the determined resolution, the sleepless vigilance, the incessant labours of Scipio belong to history. The city was finally taken by storm in the spring of 146; and by the orders of the senate it was levelled to the ground, and the ploughshare driven over its site. Scipio, a man of noble and refined soul, steeped from his youth up in the culture of Greece, obeyed the savage command with sorrow, even with horror. As he gazed on the ruin he had wrought, the thought flashed across his mind that some day Rome too might perish, and the words of the *Iliad* rose to his lips: 'The day shall come when sacred Troy shall perish, and Priam and his people shall be slain.'

Scipio, though probably the most accomplished Roman gentleman of his age, was rigorous in his observance of the antique Roman virtues; and when holding the office of censor in 142 he made fruitless efforts to follow in the footsteps of Cato. In 139 he was accused on the charge of *neglectus* by the tribune Tiberius Claudius Asellus, but was acquitted, and soon after was sent to Egypt and Asia on a special embassy. Meanwhile affairs had gone badly in Spain. Viriatus, the Lusitanian patriot, had again and again inflicted the most disgraceful defeats on the Roman armies, and his example had roused the hopes of the Celtiberian tribes, who also rushed to war against the common foe. The contest continued with varying

success; but the interest centres in the city of Numantia, whose inhabitants displayed amazing courage in the struggle with Rome. For long it seemed as if the Numantines were invincible—one consul after another finding their subjugation too hard a task; but at length in 134 Scipio, re-elected consul, went to Spain, and after a siege of eight months forced the gaunt and famished citizens to surrender, and utterly destroyed their homes. He then returned to Rome, where he took a prominent part in political affairs as one of the leaders of the aristocratic party, and, though one of the more moderate, his popularity with the populace greatly declined. Although a brother-in-law of Tiberius Gracchus, whose sister Sempronia he had married, he disclaimed any sympathy with his political aims; and when he heard of the murder of his kinsman quoted his favourite Homer: 'So perish all who do the like again.' The Latins, whose lands were being seized by the commissioners in their unwise haste to carry out to the full the Sempronian law, appealed to Scipio for protection, and he succeeded (129) in getting the jurisdiction suspended until the consuls should determine what were domain lands and what private property. But his action caused the most furious indignation among the party of reform, and shortly after Scipio was found dead in his bed, doubtless murdered by some unscrupulous member of the Gracchan party. Scipio was neither a rigid aristocrat nor a flatterer of the people. Inferior in splendour of genius to his adoptive grandfather, he surpassed him in purity of character, in simplicity of patriotism, and in liberality of culture. 'The history of Rome,' says Mommsen, 'presents various men of greater genius than Scipio Aemilianus, but none equalling him in moral purity, in the utter absence of political selfishness, in generous love of his country, and none, perhaps, to whom destiny has assigned a more tragic part. . . . It was his lot to fight for his country on many a battlefield and to return home maimed, that he might perish there by the hand of an assassin; but in his quiet chamber he no less died for Rome than if he had fallen beneath the walls of Carthage.'

Scire Facias, a writ for enforcing judgments, decisions about patents, &c., or for annulling them: often contracted, like *fi. fa.*, into *scif. fa.* See WRIT.

Scirocco. See SIROCCO.

Scirpus, a genus of plants of the family Cyperaceæ (q.v.). The plants of this genus are called Club-rushes, and *S. lacustris* of our ponds and sluggish streams is a familiar example (see BULRUSH). The species are universally diffused, although found chiefly in temperate climates. They date from the Lower Miocene period.

Scirrhus (Gr., 'hard'), a term applied to a kind of Cancer (q.v.).

Scissors. See CUTLERY.

Scitamineæ. See ZINGIBERACEÆ.

Sclerostomum, a genus of nematode worms (see THREADWORMS). One of the species *S. armatum* occurs in the mesenteric arteries and intestine of the horse, causing aneurysms and colic.

Sclerotic. See EYE.

Sclerotium is a hard, multicellular tuber-like body formed towards the end of the vegetative season by the close union of the ordinary mycelial filaments of Fungi (q.v.). It represents the dormant or resting stage of the fungus, but is not common to all fungi. At the beginning of the period of growth it sends out filaments or groups of filaments which carry on the active life-history of the individual, and soon the store of nourishment is absorbed from the sclerotium by these filaments. Ergot of Rye (q.v.) is a sclerotium.

Scolopendra. See CENTIPEDE.

Scolopendrium. See HART'S-TONGUE.

Scomberidae. See MACKEREL.

Scone (pronounced *Soon*), in Perthshire, on the Tay's left bank, 2 miles N. of Perth, was the capital of Pictavia as early as 710, and the coronation place of the Scottish kings from 1153 till 1488, as afterwards in 1651 of Charles II. (see SCOTLAND). Fordun vividly describes the semi-Celtic coronation of Alexander III. (1249), who was the last to be seated on the 'Stone of Destiny,' carried off in 1296 by Edward I. An Augustinian abbey, founded by Alexander I. in 1115, was totally demolished by a rabble in 1559; and the subsequent Palace of the Viscounts Stormont, in which the Old Pretender lived for three weeks in 1716, and which was also visited by Prince Charles Edward, has given place to a modern castellated mansion, the seat of their descendant, the Earl of Mansfield.

Scopas, an ancient Greek sculptor, founder, along with Praxiteles (q.v.), of the later Attic school, was a native of the island of Paros, and flourished during the first half of the 4th century B.C. One of his earliest works we read about was the temple of Athena Alea at Tegen in Arcadia, on the site of a previous one burned down in 395 B.C.; he superintended both the building of it and the adorning of it with sculpture. Some fifteen years or so later he settled in Athens, where for more than a quarter of a century he laboured at his profession. Towards the end of his life he was associated with Leochares and others in preparing sculpture for the great Mausoleum (q.v.) of Halicarnassus in Asia Minor. A large composition representing Achilles being conveyed to Lence by Poseidon, Thetis, and the Nereids, preserved for some time in the temple of Neptune at Rome, was accounted one of his greatest masterpieces. Another composite work attributed to him, though doubtfully, was the 'Slaughter of the Children of Niobe.' He excelled also in statues of single gods and goddesses, as the 'Apollo with the Lyre.' See E. A. Gardner, *Six Greek Sculptors* (1910).

Score, music for several voices or instruments, or for an orchestra, so written that each part has a separate staff for itself, these staves being placed over each other, bar corresponding to bar. Occasionally, where there is a deficiency of staves for all the parts, or where any of the parts have so little to do that it is not worth while to assign them a separate staff, parts related to or connected with each other, as two flutes, two clarionets, or three trombones, may be written on the same staff together. The orchestra is split up into groups, the woodwind being placed at the top of the score, then the brass, then the percussion, then (in the case of a concerto) the solo instrument, and lastly the strings at the foot of the score. In each group the highest part should be placed uppermost, then the next lower and gradually descending. All the parts of a chorus should be kept together, and placed either between the percussion and strings or in the middle of the strings, between the violin and the viola staves.

Scoresby, WILLIAM, Arctic explorer and servant, was born at Cropton near Whitby, 5th October 1789. He commenced a seafaring life at the age of eleven, by accompanying his father, a whaling captain, to the Greenland seas; and next succeeding his father, he made several voyages to the Spitsbergen and Greenland whaling-grounds. He attended classes at Edinburgh University, carried on investigations in natural history, botany, meteorology, magnetism, &c., and published the results in *An Account of the Arctic Regions* (2 vols. 1820). In 1822 he surveyed 400 miles

of the east coast of Greenland. After one more voyage he retired from seafaring life in order to enter the church; and having studied at Cambridge, and been ordained (1825), laboured faithfully at Liverpool, Exeter, and Bradford. At length failing health compelled him to retire (1849) to Torquay; but he still continued his physical researches. The results of these, as of some earlier inquiries, were published in the transactions of the learned societies, and in *Magnetical Investigations* (2 vols. 1839-52). For the better prosecution of those researches Scoresby made a voyage to the United States in 1847, and to Australia in 1856. He died at Torquay on 21st March 1857. See *Life* by his nephew (1861).

Scoriae are the cinders and slags of volcanoes, more or less porous from the expansion of the gases contained in the melted materials. See **VOLCANO**, **IGNEOUS ROCKS**.

Scorpion, a name applicable to any member of the family Scorpionidae, included along with spiders, mites, &c. in the heterogeneous class Arachnida. Among the common genera are *Scorpio*, *Androctonus*, and *Buthus*. Altogether there are about 200 species, natives of warm countries in both hemispheres. About thirteen species live in southern Europe. Shy of the light, they lurk during the day under stones and in crevices, but run about actively in the darkness seeking their prey usually insects or spiders, which they sting and afterwards suck. The form of the body is distinctive: the head and the thorax are united, covered by a cephalo-thoracic shield, and bear a pair of chelera, a pair of large pedipalps, and four pairs of walking legs. On the

(Common Scorpion (*Scorpio europæa*))

anterior part of the shield there are several pairs of simple eyes, a pair centrally and several pairs near the margin. The abdomen consists of twelve segments, of which five form the narrow 'tail,' which is curled over the back when the animal runs. On the under surface of the abdomen we see most anteriorly a small double plate covering the genital aperture, then a pair of remarkable comb-like appendages or 'pectines,' probably with tactile functions, and behind these on four successive segments the slit-like apertures of four pairs of respiratory lung-books (so called because they consist of lamellæ like the leaves of a book). The tail ends in a sting, containing a paired gland from which poison flows through the perforated sharp point. When the scorpion strikes it suddenly straightens the tail, bringing the point (which is usually up-turned) rapidly downwards. It can also bend the sting forward to poison an insect held in the pedipalps. It does not seem possible for the scorpion to sting itself, as is often alleged; there has been much controversy on the subject, the old allegation being that a scorpion surrounded by a ring of fire would, recognising its fate, deliberately commit

suicide by stinging itself on the head. But scorpions evidently suffer much from great heat, and their excited movements may readily have given rise to apparently suicidal designs such as the creature is of course utterly incapable of forming. Scorpions cannot poison either themselves or other scorpions.

In seizing the prey the scorpion's large pedipalps are of use, and the small chelicera may serve to hold the dead body close to the mouth; the pharynx is suctorial, and the food-canal is very narrow, the food being for the most part merely the juices of the victim. The brain is well developed, and there is a ventral nerve-cord with seven ganglia. The lung-books are like those of spiders. In regard to their reproduction the most interesting fact is the parental care of the mother scorpion, who brings forth her young alive, shelters them under her body, or carries them about with her. When alarmed or irritated scorpions show some fierceness, moving their tail threateningly; they are highly sensitive to sound, musical or other. They are universally disliked, and not a little dreaded, being apt to get into houses, and into beds, hiding themselves under pillows, in shoes, boots, &c., so that accidents are very frequent in countries where they abound. The wound which they give is seldom fatal, but even that of the common European scorpions is very painful, and that of some of the largest species—which are six inches long—is much more severe, attended with nausea and constitutional derangement, nor do the effects soon cease. It is of use to press a huge key or other tube on the wound, so as to force out part of the poison. The best remedy is ammonia, internally administered, and also applied externally; see **VERMIFORM BITES**.

Scorpion-grass, an old name for Forget-me-not (*q.v.*)—supposed on the Doctrine of Signatures (*q.v.*) to be good for scorpion bites.

Scory, JOHN, Bishop of Hereford, was born at Ayle in Norfolk, and about 1530 was a friar in a Dominican house at Cambridge. After its dissolution in 1538 he got preferment from his patron, Archbishop Crammer, to whom he was chaplain until in 1551 he became Bishop of Rochester. He was translated next year to Chichester as successor to the deprived Dr Day, but on Mary's accession he was himself deprived, and, appealing before Bonner, renounced his wife, did penance, and had formal absolution (1554). Still he cannot have felt safe, for he fled abroad, first to Emden, and then to Geneva; and from the Continent addressed an 'Epistle to the faithful in prison in England,' exhorting them to continue in patience and hope. Mary dead, he came back to England (1559), and the same year was made Bishop of Hereford, and helped to consecrate Archbishop Parker. We find him in 1579 petitioning Burgley for removal from Hereford ('my present purgatorie') to Norwich, but death only removed him, on 26th June 1585, at his palace of Whitbourne. See vol. i. of Cooper's *Athenæ Cantabrigienses* (1858).

Scorzonera (probably Ital. *scorzone*, 'viper'), a genus of Compositæ (Cichoriæ), having yellow or rarely rose-coloured flowers. The species are numerous, mostly natives of the south of Europe and the East. No species is found in Britain. The Common Scorzonera of kitchen-gardens, *S. hispanica*, a native of the south of Europe, has long been cultivated for its esculent roots. The root is black externally, white within, about the thickness of a man's finger, long, and tapering very gradually. It contains a white milky juice, and has a mild, sweetish mucilaginous taste; it is very pleasant when boiled, the outer rind being first scraped off, and the root steeped in water,

to abstract part of its bitterness.—Other species of *Scorzonera* are used in the same way, and the roots of Sicilian *S. deliciosa* are preserved with sugar.

Scot (or SCOTT), SIR JOHN, of Scotstarvet in Fife (1585-1670), was a lawyer and statesman, Director of Chancery and a Lord of Session, who studied at St Andrews, signed the Covenant, lost his offices under Cromwell, and did not recover them at the Restoration. His *Staggering State of Scots Statesmen* (not published till 1754) is an uncomplimentary criticism of the mean arts needful in his time to secure and hold office. He cherished a correspondence with native and foreign scholars, promoted learning, and was a brother-in-law of Drummond of Hawthornden. He seemed the publication of Arthur Johnston's *Delitia Poetarum Scotorum*, and continued Timothy Pont's Survey of Scotland.

Scot, MICHAEL. See SCOTT.

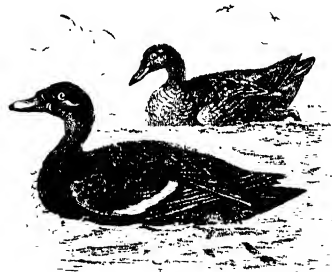

Scot (or SCOTT), REGINALD, an early disbeliever in witchcraft, was a younger son of Sir John Scot of Scotshall near Smeeth in Kent, was born about 1538, studied at Hart Hall, Oxford, and died 9th October 1599. He published *The Hoppe Garden* in 1574, and is credited with the introduction of hop-growing into England. His famous work, *The Discoverie of Witchcraft*, appeared in 1584, its deliberate aim to check the persecution of witches. The work is marked by humanity and strong sense, great boldness and power of logic, and is an admirable exposure of the childish absurdities which formed the basis of the witchcraft cases, and of the absurd manner in which the evidence was collected by the inquisitors and witch-finders. The healthy rationalism and openness of mind of the writer were more than two centuries before their time in England, and naturally excited the antipathy of a self-conceited fool like King James, who wrote his *Demonology* (1597) 'chiefly against the damnable opinions of Wierus and Scot, the latter of whom is not ashamed in public print to deny there can be such a thing as witchcraft.' The king's answer was pitiful, but he had the advantage of being able to burn Scot's book by the hands of the common hangman. Scot's work should have been complete as an antidote to Sprenger's fables and Bodin's babblings, which reach not so far to the extolling of witches' omnipotence as to the derogating of God's glorie; but, besides the feeble effort of the royal Solomon, answers and refutations continued to be written by Gifford, Perkins, Méric Casaubon, Cotta, and many eminent divines, and, with such few exceptions as the writers Webster, Wagstaffe, Ady, and others, witchcraft kept its hold upon the minds even of great men down to and beyond Glanville, Sir Thomas Browne, Richard Baxter, and even John Wesley. One great merit of Scot's book to the modern student is its richness as a collection of forms of incantations and the processes of sorcery, for its rational and liberal-minded author had the fairness to quote his antagonists honestly before pulverising them with his logic. The full title of the book best explains its scope and aim: 'The discoverie of witchcraft, wherein the lewde dealing of witches and witchmongers is notable detected, the knavery of conjurors, the impietie of incantors, the folie of soothsayers, the impudent falsehood of counsellors, the infidelitie of atheists, the pestilent practices of Pythonists, the curiositie of figure-casters, the vanitie of dreamers, the beggarlie art of Alenmystric, the abomination of idolatrie, the horrible art of poisoning, the vertue and power of naturall magike, and all the conveiances of Legier-demaine and juggling are deciphered: and many other things opened, which have long lien hidden,

howbeit verie necessarie to be knowne'—'for the undeceiving of Judges, Justices, and Juries, and for the preservation of poor, aged, deformed, ignorant people; frequently taken, arraigned, condemned, and executed for Witches, when according to a right understanding, and a good conscience, Physick, Food, and necessaries should be administered to them' was added in the 1651 title-page, besides other changes. This second edition was in quarto; the third, in 1665, was in folio, and contained, from an unknown and less rational pen, nine fresh chapters, commencing the fifteenth book, and a second book of the 'Discourse on Devils and Spirits' appended to the first and second issues. The next edition in time was the limited reprint of 1886, admirably edited, with an Introduction, by Brinsley Nicholson, M.D. See also CONJURING.

Scot and Lot. The old legal phrase *Scot* (O.E. *scot*, 'pay') and *Lot* embraced all parochial assessments for the poor, the church, lighting, cleansing, and watching. Previously to the Reform Act the right of voting for members of parliament and for municipal officers was, in various English boroughs, exclusively vested in payers of *Scot and Lot*.

Scotch Fir, properly Scots Pine. See PINE.

Scoter (*Eidemia*), a genus of oceanic ducks, represented on British coasts by the Common Scoter (*E. nigra*), the larger Velvet Scoter (*E. fusca*), and occasionally by the North American Surf Scoter (*E. perspicillata*). In

Velvet Scoter (*Eidemia fusca*).

North America *E. americana* is widely distributed. The Common Black Scoter is about the size of the common duck. The whole plumage of the male is deep black; that of the female is dark brown. They are abundant in winter on many parts of the British coast, but most migrate in spring to northern Scandinavia, Russia, and Siberia. They usually nest by inland fresh-water lakes. They feed on molluscs. The flesh is oily, and has a fishy taste, but, being therefore permitted to Roman Catholics during Lent, is in great request in some countries.

Scotists. See DUNS SCOTUS, SCHOLASTICISM.

Scotland, the northern part of Great Britain, is washed on the W. and N. by the Atlantic, on the E. by the North Sea, and on the S. is parted from England by the Solway Firth and the (largely artificial) line described in the article BORDERS. Its length, from Cape Wrath to the Mull of Galloway, is 274 miles; its breadth varies between 24 and 146 miles; and its total area is 19,070,466 acres or 29,796 sq. m. excluding 609 sq. m. of inland water. The geology, physical geography, meteorology, &c.

have already been sketched at GREAT BRITAIN; still, here we may recapitulate the outstanding features of Scotland for purposes of comparison and of reference to innumerable articles scattered throughout this work. Of 787 islands, belonging mostly to the Hebrides, Orkneys, or Shetland, sixty-two exceed 3 sq. in. area, and of these the largest are Long Island (Lewis and Harris, 859 sq. m.), Skye (643), the Mainland of Shetland (378), Mull (347), Islay (246), Mainland of Orkney (207), Arran (168), Jura (143), and North Uist (136). Of twenty-six rivers flowing direct to the sea the chief are the Tweed (97 miles long), Forth (75), Tay (93), Dee (87), Don (82), Devoon (62), Spey (96), Clyde (106), and Nith (71); and of these the Forth, Tay, and Clyde expand into important estuaries. There is also the Moray Firth; and indeed the whole coast is so intersected by arms of the sea that few places are more than 40 miles inland. Fresh-water lakes are numerous—Lochs Lomond (27 sq. m.), Ness (19), Awe (16), Shin, Maree, Tay, Earn, Leven, Kaffine, &c. The division of Scotland into Highlands and Lowlands, which puzzles strangers, who cannot understand how Wick comes to be Lowland and Inveraray Highland, has been explained at HIGHLANDS. In the Lowlands the highest points are Merrick (2764 feet) in Kirkcubrightshire, and Broad Law (2723 in Peebleshire; in the Highlands there are no fewer than 184 summits that exceed 3000 feet above sea-level—among them Ben Nevis (4406), Ben Macduinn (4296), Ben Lawers (4004), Ben Cruachan (3689), Ben Wyvis (3429), and Ben Lomond (3192). See CHRYSTIES, OCHILS, GRAMPIONS, &c. Of the total area about 50 per cent. is occupied with mountain and heath affording rough grazing, about 17 per cent. with arable, about 8 with pasture, and about 5 with woods and plantations; the rest may be said to have no special economic value. The highest proportion of cultivated area is found in Fife, and the lowest in Sutherland.

The gradual growth of the total population has been as follows: (1801) 1,608,420; (1821) 2,091,521; (1841) 2,620,184; (1861) 3,062,294; (1881) 3,735,573; (1901) 4,472,103; (1921) 4,882,497. The principal burghs in order of population are Glasgow (1,034,069), Edinburgh (420,281), Dundee (168,217), Aberdeen (158,969), Paisley (84,837), Greenock (81,120), Motherwell and Wishaw (68,869), Clyde bank (46,515), Coatbridge (43,909), Dunafermline (39,886), Kirkcaldy (39,591), Hamilton (39,120), Kilmarnock (35,756), Ayr (35,741), Falkirk (33,312), and Perth (33,204).

At the head of the administration is the Secretary for Scotland (in 1926 made one of the principal secretaries for state), who is responsible for the management of Scottish business in parliament. The Secretary of the Scottish Privy Council was under the later Stuarts, the most powerful person in the kingdom, and there was a Scottish secretary till 1725, and again in 1731-45. Thenceforward till 1885 the British Home Secretary, advised by the Lord Advocate, was responsible for Scottish business, and the Lord Advocate was the principal Scottish minister. In 1885 the office of Secretary for Scotland was created, and the new secretary has then or since taken over most of the powers of the Home Office, the Privy Council, the Treasury, and the Board of Trade; the secretary being also vice-president of the Scottish Education Department (in London) and president of the Scottish Board of Health. He has accordingly large responsibilities in regard to education, sanitation, pollution of rivers, prisons, manufactures, fisheries, county councils, and local taxation. In the House of Lords there are 16 representative Scottish peers elected by the Scottish peerage for the duration of the parliament.

CIVIL HISTORY.—An account has been given under the article PICTS of the early inhabitants of the country which has long been known by the name of Scotland, but which by the Romans was called Caledonia (q.v.). The original Scotia or Scotland was Ireland, and the Scoti or Scots, at their first appearance in authentic history, were the

people of Ireland (q.v.). The Scots were a Celtic race, and their original seat in Northern Britain was in Argyll, which they acquired by colonisation or conquest before the end of the 5th century; and thence they spread themselves along the western coast from the Firth of Clyde to the modern Ross. The name of Scotland seems first to have been given to the united kingdom of the Picts and Scots in the 10th century. It was then sometimes styled, by way of distinction, *Scotia Nova* (New Scotland), and it was a considerable time afterwards before the name of Scotland was applied to it, to the exclusion of Ireland. This interchange of names was a fruitful source of dispute between Irish and Scottish writers in the 16th and 17th centuries.

The first prince of the British Scots mentioned in our authentic annals was Fergus, son of Ere, who crossed over to Britain about 495 or 498. His nation had been converted to Christianity by St Patrick, and Fergus himself is said to have received the blessing of the saint in his early years. His great-grandson, Conal, was king of the British Scots when Columba (q.v.) began the conversion of the Northern Picts; and by that prince, according to the best authorities, Iona was given for the use of the mission. Conal was succeeded by his nephew, Aidan, who was inaugurated as sovereign by St Columba in the island of Iona—a ceremony which Scottish writers, misled by the great French antiquary Martene, long believed to be the first example of the benediction of kings. Aidan was a powerful prince, and more than once successfully invaded the English border, but in 603, towards the end of his reign, he received a severe defeat from the Northumbrian sovereign Ethelfrid at Dugastane (probably Dawstone in Liddesdale).

The history of Aidan's successors is obscure and uninteresting, except to the professed students of our early history. Their kingdom was overshadowed by the more powerful monarchy of the Picts, with which, as well as with its neighbours in the south—the Britons of Cumbria—it was engaged in almost unceasing conflict. The Scots were for a time under some sort of subjection to the English of Northumbria, but recovered their independence on the defeat and death of King Egfrid in battle with the Picts at Nechtansmere (Dunnichen, Forfarshire) in 685. In the middle of the 9th century, by a revolution, the exact nature of which has never been ascertained, the Scots acquired a predominance in Northern Britain. Kenneth Macalpin, the lineal descendant of Fergus and Aidan, succeeded his father as king of the Scots in 836. The Pictish kingdom was weakened by civil dissension and a disputed claim to the crown. Kenneth laid claim to it as the true heir in the female line, and was acknowledged king of Alban in 843.

King Kenneth transferred his residence to Forteviot in Strathern, which had been the Pictish capital, fixing soon afterwards the ecclesiastical metropolis of the united kingdom at Dunkeld, whence in 908 it was translated to Abernethy. The Picts and Scots, each speaking a dialect of the Celtic tongue, gradually coalesced into one people, whose territory extended from the Firths of Forth and Clyde to the northern extremity of Britain. The crown descended to a line of princes of the family of Kenneth, whose rule gave a unity and comparative tranquillity to the Scots of Britain which those of Ireland, at no time really united under one prince, never possessed. The first interruption to the descent of the crown in the line of Kenneth was the reign of a usurper named Grig, round whose name, amplified to Gregory by the writers of a later age, a cloud of legendary fiction gathered. The old family was restored on his expulsion in 893.

The reign of Constantine, son of Aodh, who succeeded in 904, was a remarkable one. In his time it is probable that the seat of the ecclesiastical primacy was transferred from Abernethy to St Andrews, and that the regal residence was fixed at Scone. At the latter place, in the sixth year of his reign, the chronicles mention that Constantine the king, Kellach the bishop, and the Scots swore to observe the laws and discipline of the faith and the rights of the churches and the gospels. This seems to indicate the meeting of some sort of council, civil or ecclesiastical, or more probably a combination of both, according to the form prevalent at this period both among the Celtic and the Teutonic nations. Even before the establishment of the kingdom of the Picts and Scots in the person of Kenneth, Northern Britain had experienced the attacks of a new enemy, the Scandinavian invaders, generally spoken of under the name of Danes. Constantine resisted them bravely, but towards the end of his reign he entered into an alliance with them in opposition to the English. In 937 a powerful army, composed of Scots and Picts, Britons and Danes, disembarked on the Humber, and was encountered at Brunanburh (q.v.) by Athelstan, king of England. A battle was fought there, the first of a series of unfortunate combats by Scottish princes on English ground. The confederate army was defeated, and, though Constantine escaped, his son was amongst the slain. Weary of strife, the king soon afterwards retired to the Culdee monastery at St Andrews, of which he became abbot, and there died in 953.

During the reign of Malcolm, the first of that name, and the successor of Constantine, a portion of the Cumbrian kingdom, including the modern Cumberland and part of Westmorland, which had been wrested from the Britons by Edmund, king of England, was bestowed by that prince on the Scottish sovereign. This grant was the foundation of that chain of homage made by the English kings on the Scottish sovereigns, which afterwards became the cause or the pretext for the great struggle between the two nations. The northern kingdom was still further increased in the reign of Kenneth, son of Malcolm, by the acquisition of Lothian, and of Northern Cumbria, or Strathclyde. The former province, previously a part of the Northumbrian kingdom, and entirely English in its population, was bestowed on Kenneth by Edgar, king of England. The Cumbrian kingdom, which had at one time extended along the west coast from the Firth of Clyde to the border of Wales, had been weakened by the loss of its southern territories; it was inhabited by a Celtic people speaking Cymric or Welsh, and now fell under the dominion of the Scottish king, though its inhabitants long retained their own speech and a peculiar system of laws (see BRETTES AND SCOTS). The last addition to Scotland in the south took place under Malcolm II., son of Kenneth, who acquired the Merse and Teviotdale from the Earl of Northumbria, and thus advanced his kingdom on the eastern border to the Tweed. The reign of Malcolm II. extended from 1003 to 1033. The kings who immediately followed are better known to the general readers than any of their predecessors, Shakespeare having made their names familiar to every one. Malcolm's successor was his grandson, Duncan, whose brief reign was followed by that of Macbeth (q.v.). The latter was a vigorous and prudent ruler, munificent to the church, and famous as the only Scottish king who made a pilgrimage to Rome. But, although by marriage he was connected with the royal line, he was unable to secure the affection of his subjects. Malcolm, the eldest son of Duncan, assisted by his kinsman, Siward, Earl of Northumbria, invaded Scotland. The usurper was defeated and

slain at Lumphanan, in Mar, in 1057, and Malcolm was acknowledged as king.

The long reign of Malcolm Canmore was the commencement of a great social and political revolution in Scotland. His residence in England, and still more his marriage with the English Princess Margaret, the sister of Edgar Atheling, led to the introduction of English customs, the English language, and an English population into the northern and western districts of the kingdom. The influx of English colonists was increased by the tyranny of William the Conqueror and his Norman followers. All received a ready welcome from the Scottish king, whose object it was to assimilate the condition of the Scots in every respect to that of their fellow-subjects in Lothian; and what his stern, though generous, character might have failed to accomplish was brought about by the winning gentleness and Christian graces of his English queen.

Malcolm fell in battle before Alnwick Castle in the year 1093, and Margaret survived only a few days. It seemed as if the work of their reign was about to be utterly overthrown. The Celtic people of Scotland, attached to their old customs, and disregarding the claims of Malcolm's children, raised his brother, Donald Bane, to the throne. The success, however, of this attempt to restore a barbarism which the better part of the nation had outgrown was of brief duration; Donald was dethroned, and Edgar, the eldest surviving son of Malcolm and Margaret, was acknowledged as king. The very name of the new sovereign marked the ascendancy of English influence. That influence, and all the beneficial effects with which it was attended, continued to increase during the reigns of Edgar and his brother and successor, Alexander I. The change went steadily on under the wise and beneficent rule of David (q.v.), the youngest son of Malcolm. His reign, which extended from 1124 to 1153, was devoted to the task of ameliorating the condition of his subjects, and never was such a work more nobly accomplished. David was in every respect the model of a Christian king. Pious, generous, and humane, he was at the same time active and just, conforming himself to the principles of religion and the rules of the church with all the devotion of his mother, but never forgetting that to him, not to the clergy, God had committed the government of his kingdom. He was all that Alfred was to England, and more than St Louis was to France. Had he reigned over a more powerful nation his name would have been one of the best known among those of the princes of Christendom. At the time of David's accession Scotland was still but partially civilised, and it depended in a great measure on the character of its ruler whether it was to advance or recede. It received a permanent stamp from the government of David. The Celtic people were improved morally, socially, and ecclesiastically, and all along the eastern coast were planted Norman, English, and Flemish colonies, which gradually penetrated into the inland districts, and established the language and manners of that Teutonic race which forms the population of the greater part of Scotland. David encouraged and secured the new institutions by introducing a system of written law, which gradually superseded the old Celtic traditional usages, the first genuine collections of Scottish legislation belonging to his reign. David was as great a reformer in his church as in the state. The ecclesiastical system prevalent in Scotland almost up to his time differed in some points from that established in England and on the Continent, bearing a great resemblance to that of Ireland, from which it was indeed derived. David established dioceses, encouraged

the erection and endowment of parishes, provided for the maintenance of the clergy by means of tithes, and, displacing the old Celtic monastic bodies, introduced the Benedictine and Augustinian orders.

David, though devoting his energies to the improvement of his subjects in the manner which has been mentioned, did not forget duties of a less agreeable kind. He knew that a Scottish king really held his crown by the tenure of the sword, and none of his fierce ancestors was a more intrepid warrior than the accomplished and saintly David. His skill and courage were shown, though without success, at the Battle of the Standard. As the representative through his mother of the ancient kings of England, he had many friends in that country; and had the Scottish army been successful the history of the two kingdoms might in some respects have been different. As it was, he contented himself with maintaining the cause of his sister's child, the Empress Matilda, against King Stephen.

David's grandson and successor, Malcolm IV. (1153-65), and his brother, William the Lion (1165-1214) pursued the policy of their grandfather with equal resolution, though sometimes with less success. They were embarrassed by their connection with the English King Henry II., who took advantage of his superior power and ability to impose unwise and unjust restraints on the independence of the Scottish sovereigns and their kingdom—a policy which laid the foundation of the unhappy national strife of after years. This was averted for a time by the concessions of Richard I. in 1189. 'For more than a century,' says Lord Hailes, 'there was no national quarrel, no national war between the two kingdoms—a blessed period.' That period was well employed by the next two kings, Alexander II. and Alexander III., the son and grandson of William the Lion, to consolidate the institutions of their kingdom, and extend and confirm what had been begun by David. Alexander III. was one of the ablest and best of the Scottish kings. By a treaty with the king of Norway he added to his kingdom Man and the other islands of the Western Sea, held by the Norwegians. His sudden death in 1286 was one of the greatest calamities with which Scotland could have been afflicted. It closed a period of prosperity—a course of improvement—which the kingdom did not again enjoy for fully 400 years.

On the death of the infant granddaughter and heiress of Alexander III. in 1290 the succession to the crown was disputed. The question between the two chief claimants, Baliol and Bruce (q.v.), was not free from doubt according to the customs of the time; and Edward I. (q.v.) of England, to whom the decision was referred, appears at first to have acted with good faith. But this great king, who had already subdued Wales, was now bent on uniting the British Islands under one sceptre; and in the pursuit of that object he sacrificed humanity, honour, and justice. The results were most deplorable. The national spirit of the Scots was finally roused, and after a long struggle under Wallace and Bruce, in 1314 they secured their independence on the field of Bannockburn (q.v.). The battle of freedom was won; but it was at the expense of tranquillity and civilisation. The border counties were continually wasted by the English; the central provinces were the scene of frequent warfare among the chief nobles; and the highland districts became more and more the seat of barbarism, the Celtic tribes re-acquiring something of their old ascendancy, just as they did in Ireland in the troubled times which followed the invasion of Edward Bruce. The strong arm of King Robert might have repressed these disorders had his life been longer spared after

the treaty of Northampton; but his death in 1329 and the accession of an infant son again plunged the country into all the miseries of foreign and civil war. When that son, David II., grew up to manhood he proved in every respect unworthy of his great father. The reigns of this prince and his successors Robert II. and Robert III., the two first princes of the House of Stewart, may be regarded as the most wretched period of Scottish history. In the year 1411 the kingdom would have become absolutely barbarous if the invasion of the Lord of the Isles had not been repulsed at Harlaw (q.v.) by the skill of the Earl of Mar and the bravery of the lowland knights and burghesses.

A happier time began to dawn with the release of James I. in 1424 from his English captivity. The events of the following period are better known, and a brief notice of the most important will be sufficient. Reference may be made for details to the accounts of the particular kings. The vigorous rule of James I. had restored a tranquillity to which his kingdom had long been unaccustomed; but strife and discord were again brought back on his assassination. One of the most calamitous features of the time was a long series of minorities. James himself had succeeded to the crown when a child and a captive; James II., James III., James IV., James V., Mary, and James VI. all succeeded while under age, and all except James IV. when little more than infants. The courage and ability shown by almost all the Stewart princes were insufficient to repair the mischiefs done by others in the beginning of their reigns, and to abate the great curse of the country—the unlimited power and constant feuds of the nobles. The last addition to the Scottish kingdom was made in the reign of James III., when the islands of Orkney and Shetland were made over to him as the dowry of his queen, Margaret of Denmark. The marriage in 1503 of James IV. with Margaret of England was far more important in its ultimate results, and brought about in the reign of his great-grandson that peaceful union with England which the death of the Maid of Norway had prevented in the 13th century. Many good laws were enacted during the reigns of the Jameses; but the wisdom of the Scottish legislature was more shown in framing them than the vigour of the government in enforcing them. Among the most important improvements of the period was the establishment of universities—the first of which, that of St Andrews, was founded during the minority of James I.—and the institution of the College of Justice in the reign of James V.

During the reign of the fifth James religious discord added another element to the evils with which Scotland was afflicted. The practical corruptions of the church were greater than they were almost in any other country in Europe, and one of the consequences was that the principles of the Reformation were pushed further than elsewhere. The first great ecclesiastical struggle had hardly ceased, by the overthrow of the Roman Catholic system, when the strife began anew in the Reformed Communion in the shape of a contest between Episcopacy and Presbyteranism, the former being supported by the sovereign, the latter by the common people, the nobles throwing their weight into either scale as it suited their policy at the time. James VI. struggled hard to establish an absolute supremacy, both in church and state, in opposition to a powerful party, which admitted no royal authority whatever in the former and very little in the latter. After his accession to the English crown he was apparently successful in carrying out his designs, but during the reign of his son, Charles I., the contest again broke out with increased bitterness. The nobility, whose rapacity

had been checked by the sovereign, joined the popular party. The opponents of the crown bound themselves together, first by the National Covenant, and afterwards, in alliance with the English Puritans, by the Solemn League and Covenant. Their efforts were completely successful, but their success led to the utter overthrow of the monarchy by Cromwell. See MONTROSE.

The restoration of Charles II. was welcomed by all classes, wearied as they were of a foreign and military rule, but especially by the nobles and gentry, who had learned by bitter experience that the humiliation of the sovereign was necessarily followed by the degradation of their order. Had the government of Charles II. and James VII. been reasonably just and moderate it could hardly have failed in securing general support; but it was more oppressive and corrupt than any which Scotland had experienced since the regencies in the minority of James VI. The natural result was the revolution which seated William and Mary on the throne: the Jacobite victory of Killbuckie was more than neutralised by the fall of Dundee.

The parliament of Scotland, which met for the last time in 1706, was originally composed, like the English parliament, of three classes—the ecclesiastics (consisting of bishops, abbots, and priors), the barons, and the burghesses. The spiritual lords during the establishment of Episcopacy after the Reformation were composed of bishops only. When Presbyterianism was established at the time of the Covenant, and when it was formally ratified by law at the Revolution, the ecclesiastical estate ceased to have any place in parliament. The barons, or immediate vassals of the crown, at first sat in their own right, whether holding peerages or not; but afterwards the peers alone sat, the others sending their representatives. The burghesses were the representatives of the burghs. All the three estates sat to the very last in one house, the sovereign presiding in person, or through a commissioner named by him.

Hardly had the majority of the nation been successful in the Revolution settlement when many of them began to repent of what they had done, and Jacobitism became more popular than royalist principles had ever been when the House of Stewart was on the throne. The discontent was greatly increased by the fears entertained of English influence. Ancient jealousies had been revived and intensified by the collapse of the Darien Scheme (q.v.). The state of matters grew so threatening after the accession of Queen Anne that the mingling English statesmen became satisfied that nothing short of an incorporating union between the two kingdoms could avert the danger of a disputed succession to the throne and of a civil war. Supported by some of the ablest and most influential persons in Scotland, they were successful in carrying through their design, though it was opposed by a majority of the Scottish people, under such leaders as Fletcher (q.v.). The Act of Union was formally ratified by the parliament of Scotland on the 16th of January 1707. It subsequently received the royal assent, and came into operation on the 1st of May of the same year. The union continued to be unpopular in Scotland for many years, an unpopularity increased by the corrupt means freely used to carry it through. Suspicions were cherished that the national life would pass away with the national separateness, and that the independence of the Scottish church and the distinctness of the national system of jurisprudence would inevitably suffer. There were agitations and petitions for the repeal of the union and the restoration of the national parliament. But the discontent gradually died down; not that the malcontents were silenced by argument but by the logic of facts. The

association with the larger and wealthier kingdom of the south opened a vastly wider field to the enterprise for which in all departments of life the 'præferendum ingenium Sæclorum' had already been noted; and the rapid growth of prosperity by the extension of old and the establishment of new industries helped to bring about a sense of well-being and content. The peaceful acquiescence of the great majority of the nation in the union was brought out at the time of the Jacobite rebellions of 1715 and 1745 (see JACOBITES); the Porteous Mob (q.v.) was a temporary ebullition of a discontent only partly political. It became patent to all that the consequences of the union were beneficial to both countries; yet Scotland and England are in many respects two countries still, and a Scot abroad, asked if he is an Englishman, will seldom give an affirmative answer.

Scotland and Scotsmen have taken a prominent part in the public affairs and intellectual life of the United Kingdom, in its warfare and colonial expansion; the literature of Scotland blossomed luxuriantly (see below) after the union; Reid and Dugald Stewart founded a school of philosophy (see SCOTTISH PHILOSOPHY); as Jeffrey and Cockburn did a school of criticism; and in the 18th century the 'Modern Athens' was more conspicuously a centre of literary and intellectual culture than at any former period. A long series of scientific worthies begins with Napier of Merchiston, including in mathematics, physics, and chemistry, the Gregories, Simson, Black, Brewster, J. D. Forbes, Clerk-Maxwell, Macquorn Rankine, Dewar, Tait, and Graham Bell; in engineering and steam navigation, Watt, Rennie, Telford, Symington, Henry Bell, Fairbairn, and the Stevensons; in geology, almost all the greatest British names—Hutton, Playfair, Hall, Murchison, Lyell, and the Geikies; in zoology, Edward Forbes and Wyville Thomson; Brown the great botanist; and in medicine and surgery, the dynasties of Gregories, Callers, Munros, Hunters, and Bells, Simpson, Liston, and Syme. Paterson and Law, founders of the bank of England and the Bank of France, were Scotsmen. Among British Prime Ministers Gladstone, Rosebery, Balfour, Campbell-Bannerman, Bonar Law, Ramsay MacDonald, have been Scottish by birth or descent. Erskine, Campbell, and Haldane sat on the Woolsack of England, Sir Alexander Cockburn was Lord Chief Justice. Of painters, Jameson, Allan, Nasmyth, Thomson, Raeburn, Wilkie, Dyce, David Scott, Phillip, McTaggart, MacAllister, and Orchardson, may be named, with the brothers Adam, architects. Amongst soldiers have been Marshal Keith, Marshal Stair, Abercromby, Moore, Heathfield, Lyndoch, Lord Clyde, and Earl Haig; amongst sailors, Camperdown and Dundonald; and amongst travellers and explorers, Bruce the 'Abyssinian,' Livingstone, Joseph Thomson, and W. S. Bruce.

The 'Scot abroad' was always a familiar phenomenon equally in French universities and in French, Austrian, Swedish, and Russian armies; and Scotsmen have not since then become a race of stay-at-homes. Sweden has its Haughtons, Germany its Döngelassen, and France its Macdonalds; the Russian poet Lermontoff, the Norwegian composer Grieg, the German general Mackensen bear Scottish names more or less modified. The Scots Guards (q.v.) in France became famous, while Sir Charles Dilke said (in *Greater Britain*), 'In British settlements from Canada to Ceylon, from Dunedin to Bombay, for every Englishman you meet who has worked himself up to wealth from small beginnings without external aid, you find ten Scotsmen.' But this is a pardonable exaggeration.

See the 'Historians of Scotland' series (10 vols. 1871-80), comprising the chronicles of Fordun and Wyntoun,

the lives of SS. Ninian, Kentigern, and Columba, the *Critical Essay on the Ancient Inhabitants of Scotland*, by Father Innes (q.v.), &c.; the *History of Bede*, the Irish Annals, and especially Skene's *Celtic Scotland* (3 vols. 1876-80; new ed. 1886). For the period down to the Reformation may be added the *Chronicles of Melrose* and *Lanercost*, Leslie's and Buchanan's *Histories*, E. W. Robertson's *Scotland under her Early Kings* (2 vols. 1862), and the *Acts of the Scottish Parliament*. For the period from the Reformation to the Union—Knox's, Calderwood's, Spottiswoode's, and Robertson's *Histories*, Baillie's *Letters*, Wodrow's and Burnet's *Histories*, the *Acts of Parliament*, and the *State Papers*. The *Scottish Records* publications include *The Exchequer Rolls of Scotland*, *Accounts of Lord High Treasurer*, *Register of Privy-council*, *Documents illustrating Scottish History*. See also Pinkerton's *Inquiry*; Hailes's *Annals*; the histories by Tytler, Laing, Hill Burton, Hume Brown (3 vols. 1838-1969), Andrew Lang (4 vols.) and Sanford Terry (1920-1921); various works by Rait, including *Parliaments of Scotland* (1924); Chambers's *Domestic Annals*; the works of Cosmo Innes; Craik's *A Century of Scottish History* (1901); Hill Burton's *Scot Abroad*; Fischer's books on Scots in Germany, Sweden, &c.; Grant's *Scottish Soldiers of Fortune* (1889); Mackintosh's *History of Christianity in Scotland* (1878-84); his *Scotland from the Earliest Times to the Present Century* (1896), a succession of works by W. L. Mathieson (1902-16); Mackinnon's *Social and Industrial History of Scotland to the Union* (1920), and *Constitutional History of Scotland to the Reformation* (1921); besides works on special periods. Additional references may be found by consulting articles in this work, such as GOWRIE CONSPIRACY, JACOBITES, &c., and the lives of the kings and other great personages of Scottish history. For the royal arms of Scotland, see HERALDRY.

ECCLESIASTICAL HISTORY. Christianity in Scotland dates from the 4th century, but its beginnings are obscure. What we know centres mainly round the lives of the great Celtic missionaries, Ninian, Kentigern, and Columba, and may be traced in the articles on them, as also in those on Adamnan, on Cuthbert, on the Culdees, and on the Picts. The connection of St. Palladius, 'chief apostle of the Scottish nation,' with Scotland seems mythical; he is said to have been sent 'in Scotland' in 430 by Pope Celestine; but the 'Scotia' here meant was certainly Ireland, and Skene doubts if Palladius was ever in Scotland till after his death, when St. Ternan brought his relics to Fordoun in Kincardineshire. The doctrines of the ancient Scottish Church were the same as those of the rest of Western Christendom. In ritual there were some points of difference, but so slight that the most important related to the time of observing the Easter festival. In these points also the Scots gradually conformed to the usage of the Roman and English Churches. In one point, however, there continued for several centuries to be a marked distinction between the Scots and Irish on the one hand and the churches of England and the Continent on the other. This was in reference to ecclesiastical government. The Scots recognised the same orders of the ministry, bishops, priests, and deacons, as other Christians did; and like them they held that ordination could be given only by bishops. But they acknowledged no such supremacy of jurisdiction in the episcopal order as was held by other churches. In Scotland there were neither dioceses nor parishes; but there were numerous monasteries in which the abbots, whether bishops or priests, bore the chief rule, all being in subordination to the successor of St. Columba, the presbyter-abbot of Iona, who in virtue of that office was primate of the Scots.

When Iona was desolated by the Northmen the primacy seems to have been transferred in the middle of the 9th century to the Abbots of Dunkeld, then to the Bishops of Abernethy, and finally to the Bishops of St. Andrews, who became known as *Episcopi Sæclorum*, the bishops of the Scots. Slowly at

first, but gradually, an assimilation to the English and continental usages began, a change rendered more easy by the Scottish dominion being extended over Lothian, in which the ecclesiastical system was the same as that of England. A great impulse was given in the same direction by the marriage of Malcolm III., king of the Scots, with Margaret the sister of Edgar Atheling. The king and queen used their utmost efforts to introduce the English usages in ecclesiastical as in other matters; and Margaret herself held repeated conferences for that purpose with the chief Scottish ecclesiastics, at which her husband acted as interpreter. The principal points in which she attempted to bring about a reform were the commencement of the Lent fast, the superstitious infrequency of receiving the communion, and the lax observance of Sunday and of the scriptural and canonical restrictions on marriage between relations.

The reform begun by Malcolm and Margaret was fully carried out by their youngest son, David I. These improvements were completed by his successors, and before the end of the 12th century the ecclesiastical system of Scotland differed in no important point from that of the rest of Europe. Some Scottish writers have lamented the change, as being one from purity of belief and practice to superstition and immorality. This is undoubtedly a mistake. The Celtic Church had become very corrupt, and the clergy were inferior both in learning and morals to their brethren in the south. King David was a reformer in the best sense of the word, and it does not detract from the character of his reformation that as time went on the Scottish Church became involved in those superstitions with which the rest of Christendom was overspread.

The ritual of the Scottish mediæval church was almost the same as that of England, the Salisbury Missal and Breviary being the models of the Liturgies and Office Books used in Scotland. The external system of the church—cathedral, parochial, and monastic—was also in almost every point identical. The chief monastic orders were the Benedictine and its most important branches the Cistercian and Cistercian, the canons regular of St Augustine, and the Reformed Premonstratensian canons. The Cistercians and Cistercians were in strict subordination to the mother-houses of their orders at Clugny and Cîteaux. In the 13th century the Dominican, Franciscan, and Carmelite friars were introduced into Scotland. The chapters of all the Scottish cathedrals, except those of St Andrews and Whithorn, were composed of secular canons—the chief dignitaries being a dean, archdeacon, chancellor, precentor, and treasurer. The prior and canons regular of the Augustinian monastery at St Andrews formed the chapter of that see, and the prior and Premonstratensian canons of Whithorn formed the chapter of the cathedral of Galloway. There were twelve dioceses in the Scottish Church, to which Orkney was added on the transference of those islands to the Scottish sovereign in the 15th century. The twelve dioceses were Caithness, Ross, Moray, Aberdeen, Brechin, Dunkeld, Dunblane, St Andrews, Argyll, the Isles, Glasgow, and Galloway. The larger of these dioceses were divided, like the English dioceses, into rural deaneries. The single point in which the mediæval church down to the 15th century differed from that of England and other churches of the west was in its having no metropolitan. St Andrews, and next to it Glasgow, had a certain precedence; the bishops of the former see, and failing these the bishops of the latter, having the privilege of crowning and anointing the sovereign. But they had no jurisdiction over the other sees, nor did their bishops bear the style of archbishop. This led to claims on

the part of the Archbishops of York to metropolitan authority in Scotland, which had no foundation except in regard to the southern portion of the diocese of St Andrews and the see of Galloway, the bishops of which were for several centuries suffragans of York. The court of Rome found it convenient, for the sake of its own privileges, to encourage this anomalous system; but to provide for the meetings of the Scottish bishops in provincial council a bull of Pope Honorius III. in 1225 authorised them to meet in synod. In virtue of this bull the bishops, abbots, priors, and other chief ecclesiastics, with representatives of the capitular, collegiate, and conventual bodies, assembled annually in provincial synod, sitting in one house under the presidency of a conservator chosen by and from the bishops. The chief government of the church under the pope thus devolved on these synods and their elective presidents. This continued until the erection of St Andrews into an archiepiscopal and metropolitan see, in virtue of a bull of Pope Sixtus IV. in 1472. By this bull all the Scottish sees were made suffragans to that of St Andrews, whose bishops were now to be styled archbishops.

In 1492 Glasgow was raised to the dignity of a metropolitan see by a bull of Pope Innocent VIII., and the bishops of Dunkeld, Dunblane, Galloway, and Argyll were made suffragans to its archbishop, an arrangement which was soon afterwards altered to some extent—Dunkeld and Dunblane being reannexed to St Andrews, and Glasgow having for its suffragan sees those of Galloway, Argyll, and the Isles. This last arrangement continued till the Reformation, and afterwards during the establishment of Episcopacy—the two Scottish archbishops occupying towards each other precisely the same position as the Archbishops of Canterbury and York, and being sometimes involved in the same unseemly broils, in regard to jurisdiction and precedence, which long existed between the English metropolitans.

The ignorance and immorality of the clergy were far worse than they were in England, or perhaps anywhere in Europe, except in the Scandinavian churches. The desire for reformation which led to the proceedings of Huss and Wyclif produced similar effects in the Scottish kingdom. As early as the year 1406 or 1407 James Resby, an English priest and a disciple of Wyclif, was burned at Perth; and in 1433 Paul Crawar, a Bohemian Hussite, was burned at St Andrews. The opinions of Wyclif continued to be privately taught, particularly in the south-western counties, where his followers were known by the name of the Lollards (q.v.) of Kyle. In the following century the intercourse with the Continent was frequent and close, and the effects of Luther's preaching and writings were soon felt in Scotland. In the year 1525 the importation of Lutheran books and the propagation of the Reformer's tenets were forbidden by an act of the Scottish parliament; and in February 1528 Patrick Hamilton, abbot of Ferne, was burned at St Andrews for teaching and publishing Lutheran doctrines. The piety of Hamilton and the patience with which he bore his sufferings induced others to follow his teaching and example. Several persons, both ecclesiastics and laymen, were subsequently burned, and many more fled to England or the Continent.

The persecution, though encouraged or permitted by the bishops, was disapproved of by some ecclesiastics of learning and influence, who were desirous of effecting a reform in the church without breaking off from communion with the hierarchy. The efforts of this school were unsuccessful, and the Scottish nation was gradually divided into two parties—one

of which, headed by the bishops and supported by the state, was determined to resist all change; and the other, composed of a considerable number of the clergy both regular and secular, of the gentry, and of the burghesses of the large towns, was disposed to carry its reforming principles far beyond what had been done by Luther and Melancthon. These two parties came into deadly conflict in 1546. On the 28th of February in that year George Wishart, the most eloquent of the Reforming preachers, was condemned to death by an ecclesiastical court—at which Cardinal Beaton, Archbishop of St Andrews, presided and was burned. On the 28th of May following the cardinal was murdered by Norman Leslie and other adherents of the Reforming party. The struggle continued during the regency of the Earl of Arran and that of Mary of Lorraine, the mother of Mary, the young queen of Scots.

In the year 1559 the Reformers became strong enough to set the regent at defiance. Various circumstances encouraged them to demand freedom for their opinions, particularly the death of Mary of England and the accession of Elizabeth. They were further animated at this time by the return from Geneva of their chief preacher, John Knox. The conflict was to be decided by other than spiritual weapons. The regent and the Reformed party, now known by the name of the Congregation, met in open warfare. The contest was carried on for a twelvemonth, and ended in the triumph of the Congregation. A parliament met at Edinburgh on the 1st of August 1560. The Reforming party had the complete ascendancy, and succeeded in passing several acts by which the jurisdiction of the pope was abolished, the mass was proscribed, and a Confession of Faith drawn up by Knox and his associates was ratified, the spiritual lords making a faint resistance.

The new Confession of Faith adhered in all essential articles of belief to the ancient creeds of the church. In regard to the sacraments it differed entirely from the recent teaching of the Western Church; but its language, on the whole, was moderate and conciliatory. In reference to ceremonies and the details of church polity it declared that such things were temporary in their nature, and not appointed for all times and places, and that they ought to be altered when they fostered superstition and ceased to be conducive to edification.

A Book of Discipline was soon afterwards drawn up by the compilers of the Confession, which was generally approved of, but did not receive the sanction of parliament. It followed out in detail the principles laid down in the Confession. In regard to the office-bearers of the church various orders were mentioned, but three were specially of importance—ministers, elders, and deacons. Ministers were to be chosen by each several congregation, but were to be examined and admitted in public by the ministers and elders of the church. No other ceremony, such as imposition of hands, was to be used. The elders and deacons were to be chosen yearly in each congregation, and were not to receive any stipend, because their office was only to be from year to year and because they were not to be debared from attending to their own private occupations. In order to the better provision for the wants of the time certain persons called superintendents were appointed in particular districts, with power to plant and erect churches and to appoint ministers within the bounds of their jurisdiction.

The chief governing as well as legislative and judicial power in the Reformed Church was entrusted to a General Assembly, which met half-yearly or yearly, and was composed of the super-

intendents, ministers, and lay commissioners, and which gradually, by the introduction of the system of representation, assumed the form and more than the power of a parliament.

The worship of the Reformed Church was modelled on that established by Calvin at Geneva. It was embodied in a formulary called the Book of Common Order, which for nearly a century continued to be generally used. It contained forms for the ordinary worship both on Sundays and weekdays, and for the administration of the sacraments, and for certain other occasions. The minister was not absolutely restricted to these forms. Except in the singing of Psalms, the people took no direct part in ordinary worship, and there was no distinction of ecclesiastical seasons, all holidays whatever except Sunday being abolished.

The form of church government established at the Reformation did not remain long undisturbed. Some of the most zealous Protestants thought the danger to which the church was exposed from state tyranny and aristocratical oppression could best be met by restoring the bishops to their ancient position both in the church and in the parliament; while others of equal zeal and sincerity saw in this only the commencement of a plan for bringing back all the errors of popery. A scheme of this kind was actually established for some time, and the sees were filled with Protestant bishops set apart for the office by their brethren of the ministry. It was almost immediately attacked by some of the ministers, who soon found a leader in Andrew Melville, a scholar of considerable eminence, who returned to Scotland in 1574, after a residence in Geneva, during which he had ardently embraced the new opinions as to ecclesiastical government maintained by Beza.

The struggle continued for some years, the bishops being encouraged by the sovereign and his advisers, whose support was frequently of little real advantage to them, and Melville receiving the zealous assistance of many of the ministers, and of the great body of the common people, who sympathised with him in his democratic theories of civil and ecclesiastical government. Melville was at last entirely successful. His opinions were embodied in what was called the Second Book of Discipline, which received the formal sanction of the General Assembly in 1581. This formulary differed very much from the First Book. It laid down authoritatively those principles in regard to ecclesiastical authority which the English Puritans were vainly striving to establish in the southern kingdom, and was in reality an attempt to make the civil power subordinate to the ecclesiastical, even in matters secular. It recognised four orders of office-bearers in the church, the Pastor, Minister, or Bishop, the Doctor, the Presbyter or Elder, and the Deacon. These were to be set apart by ordination and the imposition of the hands of the eldership, but no one was to be intruded into any office contrary to the will of the congregation or without the voice of the eldership. Four sorts of church courts, each rising above the other, were sanctioned; first, of particular congregations one or more; second, of a province or what was afterwards called the Provincial Synod; third, of a whole nation; and fourth, of the universal church. What is generally regarded as the most essential feature of the Presbyterian system—the Presbytery—was not yet introduced in its proper form, the lowest court being a combination of what were afterwards known as the Presbytery and the Kirk-session. It was, however, introduced before the year 1592, when the privileges of general and provincial assemblies, presbyteries, and parochial sessions were ratified by parliament, though the Book of Discipline itself did not receive any formal sanction.

Clerical 'superintendents' had been appointed over districts, but without episcopal rank or powers.

King James had assented to the establishment of Presbyterianism, but disliked its discipline and soon endeavoured to overthrow it—more effectually after his accession to the crown of England. He gradually obtained from the General Assembly a recognition of the civil rights of the bishops, and this led to the restoration of their ecclesiastical privileges. His changes were sanctioned by a General Assembly which met at Glasgow in 1610, and in the course of the same year Episcopacy was restored in reality, as well as in name, by the consecration of three Scottish prelates by four of the English bishops at London.

The king wished to assimilate the Scottish Church as far as possible to that of England, and his next important movement was the establishment of what are called the Five Articles of Perth (see PERTH).

These various changes excited great dissatisfaction in Scotland, particularly in the southern counties, but it gradually abated to a considerable extent, and might have altogether ceased had not further innovations been attempted. It was the wish of James to introduce a prayer-book like that of the English Church in place of the Book of Common Order, but he saw the danger with which the proposal was attended, and gave it up or postponed it. His son Charles was as inferior to his father in prudence as he excelled him in conscientiousness and religious zeal. During his first visit to Scotland he added another bishopric—that of Edinburgh—to the dioceses of the Scottish Church. Most unwisely and most improperly he endeavoured by his royal authority to introduce into that church a Book of Canons and a Liturgy framed on the model of those of England. The king had many loyal supporters in all parts of Scotland, and in the north Episcopacy was preferred by the people to Presbyterianism. But the storm of popular indignation which was now roused swept everything before it. The king's opponents banded themselves together by the National Covenant, and at a General Assembly held at Glasgow abolished the Perth Articles and Episcopacy and re-established Presbyterianism. Charles attempted to maintain his claim by the sword, but was unsuccessful, and obliged to ratify in parliament all that had been done by his opponents.

Had the Covenanters been satisfied with the victory which they had won Presbyterianism might have remained the established religion of the Scottish kingdom. But they could not resist the entreaties for aid from the English Puritans, or rather they yielded to the delusion of extending their own discipline over the churches of England and Ireland. They just attempted, in an opposite direction, what James and Charles had failed to accomplish. For a time their policy seemed to triumph. The Solemn League and Covenant of the three kingdoms, after having been approved by the General Assembly in Scotland, was signed by the Assembly of Divines which the parliament had summoned to meet at Westminster and by the parliament itself. The ecclesiastical documents which were afterwards drawn up originated with the Assembly of Divines, but were sanctioned by the Assembly in Scotland. The principal of these were a Directory for Public Worship, a Confession of Faith, and a Larger and Shorter Catechism. The first of these documents was intended to supersede the Book of Common Prayer in England, and indirectly the Book of Common Order in Scotland. It laid down certain general rules in regard to public worship and the administration of the sacraments, but left very much to the discretion of the particular ministers and congregations.

The union between the Scottish and English Puritans was dissolved by the ascendancy of the Independents. Scotland, distracted by civil and ecclesiastical dissension, was unable to defend itself against Cromwell. It was conquered and kept thoroughly under subjection by the English army, which forbade the meetings of the General Assembly, but left the other courts and the rest of the church system as they were before. At the Restoration the higher classes generally, who had suffered under the ecclesiastical tyranny of the ministers, were zealous for the re-establishment of Episcopacy. The greater part of the nation, except in the south-western provinces, was indifferent, and the king experienced no difficulty in restoring the bishops to their former rights both in church and state. But Episcopacy alone was restored; there was no attempt to introduce a liturgy, or even to enforce the observance of the Perth Articles. The new primate, Archbishop Sharp, was an able man of good moral character, but ambitious and overbearing, and the Covenanters never forgave his change from Presbyterianism, though he had always belonged to the more moderate of the two parties into which the church was divided. He was almost the only one of the bishops who enjoyed political influence; and, unfortunately for himself and the hierarchy, that influence was generally used to encourage, not to restrain, the severe measures of the government. When the primate was assassinated that severity became a cruel tyranny, and many who had no predilection for any particular ecclesiastical opinions were ready to welcome the change which took place at the Revolution.

When the Scottish Estates met in 1689 to consider what course was to be adopted in the northern kingdom the bishops declined to abandon King James. Whatever might have been the consequences had they taken an opposite course, this resolution was fatal to the Episcopal establishment. William and Mary were called to the throne, and Prelacy was declared to be an insupportable grievance and was abolished. In the following year Presbyterianism was re-established, and the Westminster Confession of Faith was ratified as the national standard of belief, and the right of patrons to nominate to ecclesiastical benefices was taken away. In the end of the same year a General Assembly was held, the first which had been allowed to meet since its dissolution by the order of Cromwell. It was composed as before of ministers and elders from the various presbyteries and of elders from the laighs and universities, and was presided over by a lay commissioner named by the crown and a minister elected by the members as moderator. With the exception of some years in the reign of William, the Assembly has continued to meet annually since the Revolution and to transact business during the periods when it was not in session by a commission named by itself for the purpose. The other chief ecclesiastical events of William's reign were a series of vain attempts on the part of the sovereign to bring about a comprehension of the Episcopal clergy with those of the Establishment and the passing by the Assembly in 1697 of what was called the 'Barrier Act,' which guarded against sudden legislation by providing that no permanent act should be passed until it had received the approbation of the majority of the presbyteries.

During the reign of Queen Anne and in the year 1707 England and Scotland were united into one kingdom. A special statute was passed for the security of the Protestant religion and Presbyterian church government in the latter country; providing that these should continue without any alteration in time to come, and confirming the act

of William and Mary which ratified the Confession of Faith and settled the Presbyterian form of church government.

In the year 1712 an act was passed by the British parliament which restored to patrons in Scotland their right of presentation to benefices. This statute excited great discontent among the members of the Established Church, and for many years attempts were made to obtain a repeal of it. These attempts were unsuccessful, but its provisions were long practically disregarded. When at length the General Assembly began to act upon it the dissatisfaction increased among those who held the divine right of the people to choose their own ministers. The leader of the discontented party was a minister named Ebenezer Erskine, and he with his adherents in the year 1733 finally separated from the Establishment and formed a communion which took the title of the Associate Presbytery, though its members were popularly known as the Seceders. The Seceders themselves were soon divided by a dispute as to whether it was consistent with principle to take the Burgher's oath of allegiance into two bodies, called the Burgher and Anti-burgher Synods, and later, a second split occurred in each of these on the question of civil magistracy. The two newer and smaller bodies were known as 'Old Lights' and the two older and larger as 'New Lights.' In the year 1761 another secession from the Establishment took place in connection with the law of patronage; and the separated body assumed the name of the Presbytery of Relief.

There were no further secessions for nearly a century; but the church was divided into two parties, known as the Moderates and Evangelicals, the former of whom were favourable, the latter hostile, to the law of patronage. For many years the Moderates, headed by Dr Robertson the historian and others of his school, and supported by the influence of the government, maintained an ascendancy in the General Assembly and throughout the country. In the later years of George III. and during the reign of George IV. this ascendancy began to decrease. The political excitement which prevailed in the beginning of the reign of William IV. strongly affected the Scottish Establishment, which from its very constitution is peculiarly liable to be moved by the impulses of popular feeling. The two parties in the General Assembly engaged in a struggle more fierce than any in which they had yet met; and the subject of dispute as before was immediately connected with the law of patronage. Dr Chalmers, the most distinguished minister in Scotland, added the whole weight of his influence to the popular party, and in 1834 an interim act of Assembly was passed, known as the Veto Act, which declared it to be a fundamental law of the church that no pastor should be intruded on any congregation contrary to the will of the people, and laid down certain rules for carrying out this principle. The legality of this act was doubted; and in connection with a presentation to the parish of Auchterarder the presentee, on being rejected by the presbytery in terms of the Veto Act, appealed, with concurrence of the patron, to the Court of Session—the supreme civil court in Scotland. That court decided that the conduct of the presbytery in rejecting the presentee was illegal, and their judgment was affirmed by the House of Lords. Other cases of a similar nature followed, and something like a conflict took place between the civil and ecclesiastical courts, the former enforcing their sentences by civil penalties, the latter suspending and deposing the ministers who obeyed the injunctions of the Court of Session. In the General Assembly of 1843 the dispute came to a crisis. A large number of ministers and elders of

the popular party left the Assembly and met apart in a similar body, of which Dr Chalmers was chosen moderator. They formed themselves into a separate communion under the title of 'The Free Church of Scotland,' and gave up their benefices in the Established Church and all connection whatever with that body. The Free Church carried off about one-half of the members of the Establishment and became a rival communion in most of the parishes. By an act of parliament in 1874 patronage was abolished in the Established Church and the right of choosing the minister transferred to the congregation.

In 1820 the New Light sections of the Burgher and Anti-burgher Seceders were united under the name of the Associate Synod of the Secession Church, and were joined in 1842 by the Old Lights; and in 1847 this Associate Synod and the Relief Synod were united under the name of 'The United Presbyterian Church.' Negotiations for a union of the United Presbyterian Church and the Free Church (q.v.), ineffective in 1873, were crowned by the formation in 1900 of the United Free Church, though a minority remained outside and retained the name of 'Free Church. Negotiations began in 1907 for the union of the Church of Scotland and the United Free Church, and in 1925 parliament passed the Church of Scotland (Property and Endowments) Act, in order to smooth the way.

Episcopal Church in Scotland. It is a common but erroneous opinion that almost all the Episcopal clergy were Jacobites from the time of the accession of William and Mary. The bishops were so (see NONJURORS); but a large number, probably a considerable majority of the clergy, had at first no objection to take the oath of allegiance to the new government. During the reign of Queen Anne the Episcopal clergy were well disposed to the government, knowing the queen's good wishes to their communion. They were frequently harassed by the courts of the Establishment; but all who were willing to take the oaths obtained an ample protection for their worship on the passing of the Toleration Act of 1712. On the death of the queen almost all the clergy and most of the laity were involved directly or indirectly in the attempts to overthrow the Hanoverian dynasty, and it was this which finally made the names of Episcopalian and Jacobite for many years to be convertible terms.

In the meantime the succession of bishops had been kept up by new consecrations, and after some years the dioceses, though diminished in number, were regularly filled. An important change took place in the forms of worship. No longer trammelled by their connection with the state, they adopted liturgical forms similar to those in the English Prayer-book, and in almost all cases identical, except that many of the congregations used an Office for the communion modelled on that of the Scottish Liturgy of King Charles I. The Episcopalians took no such open part in the insurrection of 1745 as they did in that of 1715, but their sympathies were known to be with the House of Stewart; and the government carried through parliament some intolerant acts, which were put in execution with great harshness, and which for many years suppressed all public worship in the Episcopal communion. It was only after the accession of George III. that these statutes ceased to be actively enforced; and it was not till 1792 that the Episcopalians, who from the death of Prince Charles had acknowledged the reigning king, were freed from the penal laws. The

1804 the bishops and clergy agreed to adopt the Thirty-nine Articles of the Church of England, and in 1863 the Prayer-book was adopted as the authorised service-book of the Episcopal Church, permission being given in certain cases to use the Scottish Communion Office. The restrictions imposed on the Scottish clergy by the Act of 1792 were modified by an act passed in 1840; and in 1864 they were entirely removed, the right being reserved to bishops in England and Ireland to refuse institution to a Scottish clergyman without assigning any reason, on his first presentation to a benefice in England or Ireland, but not after he should have once held such benefice.

The dioceses of the Scottish Episcopal Church are seven in number—viz. Moray, Aberdeen, Brechin, Argyll, St Andrews, Edinburgh, and Glasgow. The bishops are chosen by the clergy of the diocese and by representatives of the lay communicants, a majority of both orders being necessary to a valid election. One of the bishops, under the name of Primus, chosen by the other bishops, presides at all meetings of the bishops, and has certain other privileges, but possesses no metropolitan authority. The highest judicial body is the Episcopal College, composed of all the bishops. The highest legislative body is a General Synod, composed of two houses, the one of the bishops, the other of the deans and the representatives of the clergy. There is also a Church Council, composed of the bishops, clergy, and representatives of the laity, which meets yearly, and is recognised as the organ of the church in matters of finance.

Roman Catholic Church.—The ecclesiastical revolution of 1560 by no means extinguished the Roman Catholic Church. An act of parliament was indeed passed making the saying or hearing of mass a crime punishable by confiscation of goods and imprisonment for the first offence, banishment for the second, and death for the third. Under its provisions Archbishop Hamilton and some few other priests were thrown into prison in 1563. The bishops to the most part were cowed and helpless, and a number of priests fled the country. Nevertheless, many noblemen and a large part of the population, especially in the north, remained faithful at heart to the old religion, and were till the end of the century a formidable political power upon which the partisans of Queen Mary in England, the Guises, and the king of Spain could rely in their projects against the throne of Elizabeth. Missionaries, chiefly Jesuits, came into the country to keep alive as best they could the decaying faith. The sufferings of both priests and people were extreme, yet notwithstanding the bitter hostility displayed by the kirk with whom the coercive power lay, it is notable that only one priest, John Ogilvy the Jesuit, suffered the penalty of death (1615), and this not on the ground of his priestly office, but for language which was, not unanimately, judged to be treasonable.

The Scottish Roman Catholics suffered also for a long time from the want of any regular ecclesiastical organisation. In 1598 the secular clergy were placed under the jurisdiction of the newly-appointed archbishop of England, George Blackwell, and in like manner continued to be subject to Dr William Bishop, the first vicar-apostolic of England and Scotland, in 1623. It was not until nearly a century after the Reformation (1653) that they were granted a 'prefect' of the mission in the person of William Ballantyne. Meanwhile measures were taken to keep up the supply of missionary priests by the foundation of seminaries abroad. Clement VIII. founded the Scots college at Rome in 1600. In 1612 a seminary originally set up at Tournai, after many wanderings, was finally established at Douai. A college was

opened at Madrid in 1633, and subsequently transferred to Valladolid. Another seminary was established at a later period in connection with the Scottish monastery at Itatibon. During the whole of the 17th and 18th centuries, or until the episcopate of the illustrious convert from Protestantism, Dr William Hay (1769-1811), the fortunes of the Scottish Catholics were at a very low ebb. Bishop Hay founded in 1799 a seminary at Aquhorthies near Inverurie, and provided Catholics with a new literature.

A report made to Rome in 1679 estimated the total number of Catholic communicants at 14,000. Of these 12,000 belonged to the Highlands, where, however, there were only 3 or 4 priests. In 1705 there were said to be 160 Catholics in Edinburgh, 5 in Leith, and 12 in Glasgow. Certain districts of the Highlands and Islands named as exclusively Catholic are South Uist and Barra, Canna, Rùm and Muck, Knoydart and Morar, Arisaig, Moydart and Glengarry, in which places there were about 4500 Catholics. The district of Braemar contained 500. There were at this time 36 priests on the mission in all Scotland. The number of Catholics in the country about the year 1779 has been estimated at from 20,000 to 30,000, while it is said that not more than twenty of these possessed land worth a hundred a year. A very great increase, chiefly owing to the influx of Irishmen, took place at the beginning of the 19th century. In 1800 Edinburgh and Leith contained 1000 Catholics; in 1829, 14,000. In the latter year there were 25,000 in Glasgow, 1500 in Perth, 1400 at Presmore, 1500 in Glengarry, 1000 in Dumfries, and 3000 in Aberdeen—the whole Catholic population being reckoned about this time at 70,000, including the bishops and 50 priests. In 1923 there were over 600 priests, over 150 churches, and about 600,000 adherents.

The first bishop appointed as vicar apostolic for Scotland was Thomas Nicolson (1695). The vicariate was divided into a Lowland District and Highland District in 1731, and into three districts in 1828. The Hierarchy, consisting of two archbishops, St Andrews and Edinburgh, and Glasgow, and four bishops suffragans of the former, was established by Leo XIII. 4th March 1878. St Mary's College at Blairs, 6 miles south-west of Aberdeen, is a seminary removed from Aquhorthies in 1829.

The chief original authorities for the ecclesiastical history of Scotland down to the Revolution are the same as those mentioned in the article on the Civil History, to which may be added Theimer's *Fœdera Monarchia Hibernorum et Scotorum* and Joseph Robertson's *Councils of Scotland* (2 vols., Bannatyne Club, 1866). The chief modern authorities are Cook's *History of the Reformation and History of the Church of Scotland*; Principal Lee's *Lectures* (1860); Principal Cunningham's *Church History of Scotland* (2d ed. 1883); Scott's *Fæder Ecclesie Scotice* (new ed. 1915 et seq.); *The Church of Scotland, Past and Present*, edited by Professor Story (5 vols. 1891); Dowden's *The Medieval Church in Scotland* (1910); MacEwen's *History of the Church in Scotland to 1590* (1913-18); and MacGregor's *The Scottish Presbyterian Polity* (1926). See also Dean Stanley's *Lectures on the History of the Church of Scotland* (2d ed. 1879), with Principal Rany's Reply (1872); Bishop Wordsworth's *Discourse* (1881); for the Free Church point of view, McErie's *Sketches* (1841); Hetherington's *History* (1841), and Buchanan's *Ten Years' Conflict* (1849); for the Episcopal side, Russell's *Church of Scotland* (1838) and Miss Kimloch's *History* (1888). See W. Forbes-Leith, S.J., *Narratives of Scottish Catholics under Mary Stuart and James VI.* (1885); *The Catholic Church in Scotland*, edited by the Rev. J. F. S. Gordon (Glasgow, 1869); and Dr Bellesheim, *History of the Catholic Church in Scotland*, trans. by F. Hunter-Blair, vols. iii. and iv. (1889-90); and see in this work the articles on CONFESSIONS OF FAITH, COVENANT, PRESBYTERIANISM,

ASSEMBLY, ELDER, FREE CHURCH, UNITED PRESBYTERIANS, CAMERONIANS, and those on the great church leaders, Knox, Melville, Henderson, Chalmers, Macleod, Tulloch, &c.

SCOTTISH LANGUAGE.—This name is now applied to the Teutonic speech of Lowland Scotland, especially in its literary form, as the official language of the kingdom in the 15th and 16th centuries, and the vehicle of ballad and lyric poetry down to the present day. As originally used, it meant the Celtic language of the Scotti or Scots of Ireland, and to a comparatively late date it continued to be applied to the same language as spoken by the Celtic people of the Highlands and Western Isles, the 'Saxon' tongue of the Lowlander being then usually distinguished as 'Inglish' or English. All the earlier Scottish writers, Barbour, Wyntoun, Harry the Minstrel, Dunbar, and even Sir David Lyndsay recognised their language as 'Inglish.' Fordun, about 1400, still applied the name *Scottish* to the Celtic, saying of his countrymen: 'For they use two languages, the Scottish and the Teutonic (*Scotiæ et Teutonici*); the people speaking the latter occupies the seacoast and lowland districts, the people of Scottish language (*lingua gens Scotica*) inhabit the highlands and isles beyond.' But as the nationality of Scotland, as distinct from England, became more definitely recognised, there were obvious inconveniences in applying the name *Scottish* to the speech of what had become the least important section of the nation, and the Celtic tongue began to be usually spoken of by Lowlanders as *Ylische* or *Erse*; it was natural also that in the struggle with 'our auld enemies of Ingland,' the name *Inglish* should become distasteful to patriotic Scots; and, accordingly, in the 16th century, the name 'Scottis,' after having been disused for more than a century, was recalled, and applied to the Lowland tongue as being the official language of Scotland and of the vast majority of Scotsmen. Thus Gavin Douglas in the preface to his translation of *Virgil*, and the author of the *Complaynt of Scotland*, claimed to write in the 'Scottis toung;' and from 1550 onwards this has always meant the Teutonic or Saxon speech of Lowland Scotland, the original *lingua Scotica* of the Highlanders being distinguished as *Erse* or Scottish Gaelic. The latter is a form, or group of forms, of the common Celtic tongue which is spoken, with many dialectal gradations, from Cape Wrath in Scotland to Cape Clear in Ireland, the Gaelic of Argyll and Islay not differing from the Irish Gaelic of Ulster on the one hand, more than it does from the Scottish Gaelic of Inverness and Skye on the other. The *Erse* has been a literary language in Ireland from a remote period; its literary career in Scotland is much shorter, beginning with Carswell's Gaelic version of John Knox's Liturgy, printed in 1567, and of little moment before the 19th century. The Gaelic is still extensively spoken in Scotland west and north of a line which runs up the Firth of Clyde and Loch Long, and crosses by Glen Douglas, Howardennan, Aberloyle, Callander, Comrie, Dunkeld, Glen Shee, Mount Blair, till it reaches the Dee 6 miles above Balmoral; leaving the Dee 3 miles above Ballater, it continues by the southern watershed of Glen Livet to the Spey and Knock of Moray, Coulmony on the Findhorn, and reaches the Moray Firth about 3 miles west of Nairn. East of this line, as also in the north-east half of Caithness and in the Orkney and Shetland Isles, Gaelic is no longer native; but even to the west of the line a large proportion of the population is bilingual. There has never been any newspaper or journal published wholly in Gaelic, so that the literary standing of the language is very different from that of Welsh.

Lowland Scots is a form of the Teutonic or

Germanic speech introduced into Britain by the Angles and Saxons in the 5th century. These tribes spoke different dialects, which may be broadly distinguished as *Saxon*, including West Saxon and Kentish, and *Anglian*, including Mercian and Northumbrian. In the Middle English period these developed into the Southern, Midland, and Northern English dialects respectively. Lowland Scots forms part of the Northumbrian or Northern English division; modern standard English is a blending of Midland and Southern. Before the Norman Conquest, and for some centuries later, old Northumbrian was spoken probably with little or no variation from the Humber to the Firth of Forth. But after the division of the Northumbrian territory between England and Scotland, and especially after the final establishment of the independence of Scotland in the beginning of the 14th century, this common speech began to be exposed to diverse influences north and south of the Border. South of the Tweed and Cheviots Northumbrian sank from the rank of a literary language used by poets, preachers, and chroniclers, to that of a local dialect, or group of patois, overshadowed by the king's English of London, and more and more depressed under its influence. After 1400, or at least after the 15th century, it disappears from the view of the student. But north of the Tweed and Solway, though strongly influenced by Chaucer and other Englishmen, Northumbrian remained the language of a court and a nation; it spread westward and northward over districts formerly occupied by British and Gaelic (or it may be Pietish) populations, from which it sustained modifications phonetic and structural; it received literary culture, and especially contracted alliances with French and Latin on its own account; so as to acquire by the close of the 15th century distinctive and strongly-marked features of its own not found in the cognate dialects in the north of England. From the close of the 14th to the beginning of the 17th century it was the vehicle of an extensive and in many respects brilliant literature, it was the medium of legislation and justice, and fulfilled every function of a national language. But a serious shock to its independent development was given by the Reformation, in consequence of the close relations between the leaders of that movement and the English Protestants, and the use of English books, especially of the English version of the Geneva Bible, printed at Edinburgh in 1576-79. Then followed the accession of James VI. to the crown of England, the transference of the seat of government to London, and the consequent disuse of the 'Scottis toung' by the court and by the nobility, who found it desirable to speak the king's English, and gradually grew ashamed of their Scots. After this, few works were written in the native tongue, except such as were intended for merely local use. It became obsolete in public legal use at the time of the Commonwealth, and though retained a little longer in the local records of remote burghs and kirk sessions, it disappeared from these also by 1707. But though it thus became obsolete in official and literary use, so that Scotsmen thenceforth wrote in English tinged more or less with Scotticisms, or words, phrases, and idioms derived from their native speech, it still continued, in several dialectal varieties, to be the vernacular of the people, and after a period of neglect it bloomed forth anew as the vehicle of ballad and lyric poetry, in Lady Wardlaw, Allan Ramsay, Burns, and their numerous fellow-singers. Sir Walter Scott also led the way in its use in prose fiction as the characteristic speech of local characters, a purpose for which it has continued to be effectively used down to the

present day by many popular writers. These uses are, however, only *dialectal*; they must be classed with the similar use of Lancashire, Cumberland, Dorset, or Devonshire dialect, by English poets and novelists as the appropriate language of the local muse, and of local *dramatis personæ*; with this difference that Scottish, having been a literary language, has preserved a certain literary status which is wanting to these English dialects. But even this difference tends to disappear; recent writers of Scottish tales have sought to heighten the local truthfulness of their delineations by giving as close a transcript as possible of the local speech, regardless of the traditional conventionalisms of the 'literary' Scots.

The Teutonic tongue was probably introduced into the country south of the Forth as early as into any part of England. But few actual specimens of the language in these early times have come down to us; the chief is the Runic inscription still extant on the Ruthwell (q.v.) Cross in Dumfriesshire in Northumbrian of (possibly) about 660; then there are the local names, which, in so far as they are those of the dwellings of men, or of the less conspicuous natural features, are in eastern Lothian, Teviotdale, and lower Tweeddale, as truly Teutonic as in Kent or Essex. Isolated vernacular words and phrases in early Latin charters, and in the Latin texts of the early laws, some of which go back to the reign of David I., testify to the currency of the language in the 11th and 12th centuries. But connected specimens are all of later date, and the earliest of these are, moreover, known only in transcripts much later than their own date. Thus the eight lines of verse beginning:

Quhen Alexander our kyng was dede
That Scotland lost in love and ire,

though referring to events which followed the year 1289, are preserved for us only by Wyntoun who wrote after 1400. Rude snatches of song relating to the siege of Berwick in 1296 are preserved by Fabian who wrote about 1500. Even Barbour's *Brus*, written about 1375, is, with the exception of the passages incorporated by Wyntoun, preserved only in MSS. more than a century younger. A charter of 1385 in the 'Red Book of Glen Tully,' and fragments of Scottish acts of 1389 and 1398 are among the earliest contemporary documents. But after 1400 the remains become plentiful.

The Scottish language as thus known to us has been divided into three periods: *Early Scottish*, during which the language did not differ appreciably from the Northern Middle English, extending from the earliest remains down to about 1475; *Middle Scottish*, the national period of the language, from that date to about 1650; *Modern Scots*, the dialectal period, from 1650 onwards. The distinctive characters of these periods are fully set forth in the Historical Introduction to Murray's *Dialect of the Southern Counties of Scotland* (1873). It will be observed that the first is coterminous with the Middle English period of the English language, and that the second is co-extensive with the Early Modern, or Tudor and Early Stuart Period of modern English. Barbour and Wyntoun represent the Early Period; Dunbar, Gavin Douglas, Lyndesay, Montgomerie, and the fine prose of Bellenden, the *Complaynt of Scotland*, Archbishop Hamilton's Catechism, and the writings of Ninian Winzet, Father Dalrymple, and other Roman Catholics belong to the Middle Period; the poets and novelists of the 18th, 19th, and 20th centuries to the Modern Period.

The living tongue now exists in numerous dialects and sub-dialects, easily distinguished from each other by differences of pronunciation and vocabulary. The researches of Sir J. Murray, followed by those of Dr Alexander J. Ellis, estab-

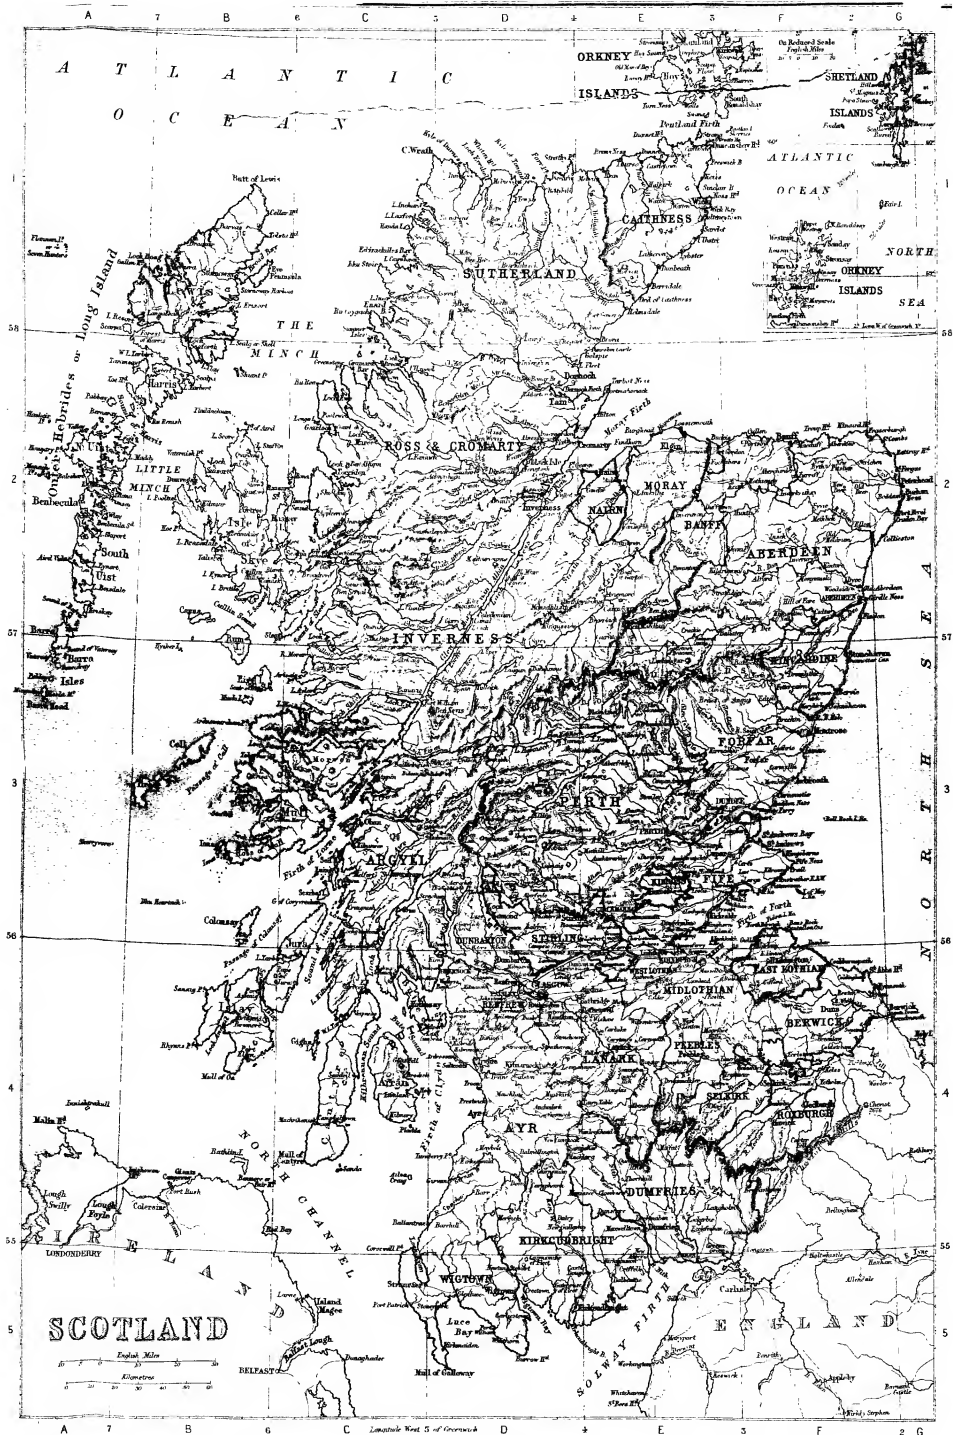

lished three main dialects, classed as Southern or Border Scots (Teviotdale, Dumfriesshire, and Selkirkshire; Central Scots (Lothian and Fife, Ayrshire and Clydesdale, Galloway, south-east Perthshire); North-eastern Scots (Angus, Aberdeen and Moray, Caithness). In the Orkney and Shetland Isles dialects of Norse survived till a century ago, many traces of which still characterise this fourth or *Insular Scots* group.

It was long a favourite notion that the Scottish speech contains a much larger Norse element than English; some writers even went to the length of claiming that it was of Scandinavian rather than of Anglo-Saxon origin. This is an entire mistake. There is no record of any Norwegian or Danish conquests and settlements in the east of Scotland, as in the east of England. In England the northern limit of Danish influence is about Dnrham; the county of Northumberland and the whole Scottish Lowlands, except a small district near the Solway, are entirely void of Danish characteristics. The differences relied upon as evidences of Scandinavian influence in Scotland, are really the differences between a pure Anglian dialect such as that of Scotland, and the largely Saxon dialect which lies at the basis of literary English. Scandinavian words and forms prevail extensively in certain English dialects, as in Yorkshire and Lincolnshire, but fewer of them have passed into Scots than into literary English.

The greatest work dealing with the Scottish language is Dr Jameson's *Dictionary* (published 1804; with supplement, 1825; new ed. 1879-87). The author aimed to include both the literary words of the earlier periods and the modern words from all the dialects. For the former he was necessarily hampered by the deficiency of available printed material. For the latter he was dependent on the co-operation of friends in different districts. It is to be wondered that in these circumstances he produced so estimable a work. Its most serious defect was due to his utter ignorance of the subject historically, and his erroneous fancy that Scots was more intimately related to the tongues of Scandinavia, even to Sino-Gothic, as he called old Swedish, than to northern English. This coloured his whole work, even his definitions. The *New English Dictionary* (vols. i.-ix. 1888-1919) includes all literary Scottish words, either in separate articles or as variants under other heads. A systematic collection of all living Scottish words, of all the dialects, has been undertaken. Meanwhile the *English Dialect Dictionary* (6 vols. 1895-1905), edited by Prof. Jos. Wright, partly covers the ground. See also Gregor's *Glossary of Banffshire* (1866) and Edmonstone's *Shetland Glossary* (1866), both published by the Philological Society; Warrack's *Scots Dialect Dictionary* (1911); Watson's *Highlandshire Word-book* (1923); books by Sir James Wilson on the dialects of Strathclyde, central Ayrshire, and central Scotland (1915-26); Grant and Dixon's *Manual of Modern Scots* (1921); and Gregory Smith's *Specimens of Middle Scots*.

SCOTTISH LITERATURE.—A special difficulty presents itself in connection with the literary history of Scotland. Are we to regard as Scottish literature only what is written in the Scottish vernacular in its various developments from Barbour to Burns? Thus regarded, Scottish literature would manifestly be the inadequate expression of the Scottish character and genius. On the other hand, the literature produced by Scotsmen in standard English is for many reasons best treated under the general head of English literature. Nevertheless, a national literature being the expression of the national consciousness only when considered as an organic whole, the survey here attempted will take account of the total contribution made by Scotsmen to the literature of the world.

If we pass over the enigmatical 'Huchonn of the Awle Ryale,' the literature of Scotland begins with John Barbour (died 1395). A few scraps of verse of questionable authenticity and doubtful author-

ship hardly justify us in saying that he had any predecessor. Barbour's *Brus* marks an epoch at once in the literature and the political history of the country. As has been said of him, he is the first poet and, at the same time, the first historian of Scotland. In his sober and yet imaginative presentation of his theme—the deeds of the national hero and the establishment of the national independence—Barbour struck that note in Scottish literature so conspicuously manifest in the intense national feeling of Burns and Scott. As the exponent of the same tradition with all the exaggerations of popular feeling, Blind Harry, though he came a century later, may be naturally grouped with Barbour. Of little value as poetry, and grotesque in its perversion of the story he professed to tell, Blind Harry's *Wallace* has its distinct place in the national life of Scotland. 'Next to the Bible,' it has been said, 'it was probably the book most frequently found in Scottish households.'

Chaucer may with even greater truth be called the father of Scottish than of English poetry. In England he had predecessors who cannot be altogether disregarded; in Scotland, with the exception of Barbour, who was not great enough to be a source of inspiration, he had none. Moreover, the Scottish poets who looked to him as their master made a far more distinguished succession than his imitators in England. Inspired by the form and the themes of Chaucer, his followers in Scotland in individual effects often surpassed their model, and even suggest the question whether they would not have done better to trust more to their own natural impulse. To the close of the 16th century, however, it was on Chaucer that the poets of Scotland had ever their eyes fixed, and it was by their approximation to his models that they measured their success in their art.

The Scottish line of Chaucerians begins with James I. (died 1437). By his own natural affinities, and by the accident of his personal history, James is the most deeply imbued of them all with the spirit of the English poet. While he was thus so distinctly the vehicle of another's inspiration, every reader of the *King's Quair* feels that in its delicacy of feeling, its sense for the music and subtler shades of language, it is the expression of a mind essentially poetic in its deepest construction of nature and human life. It is in itself a fact of curious interest that the Scotland of James II. and James III. should have produced a poet of the type and of the importance of Robert Henryson. That Henryson achieved the work he did is, in truth, conclusive proof that there was a higher consciousness in the nation than the external history of the time would lead us to infer. The work of Henryson is marked by qualities which have not been conspicuous in poets of his country even greater than himself—pervading artistic feeling and justness of thought and sentiment. In his *Fables*, the *Abbey Walk*, *Robene and Makyn* ('the first English pastoral'), and the *Garmand of Fair Ladies* he exhibits such a range of poetic gifts, and of such an order, as must always ensure to him his own niche among the imaginative writers of British literature. Of a very different type and of far greater natural force is Henryson's younger contemporary William Dunbar. A Chaucerian also, Dunbar is generally acknowledged to have surpassed his master in imaginative intensity and in the blended effects of ghastly humour and daring conception. 'In brilliancy of fancy,' says Scott, 'in force of description, in the power of conveying moral precepts with terseness, and marking lessons of life with conciseness and energy, in quickness of satire, and in poignancy of humour, the Northern Maker may boldly aspire to rival the Bard of Woodstock.'

Where Dunbar falls short of the highest order of poets is in that largeness of humanity, in that just and genial survey of life which gives its breadth and serenity to the work of Chaucer, and has assured his supreme place in English literature. From the number of Dunbar's poems it is sufficient to specify *The Thrissill and the Rois*, *The Golden Targe*, *The Dance of the Sevin Deidly Synnis* (one of the memorable efforts of poetic genius), *The Justis betwix the Tailzeor and the Soutar* as those which best exhibit his power. Of Dunbar it has to be added that he is the first Scottish writer in whom are unmistakably present the distinctive traits of the national genius as it has expressed itself in literature. As the translator of the *Æneid*, Gavin Douglas (1475-1522) must always remain an interesting figure; and it is on his translation that his claims as a poet mainly rest. In the opinion of the very latest critics Douglas has rendered his author with a sympathetic insight and frequent felicity of interpretation which have not been surpassed by any subsequent translator. Without natural inspiration, however, he fails when left to his own resources. His *Police of Honour* and *King Hart* are purely conventional productions, without individual stamp, in the tedious allegorical fashion of the time. Like his three predecessors, Sir David Lindsay (1490-1555) regarded Chaucer as his great exemplar in poetry, and in his early poem *The Dreme* he is directly inspired by his model. Yet no two minds could be more essentially unlike than Chaucer and Lindsay. Chaucer's view of life was essentially that of a poet: for Lindsay the world around him was a sight which he regarded not through the medium of the poetic imagination, but with the direct feeling of one moved to the heart by the strivings and sufferings of his fellow-men. The period in which he lived, also, was more proper to men of his type than to men of the purely poetic temper. By the time he reached manhood the great religious revolution of the 16th century had broken upon western Europe, and was begetting universal discontent with existing conditions, and specially with the clergy of the ancient church, who were mainly responsible for the state to which society had come. With the majority of the men of letters of his time, therefore, Lindsay found scope for his talent as the critic and censor of the social order around him. By the vigour and effect with which he accomplished this task in such poems as *The Testament of the Peppinys*, *The Satyre of the Thrie Estatis*, and *The Dialog concerning the Monarchie* he did for Scotland what Erasmus did for Europe, preparing the way for Knox as Erasmus did for Luther. As poet and champion of the people Lindsay came to hold a place in the hearts of his countrymen from which Burns alone was able to dislodge him.

The very success which the four poets just named achieved in their art is proof of a cultivated opinion which made their development possible. It is but what we should expect, therefore, that these four poets are only the brilliant survivors of a numerous race who were their rivals for poetic distinction. The list of such given by Dunbar in his *Lament for the Makars* leaves us with a lively impression of the intellectual activity of an age which many things might persuade us was one in which the finer play of the human spirit was hardly to be looked for. In this connection reference should also be made to that ballad poetry of which Scotland has produced such splendid specimens in their kind. Though their date and authorship cannot be definitely fixed, it seems unquestionable that many of the best of the ballads belong to the 15th and 16th centuries.

It was in vernacular poetry that the Scottish

genius found its highest expression during the period of which we are speaking; but along other lines of expansion there was no lack of well-directed effort. There is conclusive evidence that the intellect of Scotland had already taken that bent which it has kept ever since—that bent for the dialectic treatment of abstract questions which eventually produced Scottish theology and Scottish philosophy. At the close of the 15th century Erasmus notes as a generally recognised fact the affinity of the Scots for abstract thinking, and about the middle of the 16th the younger Scaliger made a similar remark in somewhat different terms. According to Renan, Michael Scott was the first (1230) to introduce the Aristotelian Commentaries of Averroes into the western schools—an event of the first importance in the intellectual history of Europe. To Duns Scotus (who according to the best authority, John Major, was undoubtedly a Scotsman) belongs the credit of leading the way by his remorseless logic to the emancipation of men's minds from the scholastic philosophy after it had done its work of discipline on the mind of Europe. The foundation of the three universities of St Andrews (1411), Glasgow (1451), and Aberdeen (1494) is another proof of what has been already said, that in spite of chronic strife and confusion there was a section of the community who had steadily at heart the highest interests of the country.

Like other countries of Europe, Scotland had also during this period its succession of chroniclers of varying degrees of merit. The first of these was John of Fordun, who between 1384 and 1387 wrote his Latin chronicle of the Scottish nation (*Scotichronicon*), afterwards miserably interpolated and continued by Walter Bower (died 1449). With these, though he wrote in vernacular verse, may be mentioned Andrew of Wyntoun, who towards the end of the 14th century composed his *Orryngyule Cronycle*, or story of the world from its creation. Of much higher merit as being the product of a time when the Revival of Learning had extended knowledge and raised the level of thought are the Latin histories of Hector Boece (died 1536) and John Major (died 1550). The translation of Boece's history into Scots by John Bellenden is the work of a writer who consciously uses language both with knowledge and skill. An interesting anonymous tract in the Scottish dialect, *The Complaynt of Scotland* (1548), is a curious example of that superfluous writing which among the humanists of the time was known as Ciceronianism.

During the latter half of the 16th century the mind and heart of Scotland were engrossed in the task of adjusting its social and political system to the religious settlement accepted by the country in 1560. The time was therefore in the highest degree unfavourable to the growth of imaginative literature. Such productions as the *Gude and Godly Ballades*, interesting as the deepest utterance of the time, show the dominant note even of poetic feeling. When every explanation has been suggested, however, it is a strange fact that Scotland, which during the 15th century had so distinctly the advantage of England in the quality of its poetic literature, for this period can only show against the Elizabethan galaxy such names as Sir Richard Maitland, Alexander Montgomery, Alexander Hume, and King James VI. In vernacular prose the most notable production of the period is John Knox's *History of the Reformation in Scotland*, a work of national importance to his own country, and by the imprint it bears of a commanding personality holding a unique place in its literature. The *History of Scotland* by Bishop Lesley (afterwards translated into Latin), the *Memoirs* of Sir James Melville,

and the *Tractates* of Ninian Winzet, though of no special literary excellence, are all the works of men alive to the great questions that moved the world of their time. Of all the Scotsmen of this period, however, the greatest literary genius was George Buchanan, who by the grace of his Latin poetry and his equal skill in prose gained a reputation second to no writer in Europe. In Buchanan's vernacular writings also, the *Admonition and The Charnieleon*, we have the most skilfully wrought Scottish prose that has come down to us. As a scholar of singular attainments, though of no distinctive literary genius, Andrew Melville may also be mentioned as one among many examples of Scotsmen who profited to the utmost by the new studies of the Revival of Learning.

For the 17th century Scotland has but one distinguished poet to show—William Drummond of Hawthornden (1585-1649). In other departments of literature there were many able workers, but none of whom it can be said that their work is of very high order in its kind. During this century also Scotland was absorbed in questions that lay at the roots of the national life, and till these questions should be finally settled a collective intellectual movement, such as is necessary to a great literature, was a moral impossibility. The union of the crowns and the removal of the court in 1603 had likewise for the time an injurious effect in weakening the national spirit, which in the 15th century had been so potent an inspiration. Thenceforward the Scottish language gradually gave way before the standard English, and it is a significant fact that Scotland produced nothing of literary importance in its own dialect till the appearance of Allan Ramsay's *Gentle Shepherd* in the following century. As regards its achievement in literature during the 17th century, therefore, Scotland may be very briefly disposed of.

With Drummond of Hawthornden may be named as poets Sir William Alexander (Earl of Stirling) and Sir Robert Ayton, though neither produced work that deserves a place in a British anthology. In Drummond, however, we have a poet the distinction of whose character and genius has made him one of the interesting figures in literary history. Poor as was the beginning of the century in poetry, the latter half is poorer still, since it boasts not one name that deserves even a passing mention. As continuing the tradition in Latin poetry so brilliantly initiated by Buchanan may be noted the *Delitiae Poetarum Scotorum*, a collection of Latin poetry written by Scotsmen. Among its contributors Arthur Johnston merits special mention as the Scotsman of the period who after Drummond gave proof of the finest literary gift. In history the best work was done by David Calderwood and Archbishop Spotsiswoode during the first half of the century, and by Sir James Dalrymple and Bishop Burnet in the second half. Against the brilliant list of English divines for this period Scotland can only show as its two best known Samuel Rutherford and Archbishop Leighton—the latter, however, a writer of such fine suggestions that Coleridge could speak of him as a Christianised Plato. As miscellaneous writers holding a place apart Sir Thomas Urquhart, the translator of the first three books of Rabelais, and Robert Barclay (1648-90), author of the *Apology for the Quakers*, close the list of the most distinguished names in Scottish literature during the 17th century.

Far different is the literary record of Scotland for the 18th century. Due proportion granted, it may be safely said that during this period she was surpassed by no country in Europe in brilliant initiative and in solid contribution in every field of intellectual activity. The mere enumeration of

the more important names in each department shows that this statement is no exaggeration.

Of the crowd of poets who wrote in the vernacular two stand out pre-eminently as the representatives of their fellows. In the first half of the century Allan Ramsay in his *Gentle Shepherd* produced a work which, in virtue of its intrinsic quality, and as the only example in its kind, is in its own degree a British classic. Robert Burns, born the year after Ramsay's death, is the greatest natural force in the imaginative literature of the 18th century, and it is the supreme tribute to his genius that his poems have made classic the dialect in which he wrote. Two poets who wrote in English also call for special notice in virtue of the fresh impulse of thought and feeling which they communicated to the poetry not only of Britain but of Europe. In his *Seasons* James Thomson (1700-48) gave expression to certain aspects of man's relation to nature which freshened the sources of English poetry and on the Continent influenced notably, among others, Jean-Jacques Rousseau. As perhaps the first to strike the dominant note of Romanticism James Macpherson (1738-96), the 'translator' of the pseudo-Ossianic poems, is rightly regarded as one of the literary forces of his century. In history David Hume (1711-76) and William Robertson (1721-93), both writing before Gibbon, gave a new character and aim to the treatment of the past, and by their insight, philosophic breadth, and literary skill made an era in the science of human affairs. As has been already said, it is the ruling instinct of the Scottish mind to busy itself with the mysteries that lie at the heart of things, and in the 18th century we have signal illustration of the fact. In the line of philosophic thinkers it is sufficient to name Hume, Reid, and Adam Smith to indicate the far-reaching importance of Scottish thought and speculation during the period we are considering. From Hume's disintegrating scepticism dates an epoch in metaphysical science, the extraordinary development of modern German thought resulting by natural recoil from his main position. As the founder of what is distinctively known as the Scottish philosophy Thomas Reid had in France an even more direct and potent influence than Hume in Germany. Of Adam Smith's *Wealth of Nations* it is enough to say that by the consenting opinion of Europe it is one of the epoch-making books in man's history. As masters in their own department, Smollett and James Boswell likewise deserve to be named even in the most cursory account of British letters.

The time has not yet come when the literary forces of the 19th century can be reckoned with the same precision as in the case of the centuries that preceded it. Of Scotland, however, it may be safely said that the literary succession of the 19th century is not unworthy of its brilliant predecessor; and it may also be added that all the work of the highest order contributed by Scotsmen to the imperial literature bears the unmistakable stamp of its national origin. In the two greatest literary Scotsmen of the century, Scott and Carlyle, the distinctive genius of their country cannot be missed. While the work of Scott has its elements of universal interest, in its initial inspiration, in its recurrent moods it is one in nature with the Scottish soil and the Scottish race. In Carlyle we have in ungovernable force that emotion in the presence of the mystery of things against which, as he has himself told us, Scott likewise had all his life to do battle, and which, as we have seen, may be regarded as the deepest and most constant note of the Scottish character and genius.

In the foregoing sketch only writers of the first

importance have necessarily been mentioned; but such names as the following can hardly be left unnoticed in the briefest account of the literature of Scotland. For the 18th century Miss Jean Elliot, Mrs Cockburn, Lady Anne Barnard, John Skinner, and Robert Ferguson as writers of Scottish verse; and John Home, Henry Mackenzie, Lord Hailes, and Dr Adam Ferguson as writers in standard English prose may be specially named. In the 19th century there was no lack of poets in the vernacular—among the best known being Robert Tannahill, Baroness Nairne, James Hogg, Allan Cunningham, William Tennant, William Laidlaw, Lady John Scott, and William Motherwell. In standard English, Thomas Campbell, Joanna Baillie, Professor Wilson, and Professor Aytoun, as poets; George Chalmers, Malcolm Laing, John Pinkerton, Dr McCre, Patrick Fraser Tytler, Sir Archibald Alison, John Gibson Lockhart, Hill Burton, and Hume Brown, as biographers and historians; Dugald Stewart, Brown, Mackintosh, Hamilton, and Ferrier, as philosophers; Dr John Brown, Alexander Smith, and Skelton, as essayists; and Galt, Wilson, Lockhart, Miss Ferrier, Michael Scott, William Black, Mrs Oliphant, George MacDonald, and R. L. Stevenson, as novelists, are representative 19th-century names; while Andrew Lang and Barrie connect the 19th with the 20th century.

Scotland Yard. on the Thames Embankment, since 1890 the headquarters of the Metropolitan Police, is known as New Scotland Yard, to distinguish it from the old building in Whitehall used as headquarters 1829-90. The latter is believed to have received its name from a palace there, in which kings of Scotland and their ambassadors occasionally lodged. See POLICE.

Scots Greys. See DRAGOON.

Scots Guards is the name of a well known regiment of Guards (q.v.) in the British army. But the name has most national interest as that of the Scottish force which served the kings of France. The alliance of the Scots and the French, never, perhaps, very cordial and spontaneous on either side, lasted, nevertheless, for a very long period, and was maintained by common interest and reciprocal benefits, and is still distinctly traceable in the Scottish language, laws, and institutions. This alliance originated and developed in the persistent efforts of the Edwards and their successors to subdue both France and Scotland to the English crown. In no outward fact, however, does this alliance appear more conspicuously and interestingly than in the history of the Scots Guards or Scottish Archers in France, extending over 400 years, from 1418 till 1830. All Scotland and all Europe is familiar with the vivid picture of that theme presented by Walter Scott in *Quentin Durward*, in *Le Balafre*, in the veteran Lindsay, and in the other living figures of that romance, which is mainly based on fact.

In the distracted, almost hopeless, state to which Henry V. of England reduced France in the time of Charles VI. the Scots archers, who then began to flock thither in large numbers by way of La Rochelle, the only port at that time not yet in

possession of the English, distinguished themselves as the staunchest element in the French forces, as the rallying centre of a new army. From 7000 to 10,000 landed in 1419 under the command of the Earl of Buchan. The great victory of Charles VII. at Baugé on 22d March 1421, celebrated in the French court by a whole month's rejoicings, was the achievement of Scottish valour. In that engagement the Duke of Clarence was unhorsed by Sir John Swinton, and had his death-blow dealt him by the Earl of Buchan, who was rewarded with the highest military office in France—that of Constable. At Verneuil in 1424 the Scots fought to the last with stubborn determination, but the English gained a bloody victory. Soon after this the Scottish gentlemen were constituted the king's special bodyguard, and Archibald, Earl of Douglas, who had come over from Scotland at the invitation of the king, was created Duke of Touraine. Of the fifteen companies of men-at-arms, the beginning of a standing army, formed by Charles VII. two were composed exclusively of Scotsmen—'Les Gendarmes Ecossois' and 'La compagnie Ecossoise de la Garde du Corps du Roi.' Subsequently Louis XII. solemnly recognised 'that the institution of the Scots Men-at-arms and the Scots Life-guards was an acknowledgment of their services and their great loyalty and virtue.' To the league against his father the Dauphin (afterwards Louis XI.) tried in vain to gain over the Scots Guards, and after his own accession to the throne Louis XI. rewarded their constancy by increased pay and privileges. And assuredly he had no cause to regret his favour towards them, for on two occasions he had them to thank for his personal safety: the first time, after the dawn battle of Montherly, when 'the Scots Guards, considering the danger the king was in, took his majesty, who had been in arms all day without eating or drinking, and carried him safe to the castle of Montherly;' the second time, when Louis XI. would have fallen in the furious night sortie of the Liégeois against the besieging forces of France and Burgundy but for the valiant defence of the Scots Guards. In the field of Seminara, when the French cavalry were cut off and the Italian rear-guard had fled, the Scots still stood their ground, refusing to fly or surrender, and preferring to be hewn down, as they were to the number of 400. In the wars of Charles VIII., Louis XII., and Francis I. the Scots took a leading part.

After Scotland became Protestant the alliance with France naturally declined. Yet in the war of Richelieu with the Spanish monarchy we find, besides the Scots men-at-arms under Lord Gordon, the regiment of the *Gardes Ecossoises*, Sir John Hepburn's famous regiment, Forbes's corps of infantry and cavalry, and Colonel Douglas's regiment—all purely Scottish; and under Louis XIV. the Scots continued to take precedence of the rest of the army, heading the French in all the great battles of that reign, Minden, fought on 1st August 1759, being the last in which they figured. After this time the regiments, though they retained the Scottish name, were recruited mainly by French youths; and at the Revolution Scots guards and men-at-arms were, of course, disbanded. Reinstated again in their old privileges, they finally disappeared with the old monarchy in 1830.

See Father William Forbes-Leith, S.J., *The Scots Men-at-Arms and Life-guards in France* (2 vols. 1882).

Scott, a great Border house whose pedigree has been traced back, somewhat dubiously, to one Uchtred Filinus Scott, or Fitz-Scott, a witness to David I.'s charter to Holyrood Abbey (1128), and

thereafter to Richard Scot of Murthockston in Lanarkshire (1294), the cradle, however, of the race having been Scotstoun and Kirkcaldy in Peeblesshire. Anyhow, we find them possessors of Buccleuch in the lonely glen of the Rankle Burn, Selkirkshire, in 1415, and of Branksholm, near Hawick, from 1420-46 onwards. The then Sir Walter Scott fought for James II. at Arkinholm against the Douglasses (1455), and was rewarded with a large share of the forfeited Douglas estates; and at subsequent periods his descendants acquired Liddesdale, Eskdale, Dalkeith, &c., with the titles Lord Scott of Buccleuch (1606) and Earl of Buccleuch (1619). Among them were two Sir Walters, one of whom fought at Melrose (1526), Ancrum (1544), and Pinkie (1547), and in 1552 was slain in a street fray at Edinburgh by Kerr of Cessford, whilst the other was the rescuer of Kinnmont Willie from Carlisle Castle (1596). Francis, the second earl (1626-51), left only two daughters—Mary (1647-61), married at eleven to the young future Earl of Tarras, and Anna (1651-1732), married at twelve to James, Duke of Monmouth (q.v.), who took the surname Scott, and was created Duke of Buccleuch. After his execution in 1685 his duchess, who had borne him four sons and two daughters, retained her title and estates as in her own right. She afterwards married Lord Cornwallis. Her grandson Francis succeeded her as second duke, and through his marriage in 1720 with a daughter of the Duke of Queensberry that title and large estates in Dumfriesshire devolved in 1810 on Henry, third Duke of Buccleuch (1746-1812), the pupil of Adam Smith, and a great agricultural improver. Walter Francis, fifth Duke (1806-84), was the founder of Granton, and owned in Scotland 673 sq. m. The Harden branch of the Scotts (represented now by Lord Polwarth) separated from the main stem in 1346; and from the Harden branch sprang the Scotts of Ilaelburn, ancestors of the greatest of all that great line, Sir Walter.

See Sir William Fraser, *The Scotts of Buccleuch* (2 vols. 1879); and Mrs Oliver, *Upper Teviotdale and the Scotts of Buccleuch* (1887).

Scott, CYRIL, composer and author, was born at Oxton, Cheshire, in 1879, and studied music at the Hoch Conservatorium in Frankfurt. He has composed numerous songs, piano, chamber, and orchestral works, mostly in rather a fugitive and impressionistic idiom, and has also published volumes of poems, as well as essays on occultism and on the relation of tones and colours.

Scott, DAVID, R.S.A., a painter of distinct originality and great imaginative power, was born in Edinburgh on the 10th or 12th of October 1806. He was a grave, silent boy, fond of drawing; probably a copy of Blake's 'Illustrations to the *Grave*' was not without effect in influencing the especial direction of his art. He studied in the Trustees' Academy, under Andrew Wilson, and was apprenticed to his father as a line-engraver. The impetus towards original work, however, was too strong to be resisted, and he determined to devote himself to painting. In 1828 he exhibited his first picture, 'The Hopes of Early Genius dispelled by Death,' in the Royal Institution, Edinburgh; and in the following year he was admitted a member of the recently formed Scottish Academy. The poetical subject of 'Adam and Eve singing their Morning Hymn' dates from 1829; and in 1831 he produced his vigorous personification of 'Nimrod the Mighty Hunter,' and his rendering of 'The Dead Sarpedon borne by Sleep and Death.' In the same year he published six etched plates, 'The Monograms of Man,' a series of profound symbolical inventions, and designed his twenty-five 'Illustrations to the *Ancient Mariner*,' etched and pub-

lished in 1837, which seize with a wonderful force and intensity the weird conceptions of Coleridge's great poem. In 1832 he visited Italy, and remained in Rome for fifteen months, studying the old masters, and painting 'The Vintage,' now in the National Gallery, and other works. His impressions of the art of Italy were embodied in a series of papers published in *Blackwood's Magazine* in 1839-41. In his twenty-eighth year he returned to Edinburgh, and, amid much discouragement from the almost complete want of popular sympathy or interest in his work, he produced his 'Alchemystical Adept (Paracelsus) Lecturing' (1838), now in the National Gallery of Scotland; 'Queen Elizabeth at the Globe Theatre' (1840); and 'The Traitor's Gate' (1841), one of the quietest, most impressive, and entirely satisfactory of his paintings. The following year saw the completion of 'Vasco da Gama encountering the Spirit of the Cape,' a colossal gallery work, over 16 feet in length, now in the Trinity House, Leith. Meanwhile the artist's health had been failing, and the want of appreciation had been chilling him to the heart. Year by year his life became more withdrawn and saddened, and he died before he had reached the age of forty-three, on the 5th of March 1849. His forty designs to the *Pilgrim's Progress*, executed in 1841, were published in 1850, and eleven of his remarkable and daringly imaginative Astronomical Designs, drawn in 1848, were engraved in an edition of Professor J. P. Nichol's *Architecture of the Heavens* (1850). In spite of their frequently hurried execution and consequent faults of detail, Scott's works, on their technical side, have much of the large and powerful draughtsmanship and of the rich and dignified colouring that characterise the productions of the old masters. Their highest value, however, lies in their imaginative quality, in their power and originality as inventions. In his own words, Scott 'always judged painting by its sentiment, by its mental bearing, and thought most of new spheres of meaning.'

See the Memoir by his brother W. B. Scott (Edin. 1850); Selections from his Works, edited by his brother (Glasgow, 1856 67); and the monograph by the present writer (Edin. 1884).

His brother, WILLIAM BELL SCOTT, painter and poet, was born at St Leonards, Edinburgh, September 12, 1811, and was educated at Edinburgh High School. He studied art both at Edinburgh and London, settled in London in 1836, but exhibited only twenty pictures from 1840 down till 1869. The subjects of these were mostly historical or poetical. From 1843 till about 1858 he lived at Newcastle, in charge of the government school of art there, and down till 1865 he acted as one of the South Kensington examiners. His most important work in painting was the series of eight large pictures illustrative of Northumbrian history at Wallington Hall, completed later by eighteen pictures devoted to Chevy Chase in the spandrels. He produced a similar series, illustrating *The King's Quair*, on the walls of a newel staircase at Penkill Castle, near Girvan. Here he died, November 22, 1890. He began early to write poetry, and published *Hades, an Ode* (1838); *The Year of the World* (1846); and the more important *Poems of a Painter* (1854). Later volumes were the carefully selected and revised *Poems* (1875), and the genial and delightful little volume of a hundred short pieces, *A Poet's Harrest Home* (1882). To the literature of art he contributed *A Memoir of David Scott* (1850), *Half-hour Lectures on Art* (1861), *Albert Durer* (1869), and *The Little Masters* (1879) in the 'Great Artists' series. See the Autobiography edited by Professor Minto (1892).

Scott, Sir George Gilbert, architect, was born on 13th July 1811, at Gawcott, Buckinghamshire, of which his father, son of Thomas Scott (q.v.), the commentator, was perpetual curate. His education was neglected, but he had a good drawing-master; and his love of old churches suggested his being articled to a London architect (1827-30). His first start in life was as a designer of work-houses (1835); in 1838 he married a second cousin, Caroline Oldrid (1811-72), who bore him five sons, two of whom became architects; and soon after he built the first of several cheap and nasty churches. His 'awakening,' by the Cambridge Camden Society and an article of Pugin's, was in 1840-41; and thereafter, as a leading spirit of the Gothic revival, he built or restored 26 cathedrals, 9 abbey and 2 priory churches, 1 minister, 474 churches, 26 schools, 5 almshouses, 23 parsonages, 57 monumental works, 10 college chapels and 16 colleges, 27 public buildings, 42 mansions, &c. The Martyrs' Memorial at Oxford, St Nicholas at Hamburg, St Georges at Doncaster, the new Government Offices, Albert Memorial, and Midland Terminus in London, Preston town-hall, Glasgow University, the chapels of Exeter College, Oxford, and St John's College, Oxford, and the Episcopal cathedral at Edinburgh may be specified; but countless other notices of his work are scattered throughout this work under the different towns. He was elected an R.A. in 1855, an R.A. in 1861; held the professorship of Architecture at the Academy; and was knighted in 1872. He died 27th March 1878, and was buried in Westminster Abbey.

See his *Personal and Professional Recollections* (1879).

Scott, Sir Giles Gilbert, architect, grandson of Sir George Gilbert Scott (q.v.), was born in 1880, elected R.A. in 1922, and knighted in 1924. He achieved sudden fame as the architect of the new cathedral at Liverpool (q.v.), the foundation-stone of which was laid in 1903, but he has also built various smaller churches.

Scott, J. R. Hope. See HOPE-SCOTT.

Scott, Michael, a mediæval sage, who is said to have been astrologer to Kaiser Frederick II. (1194-1250), and to have translated for him, through the Arabic, some of the works of Aristotle, with Averroës' commentaries. His translation was apparently used by Albertus Magnus, and seems to have been one of the two manuals to Dante (see Jourdain, *Traductions Latines d'Aristote*, and the *Academy*, January 1892, p. 14). Dante, who died in 1321, alludes to him in the *Inferno* (canto xx., 116-117) in a way which proves that his fame as a magician must already have spread over Europe; and he is also referred to by Albertus Magnus and Vincent of Beauvais, and this really is all that we know of him. Dempster (1627) may be right in maintaining that 'Scotus' was the name of his nation, not of his family, in which case he would be probably an Irishman; but by Boece (1527) he was boldly identified with a Sir Michael Scott of Balwearie, near Kirkcaldy, in Fife, who went on two embassies to Norway in 1290 and 1310. Camden, again (1580), asserts that he was a Cistercian monk of Holme Cultram in Cumberland; and Satchells, that in 1629 he had examined at Burgh-under-Bawness a huge tome which was held to be his *gemmaire*. In Border folklore the 'wondrous wizard' of Sir Walter's *Lay* is credited with having 'cleft the Eildon Hills in three, and bridled the Tweed with a curb of stone'; and his grave is of course shown in Melrose Abbey. Nay, the 'Jingler's Room' in Jakwood Tower, near Selkirk, is pointed out as his, though Oakwood dates only from the 16th century. See monograph by J. Wood Brown (1897).

Scott, MICHAEL, author of *Tom Cringle's Log*, was born in Glasgow, 30th October 1789, and, after attending some classes at the university, went to seek his fortune in Jamaica. He spent a number of years in the West Indies, but in 1822 established himself in business in Glasgow, where he died, 7th November 1835. In 1829 he published anonymously in *Blackwood's Magazine* the brilliant serial story, *Tom Cringle's Log*, which, like *The Cruise of the Midge*, another of his contributions to 'Maga,' was republished separately. See Sir George Douglas, *The Blackwood Group* (1897).

Scott, ROBERT. See LIDDELL.

Scott, ROBERT FALCON (1868-1912), explorer, was born at Devonport, and entered the royal navy in 1882, eventually being promoted to captain in 1904. He commanded two expeditions to the Antarctic 1901-4 and 1910-12, on the second of which he reached the pole about a month after Amundsen. On the return journey Scott and his companions, Wilson, Oates, Bowers, and Evans, all lost their lives, a disaster due to exceptionally severe weather, resulting in slow travel and shortage of food supplies. The journal was afterwards published, *Scott's Last Expedition* (1913). See POLAR EXPLORATION.

Scott, THOMAS, commentator, was born the tenth of a grazier's thirteen children at Braytoft, in Lancashire, 16th February 1747. He studied hard in spite of drawbacks as a surgeon's apprentice and farm labourer, and received priest's orders from Bishop Green of Lincoln in 1773. He became curate at Weston Underwood, and in 1780 succeeded as curate at Olney the famous John Newton, whose characteristic Calvinistic theology he had already imbibed. In 1785 he became lecturer to the London Lock Hospital, and in 1803 was preferred to the rectoryship of Aston Sandford in Bucks, where he died, 16th April 1821. His *Force of Truth* (1779) has great autobiographical interest, and *Essays on the Most Important Subjects in Religion* (1793) long enjoyed and deserved celebrity, but his name is best remembered by his *Bible, with Explanatory Notes* (5 vols. 1788-92; 5th and best ed. 6 vols. 1822). The prospectus of the 1850 edition stated that already £500,000 had been paid by purchasers for copies of this work, which is beyond doubt a remarkable monument of sound learning and exegetical sagacity.

His complete Works, including sermons and treatises doctrinal and controversial, were edited by his son, the Rev. John Scott, (10 vols. 1823-25), who also published a Life, partly autobiographical (1822). See Life by Downer (1909).

Scott, SIR WALTER (created a baronet in 1820), the greatest of Scottish men of letters, and probably the best beloved author who ever lived, was born in the College Wynd at Edinburgh, beside the university, on the 15th August 1771. His father, Walter Scott, was a member of the society of solicitors called Writers to the Signet; his mother, Anne Rutherford, was the daughter of Dr John Rutherford, professor of Medicine in the University of Edinburgh. Scott thus sprung from the professional middle classes, but on both sides he came 'of gentle blood.' When he blazoned his quarters on the roof of the entrance-hall of Abbotsford three shields of the sixteen had to be left blank, through a difficulty about the pedigree of the Rutherfords of Hunthill. Nevertheless, he came of the best blood on the Border, Scotts, Swintons, and Rutherfords. His great-grandfather was the grandson of Auld Wat of Harden, who married the Flower of Yarrow in 1567, and whose son again married Muckle Mould Meg of Elibank. The facts of Scott's history are too universally known to be

dwelt upon at length. An ingenious writer has tried to show that genius is a 'sport' or accidental variety of the consumptive and nervous temperament. It is certain that the first six children of Scott's father and mother died between 1759 and 1766. Locks of their hair, still glossy and golden, lay in Sir Walter's great desk, in his study at Abbotsford. Of the other six children only two, Walter and Thomas, left issue; the present descendants of Sir Walter Scott are the children and grandchildren of the Hon. Mrs Maxwell Scott, daughter of Mrs Hope-Scott, who again was the daughter of Sir Walter's daughter Sophia, who married Mr John Gibson Lockhart. The mother of Sir Walter survived all her children except the poet and Mr Thomas Scott. Scott himself, though one of the strongest men of his time, with a largericeps, the Ettrick Shepherd tells us, than any man of the Rough Clan, nearly died in infancy 'in consequence of his first nurse being ill of a consumption.' At eighteen months he was suddenly affected with fever in teething, and lost the power of his right leg. In his third year he was sent to his grandfather's farm at Sandyknowe, where he was taught, not without difficulty, to read, and learned and shouted the ballad of *Hardyknott*. For about a year and a half he was at Bath, then returned to George Square, in Edinburgh, where he astonished Mrs Cockburn (a Rutherford of Fairlie, and author of *The Flowers of the Forest*) by his infant genius. Still lame, he was taken to Prestounpans (aged eight), where he met a veteran named Duggetty and Mr George Constable, from whom (and from himself) he drew Monkbarrow, and heard of Falstaff. Thence he returned, 'a gambler's child,' to George Square, where he lived, always reading and repeating ballads and poetry. In 1779 he was sent to the High School of Edinburgh, where he suffered from the senseless Scottish system of giving 'removes' each year, and from the coteries formed in large classes. He amused the boys with tales; he was ready to fight, 'strapped to a board,' as he was lame; he made game of Burns's friend, the blackguard dominie, Nicol; he fought in bickers with Greenbrecks; he wrote some English verse; he learned some Latin from Dr Adam, the rector or head-master. His schooling was interrupted by a visit to Kelso, where he had the misfortune to become intimate with the Ballantynes. In Edinburgh the blind and venerable Dr Blacklock instructed his poetical taste, and he had his one famous meeting with Burns. He left the High School with a great knowledge of all that he had not been taught, but at Edinburgh University he did not improve his Latin, and, like St Augustine, he declined to learn Greek. His account of the studies of Waverley contains his regrets for wasted time, and his autobiography expresses his grief that he had turned away from Greek, 'considering what that language is, and who they were who employed it in their compositions.' Meantime his lameness was never cured, though he could walk thirty or forty miles in the day. His sweetness of temper did not suffer, as Byron's did from an infirmity which after all was not so great as to prevent Byron from bowling for Harrow. But Scott had not, like Byron, to feel that, but for this one defect, he would have been a perfect model of beauty. With red hair, an upper lip of unusual length, a brow like a tower, and rugged Border features, he had no temptation, as Byron had, to vanity. Yet a lady has left her evidence that 'young Walter Scott was a comely creature.' About 1785-86 he entered his father's 'office,' the weary 'office' which, like some fabled monster, gapes for the boys of Edinburgh. Here, at least, he learned to cover paper at such a pace as never man did, and in a hand which could put some seven hundred

words on one side of a sheet of foolscap. He studied Scots law sedulously, though his long fishing and antiquarian rambles made his excellent father (described in *Redgauntlet*) fear that he would never be better than 'a gangrel scrape-gut.' As a lawyer's clerk, superintending an eviction, he first entered the Highlands, where he already knew Invernahyle, of the '15 and the '45, and many another veteran, whose legends appear in his novels. In Edinburgh he won friendships which only ended with life, and, in the heat of youth, according to his own account, he was at least sufficiently convivial. Of all his friends the world best knows William Clerk of Eldin, the original of Darsie Latimer in *Redgauntlet*. Even now, it seems, the romance of his life had begun, and he loved the lady whom he loved till the end. 'This was the early and innocent affection to which we owe the tenderest pages, not only of *Redgauntlet*, but of the *Lay of the Last Minstrel* and of *Rokeby*. In all of these works the heroine has certain distinctive features, drawn from one and the same haunting dream of his manly adolescence.'

In the autumn of 1796 that dream had gone where dreams go, but it endured where dreams endure, in the heart. On October 12, 1796, one of his friends, who knew the story wrote, "Men have died and worms have eaten them, but not for love." I hope sincerely that may be verified on this occasion.' Scott did not die, only his heart, as his *Journal* records, was broken for two years, then 'handsomely pieced,' but the crack will remain till my dying day' (*Journal*, December 18, 1825). '*Humana perpassi sumus*,' he adds, in his *Journal*, towards the end of his life. A short poem, *The Violet*, is almost the only direct allusion to this affair in his works. Not wholly unconnected with his hopes as a lover was his first publication, rhymed versions of ballads by Burger (October 1796). The poems were admired, but 'proved a dead loss.' The spring of 1797 was spent in yeomanry drill. In July Scott made a tour into Tweeddale, and met David Ritchie, the Black Dwarf. Thence he wandered to Gilsland, where he first saw Miss Charlotte Margaret Carpenter, a lady of French extraction, but of English education. They soon became engaged, and were married at Carlisle on Christmas Eve 1797. 'Though not a regular beauty, Mrs Scott had large dark eyes, and an engaging air, with plenty of gaiety and sense. Hogg describes her as 'a brunette with raven hair and large dark eyes, but, in my estimation, a perfect beauty.' The marriage, founded on sincere affection, was happy, though some of Scott's friends feared that the successes which left him unharmed might turn the head of Mrs Scott.

Already (1792) Scott had made his first raid into Liddesdale, and every year till 1798 he repeated it, gathered legends, studied characters like Dandie Dimmont, and 'was making himself,' as Shortreed said. His country home was a cottage at Lasswade, agreeably described by Mr R. P. Gillies in his *Recollections*. Scott made M. G. Lewis's acquaintance, wrote for a collection of Lewis's *Glenfinlas* and the *Ere of St John*, and translated Goethe's *Goetz von Berlichingen*. At the end of 1799, after the death of his father, he was appointed sheriff of Selkirkshire. In hunting for ballads he made the acquaintance of Hogg, of Leyden, and of his dear friend and occasional amanuensis, William Laidlaw. In 1800 he suggested to James Ballantyne that 'he should remove from Kelso to Edinburgh. At the same time he announced that he would give Ballantyne the printing of *The Border Minstrelsy*. The first two volumes appeared in 1802. In the autumn of that year, on Lady Dalkeith's suggestion, he began what he meant for

a ballad. It became *The Lay of the Last Minstrel*, the first, perhaps the best, of his long poems. It was printed by Ballantyne in Edinburgh. The foundations of Scott's triumph and discomfiture were laid. The *Lay* made him at once the most popular author of the generation, and his share in the Ballantynes's business proved his ruin. From the moment that he entered as the secret but only moneyed partner into Ballantyne's business he was never free from financial complications. For these, and all the evil they wrought, it would be unjust to lay all the blame either on the Ballantynes, on Constable, or on Scott. Sir Walter was the last to shirk his own share of the responsibility. Perhaps an accountant can make sense of the controversy, in three pamphlets, between Mr Lockhart and the representatives of the Ballantynes (1838-39). To an ordinary reader it seems clear that Scott hoped to make money by the business of printing, and that he also had 'a kindness like an elder brother's love' for the Ballantynes. It appears quite certain that John Ballantyne, when he entered the firm with no capital, complicated it by his ambition as a publisher, and by a sanguine temper which would not face nor state difficulties. On the other hand, Scott had a century of literary inventions, editions and the like, which were often started to benefit poor working men of letters, but which nearly always failed, except when he himself was the editor. Thus the publishing business was overwhelmed with unsaleable 'stock.' Both Ballantynes were undeniably extravagant. John was recklessly so. Scott himself bought land, always at a price beyond its value, he bought curiosities, his hospitality was more than princely, his generosity was unstinted; he was the providence of poor literary men, and the guardian genius of his neighbourhood. Yet he has been too severely blamed for profusion. Up to 1821 his purchases of land had cost about £30,000, while his official income (as Clerk of Session and Sheriff) had been £1000 a year, 'and he had gained as an author £80,000.' Abbotsford is not 'a wide domain'—far from it—and the house was so far from being a palace that Mr Hope-Scott found it necessary to build a large additional wing thereto. The ruin came not so much from personal extravagance as through business conducted by London connections of Constable's house, in the wildest way, by 'bank accommodation' and bills, eternally renewed. James Ballantyne's own time was much occupied in the correction of Scott's proof-sheets rather than in attention to the details of his commerce. The value of his criticisms has been overestimated; his remarks on the proof-sheets of *Redgauntlet* are inept, and it cannot be said that he was a careful master-printer. Constable's own visionary character added to the complexities, and at last the crash came. Every one was in fault, every one was intoxicated by success. There is no more reason to doubt the uprightness of James Ballantyne than of Sir Walter, who finally paid his debts with his life. Admirers of Lockhart regret his tone towards the Ballantynes. To him it is clear they had ever been distasteful. He was as fastidious as Scott was almost over-tolerant, and the mere presence of the brothers must have been odious to him. But both had, with all their social defects and commercial demerits, a touching affection for Sir Walter.

We have anticipated the financial tragedy of Scott's life, or rather we have sketched its history from the moment when it began. Scott's prosperity never had a sound commercial basis. He was never really free from anxiety about money. How his sagacity and uprightness endured these bonds is a psychological mystery. In 1804 Scott, as sheriff of Selkirkshire, removed from Lasswade

to Ashestiel, a small house beautifully situated on a wooded 'brae' above the Tweed, about four miles from the influx of the Ettrick. Had he been able to purchase Ashestiel, Abbotsford might never have risen from the swamps of 'Clarty Hole.' Early in 1805 the *Lay* was published, and met a deserved success. Scott now busied himself with articles in the *Edinburgh Review*, with his edition of Dryden, and with the commencement of *Waverley*. The early chapters did not please a friend, probably Erskine, and it was not completed till 1813-14. In 1806 Scott was appointed Clerk of Session, and withdrew from the bar. He discharged the duties for some years without the emoluments, which went to his predecessor in the office. In 1806 *Marmion* was begun. The plot is partly based on perfectly fictitious documents, foisted on Scott by Mr Surtees of Mainsforth. He never discovered the fraud. *Marmion* appeared early in 1808. A review, a most quibbling and unfair review, of it was written by Jeffrey for the *Edinburgh*. This attack, and the whiggery of the *Edinburgh*, caused Scott to break off his connection with that serial, and to busy himself in starting the *Quarterly*. Jeffrey did not injure *Marmion*, and its popularity outdid even that of the *Lay*. Scott, who feared to take another 'scourging crop' of verse off the soil, now occupied himself with editing Dryden, Swift, and other classics. He quarrelled with Constable (the publisher of the *Edinburgh*), or rather with his partner, Mr Hunter, and in January 1809 he tells Southey that 'Ballantyne's brother' (John) 'is setting up here as a bookseller, chiefly for publishing.' Ballantyne was to be in alliance with Mr Murray, but this arrangement did not last, and the publishing business only added to financial complications. In 1810 the *Lady of the Lake* was finished, and over-crowned even Scott's former triumphs. A Highland poem had long been in his mind, alternating with the scheme of a Highland romance in prose. Scott now visited the western isles, and schemed out *The Nameless Glen*, afterwards called *The Lord of the Isles*. He also reconsidered *Waverley*, but seems to have made no progress with it. In 1811 he received at last the salary of his clerkship, and came into a legacy of £5000. Now, too, he bought his first farm, and began to turn the cottage on it into a mansion. The year 1811 saw him busy with *Rokeby*, which proved a comparative failure. *Childe Harold* had appeared; popularity had selected Lord Byron for its new idol. For a wonder, Scott did not rate *Childe Harold* much above its merits, but he entered into a friendly correspondence with Byron. He had never been much galled by *English Bards and Scotch Reviewers*. In 1813 (after *Rokeby* and the *Bridal of Triermain*) he declined the laureateship in favour of Southey. In 1814 he finished his *Life of Swift*, and published *Waverley*, writing the last two volumes in three weeks. *Waverley* took the world by storm, and Scott, who did not acknowledge the authorship, might well suppose he had found the purse of Fortunatus. The cold reception of *The Lord of the Isles* did not discourage him, and in January 1815, by way of a holiday, he began *Guy Rannering*, 'the work of six weeks at Christmas time.' It was published by Messrs Longman, but, with rare exceptions, Constable, with whom Scott had been reconciled, published the rest of his *Waverley* cycle. From this point space does not serve to retell the oft-told tale of Scott's amazing fertility. In 1817 a violent illness showed him that even his strength was mortal, but no malady clouds *Rob Roy* or *The Heart of Midlothian*. In 1819 a return of his complaint endangered his life, and in paroxysms of agony he dictated *The Bride of Lammermoor*, which, when printed, he read as the

work of a stranger. He did not remember a line of it. His health was in part re-established; he opened a new vein of gold in *Ivanhoe*, but failed to please his readers with *The Monastery*.

If it is na weel bobbit
We'll bob it again,

he said. Novels poured from his pen, society flocked to Abbotsford, he seemed to Miss Edgeworth 'the idliest man alive.' Yet he never neglected his official duties; he toiled like a woodsman in his plantations, and he entertained all comers. As he said of Byron, 'his foot was ever in the arena, his shield hung always in the lists.' He managed the king's reception in Edinburgh, he heard cases at Selkirk, he took part in raising volunteer corps, he conducted an enormous and distracting correspondence, he cared for the poor with a wise beneficence, he had a great share in starting the Edinburgh Academy, he presided at the councils of the new gas company, he began the *Life of Bonaparte*, and still the novels flowed on. In 1825 he commenced his *Journal*, and for all that followed the immortal pages of that sad and splendid record must be consulted. *Woodstock* was in hand when the commercial crash came. Scott bore it like a stoic. From that hour all the energy not needed for public duties went into literature. He sometimes toiled for fourteen hours a day, led on by the hope of paying every penny of his debts. His labour cleared them, though not in his lifetime. Before his wearied eyes and worn brain the mirage of his complete success used to float at intervals, and who could gudge him these dreams through the ivory gate? It is needless to repeat the tale of his last days, his desolation when his publisher, Mr Cadell, disapproved of *Count Robert of Paris*, the insults heaped on him by the Jedburgh radical mob, his last voyage, his continued work at *The Siege of Malta*, his return home, his death. Few out of all who have read Lockhart or the *Journal* can have studied these chapters with tearless eyes. It is said that on the last morning of his life consciousness returned. He asked his nurse to help him to the window; he gave one last look on Tweed and said, 'To-night I shall know all.' That night he was 'Heaven's latest, not least welcome guest,' September 21, 1832.

In a brief record of his life it is impossible duly to estimate Scott, as an author or as a man. The greatness of his heart, the loyal affection and kindness of his nature, are at least as remarkable as his astonishing genius. There is only one voice as to his goodness. He was the most generous, the most friendly, the most honourable of men. In no relation of life did he fall short of the highest excellence. The magnetism (as we may call it for want of a better word) of his personality endeared him not only to mankind, but to the lower animals. Dogs, cats, and horses took to him at once. He was even persecuted by the affection of grotesque friends, pigs and chickens. He is one of the few who retain, after death, this power of making us love those 'whom we have not seen.' Nor was he less sagacious, in all affairs but his own, than he was sympathetic. As a man of letters he was more than generous, far from being envious, he could hardly ever be critical, and he admired contemporaries in whom the judgment of posterity has seen little to approve. In his lifetime the Whigs, as Whigs, did not love him. He was a Tory. With a sympathy for the poor, which showed itself not only in his works, but in all his deeds, and in all his daily life, he believed in subordination. All history showed him that equality had never existed, except in the lowest savagery; and he could not believe in a sudden reversal of experience. His tastes as a poet also attached him to the antique world. His ideal was, perhaps, a feudalism in which every order

and every man should be constant to duty. Absentee landlords he condemned as much as callous capitalists. He had seen the French Revolution, he had witnessed various abortive 'risings' in the west country, and his later years were saddened by apprehension of a Jacquerie. He hated the mob as much as he loved the people, his own people, the kindly Scots. He was a sturdy Scotchman; but, says Lockhart, 'I believe that had any anti-English faction, civil or religious, sprung up in his own time in Scotland, he would have done more than any other living man could have hoped to do to put it down.'

As a writer it is a truism to say that, since Shakespeare, whom he resembled in many ways, there has never been a genius so human and so creative, so rich in humour, sympathy, poetry, so fertile in the production of new and real characters, as the genius of Sir Walter Scott. To think of the Waverley novels is to think of a world of friends, like the crowd whose faces rise on us at the name of Shakespeare. To say this is to say enough, but it must be added that scenes as well as people, events as well as characters, are summoned up by his magic wand. There is only one Shakespeare, however, he possessed, what Scott lacked, every splendour and every glory of style. Of both men it might be said that 'they never blotted a line': but the metal flowed from the furnace of Shakespeare's brain into many a mould of form, all magical and immortal in their beauty. Scott 'never learned grammar,' as he said, and his style is that of an improviser. Its recklessness, and occasional flatness, he knew as well as any of his critics. But again and again, in published work, as in unpublished letters, he owes himself to be incapable of correcting, and impatient of the labour of the file. In proofs he corrected freely, but seldom to improve the style. It is often lax, and even commonplace; it rarely approaches distinction. It is at its best, absolutely perfect indeed, in his Scotch dialogue. Nor was he more careful of his plots. In the Introduction to the *Fortunes of Nigel* he shows us exactly how he worked, incapable of laying down the lines of a plot, and sticking to them, following always where fancy led him, after Dugald Dalgetty, or Bailie Nicol Jarvie. Delay, painstaking, would not have made him a more finished writer, and would have deprived us of many a Waverley novel. Every man must do his work as he may: speed was Scott's way. The only real drawback to his unapproached excellence, then, is this congenital habit of haste, this quickness of spirit, which, as Lady Louisa Stuart said, made him weary of his characters long before his readers were weary. Yet his genius triumphs in his own despatch, and what he wrote for the amusement of a generation is fashioned for immortality, living with the fiery and generous life of his own heroic heart. Scott's poetry suffers more from his 'hasty glance and random rhyme' than his prose, because from poetry more exquisite finish is expected. That finish is only to be found in his lyrics, the freshest, most musical, most natural and spirited of English verses. In his metrical romances he has spirit, speed, ringing cadences, all the magic of romance, all the grace of chivalry. Since Homer no man has written so much in Homer's mood, so largely, so bravely, with such delight in battle. But 'the grand style' is absent, save in the more inspired passages. Scott's lays are lighted with the Border sun, now veiled in mists, now broken with clouds: we are not here in the wide and luminous ether of Homer and of Hellas.

Wild as cloud, as stream, as gale,
Flow forth, flow unrestrained, my tale!

he exclaims, in lines addressed to Erskine, conscious of his fault, but impenitent. His fame must suffer

in some degree from his own wilfulness, or, rather, from the incurable defect of a genius which was rich, but not rare; abundant, but seldom fine. It may suffice for one man to have come nearer than any other mortal to Shakespeare in his fiction, and nearer than any other mortal to Homer in his verse. His influence on literature was immense. The Romantic movement in France owed nearly as much to him as to Shakespeare. Alexander Dumas is his literary foster-child, and his only true successor. To him also is due the beginning of a better appreciation of all ancient popular antiquities, and a more human understanding of history.

The best source for information about Scott's life is, necessarily, Lockhart's biography (2d and best ed., 10 vols., 1839). It has been supplemented by the *Journal* (2 vols., 1890), and by the *Familiar Letters* (2 vols., 1893). The *Ballantyne Hamburg and the Refutation* may be studied, by people who must study them, in various editions of 1878-39. There is much interesting matter in R. P. Gillies's *Recollections of Sir Walter Scott* (1837), and some amusing anecdotes in Hogg's *Domestic Manners and Private Life of Sir Walter Scott* (1834), though the Shepherd is a garrulous and graceless witness. Carruthers's *Abbotsford Nolaunda* contains a few facts worth noting, and so does the Catalogue of the Century Exhibition. The Catalogue of the Abbotsford Library is a valuable index to his studies, and there are letters of some importance in *Archibald Constable and his Literary Correspondents* (1873). In 1872 Hope-Scott published a reprint of Lockhart's condensed version of the *Life*, with a postscript letter to Gladstone. There are lives of Scott by E. H. Hutton (1879), Sansbury (1897), W. H. Hudson (1900), Norgate (1906), the writer of this article, Andrew Lang (1906), and Wyndham (1908). See also W. S. Cockett, *The Scott Country* (1902), Mrs Maxwell Scott, *Personal Recollections of Sir W. Scott* (1893), Canning, *History in Scott's Novels* (1905), and Husband, *Dictionary of Characters in the Waverley Novels* (1910).

Scott's works, especially the novels, have been translated into almost every civilized tongue, and he has had imitators in all languages. See also the articles in this work on Abbotsford, Dryburgh, Ballantyne, Constable (Archibald), Ladlaw, Lockhart, Hope-Scott, Ballad, and Novels.

Scott, W. BELL. See SCOTT (DAVID).

Scott, WINFIELD, an American general, was born near Petersburg, Virginia, 13th June 1786. He was educated at William and Mary College, studied law, and was admitted to the bar at Richmond in 1807. Feeling, however, greater aptitude for military life, he obtained a commission as captain of light artillery in May 1808. At New Orleans he was court-martialled for disrespectful remarks about his commanding officer, and suspended for a year. When war was declared against Great Britain in 1812, Scott, being made lieutenant-colonel, was ordered to the Canadian frontier. Crossing the Niagara River in October, he fought at Queenstown, and was taken prisoner, but was exchanged after three months. In May 1813 he was wounded at the capture of Fort George, and in July 1814 at Lindy's Lane; from this battle his commission as major-general was dated. The attempts to invade Canada proved failures, but Scott's personal achievements were regarded by his countrymen as redeeming features in the record.

During the ensuing years of peace Scott framed the 'General Regulations' for the army, and introduced the French system of tactics. In various local troubles his tact in preventing outbreaks was shown, especially during the Nullification excitement in South Carolina in 1832, and in the dispute about the boundary of Maine in 1839. He succeeded to the chief command of the army in 1841. In 1847 General Scott was given the command of the army for the invasion of Mexico; and on 9th March, with about 12,000 troops, he invested

the city of Vera Cruz. After a heavy bombardment, the city and the strong castle of San Juan de Ulloa capitulated on the 26th. Scott then hastened to the tablelands, defeated Santa-Ana at the pass of Cerro Gordo, and captured Jalapa and Puebla. Here from May till August he was obliged to wait for and drill reinforcements. When he resumed the march the battles of Contreras and Churubusco opened the highway to the city of Mexico, but a vain attempt to negotiate a treaty caused some weeks' delay. On 13th September the castle of Chapultepec was carried by storm; Santa-Ana fled from the capital, and Scott entered in triumph on the 14th. Here he remained until the following February, when the treaty of peace was signed. On this war General Scott's fame rests; he boldly claimed that his campaign had been 'successful as to every prediction, plan, siege, battle, and skirmish.'

Scott had in politics belonged to the Whig party, and in 1852 was its candidate for the presidency, but was easily defeated, owing both to the disintegration of the party and to his own blunders as a politician. In 1855 the rank of lieutenant-general was revived in his favour. Scott was always a firm supporter of the Union, and in the crisis of 1860-61 remained true to his allegiance even when his native state seceded. Though crippled by the infirmities of age, he retained nominal command of the army until October 1861. He died on 29th May 1866, at West Point, and was buried there. Scott was a man of imposing presence, 6 feet 4 inches high. Though undeniably vain and pompous, he was a sincere patriot and of unblemished integrity. His military genius was evidently adequate for a grander field than that in which it was exercised. But his fame has been obscured by the glare of the civil war, in which the officers trained under him had greater opportunities to display their powers. His *Memoirs*, published in 1864, unfortunately rather emphasised his vanity than vindicated his fame; see Keyes's *Fifty Years of Observation* (1884). There are lives by Headley and Victor (1861), and Wright ('Great Commanders Series,' 1894).

Scottish Philosophy. Scotsmen taught philosophy in Paris and other foreign universities during the middle ages and as late as the 16th century, and in some cases they returned to academic positions in their native land. When it is added that David Hume, the greatest name which Scotland has contributed to philosophy, is not included in the Scottish school, it will be apparent that the designation is not merely a mark of nationality, but expresses definite doctrines, or at least a definite tendency, in philosophy. The school may, for all practical purposes, be said to take its rise in the revulsion headed by Reid (1710-96) against the conclusions of the great sceptic. Antiquarian research has sought to place the foundation of the school earlier, in the teaching, for example, of Gershom Carmichael, who was professor in Glasgow from 1694 to 1729, or George Turnbull, Reid's teacher at Aberdeen, who lectured from 1721 to 1748. Francis Hutcheson, who succeeded Carmichael in Glasgow, and lectured from 1729 to 1746, is more frequently mentioned as the founder of the school, but he has a place rather among the succession of English moral philosophers, while the two other names are too obscure to be of any real account. Reid's answer to Hume appeared in 1764 under the title *An Enquiry into the Human Mind on the Principles of Common Sense*. Hence the current but somewhat misleading designation of Reid and his followers as the Common Sense (q.v.) school, which seems to imply an appeal from philosophical conclusions to the unreasoned verdict of ordinary consciousness. No

doubt a certain warrant for this view of the Scottish philosophers may be found in certain passages of Reid himself, and still more in the diatribes of the lesser men, like Beattie and Oswald, who joined in the outcry against Hume. But common sense meant to Reid simply the common reason of mankind, as constituted by certain fundamental judgments which are expressed in the very structure of human language, and which are intuitively recognised by the mind as true. Reid's answer to Hume thus consists in traversing his reduction of experience to unconnected ideas. He attempts to show by a deeper analysis of experience that the having of ideas, or rather of knowledge, implies certain primitive or fundamental judgments as irreducible elements. This constitutes his attack upon what he calls 'the ideal theory,' that is to say, upon the presuppositions which he finds common to Descartes, Locke, Berkeley, and Hume; and in this, its most philosophical aspect, his theory may be compared with Kant's vindication of the categories as elements necessary to the constitution of the simplest experience. The weakness of Scottish philosophy has lain in its tendency to treat these rational elements as isolated intuitions. The reiterated appeal to 'the testimony of consciousness' is a short and easy method of disposing of an opponent, but it is apt to leave the opponent unconvinced. The natural dualism or natural realism which forms such an outstanding feature of Scottish philosophy asserts, against subjective idealism, that the object or the non-go is given in knowledge along with the subject. But this important epistemological position degenerates too often into a crude metaphysical dualism of mind and matter as two heterogeneous substances.

Scottish philosophy has not produced anything like a metaphysical system, but its inductive method of procedure has led to a large amount of valuable psychological observation both in the intellectual and moral sphere of mental activity. This is mainly what we find in Dugald Stewart (1753-1828), accompanied by a power of persuasive eloquence which made philosophy a force and a tradition in the national life. Dr Thomas Brown (1778-1820), his successor in the Edinburgh chair of Moral Philosophy, was led by his acute psychological analysis so far in the direction of English associationism that he can hardly be counted a continuator of the school. The most eminent successor of Reid and Stewart was Sir William Hamilton (1788-1856), who endeavoured to combine the traditional Scottish doctrine with the negative results of the Kantian critique of knowledge. Apart from his contributions to psychology and logic, his philosophy is in the main an assertion of the relativity of human knowledge, and the impossibility, therefore, of reaching a coherent metaphysical view of the universe. This position, however, has been disclaimed by McCosh and others as savouring too much of agnosticism, and as inconsistent with the original position of Scottish philosophy in regard to our immediate knowledge of mind and matter. Scottish philosophy has had a wide influence not only in Scotland and America, but also in France, through Cousin and his 'spiritualistic' followers.

See McCosh, *The Scottish Philosophy from Hutcheson to Hamilton* (1874); and A. Seth Pringle-Pattison's *Balfour Lectures on Scottish Philosophy* (1885).

Scotus. See DUNS SCOTUS, ERIGENA, SCHOLASTICISM.

Scouts. See BOY SCOUTS.

Scranton, the third city of Pennsylvania, and capital of Lackawanna county, is on the Lackawanna River, 144 miles by rail NW. of New York. It lies in an important anthracite basin,

and is a busy railway and distributing centre. Its trade in coal is enormous, and it has car and carriage works, and great iron and steel manufacturing, turning out locomotives, boilers, machinery, stoves, and edge-tools, also factories for clothing and silk and woollen goods. Scranton is well built, its streets wide, with many handsome public buildings, though coal-mining too near the surface has caused subsidence. It was founded in 1840, and became a city in 1856. Pop. (1860) 9223; (1880) 45,850; (1900) 102,026; (1920) 141,451.

Screamer (*Palamedea*), a genus of birds of rather doubtful affinities, probably most nearly allied to the Anseres (ducks and geese). The bill is rather short, conical, curved at the extremity; there is a bare space around the eyes; the toes are long; each wing is furnished with two strong spurs. There are several species, sometimes referred to two genera—*Palamedea* and *Chauna*. The Horned Screamer, or Kamichi (*P. cornuta*), inhabits swamps in Brazil and Guiana, and feeds on the leaves and seeds of aquatic plants. It is of a blackish-brown colour, nearly as large as a turkey, and has somewhat the appearance of a gallinaceous bird. It receives its name from its loud and harsh cry. From the head, a little behind the bill, there rises a long, slender, movable horn, for which no use has been conjectured. The spurs of the wings are supposed to be useful in defence against snakes and other enemies.—The Crested Screamer (*Chauna* or *Palamedea chavaria*)

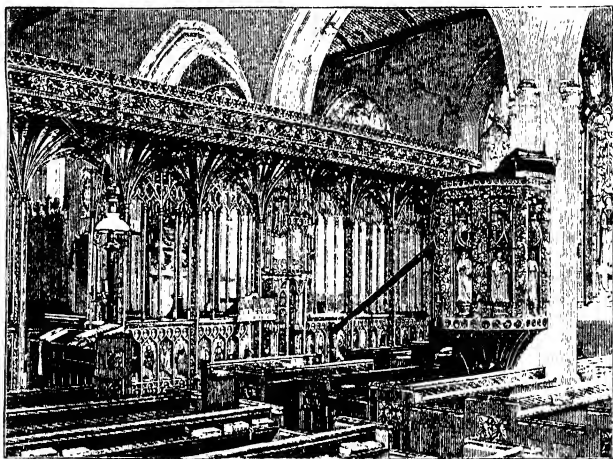

Crested Screamer (*Chauna chavaria*).

is a native of Brazil and Paraguay, the head of which has no horn, but is adorned with erectile feathers. The plumage is mostly lead-coloured and blackish. The wings are armed with spurs.

It is very capable of domestication, and is sometimes reared with flocks of geese and turkeys, to defend them from vultures, being a bold and powerful bird. Very closely allied to this is the Derbyan Screamer (*C. derbiana*).

Screen, in Architecture, an enclosure or partition of wood, stone, or metal work. It is of frequent use in churches, where it shuts off chapels from the nave, separates the nave from the choir, and frequently encloses the choir all round. Such choir-screens are sometimes much ornamented, the lower

Rood-screen in Harberton Parish Church.

part being solid, and the upper very often perforated. The rood-screen (see Rood) is that on which most labour is usually bestowed. It derives its name from the rood or cross which stands, or in churches now Protestant once stood upon it. The rood screen usually forms the division between the nave or transept and the choir. It has generally an ornamental gateway in the centre. In Catholic churches it may have an altar at each side, and is frequently a structure of some size, with a staircase leading to the rood-loft on the top, where the cross or crucifix stands conspicuous at the entrance to the choir. The loft is also used for certain religious functions and ceremonies. In England many beautifully carved screens in stone, enriched with pinnacles, niches, statues, &c., remain, such as those of York, Lincoln, Durham, &c.; and specimens in wood, carved and painted, are common in parish churches, that at Harberton, near Totnes, which is represented in our illustration, being one of the finest in the kingdom. In France the screen round the choir is sometimes the subject of beautiful sculptures, as at Amiens and Paris. In halls of castles and mansions there was usually a wooden screen at one end to separate the entrance-door and a passage from the hall. Over this was a gallery. The term 'screen of columns' is also applied to an open detached colonnade.

Screw. Under ROTATION it is pointed out that the most general displacement which a rigid body can experience may be represented by a screw motion about and along a definite axis. The kinematic characteristic of screw motion is easily studied by help of any ordinary screw working in

its nut. We may fix the nut and consider the motion of the screw; or fix the screw and consider the motion of the nut. In either case we find a certain translation associated with a proportional amount of rotation. The ratio of the translation to the associated rotation is called the *pitch* of the screw. In an ordinary single-threaded screw the practical measure of the pitch is the distance between the threads, and is simply the translation for one complete rotation. In dynamics it is more scientific to take the pitch as the translation for a rotation through the radian or unit angle (see CIRCLE). The ratio of the scientific to the practical pitch is the same as the ratio of the circumference of a circle to its radius. The smaller the pitch, the less is the translatatory motion for a given rotation; and when the pitch is made zero, the screw motion is reduced to a pure rotation. On the other hand, the larger the pitch, the greater is the translation for a given rotation; so that a screw of infinite pitch corresponds to a pure translation. Thus screw motion includes all possible kinds of motion, translation and rotation being limiting cases.

Dynamically, screw motion is said to be produced by a *wrench*, which is the most general quantity of the force type. When the screw motion is reduced to translation, the wrench becomes force in the usual sense of the word; and couple, which produces rotation, is the other limiting case of wrench. The simplest conception of a wrench is obtained from the combination of pushing and twisting needed to bore holes with a gimlet.

The screw is a very important element in machinery. In itself, however, it is not complete, being only half of the *screw-pair* or elementary mechanism to which it belongs. The complete mechanism is well illustrated by the combination of screw and nut. By making the pitch zero, we pass to the one limiting case known as the *turning-pair*; and by making the pitch infinite we get the other limiting case *viz.* the *sliding pair*. These three combinations form the simple elements of all machines.

One of the most important uses of the screw (as in the screw-press) is to apply or sustain a large pressure in the direction of its axis by means of a comparatively small couple acting about its axis. We shall suppose the couple to be applied by a force, F , acting at the end of a lever attached to the screw; and that the result is a thrust, P . If a is the arm of the lever, and p the pitch, the principle of work (see ENERGY) gives us the relation $Fa = Pp$. Hence the smaller the pitch the greater the pressure exerted by the screw for a given couple acting round its axis. The pitch is diminished by making the thread of the screw finer. But, as this also makes it weaker, we see that there must be a practical limit to increasing the advantage of the screw in this way. So far we have neglected friction, which must, however, be considerable in all screw-pairs because of the great pressures existing between the opposed faces of the threads of the screw and nut. The power applied, Fa , must, therefore, be greater than the effective work done. In some cases, when the pitch is small, the efficiency, or ratio of useful work done to work expended, may be reduced to one-third. If the pitch is very large the action of the screw may be reversed, the driving force being the thrust, P , and the resistance the couple, Fa , opposing the rotation of the screw. In most cases the pitch is too small for reversal, the couple brought into play by the friction always being sufficient to prevent motion. It is this non-reversibility that gives the screw its peculiar virtue in holding together parts of a frame or machine. For the screw-propeller, see SHIPBUILDING.

Screw Bean. See MEZQUITE.

Screw-nails, called in the trade 'wood-screws,' are made from mild steel and iron; or from brass, copper, and zinc, when others would be destroyed by rust. Wood screws were in use long before the year 1700, when the brothers Wyatt obtained a patent for cutting screws by machinery. Before 1817, wood screws, being nearly all forged and then shaped by hand, were very expensive; but at that time a patent was granted to John Colbert, a German watchmaker, who made the first automatic machinery for this purpose. In the year 1854 a greatly improved machine was introduced from America, which may be said to have revolutionised screw-making. In a worming-machine a cutter passes several times along the blank and forms the head and gimlet point. For another method two reciprocating plates, or revolving discs, are made from hard steel, and grooved at an angle; the screw blank is rolled between them under great pressure, receiving the reverse impression of the grooves which form the thread.

Screw Pine (*Pandanus*), a genus of plants of the family Pandanaceæ, natives of the tropical parts of the east and of the South Sea Islands. Many of them are remarkable for their adventitious roots, with large caps, which their branches send down to the ground, and which serve as props. Their leaves are sword-shaped, with spiny edges, and are spirally arranged in three rows. In general appearance, when unbranched, they resemble gigantic plants of the pine apple, whence their popular name. *P. utilis* is a widely-diffused species; a spreading and branching tree of 25 or 30 feet high, much used in India for hedges. It grows readily in a poor soil, and is one of the first plants to appear on newly-formed islands in the Pacific. The male flowers are in long spikes, the female flowers in shorter branches. The flowers are frequently gathered before expanding, and boiled with meat are regarded as an aphrodisiac. Their delightful and very powerful fragrance has made the plant a favourite everywhere. Oil impregnated with the odour of the flowers, and the distilled water of them, are highly esteemed East Indian perfumes. The seeds are eatable; and the fleshy part of the drupes, which grow together in large heads, is eaten in times of scarcity, as is the soft white base of the leaves. The terminal buds are eaten like those of palms. The roots are spindle-shaped, and are composed of tough fibres; they are therefore used for making baskets and coarse paint-brushes; and in Japan they are used as corks. In Mauritius, from continual cropping of its leaves, the tree is usually dwarfed to 6 or 10 feet. The fibres of its leaves are used for making the *Varoa* bags, which rival in cheapness and usefulness the gunny-bags of India. The leaves are cut every second year. Immediately on being cut off the leaves are split into fillets, which are nearly an inch broad at the base, but taper to a point, and are 3 or 4 feet long.

Scriabine. See SKRIABIN.

Scribe (Heb. *Sofer*), among the Jews, originally a kind of military officer, whose business appears to have been the recruiting and organising of troops, the levying of war-taxes, and the like. Later the Hebrew name *sofer* seems to have been especially bestowed on a copyist of the law books (Gr. *grammateus*). After the exile, under Ezra, apparently the copyist became more and more an expounder of the law (Gr. *nomodidaskalos*). In Christ's time the name had come to designate learned men, or doctors of the law. Christ himself recognises them as legal authorities (Matt. xxiii. 2); they were the preservers of traditions, and formed a kind of police in the Temple and synagogues, together with the high-priests; and the people revered them, or were expected to reverence them, in an

eminent degree. They were to be found all over the country of Palestine, and occupied the rank and professions of both lawyers and theologians. Their public field of action was thus probably threefold: they were either assessors of the Sanhedrin, or public teachers, or administrators and lawyers. Many of these teachers had special classrooms somewhere in the Temple of Jerusalem, where the pupils destined to the calling of a rabbi sat at their feet. The calling of a scribe being gratuitous, it was incumbent upon every one of them to learn and to exercise some trade. Those scribes who were not eminent enough to rise to the higher branches of their profession, to enter the Sanhedrin, to be practical lawyers, or to hold schools of their own, occupied themselves in copying the Book of the Law or the Prophets, in writing phylacteries, contracts, letters of divorce, and the like. Much of the Halakha, Haggada, and Mishna were due to them. As a rule they were Pharisees (q.v.), and in their zeal to keep the law pure from any foreign influence, even Chasidim (q.v.). Amongst famous scribes are to be reckoned Hillel, Shammai, and Gamaliel.

See JEWS, PHARISEES, EXEGETES, MISHNA, SANHEDRIN, TALMUD; also the histories of the Jews by Ewald, Graetz, and others; and Schürer's *History of the Jewish People in the time of Jesus Christ* (Eng. trans. 1886-90).

GENERAL: see Max Schlegel in *Jen. Zzt.*, vol. xi, p. 123; also refs. (under *Sopherim*) on p. 338 of R. Travers Herford's *Pharisismus* (Lond. 1912). RISE AND DEVELOPMENT: see J. Z. Lauterbach, pp. 176-198 of *Studies in Jew. Lit. in honour of K. Kohler* (Berlin, 1913); S. Funk, *Die Entstehung des Talmuds* (Leipzig, 1910). CONFLICT WITH JEWS and estimate of their character, see refs. in C. G. Montefiore's *Synoptic Gospels*, p. 117 (Lond. 1900; new ed. in Press); also refs. (under *Schrieffolter*, &c.) on p. 864 of vol. ii. of H. L. Strack and P. Billerbeck's *Kommentar z. N. T.* (Munich, 1922-26). MANKERS AND THROGHT: see I. Abrahams, 'Pharisee-diseases,' *et al.*, xiii, in *Studies in Pharisaism*, vol. ii. (Cambr. 1924; the other essays in this and the earlier vol. should be noted); J. M. Myers, *Story of the Jewish People*, vol. i. (Lond. 1909; popular but accurate). BIOGRAPHIES: see W. Bacher, *Agada d. Tannaiten* (Stassburg, 1890).

Scribe, AUGUSTIN EUGÈNE, a French dramatic writer, son of a wealthy silkmercer of Paris, was born in that city on 24th December 1791, and died there on 20th February 1861. Although educated for the legal profession, his whole life was given to the 'manufacture' of stage-pieces of all kinds. His first play that can be identified was a failure, in 1811, and it was not until 1816 that he had any success to boast of. From that time, however, his productions were so greatly in demand by theatrical managers that he established a sort of dramatic manufactory, in which numerous *collaborateurs* were constantly at work under his supervision. His plots are interesting and his dialogue light and sparkling; and not a few of his pieces have been adapted for the English stage. As literature they have little value. The best known are *Le Verre d'Eau*, *Adrienne Lecouvreur*, *Une Châine*, and *Batailles de Femmes*. Scribe also wrote various novels, and composed the *libretti* for a considerable number of well-known operas, including *Masaniello*, *Fra Diavolo*, *Robert le Diable*, *Les Huguenots*, *Le Prophète*, and *L'Africain*. His *Œuvres Complètes* were published in 76 vols. in 1874-85. See Life by Legouvé, a collaborator (1874); Arvin, *Eugène Scribe and the French Theatre* (1924).

Scriblerus. See ARBUTHNOT.

Scribner, CHARLES, publisher, was born in New York City, 21st February 1821, graduated at Princeton in 1840, and in 1846 joined in founding the publishing firm of Baker & Scribner. His partner died soon after, and the firm became Charles Scribner & Co. *Hours at Home*, first

issued in 1865, in 1870 was merged in *Scribner's Magazine*, which was sold by the firm in 1881, and re-christened the *Century Magazine*. Charles Scribner had died in 1871 (August 26), and the firm in 1879 became Charles Scribner's Sons; and these in 1887 began a new *Scribner's Magazine*, in addition to their large publishing (as distinguished from printing and publishing) business.

Scrivelloes. See IVORY.

Scrivener, FREDERICK HENRY AMBROSE, New Testament critic, was born at Bernondsey, 29th September 1813, and educated at St Olave's, Southwark, and Trinity College, Cambridge. He was assistant-master at Sherborne, head-master of Falmouth School (1846-56), rector of Gerrans (1861-76), vicar of Hendon and a prebendary of Exeter. One of the New Testament revisers from the beginning, he died at Hendon, 26th October 1891.

Scrivener's Palsy, another name for Writer's Cramp. See CHAMP.

Scrofula is a term whose significance has varied much at different periods and in the usage of different writers. The term is not used by modern writers because it has been found that a weakly state of nutrition, combined with chronic enlargement of glands, disease of bone, &c., is so commonly associated with the presence of the tubercle bacillus that the term 'tuberculosis' has come to be used instead. The term 'king's evil' was also applied to scrofula because of the superstition that it was cured by the royal touch. The older physicians (Hippocrates, Celsus) restricted scrofula practically to a swelling of the *lymphatic glands*, more especially about the neck. Though frequent attempts were made to widen its significance so as to include supposed kindred processes in other structures, the old view remained dominant both in lay and medical parlance till recently. Most pathologists nowadays regard the tubercle bacillus as the one essential cause of so called scrofula, and hold the latter (when used in the more limited sense of Hippocrates) as synonymous with a *localized tuberculosis*. Other authorities regard the weakness, loss of appetite, and general poor nutrition from which children often suffer as a pre-tubercular manifestation which renders them liable merely to contract this disease, a suitable soil being offered by the weak tissues in which the tubercle bacillus, when once it has gained access, flourishes and multiplies, giving rise to tuberculosis proper. This subject will be therefore more fully treated under Tubercle (q.v.). Scrofula is synonymous with struma.

This disease for centuries was thought capable of being cured by the touch of a king, and it was claimed that this power was of English growth, commencing with Edward the Confessor, and descending only to such foreign sovereigns as could show an alliance with the royal family of England. But the kings of France claimed the gift, and it was certainly practised by Philip I., although he was allowed to have lost the power through his immorality. Laurentius, physician to Henry IV., claims that the power commenced with Clovis I., and says that Louis I. added to the touch the sign of the cross. He tells us also that Francis I. even in captivity preserved the power. In France it did not fall completely into disuse till 1776; and Louis XVI. at his coronation touched as many as 2400 persons. William of Malmesbury is the first to mention the gift of healing in England and to attribute it to that most miserable of saints, Edward the Confessor. From his time down to Henry II. there is no account of the practice, but it reappears under Henry II., John, Edward II., Edward III., Richard II., Henry IV., V., VI., VII., and VIII., its truth guaranteed by grave and credible writers like

Archbishop Bradwardine, Sir John Fortescue, and Polydore Virgil. Henry VII. was the first to institute a particular service of ceremony on the occasion of the touching; that used in Queen Anne's time will be found in the contemporary Prayer-books. In Henry's reign also the presentation of a piece of gold was first generally introduced, usually the angel-noble; but after the reign of Elizabeth the size of the coin was reduced for the sake of economy. James I. and Charles I. both touched, and we are told that the latter sometimes gave as his touch-piece silver instead of gold. But the practice reached its greatest height under Charles II., who even touched 260 persons at Breda before crossing to England, and we learn from the *Charisma Basilicon*, the third part of the *Adeno-choiratelagya* (1684) of the royal surgeon John Browne (1642-1700), that no fewer than 92,107 persons were touched between 1660 and 1682. Yet we learn from the Bills of Mortality that more persons died of scrofula during this period than any other, the evil having greatly increased during the king's absence. Browne's work is the best contemporary account of the rite that we possess. It is interesting that Sir Thomas Browne does not allude to the royal gift of healing, although there are allusions in his domestic letters to the practice of touching and to his granting the ordinary certificate as a physician. James II. also touched for the evil, but William III. put an end to the practice. Anne renewed it, and we read how on March 30, 1714, she touched 200 persons, among

Touch-piece (time of Queen Anne).

them Samuel Johnson, whom, however, she did not heal. With the accession of the House of Brunswick the practice entirely ceased, but it seems that the Pretenders for some time attempted to maintain it, and we are told that the prince Charles Edward touched a child at Holyrood in 1746, which was healed within 21 days after, and even practised the art as late as 1770. In 1748 the nonjuring historian Thomas Carte lost his subsidy from the Common Council of London for a note in the first volume (December 1747) of his *History of England* to the effect that a man had been cured of the king's evil by the touch of the Pretender at Avignon in November 1716. We find frequent allusions to the practice in Pepys and Evelyn, and indeed it was for centuries an article of popular belief, so that we need not wonder at the credulous warmth of Heylin, Sergeant-surgeon Wiseman, and Jeremy Collier. See Dr Raymond Crawford, *The King's Evil* (1911), and Marc Bloch, *Les Rois thaumaturges* (1926), for the superstition.

Scroggs, SIR WILLIAM, became Chief-justice of the King's Bench in 1678, and was specially notorious for cruelty and partiality during the trial of the unfortunates accused of complicity in the alleged Popish Plot (see OATES). In 1680 he was impeached by the Commons, but removed from office by the king on a pension. He died in 1683.

Scroll, an ornament of very common use in all styles of architecture. It consists of a band arranged in convolutions, like the end of a piece of paper rolled up. The Greeks used it in their Ionic

and Corinthian styles, the Romans in their Composite; and in mediæval architecture, and all styles which closely copy nature, it is of constant occurrence as in nature itself.

Scrope, a famous family of the north of England that produced, amongst others, Richard le Scrope, Chancellor in 1378 and 1381-82; Richard Scrope, Archbishop of York, who joined in the conspiracy against Henry IV., and was beheaded at York in 1405; and Lord Scrope of Bolton, Warden of the West Marches under Queen Elizabeth.

Scrope, GEORGE POULETT, geologist, was born in London in 1797, and was educated at Harrow and Cambridge, and on his marriage in 1821 exchanged his own name, Thomson, for that of his wife's family. He made studies of volcanic phenomena at Vesuvius, in central France, and elsewhere, and expounded his views in *Considerations on Volcanoes* (1825) and *Geology of the Extinct Volcanoes of Central France* (1827; 2d ed. 1858). As member of parliament for Stroud from 1833 to 1868 he became famous as a writer of pamphlets in the interests of the agricultural labourer. A Fellow of the Royal Society and other learned associations, he died 19th January 1876.

Scrophulariaceæ, a family of dicotyledons, chiefly herbaceous and half-shrubby plants. The family is a very large one, containing between 2000 and 3000 known species, which are distributed over the whole world, both in cold and warm climates. The flowers are commonly zygomorphic and lipped, but may be almost regular as in *Verbascum*, or, as in *Veronica*, the corolla may be rotate, with the two posterior petals united, the posterior sepal wanting. Commonly there are four stamens, sometimes five (*Verbascum*) or two (*Veronica*). The ovary is bilocular, with axile placentæ. Acridity, bitterness, and astringency are prevalent characteristics, and many species are poisonous. Mucilage, resinous substances, and essential oils are also products of many of the species. Some are root parasites. Some are admired and cultivated for their flowers; some are used medicinally. *Digitalis* or Foxglove, *Calceolaria*, *Mimulus*, *Verbascum* or Mullein, *Antirrhinum* or Snapdragon, *Gratiola*, *Scrophularia* or Figwort, *Veronica* or Speedwell, and *Euphrasia* or Eyebright are familiar examples. Very different from these humble herbaceous plants is *Paulownia imperialis*, a Chinese tree, 30 to 40 feet high, with trunk two or three feet in diameter, and flowers in panicles, about as large as those of the common foxglove; the tree is hardy in the milder parts of England, and is a beautiful ornament of shrubberies from London southwards.

Scrub. See AUSTRALIA.

Scruple (Lat. *scrupulum*, 'a small, sharp stone') was the lowest denomination of weight among the Romans, and with them denoted the 24th part of an ounce (*uncia*), or the 288th of a pound (*libra*). As a measure of surface it was also the 24th part of the *uncia* (see OUNCE). In Apothecaries' Weight a scruple contains 20 Troy grains, is the third part of a drachm, the 24th of an ounce, and the 288th of a Troy pound. See WEIGHTS AND MEASURES.

Scudéry, MADELEINE DE, an interminable French novelist, was born at Havre in 1607, her father of Provençal origin. Left an orphan at six, she received a careful education from an uncle, and, still young, came up to Paris, where she soon became a notable figure in the brilliant society of the Hôtel Rambouillet. She was plain, if not ugly, thin, dark, and long-faced, full of vanity and prudishness, a 17th-century Madame de Genlis plus virtue, as Sainte-Beuve styles her. But blue-stocking as she was she had a woman's heart, and loved after the fashion of her heroines, with an exalted and chaste affection, the ill-

favoured but learned Pellisson, in whom she had inspired a passion. Her half-crazy brother Georges (1691-67) left the service in 1630 to devote himself to literature, and, being gifted with fatal facility, posed as a rival of Corneille, and wrote many pieces long since scarcely forgotten. To Christina of Sweden he dedicated one poem, *Alaric*, of 11,000 verses. A kind of swashbuckler among men of letters, he wrote prefaces that read like cartels of defiance to any who had the temerity to doubt his genius. His sister used to help him in his writing, and Tallemant ascribes to her the entire responsibility of *Ibrahim ou l'illustre Bassa*, a romance in four large volumes, which he signed and published in 1641. Similarly *Artamène ou le Grand Cyrus* (10 vols. 1649-53) and *Clélie* (10 vols. 1654-60) both bore the name of Georges de Scudéry, although he contributed only the framework of the two, that is to say, the part which is the worst in both. Mdlle. de Scudéry lacked real invention, and took her figures from her acquaintance and from the society of the day, travestying them as Romans, Greeks, Persians, or Carthaginians—thus, she has half-painted herself as Sapho in vol. x. of the *Grand Cyrus*. Victor Cousin discovered a key (1657) which named all the figures definitely, as Artamène for Condé, Mandane for Mme. de Longueville, Parthénie for Mme. de Sablé, &c. But she had real skill in polished conversation, and, in later days when her stories had gone out of fashion, she reproduced ten volumes (1680-92) of these taken from her novels. Madame de Sévigné writes her daughter, 'Mdlle. de Scudéry has just sent me two little volumes of conversations; it is impossible that they should not be good, now that they are not drowned in a great romance.' The *Grand Cyrus* is one of the masterpieces amongst the romans de longue haleine, as their order has been felicitously named, but a modern reader seldom strays far into its 15,000 pages. The incidents follow in the most helpless monotony and lack of verisimilitude, but the naïveté of the reflections completely disarms the critic. The virtuous anchoress prided herself on her ability to fathom all the depths of love without having sounded them in her own experience, and the famous 'Carte de Tendre' in *Clélie*, *histoire romaine*, is a fantastic but pretentious attempt to construct an analysis and guide to the whole kingdom of Love. It was not an invention of Mdlle. de Scudéry, but due to the collaboration of the superlative ladies and gentlemen who frequented her Saturdays. She lived till the age of ninety-four, respected and honoured to the last, dying at Paris, 24 June 1701. The etherealised sentiment of her novels had already wearied the world, but the death-blow waited to be dealt by the hand of Boileau. Cousin calls her, but not happily, 'a sort of French sister of Addison.' As a woman it should not be forgotten to her honour that her brave devotion to friends like Mme. Longueville and Fonquet survived their fall; and none could ever be an object of indifference to the world of whom Madame de Sévigné could write, 'In a hundred thousand words I could tell you but one truth, which reduces itself to assuring you, Made-moiselle, that I shall love you and adore you all my life; it is only this word that can express the idea I have of your extraordinary merit. I am happy to have some part in the friendship and esteem of such a person. As constancy is a perfection, I say to myself that you will not change for me; and I dare to pride myself that I shall never be sufficiently abandoned of God not to be always yours.'

See Victor Cousin, *La Société Française au Dix-septième Siècle* (1858); Sainte-Beuve, *Causeries du Lundi*, vol. iv.; André Le Breton, *Le Roman au Dix-septième Siècle* (1880); and chapter iii. of Amelia Gere Mason's work, *The Women of the French Salons* (1891).

Scudo (Ital., 'shield'), an Italian silver coin corresponding to the Spanish Piastre (q.v.), the American Dollar (q.v.), and the English Crown (q.v.). It was so called from its bearing the heraldic shield of the prince by whose authority it was struck, and differed slightly in value in the different states of Italy, the usual value being about four shillings.

Sculling has two senses, a river sense and a sea sense. In its fresh-water acceptance sculling is the propulsion of a boat with a pair of sculls or light oars by one man (see ROWING). Among seafaring men, however, to scull is to drive a boat onward with one oar, worked like a screw over the stern.

Sculpin, a name given to the Dragonet (q.v.), and also in the United States to various marine species of Cottins or Bull-head—notably to *C. octodactylus* and *C. scorpius*; the 'Daddy-Sculpin' being *C. grandaudicus*.

Sculpture has been practised in all ages and by all races. There is no savage so untutored but can scratch a rude design upon a flat surface (the beginning of relief) or fashion a stone into the rugged semblance of a god. The sculptures of palæolithic man (see ART) fall but little short of those of archaic Greece. Such backward races as remain in the state of barbarism from which the more highly developed emerged countless centuries ago still aim at the innocent realism of prehistoric times. But these furtive attempts have little in common with art; their interest is more anthropological, though some of the African negro sculpture in wood, apparently no longer produced, is well worthy of consideration. The present article, however, treats of sculpture as it has been pursued by craftsmen with a certain control of their material and a consciousness of the effect it is thence to produce. The sculpture of India, for instance, is merely fantastic; its preoccupation is religious rather than artistic. When viewed in relation to the great stream of tradition which connects the work of Rodin or Gilbert with the colossal figures of Egypt, it is but a shallow backwater. But from the time when the great Sphinx was set up at Gizeh until yesterday a countless succession of men have expressed their ideals in clay, bronze, marble, and other more or less stubborn substances, with a deliberate intention and tutored sense of dignity or beauty which entitle them to be revered as artists and then works to be treasured as masterpieces. With their achievement we are alone concerned; the ingenious scratchings of the savage—whether ancient or modern—and the fantasies of the Oriental mystic are for the curious to consider.

The material of sculpture is as various as the methods of its treatment. Wood, marble, basalt, granite, bronze, gold, and ivory are but a few of the substances which have been fashioned into beautiful and stately forms. Here at once we discover one determining element of style. An artist who works in porphyry or granite cannot express his fancy with freedom. A largeness and dignity is forced upon him by the rigid substance upon which he has chosen to work. So we find in the works of ancient Egypt a severe and monumental repose which would be out of place in figures of a modest size and more malleable material. It has ever been the supreme merit of the sculptor perfectly to adapt his means to his end. The Greeks of the 5th century expressed in marble the most beautiful lines and shapes which the material could suggest. Where there was no place for common or familiar ideas all was simple and restrained. On the other hand, the artists of Tanagra, working in the ready and pliant medium of terra cotta, did not venture beyond a scale and a technique

which, though perfectly consonant to their purpose, have the grace and elegance of the masterpiece in little. The artist does not carve and slash his marble as though it were paper, nor does he break up its surface into a thousand furrows as though it were putty; but, still within the bounds of taste and knowledge, he gives to his work a breadth and simplicity which are at war neither with art nor with nature. Indeed the problem of sculpture may be defined as the translation of the forms of the visible world into the language suggested by the material employed. Many of the grandest sculptures that time has spared were composed to fill certain spaces in wall or pediment. Their purpose being thus decorative, it follows that there is another force by which the artist is controlled. The variety of pose and contour which distinguishes the Elgin marbles was suggested by the varying depth of the pediment they were destined to adorn. So also the flowing harmony of the Parthenon frieze proceeds from the subtlest adaptation of the design to the space. It is only necessary to contrast the masterpieces of Greek art with some of the outrages upon taste which have defaced Westminster Abbey since the 18th century to recognise how much beauty depends upon a sense of fitness. To represent chosen aspects of animal forms which are in discord neither with their material nor with the site they occupy, this is the end of the sculptor, and in its attainment a sense of beauty must always conquer the interest of facts, and a respect for tradition must forbid the play of ingenious artifices.

The Egyptians were the most prolific sculptors. Their temples and palaces were covered with reliefs; innumerable statues of gods and heroes stood upon their plains. The Sphinx (q.v.) is the product of an art already mistress of her resources. There is not a tentative touch in this noble monument; it is not an experiment like the seated figures from Branchida, which only preceded the efflorescence of Greek sculpture by a few centuries, but a work as finished in its grand impassiveness as the *Thesens* (so called) of the Parthenon. But Egyptian art, as it seems perfect in the beginning, knew no progress but decay. Its purpose was consistently the same. It did not advance, like Greek sculpture, from naiveté to accomplishment, from hieratic restraint to artistic enfranchisement. The school of Memphis is already a school of the decadence. And yet its artists are still for the most part bound in the chains of hieratic tradition. Their seated figures are always posed in the attitudes sanctioned by custom, the elbows firmly planted against the sides, the hands set forward upon the knees. Their reliefs also are stiff and archaic. While they display a knowledge of anatomy and an observation of the human figure in action, the head and legs are presented in profile, while the upper part of the body faces the spectator. This peculiarity was the result not of incompetence, but of a fierce conservatism. The reliefs, the figures of which either project from the ground or are depressed beneath it, were always coloured: indeed polychromy was invariable when the material was not naturally veined or coloured. But excavations at Boulak have shown that under the Memphis dynasty, despite the influence of the ancient school, realistic portraiture was practised with amazing success. Such a figure as the wooden *Sheik-el-beled* (see EGYPT, Fig. 6) is neither stately nor beautiful, yet there is little doubt that it is a speaking likeness; and so much may be said for a dozen masterpieces treasured at Boulak. The first Theban school, which flourished from the 10th to the 16th dynasty, drew its inspiration from the school of Memphis. The same respect for tradition, the same interest in portraiture were piously preserved. Indeed Egyptian

art clung to the ideals of grandeur and formality until the advance of Greece introduced a fresh science and a fresh civilisation. By its very austerity no less than by its balanced union of observation and convention the sculpture of Egypt displays a grandeur and impressiveness which it shares with no other manifestation of art. Its hybrid colossi and monstrous deities, hewn out of the stabbornest material, are still noble in spite of their ugliness; and that even the formal Egyptian was not incapable of representing graceful types the portrait of Menephithah and Queen Taia remain to show. And yet from the classical period the Sphinx alone survives (see figures in the articles EGYPT, ABU-SIMBEL).

Assyrian sculpture, which grew out of the ruder art of Chaldaea, like Egyptian, knew neither progress nor development. Its earliest monuments date from the 12th century B.C., but the magnificent series of reliefs in the British Museum are not earlier than the 9th and 8th centuries, and they display the inflexible characteristics of the most ancient period. The kings and viziers, who figure in the reliefs, conform to an invariable type. The monarch is recognised by his square-cut beard and jewelled tiara. He is often represented, like the figures of Egyptian reliefs, partly fronting the spectator, partly in profile. There is no attempt at portraiture, not a suggestion of naturalism. But in the treatment of animals the Assyrian allowed himself complete freedom. The lion-hunts are masterpieces of observation and execution. The finest reliefs prove that even before the matchless frieze of the Parthenon there were artists who could model the horse with animation and understanding. The Assyrians delighted also in hybrid forms; the portals of their palaces were guarded by colossal winged bulls with human heads, admirable specimens of which may be seen at the British Museum from the palace of Sargon (721-705 B.C.). Assyrian art in fine, despite its many conventions and inveterate symbolism, lacked the grandeur and the nobility of Egyptian sculpture. On the other hand, the artists of Assyria display a sense of life and movement, especially in their treatment of animals, unknown before them (see figures in the articles ASSYRIA, BABYLONIA).

Cretan art, as far as sculpture is concerned, confined itself to a few reliefs in wood or stone frescoes, and to small figures in pottery, metal, or ivory. Large sculpture in the round was unknown. The origins of Greek sculpture are still in dispute. Some there are who would have us believe that the art which enlivened in Phidias derived directly from Egypt or Assyria; others assert that it was autochthonous. The question does not admit of a positive answer. That the archaic Greeks were influenced by the art of the Orient is incontestable, but it seems no less certain that, the influence being superficial, Greek sculpture followed a natural course of development. In the treasure-house at Mycenae are certain scabbards and sword-hilts of eastern design, if not of eastern workmanship, and there is no reason why the Phœnicians, the bagmen of antiquity, should not have carried these precious wares to Argolis. The famous Lion-gate, too, is Assyrian in character, and many examples of primitive Greek art are conspicuously Oriental. But both history and common sense are opposed to the view that the early masters of Selinus or the authors of the primitive Apollo statues (so called) owed a direct debt to Egypt. It has been pointed out that Egyptian art, when we first meet it, was finished and complete; its ideal was attained in obedience to hieratic laws. The sculptors of archaic Greece were too naive to be the mere imitators of a classical style. Their aim was realism, so far as their limited resources and control of

marble or bronze would carry them. The early history of Greek art is shrouded by the Greeks themselves in a veil of legend. With characteristic anthropomorphism the ancient critics were wont to represent each epoch in the development of art by a purely mythical hero. The Cyclopes, the Telchines, Dedalos, Batades, and Kore, to whom the invention of modelling is ascribed, are one and all very pretty fictions. Even Rhæus and Theodorus, the inventors of bronze-casting, and Glaucus, who invented the soldering of iron (*σάβρον κάλλειαν*), are names and no more. Indeed it is impossible until a comparatively late period to connect extant works with the name of their authors. When we examine the archaic monuments, such as the earliest metopes of Selinus, which are as old perhaps as 600 B.C., we find a style awkward and ingenious even to barbarity. While the figures of Perseus and Medusa front the spectator, the feet are planted from left to right, and the mason, so far from aiming at symmetry of design, was doubtless content with a vague semblance of humanity. The seated figures from Branchida, which may be as late as 540 B.C., are merely blocked out, and the seated Athena, ascribed to Endouus (550 B.C.), gives no promise of the golden age which followed less than a century later. The celebrated Lycian reliefs, known as the Harpy Tomb, mark a distinct step in advance. There is charm and dignity in their stiff elegance and beautiful drapery; and yet are they not still marred by the clumsy ingenuousness of the true primitive? At Athens art was born late and lived a brief, if brilliant, life. Nor is the *style* of Aristocles much better than an archaic experiment; though the relief of a woman stepping into a chariot, which may have been a metope of the Hecatompelon, has at least the suggestion of freedom and mastery. There exists a group of statues—called Apollo—which were fashioned in obedience to the same convention. They are rigid and clumsy in handling; the arms are fixed firmly to the side; and yet the surface is treated with breadth and simplicity, and there is an unmistakable Hellenism in the flow of the lines. That of Orchomeneus is probably the most ancient, and may date from the 7th century; the most advanced in style is the so-called Strangford Apollo—now in the British Museum—which is doubtless not much older than the Ægina pediments.

The marble statues which adorned the gable-ends of the temple of Aphaia at Ægina, and are now the chief ornament of the Glyptothek at Munich, form the first great monument of Greek art which has come down to us. Each pediment represented the struggle of two opposing forces over a dead warrior. Though there is an archaic touch in the spare proportions and rigid attitudes of the figures, they are evidently the work of a master who understood his craft, and it is possible that the stern handling and the archaic smile were deliberate. The author is unknown. The eastern pediment is freer, and possibly later than the western, and the historians have ascribed it to Onatas, a sculptor whose name is preserved in the texts. But there is not a shred of definite evidence, and we can only describe these fine statues as the best specimen of Greek sculpture half a century before the advent of Phidias. The style of Myron and Polyclethus is known to us only by copies; that of Kalamis not at all, unless the Choiseul-Gouffier Apollo (so called) be a copy of his famous Apollo Alexikakos. All three were older contemporaries of Phidias, and concerning them all the ancient critics waxed eloquent. If we may believe a hundred epigrams, Myron aimed at realism and illusion rather than at beauty. His disc-thrower has been celebrated through all the

ages, although, if the copy be accurate, Quintilian described it accurately as *distortum et elaboratum*. Polyclethus, on the other hand, was a true academic, and would have imposed a canon on the world. The well-known *Doryphoros* and *Diadumenus* are copies of his works; and though we may not determine therefrom his technique, we may at least realise the square proportion to which he bade his contemporaries conform.

In Phidias the art of sculpture culminated. Born at the most fortunate moment of the world's history, the artist of the Parthenon was a worthy contemporary of Sophocles and Plato. To his personal genius must be ascribed the marvellous efflorescence of art which conferred a unique glory upon the 5th century B.C. Cupidity and barbarism have effaced the monumental Chryselephantine (q.v.) figures of Athena and Zeus, which antiquity esteemed his masterpieces. The bronze colossus—Athena Pronaïchos—no longer stands upon the Acropolis to strike fear into the heart of invading Goths. But the sculptured decorations of the Parthenon have been preserved, though not unhurt by time, for our admiration. In style there is a profound difference between the metopes, which are marked by a dry archaism, and the magnificent works which are still the supreme expression of the art. Maybe the metopes preceded the rest by some years, and there is at least a mystery and solemnity in their handling which separates them by a long interval from the Æginetan sculptures. But the frieze and such groups from the pediments as have survived the shocks and explosions of history are the work of a hand and brain balanced and complete. Here breadth, simplicity, and finish unite; there is ever an exquisite quality of surface; plane is related to plane with amazing subtlety; the accidental is rigidly excluded; nature and the convention of the art are happily blent; a sense of dignity, beauty, and control is everywhere apparent; not only is each figure perfect in itself, but each is perfectly adapted to the space it fills; the structure of the pediment compelled the sculptor to set his figures in exquisitely varied pose, so that the composition of the groups—which represented episodes in Athena's career—was at once flowing and coherent. The march of the frieze—a procession in the Panathenaic festival—is as large and stately as its details are exquisite (see figure in article *ELGIN MARBLES*). Phidias (q.v.) remains to-day one of the greatest sculptors of the world; and his school handed on the torch he had given into their hands. The restrained elegance of the Caryatides of the Erechtheum, the graceful Victories, with their beautiful draperies, which adorned the temple of Nike Apteros, the refined grandeur of a dozen *stèle*, the charming movement of the Phigialian frieze, are the outcome of Phidias' serene example. The sculptured figures of the temple of Zeus at Olympia, the shrine of the gold and ivory statue, are an interlude in the history of art. Legend in ascribing the east pediment to Pæonius (the author of the famous Nike), the west to Alcamenes, is almost certainly false; and, if judgment may be based upon style, these figures are earlier in date than the Parthenon. The so-called Neo-Attic school marks the decadence. Still beautiful in their decay, the works of Scopas (390-350), and of Praxiteles, his contemporary, have already declined from the austere and classic style of Phidias. Their works lack something of the repose and impartiality which distinguish the masterpieces of the Parthenon. Though both produced an immense quantity of works, we know little else than copies and the ancient texts can tell us. The one undoubted work of Praxiteles which still remains to us is the Hermes, discovered

at Olympia in 1877; while the handiwork of Scopas may be seen in the sculptures of the Mausoleum. To the same period perhaps belong the incomparable Venus (q.v.) of Milo, and the grave Demeter of Chios now in the British Museum. Lysippus, the court sculptor of Alexander, followed with his new canon of small heads and jimp figures, and then the school of Pergamum, beginning the revolt against Attic repose, inflicted an irredeemable injury upon the art of sculpture. The school of Rhodes, with its much bepraised Laocoon (q.v.), the school of Thalles, with its impossible Farnese bull, completed the glory of the un-sculpturesque. The capital of art was then shifted from Athens to Rome, and the industrious band of *Gravatores* fashioned for us the excellent if uninspired copies to which we owe so much of our knowledge of Greek sculpture. To catalogue their names were superfluous; they were not wont to sign them themselves. But they preserved for future ages such admirable works as the Amazon and the Porphyrus; and if the Apollo (q.v.) Belvedere and the Venus de Medici have since been monstrously overrated, their authors are not to blame. Lastly, mention must be made of Pasiteles, who, in the time of Pompey, made a determined effort—like the Pre-Raphaelites of England—to revive an archaic style, and even succeeded in establishing a school.

And then the art of sculpture suffered eclipse. In the early centuries of Christianity the attempt to model the human form was condemned as idolatrous, and such poor barbarous experiments as were made may be passed over in silence. In the 6th century a revival was inaugurated at Byzantium, and flatterers compared a monument erected by Justinian in 534 A.D., in honour of a victory over the Persians, to the masterpieces of Phidias. But the Christian spirit invading, Byzantine sculpture, truly the very lees of classicism, must needs take refuge in an elaborate symbolism. The use of gems and precious metals gave a certain splendour to the best examples of Byzantine art, and its influence was universal. No country in Europe escaped it, and until the 12th century its reign was undisputed. In the Gothic period sculpture was, as it were, rediscovered. Commonly somewhat rude and barbarous, often resigned to a vigorous realism, it was not an art deliberate and complete as was the sculpture of the Greeks. Its conventions grew up with its growth, and save in France it was rarely emancipated from the fetters of experiment. In England such monumental sculpture as belongs to the Gothic period is undistinguished and maladroit. William Torell's Queen Eleanor (13th century) will serve as an example as well as another, and the sculptured decoration of Henry VII.'s chapel at Westminster shows the Gothic style as it was before the Renaissance reached England. In France there is another tale to tell. The manifold figures which adorn the cathedrals of Chartres and Rheims, though Gothic in spirit, were produced under the influence of classical art. Their freedom and simplicity is a complete contrast to the barbarous productions of the previous century. However, there is no difficulty in the supposition that the French artists of the 13th century were familiar with Roman art, and to this acquaintance with a good school they owed their superiority both to their predecessors and to their contemporaries in other parts of Europe. The 14th and 15th centuries were a period of decline; the northern spirit gained a complete ascendancy, and with the exception of the works of Claux Sluter, which may be studied at Dijon, there is little to note before the Renaissance. Germany escaped from the thrall of Byzantium in the 12th century, but she produced little work in the Gothic

period that is either beautiful or sculpturesque. Not until the 15th century, when Syrlin, Dürer, and Wohlgemut practised wood-carving, is there any notable advance. To Adam Kraft (1430-1507) a feeling of beauty and rhythm was denied. His figures are square and squat, his drapery is arranged after the German method in stiff, hard-cornered folds. The Visscher family—Peter Visscher (1455-1529) was the greatest—made no conspicuous progress. They were still true to the Gothic ideal, and though their best work, such as Peter Visscher's portrait of himself, displays a bluff realism, it was based upon an inartistic convention and possessed no vital inspiration.

In Italy the classical tradition did not die, and such Gothic sculpture as the Italians produced was either of foreign origin or tinged strongly with a feeling of classicism. Nicolo Pisano, who was born in 1205, was a devout student of classical models. In much of his work the two styles were ingeniously blent—in the pulpit at Pisa, for instance—and he was profoundly influenced by Roman sarcophagi. Nicolo's son, Giovanni, followed in his father's steps, and, though still a primitive, conferred fresh glory upon the Pisan school, which the ingenious Oragna (born 1329) brought to an end. Giacomo della Quercia (born 1374), the author of the celebrated Fonte Gaia at Sienna, marks the transition from the old to the new, from the middle ages to the Renaissance. A student of nature, he only half understood the possibilities of the great revival, but his design for the gate of the baptistery at Florence (1401) was placed next in order after the designs of Ghiberti and Brunelleschi, and therefore he may be said to have heralded the re-birth of art. In Italy, where the Goth had never dominated, the Renaissance was a development rather than a revolution. The spirit had always been the same, and Ghiberti (born 1381), the first master of the new school, may hardly be called an innovator. His famous gates at Florence occupied the larger part of his life. The first was begun in 1403; the second was not finished until 1452. The work is marked by a suavity of line and a certain elegance in individual figures. But it is entirely pictorial; the design is rarely thought out with reference to the necessities and limitations of the art of sculpture, and there is scarce a panel in either gate that is not overcrowded with figures.

In 1386 was born Donatello, by far the greatest sculptor of the 15th century. Endowed richly with the artistic temperament, learned in all the new learning, Donatello was also an indefatigable observer of nature and a master of design. His work is Greek in the best sense; large, simple, and restrained. He did not, like Ghiberti, overstep the limits of his art; he did not, like Michelangelo, a man of far rarer genius, use sculpture to express the passions of a violent brain. Content to aim at perfection in his art, he produced a series of masterpieces, which for feeling of rhythm, sense of proportion, and architectural adaptation may scarce be matched save in the golden age of Athenian sculpture. Simplicity of plane, breadth of style, harmony of line, dignity of pose—these are the qualities which confer everlasting distinction on his St George, his equestrian statue of Gattamelata, and his incomparable reliefs. Michelangelo (1475-1564) has been discussed at length under his own name, and no more need be said of him here than that his gigantic personality has dominated the modern world; that his knowledge of the antique was so profound, his technical mastery so complete, that nothing save restraint was impossible to him; that he produced a series of extraordinary masterpieces in paint and marble;

and that he founded a school which, beggared of his genius, did but exaggerate his more obvious faults. Luca della Robbia, the author of the 'Singing Boys' (1399-1482), is better known as the inventor of the famous Robbia ware than as a sculptor; while Benvenuto Cellini (1500-71), though he modelled the Perseus, is chiefly eminent as goldsmith and swashbuckler. The school of Michelangelo culminated in that most accomplished craftsman and mediocre artist Lorenzo Bernini (1598-1680), whose love of exaggerated forms and fantastic devices rendered his indubitable talent of no avail, though the unbounded influence which he exerted upon his contemporaries easily compassed the triumph of lawlessness and vulgar taste. Meanwhile the influence of the Renaissance was felt throughout Europe. In the 16th century, while Goujon imitated Cellini in France, Torrigiano inspired the English with an admirable taste in decoration, and Adrian de Vries reproduced in Germany the unchastened vigour of Giovanni da Bologna. In the 17th century there followed a universal decadence. Bernini's theatricality bore abundant fruit. Coyzevox, Clodion, Adam, the Coustons, Pigalle, and the rest, in spite of their eminent talent, always suffered from lack of repose and the lust of effect. Yet are they by far the most distinguished sculptors of the 17th century. In England nothing memorable was produced save the still-life of Grinling Gibbons (q.v.; 1648-1721); while Andreas Schlüter (1662-1714) best represents the art as it was pursued in Germany. The flamboyant style lived through the first half of the 18th century. A group of foreigners—Ronbillac, Scheemakers, and Rysbrack—practised their trade in England with a certain success. But the one great artist of the age was a Frenchman, Jean-Antoine Houdon (1741-1828). This distinguished artist, despite his education, avoided on the one hand the dry frigidity of effete classicism, on the other the cheap ingenuity of the imitators of Bernini. A naturalist, he never surrendered the dignity of his art to catch a fleeting resemblance. Above all he was from first to last a sculptor. His modelling is always large and simple; and though in his bust of Glück he attempted to reproduce the texture of a mottled skin, he was justified by the event. He was the greatest portrait sculptor of his own or indeed of any age; he invented the type of Mohère, and the great men of the great age live to-day as he created them. And then came Canova (1757-1822), who drove sculpture back into an antique channel. Neglecting the achievement of the Renaissance, he revived the Greco-Roman style with an insipid triviality, which has been a law to several generations of industrious workmen. In England Gibson, Macdowell, Chantrey, Wyatt, and a hundred others proceeded from Flaxman and the new classic school. In France Chaudet, Pradier, and Rude (by far the most accomplished of them all) neglected Houdon for Canova. Thorwaldsen, relying upon this false example, built up an amazing reputation, which did not, however, long survive him. A tasteless imitation, an incapacity to observe, a flabby modelling mark on the achievement of the whole school as a warning to sculptors, and serve to prove that salvation never comes by an unthinking adherence to a dead tradition.

The reaction came with the second half of the 19th century. In Alfred Stevens (1817-75), the author of the superb monument to the Duke of Wellington, who added an unfailing sense of decoration to a profound study of Michelangelo, Britain found her greatest sculptor. Alfred Gilbert (b. 1854), whose Piccadilly monument was for some time so grossly neglected, united a fanciful imagination with a cultured interest in metal-work and other arts. The output of this British school was

considerable. The work of Sir T. Brock and Sir Hamo Thornycroft is harmonious and dignified, while that of Alfred Drury and of A. G. Walker tends to decorative effect. Sir G. Frampton specialised in polychrome work, and Onslow Ford in portraiture. Leighton and Watts both did some important sculpture. Pittendrigh Macgillivray founded the Scottish school of sculpture, while the names of the Australian, Mackennal, and the Canadian, Proctor, are worth mentioning. It was in France, however, that the break-away from Italian influence was most apparent. Barye was a brilliant *animalier*, and Carpeaux infused astonishing vitality into the marble; but the greatest name in modern times is, of course, that of Rodin (1840-1917), whose work, eminently Gothic in character and unconventional in treatment, is outstanding for its terrific dynamic power and emphasis. The versatile Antoine Bourdelle has been quoted as the successor of Rodin, and Aristide Maillol came under the influence of Cézanne, but both confine themselves definitely to plastic ideas. Falguère, Dubois, and Bartholomée learnt more on tradition, but always stressed the importance of fine modelling, while Dalou had an enormous influence on British art during the seventies and eighties. In the works of the Belgian, Constantin Meunier (1831-1905), the working-classes came into their own, and beauty was found to be present in the commonest phases of human life and action. The 'impressionism' of the Italian, Rosso, probably influenced the Balzac of Rodin. Von Hildebrand (1847-1921), Autokolsky (1845-1902), and Saint Gaudens (1848-1907) were the pioneers in the modern revival of sculpture in Germany, Russia, and the United States respectively. Other prominent late 19th-century sculptors are Vincotte and Lambaens in Belgium, Trentacoste in Italy, Max Klinger in Germany, von Zumbusch in Austria, and Daniel French and Stirling Calder in the United States; while of those whose work has been done mainly in the 20th century there must be mentioned the Spaniard, José Clara, and the Frenchman, Paul Landowski, who both discard decoration in favour of naturalism; the German, Wilhelm Lehmbruck, with his curious elongated figures; the Serbian, Ivan Meštrović, whose paternal and heroic works became largely known during the Great War; the Pole, de Swiecencki, whose style was described as 'hieratic'; and the Englishman, Derwent Wood, the author of many works of great individuality and power. Dobson and Reid Dick each have their own followers; the originality, sometimes very striking, sometimes very ugly, of Jacob Epstein has aroused much controversy; Céline Lepage reverts to Greek principles in identifying sculptured figures with pilasters or columns; while Archipenko applies the principles of cubism to sculpture, usually with very odd results. After the Great War, the erection of numerous memorials in various countries gave an impetus to the production of sculpture. A significant characteristic of the modern work generally has been the predominance of blocks of unheavily marble serving as background, or actually incorporated into the subject of the work. In monumental work, the connection between architecture and sculpture is very close, but proportion of subject-matter and treatment is infinitely more desirable than mere hugeness, and the month has not always necessarily an aesthetic value. Further, it is worth noting that while funerary work, such as that of Bistolfi, is characteristic of Italian work, and portrait busts of Belgian and French, in Germany activity is directed more to the making of fountains, memorials, and town and house adornment. It must be

admitted that, generally speaking, more official recognition and more private encouragement are given to sculpture on the Continent than in Great Britain.

Sculptured Stones. a general name given in Britain to a class of monuments of the early Christian period, many of them being mere unhewn stones, with sculpturings of rude inscriptions, or symbols, or ornamental designs, corresponding in style and patterns to the illuminated decorations of Celtic manuscripts of the Gospels. The rude stones erected for memorial purposes in pagan times (unless under Roman influence) are uninscribed and unornamented (see under **STANDING STONES**). The sculptured stones of Britain may be divided into two classes—those that are simply incised and those that bear sculpture in relief, the former being the earlier method. Sculptured stones of the incised or earlier class may be subdivided into two sections, inscribed or uninscribed, irrespective of their bearing symbols and ornamentation. The advantage of this division is that the inscribed monuments can be arranged in chronological order by their palaeographical characteristics, and the uninscribed examples bearing similar symbols and ornamentation to those found on the inscribed examples will follow the same sequence. We know from palaeographical data that the earliest lapidary inscriptions in Britain are in Roman capital letters, and that the minuscules, or small letters, do not make their appearance till about the 6th century. Hence we have a means of dividing the inscribed stones into an earlier and a later group according as they are written in capitals or minuscules, while those that are mixed or partly in capitals and partly in minuscules will represent the middle or transition period. But many of the inscribed monuments bear inscriptions which are written in a character peculiar to the British Isles, and known as Ogam (q.v.). Sometimes the Ogam inscription is associated with an inscription in Roman letters on the same stone, sometimes the monument bears an Ogam inscription only. In the latter case it is frequently associated with sculptured ornamentation in relief of the most advanced type, and therefore we have another means of dividing the inscribed stones into two groups, one of which is demonstrably later than the other. Of these four groups, which are (1) inscribed in Roman capitals only; (2) inscribed in Roman letters and in Ogam, or bilingual and biliteral; (3) inscribed in Ogam only; and (4) inscribed in Roman minuscules or small letters, the first and second have their chief development in Wales, and the third and fourth in Ireland.

Stones of the first group are in general rude undressed pillar-stones or oblong boulders from 4 to

9 feet in height, the inscriptions generally incised vertically. They are always in the Latin language, and usually consist of the name of the deceased, preceded by one or other of the varieties of the distinctively Christian formula 'Hic jacet,' &c. The greater number of these stones are found in association with ancient ecclesiastical sites, and some bear also incised crosses of the earliest known type. A well-known example is the Cat Stone near Kirkliston, west of Edinburgh (fig. 1), which stands in a cemetery of early Christian graves, and bears the inscription, IN [H]OC TUMVLO JACIT VETTA F[ILIIUS] VICTI. One of a group of three at Kirkmadrine in Wigtownshire commemorates two priests, Viventius and Mavorius, probably of the church founded there by St Ninian in the 5th century. The greater purity of the forms of the letters and the style of the Latin of the inscriptions of this group indicates their closer proximity to the period of the Roman occupation. The characteristic of the second group of inscribed stones is that they bear two inscriptions, one in the Latin language and in Roman letters (capitals as a rule), and the other in the vernacular in Ogam letters, one inscription being always an echo of the other. Two examples will show the general character of their inscriptions. One in Pembrokeshire has, in debased Latin capitals, SAGRAMNI FILI CVNOTAMI, reading from the top of the stone downwards on one face, and on one edge the answering inscription in Ogam letters, SAGRANI MAQI CVNOTAMI, *maqi* being the usual form in these inscriptions for son. Another in Carmarthenshire reads in Latin AVITORIA FILIA CVNIGNI, while the answering Ogam has AVITORIGES INIGINA CUNIGNI—*inigna* standing for daughter, and answering to the modern Gaelic *ingen*, as *maqi* answers to *mae*. The third group of inscribed monuments, those bearing Ogam only, has chiefly in Ireland. Many examples are associated with early forms of the cross incised on the same stone. From their native these Ogam inscriptions are peculiarly difficult to decipher; but when the reading is clear they are usually of the same brief character as the bilingual inscriptions of the group previously described. The fourth group of inscribed monuments comprises those in minuscules or small letters of the Roman alphabet, chiefly in the forms of those letters adopted by the Irish scribes. The largest group in Ireland is in the ancient cemetery of Clonmacnois, where there are over eighty examples, many of which can be dated by the names of the persons commemorated. They are chiefly undressed slabs laid flat on the graves, and incised sometimes with the inscriptions only, sometimes also with crosses, and more rarely with Celtic ornamentation. Of the names which can be identified from the Irish annals four belong to the 7th century, six to the 8th, twenty-eight to the 9th, eighteen to the 10th, and the same number to the 11th century. The earliest bear nothing but the inscriptions and plain crosses. Ornamentation does not begin to be added till the 9th century. In Ireland the inscriptions are usually in the ver-

Fig. 1.—The Cat Stone.

nacluar, with the formula *oroit do* — and its contractions, or *oroit ar anmain* — and its contractions, meaning 'pray for —' or 'pray for the soul of —.' In Wales, however, the inscriptions of this group are usually in Latin. Though the majority of these stones are sepulchral monuments, others have been erected for different purposes, commemorative or terminal, to mark the boundaries of church lands or sanctuaries. In the Anglo-Saxon parts of Britain the inscribed stones bear inscriptions in Anglian runes, and in the Isle of Man and the northern and western isles of Scotland, colonised from Scandinavia, the inscriptions are in Scandinavian runes. The monuments with Anglian runes are chiefly sepulchral slabs of small size, incised with a cross and the name of the deceased. In a few cases, however, they are great commemorative crosses, covered with sculptured ornamentation, and bearing elaborate inscriptions. The finest of these crosses are at Bewcastle (q.v.) in Cumberland and Ruthwell (q.v.) in Dumfriesshire. The shaft only of the Bewcastle cross remains, 14½ feet in height; the Ruthwell cross measures 17½ feet in height. Both are so similar in design and in style of ornamentation that they must be attributed to the same period. Both have long runic inscriptions—that on the Ruthwell cross being associated with a series of inscriptions in Roman capitals descriptive of the scriptural scenes carved on the panels of its two broad faces, while the runes are on the borders of the long panels on the sides of the cross, enclosing scrolls of foliage. They contain twenty-one lines of an Anglo-Saxon poem—'The Dream of the Holy Rood'—which was not known to exist in any other form until a South Anglian version was discovered in a manuscript at Vercelli in 1823, and attributed to Cynewulf, though Professor

honour of Aelfrith, king of Northumbria, in the 7th century, though the opinion is gaining ground that the dates of both these crosses must be placed considerably later than his time.

The monuments included generally under the name of the sculptured stones of Scotland are for the most part uninscribed. But they are profusely decorated (as will be seen from the annexed figure of one of the most ornate, at Nigg in Ross-shire), and their chronological place in the general group of the early Christian monuments of Britain falls to be determined partly from the relations of their general system of ornamentation to that of the illuminations of the Celtic manuscripts of the Gospels of the 7th to the 10th and 11th centuries, and partly by the characteristics of the few inscriptions they do bear. Taken by themselves, they exhibit peculiar characteristics, which show that, although they form part of the general group which is peculiar to the British Isles, they have been affected by strong local influence. They present a peculiar set of symbols, not one of which is known to have occurred beyond the Scottish area, while the special form of the erected cross-bearing slabs, and the partiality to the representation of conventional beasts as part of their decoration, distinguish them from the English, Welsh, and Irish groups. The Scottish sculptured stones, of which over 370 are known, are divided into three varieties: (1) rude undressed pillar-stones or oblong boulders incised with unexplained symbols; (2) erect shaped slabs of headstone form, sculptured generally in relief, with a cross on one face and figure subjects and symbols on the other; and (3) high crosses with figure subjects and Celtic

Fig. 2.—Sculptured Stone at Nigg.

Stephens of Copenhagen maintained that a line of runes on the top of the cross, now obliterated by exposure, gave the authorship to Cudmon. The inscription on the Bewcastle cross is less legible, and has been read as recording its erection in

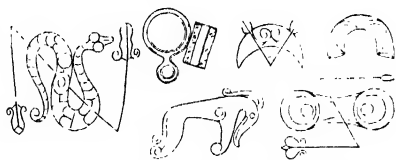

Fig. 3.—Symbols on the Sculptured Stones of Scotland.

ornamentation similar to those of the cross-bearing slabs, but without the symbols. The rude pillar-stones of the first variety occur chiefly along the eastern side of Scotland from the Firth of Forth to the Orkney and Shetland Isles, being most numerous in the district between the Tay and the Spey. Outlying examples, however, occur as far south as Dumfriesshire and as far west as the outer Hebrides. The unexplained symbols incised on these stones are more easily represented than described. Those of most common occurrence are represented in fig. 3. Some of these are arbitrary symbols, to the development and meaning of which there is no clue. Others—such as the serpent, and the mirror and comb—are representations of existing objects, apparently used with a symbolic meaning. Some of the arbitrary symbols occur also on silver ornaments of the same period. On stones of the second variety, sculptured in relief, and presumably of later date, these symbols are associated with well-known symbols of the Christian faith, such as the cross and the fish, and with the ornamentation so characteristic of the illuminated pages of Celtic manuscripts of the Gospels. The figure subjects on the stones of this variety are partly scriptural and mostly related to the general cycle of early Christian symbolism. Among the scriptural subjects are the Temptation of our First Parents by the Serpent, Daniel in the Den of Lions, the Destruction of

Pharaoh's Host in the Red Sea, the Raising of Lazarus, Jonah disgorged by the Whale, the Virgin and Child, &c. Along with these are hunting scenes, including the chase of the stag, wild boar, &c., and groups of animals evidently taken from the Bestiaries of the early middle ages, a species of natural history spiritualised, in which the characteristics of the various animals, real and fabulous, were set forth as symbolising the spiritual condition of man as related to the scriptural plan of salvation (see *BESTIARY*). Of the third class of sculptured stones, the high crosses, there are but few in Scotland, and they are nearly all characterised by the presence of scriptural subjects. There are no data by which the age of the stones of the first variety, bearing only the incised symbols peculiar to Scotland, can be estimated. But there seems no reason for assigning to them a higher antiquity than that of the inscribed stones of the first and second classes, which seldom bear ornamentation or symbols, except the early form of the cross. The style of the ornamentation of the second variety, sculptured in relief and arranged in panels, is similar to the decoration of the illuminated Celtic manuscripts of the Gospels of the period ranging from the 7th to the 10th century. The third variety, consisting of high crosses with pure Celtic ornamentation, may range from the 10th to the 12th century. This form of monument—a high cross—with local variations and a remarkable development of foliage-ornamentation common to the recumbent sepulchral slabs of the same district, continued in the West Highlands from the 13th to the 16th century.

Scurf. See *PHYRIASIS*.

Scurvy, or *SCORBUTUS*, is a disease in which there is great debility of the system at large, with a tendency to congestion, hemorrhage, &c., in various parts of the body, and especially in the gums. It still breaks out every spring in the northern regions of Russia, following on six months' deprivation of fresh vegetables, sunshine, &c. It has probably existed from the earliest times, but the first distinct account of it is contained in the history of the crusade of Louis IX. in the 13th century against the Saracens of Egypt, during which the French army suffered greatly from it. In the 16th century it prevailed epidemically in various parts of the north of Europe, and it seems only to have abated towards the close of the 18th century. It was in badly-fed armies, in besieged cities, and on board ship that its ravages were most appalling, and it is believed that more seamen perished from scurvy alone than from all other causes combined, whether sickness, tempest, or battle. For instance, only 1512 sailors and marines were killed in all the naval battles of the Seven Years' War; but 133,708 died of disease or were missing, and scurvy was the principal disease. Whole crews were prostrated by this scourge, as in the well-known case of Lord Anson's (q.v.) memorable voyage. It is now met with under similar conditions, though cases are comparatively rare (in 1873 only 19 cases were reported to the Board of Trade, in 1881 as many as 99), and also among the lower classes in large towns, navvies engaged in railway work, &c., when they confine their dietary to tea, bread, ham, salt-fish, &c., to the exclusion of fresh vegetables and meat.

The first effect of the disease is generally a decline in the general health, and the patient becomes depressed, is easily fatigued, and has a peculiar sallow complexion. After a variable period the more characteristic symptoms appear, the chief of which are hemorrhages and sponginess of the gums. The hemorrhages closely resemble those of *Purpura* (q.v.), and occur into and under the skin, where they give rise to red or purple discolorations which change colour like the marks of bruises; into the muscles and other deeper tissues, where they cause brawny swellings; and into internal organs or cavities. Hemorrhage also frequently takes place from the mucous membranes of the nose and alimentary canal. The affection of the gums is still more characteristic, and is rarely absent, except in the very young or very old, who are without teeth. The gums are swollen, discoloured, detached from the teeth, and bleed extremely easily, while the breath becomes very fetid. This condition sometimes precedes but often follows the occurrence of hemorrhage in other situations.

The cause of scurvy is now well known to be an improper dietary, and particularly an insufficient supply of fresh vegetable food. The disease is never known to have occurred in anyone who had eaten freely and habitually of such articles of diet. Even preserved vegetables, if kept in a juicy condition, prevent the occurrence of the disease. In the absence of vegetables abundant fresh meat and in a less degree milk are antiscorbutic. But the most efficient protective if fresh vegetable food is not attainable is fresh lemon or lime juice; and the constant use of these during long voyages prevents the occurrence of scurvy when it would otherwise be inevitable. It is more apt to affect those who are deprived of fresh air and sunlight, are mentally depressed, and have had their health enfeebled by previous disease. In what way the deprivation of fresh vegetables acts on the blood to produce scurvy is as yet unknown. It appears certain, however, that the important factor is the absence of principles known as 'vitamins,' which are found in fresh meat, milk, or vegetables, but which are destroyed by long desiccation or by boiling. See *VITAMINS*.

Although the virtues of lemon-juice in scurvy were known in England as far back as 1636, when John Woodhall, Master in Surgery, published *The Surgeon's Mate, or Military and Domestic Medicine*, this invaluable medicine was not made an essential element of nautical diet till 1795, the author of the change being Sir Gilbert Blane (q.v.). The effect of this official act may be estimated from the following numbers. In 1780 the number of cases of scurvy received into Haslar Hospital (a purely naval hospital) was 1457, while in 1806, as also in 1807, there was only one case. Many naval surgeons of the present day have never seen a case of the disease. The potato possesses almost equally great antiscorbutic properties, and fortunately potatoes when cooked still possess considerable activity. Dr Baly (1814-61), to whom we are indebted for this discovery, states that 'in several prisons the occurrence of scurvy has wholly ceased on the addition of a few pounds of potatoes being made to the weekly dietary.' For the cure, as for the prevention of the disease, the diet is by far the most important agent; lemon, orange, or lime juice should be given freely. Sometimes the condition of the mouth prevents the administration of potatoes and other vegetables; but when possible they should be given freely. Washes of chlorate of potash, tannin, or Condy's fluid should be used for the gums; and rest in bed with tonic treatment is necessary for the muscular and cardiac weakness accompanying the severer cases.

Scurvy-grass (*Cochlearia*), a genus of plants of the family Cruciferae, having small white flowers and many-seeded pouches. They are annual or biennial, rarely perennial plants; of humble growth, with branched smooth stems, smooth simple leaves, and terminal racemes of flowers. They have an acrid, biting taste, containing the same pungent volatile oil which is found in horseradish, and are valued for their antiscorbutic properties. Common Scurvy-grass (*C. officinalis*) is sometimes a foot high; the root-leaves are stalked and heart-shaped, the pouches globose, ovate, or elliptical. It is a variable plant, and some of the other species described by botanists are probably not essentially different. Scurvy-grass is very common on the shores of Britain, growing both on rocks where there is little soil and in muddy places. It is also found on high mountains. It is a very widely distributed plant, and, being found on the shores of almost all temperate parts of the world, was of great benefit to sailors in times when the modern precautions against scurvy at sea were unknown.

Seutage, or ESCUAGE (Lat. *scutum*, 'shield'), a pecuniary fine or tax sometimes levied by the crown in feudal times as a substitute for the personal service of the vassal.

Scutari (Italian or Levantine form of the Turkish *Uskudar*), (1) a town of Asiatic Turkey, on the eastern shore of the Bosphorus, immediately opposite Constantinople, of which it is considered a suburb. It is built on the slopes of a hill, and bears a great resemblance to Constantinople, though its streets are wider. It contains several handsome mosques, bazars, and baths, and a college of howling dervishes, and manufactures silks and cotton fabrics and leather goods. It has long been famed for its extensive cemeteries, adorned with magnificent cypresses, the chosen resting place of many of the Turks of Constantinople from attachment to the sacred soil of Asia. Pop. about 60,000. During the Crimean war the enormous barracks built by Sultan Mahmud on the southern outskirts of the town were occupied as barracks and hospital by the English troops, and formed the scene of Miss Nightingale's labours. On the cliffs bordering the Sea of Marmora stands a marble obelisk marking the site of the densely filled English burial-ground. A white tower (90 feet high) near the shore, now used as a lighthouse, is known as Leander's Tower (see HERO). Scutari occupies the site of the ancient *Chrysopolis*; and about two miles to the south lies the village of Kadikoi, the ancient *Chalcodon*.

(2) A town of Northern Albania, situated at the southern end of the Lake of Scutari, 16 miles from the Adriatic, with which it is connected by the river Bojana. It is overlooked by an old Venetian citadel on a commanding height, has the cathedral of a Catholic archbishop, manufactures of arms and cotton goods, and carries on a considerable trade, especially in wool, skins, and sumach. There is some fishing. Scutari was the scene of much fighting during the Balkan wars and the Great War. Pop. about 32,000.

Scylla and Charybdis, according to the Homeric legend, were two sea monsters who dwelt on opposite sides of a narrow sea-strait. Scylla possessed twelve feet, six long necks and mouths, each with three rows of sharp teeth, and barked like a dog. Charybdis thrice every day sucked down the water of the sea, and thrice threw it up again; she dwelt under a cliff on which grew a conspicuous fig-tree. Ulysses passed between these voracious monsters, and Scylla snatched six seamen from his ship. There are other versions of the myth. In later times the names were applied to a

couple of 'races' or rapids in the Strait of Messina, Scylla being the one next the Italian shore. From the supposed difficulty of navigating the strait without getting into the one or the other of these dangerous spots arose the proverbial 'To shun Charybdis and fall into Scylla.' But the dangers of these 'races' have been very greatly exaggerated.

Scyphomedusa. See JELLYFISH.

Scythe. See REAPING.

Scythian Lamb. See BAROMETZ.

Scythians, a nomad race of Asia known to the ancient writers. They were originally either of Mongolian or of Iranian origin—opinion is divided on the subject, but if the latter, certain Uralo-Altaic influences were certainly present. They moved westward and first came into historical prominence in the 7th century B.C., when they dispossessed the Cimmerians of the rule of the Russian steppes, and eventually controlled the vast treeless plain from the Danube to the Volga. It must be clearly understood that the Scythians formed a ruling military caste—only an aristocratic minority of the population, but some of the ancient writers indiscriminately termed Scythians all the tribes living north of the Euxine. The Scythians proper lived mostly in the territory between the rivers Dnieper and Don, kept herds of horses, cattle, and sheep, lived in tent-covered wagons, wore coats, breeches, and boots, fought with bows and arrows on horseback, made drinking-cups of the skulls of their slain enemies, were filthy in their habits, and worshipped without images various gods like those of the Aryan Greeks. In the 7th century B.C. some of the Scythians invaded Media, and were only got rid of after ten years' occupation by Cyaxares making all their chiefs drunk at a banquet, and then slaying them. About the same period (626) certain fair-haired men from the north invaded Palestine and Egypt (see SCYTHOPOLIS); these have been identified with the Scythians, and may have been the same as the ideans and bowmen of whom the prophet Jeremiah speaks (chaps. iv.-vi.). In 515 Darius (q.v.) crossed the Hellespont and went north over the Danube, probably solely with the intention of making a demonstration of Persian power, so as to be free to carry on his projected conquest of Greece. In the 5th century the Scythians reached their highest power. From the Greek colonies established north of the Euxine, they learnt many of the arts of civilisation (one of their kings, Anacharsis (q.v.), even going to Athens to learn at the feet of Solon); trade followed, and 4th century funerary monuments round the Sea of Azov reveal splendid metal work of both Scythian and Greek design and manufacture. The presence of a stable power on the north of the Euxine (and also partly on the south) contributed greatly to the prosperity of the Greek colonies, but indeed the help was mutual. At this time, however, the far-reaching influence of the Scythians began to lessen owing to pressure from the Thracians on the west and from the Sarmatians on the east, but it was not till the second half of the 3d century B.C. that the latter definitely superseded the Scythians, who henceforth cease to count in European history. The Scythians of Asia, however, after about 128 B.C. overran Parthia (Persia), routed several Parthian armies, and levied tribute from the Parthian kings. They founded also in the east of the empire the kingdom of Sacastane, so that that part of Asia was long known as Indo Scythia. During the first century before and the first century after Christ hordes of Scythians, having overthrown the Bactrian and Indo-Greek dynasties of Afghanistan and India (125-25 B.C.), invaded Northern India; and there they maintained themselves with

varying fortune for five centuries longer. Their kings were warm supporters of northern Buddhism; indeed an attempt has been made to show that Buddha was of Scythian descent. The Jats of India, and the Rajputs, have both been assigned the same ancestry. Greek influence told strongly on the Scythian conquerors: Greek was even used as the official language of several dynasties in Bactria and the Punjab.

See Rawlinson's and Sayce's editions of Herodotus; Neumann, *Die Hellenen im Skythenlande* (1855); Müllenhoff and Cuno, *Die Skythen* (1871); Fressl, *Skythe Saken* (1886); Mahaffy, *The Great World under Roman sway* (1890); Minus, *Scythians and Greeks* (1913); Rostovtzeff, *Iranians and Greeks in South Russia* (1922); and the article AUR.

Scythopolis (*Beth-shean* in the Old Testament, *Beisan* during the Crusades, *Beisan* in modern times), a small town of Palestine, 55 miles NNE. of Jerusalem. It was on the main route from Egypt through Palestine to Damascus and the Euphrates, and 20th century excavation has revealed many important Egyptian remains, notably a great XIXth dynasty temple to Ashtaroth, attributed to Amenophis IV. (probably that referred to in 1 Samuel xxx. 10), standing over an earlier temple, perhaps of Thothmes IV. (XVIIIth dynasty). The fortress eventually fell into the hands of the Philistines, who took Saul's body there after the battle of Gilboa; but strong Minuan influences had been present as early as 1375 B.C. The Greeks called it Scythopolis, but there is not enough evidence to prove any permanent Scythian occupation (see SCYTHIANS). Later, it became the chief city of the Decapolis and an independent town of the Roman empire.

Sea. All primitive peoples appear to have experienced a feeling of dismay when they braved the dangers of the sea. The great majority of the civilised nations of antiquity took but little interest in the physical phenomenon of the ocean. The few facts that were known with reference to the sea were limited to maritime nations like the Phœnicians. Among the learned men of antiquity two views were held with reference to the distribution of land and water. The Homeric school—to which Eratosthenes and Strabo belonged—regarded the old world as a single island surrounded by the ocean. The Ptolemaic school, on the other hand, looked on the Atlantic and Indian Oceans as enclosed seas like the Mediterranean, and held that the east and west points of the known world approached so close to each other that a ship sailing from Spain might easily reach the eastern coasts of Asia. This mistaken notion led, fourteen centuries after Ptolemy, to the discovery of America by Columbus. The discoveries of Columbus, Vasco da Gama, and Magellan, during the thirty years from 1492 to 1522, added a hemisphere to the chart of the world. These voyages doubled at a single bound all that was previously known of the surface of the globe, and in a special manner enlarged our knowledge of the sea. Down to the time of the *Challenger* and similar recent scientific expeditions all our knowledge of the sea might, literally speaking, be called superficial; it was limited to the upper layers of oceanic waters and to the shallower depths surrounding continents and islands. Owing to the recent introduction of improved apparatus and methods, the most profound depths of the ocean have been examined with precision and success, so that we now possess a large amount of definite information concerning the physical and biological conditions of all regions of the ocean.

Area.—The waters of the sea cover about 139,000,000 sq. m., or about five-sevenths of the surface of the earth, of which the Pacific occupies about 69 millions, the Atlantic about 41 millions,

and the Indian Ocean about 29 millions of square miles.

Depth.—The solid globe or lithosphere, viewed as to its superficial aspect, may be regarded as divided into two great planes of average level: one of these corresponds to the dry land or upper surface of the continental masses, and occupies about two-sevenths of the earth's surface; the other, corresponding to the abysmal regions of the ocean, is depressed over 2½ miles below the general level of the continental plane, and occupies about four-sevenths of the earth's surface. The transitional area, uniting these two planes, forms the sloping sides or walls of the ocean basins, and occupies about one-seventh of the earth's surface; it is called the area of 'continental slope and continental shelf.' The depressed regions of the globe, represented by the ocean basins, are filled with seawater up to within about 375 fathoms (2250 feet) of the general level of the continents, the average depth of the water in the ocean basins being on the other hand about 2080 fathoms (12,480 feet). Were the solid crust of the earth to be reduced to one uniform level by removing the elevated continental masses into the depressed abysmal areas, the surface of the earth would then be covered by a universal ocean or hydrosphere with a depth of about 2 miles. This depth of 2 miles below sea-level has been called by Dr Mill the mean sphere level. The average depths of the main divisions of the ocean are:

Pacific Ocean	2,500 fathoms.	Southern Ocean	2,100 fathoms.
Atlantic "	2,200 "	Antarctic "	630 "
Indian "	2,900 "	Arctic "	630 "

The greatest depth recorded is 5348 fathoms in the North Pacific (1912), near the Philippine Islands; in the Atlantic the greatest depth is 4662 fathoms, near the West Indies; and in the Indian Ocean the greatest depth is 3828 fathoms, near the East Indies. By far the larger portion of the sea floor lies between the depths of 1000 and 3000 fathoms, equal to nearly 78 per cent, while about 15½ per cent. is found in depths less than 1000 fathoms, and about 6½ per cent. in depths greater than 3000 fathoms. The bulk of water in the whole ocean is estimated at 323,800,000 cubic miles, and it is probable that the volume of water in the ocean has been increasing throughout geological time.

The limited regions of ocean floor which are more than 3000 fathoms in depth are called 'deeps.' There is a remarkable tendency, in all the oceans, for the deeps to be situated on the margins, rather near to the land. In general the oceans are shallower in their central regions than round the margins. Recent geophysical research traces this to a process of warping of the ocean beds which is set up by the secular cooling of the earth's crust.

Temperature.—The temperature of the surface-waters of the ocean varies from 28° F. in the polar regions to 85° or 86° in equatorial regions. In many places the surface-layers are subject to great annual changes due to the seasons and the direction of the wind. The temperature of the water at the bottom of the ocean over the abysmal areas ranges from 32.7° F. to 36.8° F. In some large basins separated from each other by low ridges the temperature may differ to the extent of one or two degrees, but the temperature is apparently constant at any one spot throughout the year. The great mass of the ocean consists of cold water—i.e. of water below 40° or 45° F.; at a depth of little over half a mile the water in the tropics has generally a temperature below 40° F. In the open ocean the temperature usually decreases as the depth increases, the coldest water being found at the bottom. Some temperature observations

immediately over the bottom-deposits appear to indicate a slight rise of temperature. In enclosed or partially enclosed seas, cut off by barriers from the great ocean basins, the temperature remains uniform from the height of the barrier down to the bottom; for instance, in the Mediterranean the temperature is about 56° from 200 fathoms down to 2000 fathoms; in the Sulu Sea, 50·5° from 400 fathoms to 2500 fathoms; in the Celebes Sea, 38·6° from 800 fathoms to the bottom in 2600 fathoms. In regions where there are heavy rains, or where rivers pour fresh water into the sea, alternating layers of colder and warmer water have been observed within a hundred fathoms from the surface.

Circulation.—The circulation of oceanic waters is maintained by the action of the prevailing winds on the surface-layers. In the oceanic areas the prevailing winds are governed by the large anticyclonic areas situated towards the centres of the North and South Atlantic and North and South Pacific. The winds blow out from and around these anticyclonic areas. For instance, in the southern hemisphere the warm salt water of the tropical regions is driven to the south along the eastern coasts of South America, Africa, and Australia, till on reaching a latitude of between 50° and 55° S, it sinks on being cooled, and spreads slowly over the floor of the ocean to the north and south. A similar circulation takes place in the northern hemisphere, although much modified by the peculiar configuration of the land-masses; for instance, the cold salt water at 30° F, which occupies the deeper parts of the Arctic basin is largely made up of the dense Gulf Stream water, which sinks to the bottom on being cooled in the Norwegian Sea. The water evaporated from the sea-surface is borne to the land-masses and condensed on the mountain-slopes. It is estimated that over 6500 cubic miles of this water is returned to the sea by rivers annually, bearing along with it a burden of soluble salts and earthy matters in suspension; in this way the ocean has in all probability become saltier in the course of ages. The saltiest waters are found in the regions of greatest evaporation; for instance, in the Red Sea, Mediterranean, and in the trade-wind regions of the great ocean basins. It has been shown that by the action of off-shore winds cold water is brought up from the deep sea to supply the place of the surface-water carried seawards off the west coast of Africa and America, and off Cape Guardafui on the east coast of Africa; and the absence of coral reefs off these coasts is believed to be due to the great range and variation in the temperature of the water thus produced. It has been shown that a similar vertical circulation takes place in the lochs of the west of Scotland.

Composition of Sea-water.—It is probable that every element is in solution in sea-water; the great majority are, however, present only in exceedingly minute traces. Sea-water contains about 35 parts per thousand of solid substances altogether, in the proportions shown in the following table:

	Parts per Thousand	Percentage of Total Solids.
Sodium chloride (NaCl)	27·213	77·76
Magnesium chloride (MgCl ₂)	3·807	10·88
Magnesium sulphate (MgSO ₄)	1·658	4·74
Calcium sulphate (CaSO ₄)	1·220	3·60
Potassium sulphate (K ₂ SO ₄)	0·863	2·46
Calcium carbonate (CaCO ₃)	0·123	0·34
Magnesium bromide (MgBr ₂)	0·076	0·22
	35·000	100·00

Here the acids and bases are arbitrarily combined, but it is now known that the dissolved substances in sea-water are present mainly as ions,

and it is usual to write the composition of sea-water thus:

	Parts per Thousand.	Percentage of Total Solids.
Na	10·722	30·64
Mg	1·316	8·76
Ca	0·420	1·20
K	0·282	1·09
Cl	19·324	55·21
SO ₄	2·696	7·70
CO ₃	0·074	0·21
Br	0·060	0·19
	35·000	100·00

The total amount of sea-salts may vary greatly in different samples of sea-water, but it has been shown by hundreds of carefully conducted experiments that the ratio of the constituents of sea-salts is very similar in all seas, with one significant exception, that of lime, which is in slightly greater proportion in the water from the deeper parts of the ocean basins. Recent research has shown the very great importance of some substances that exist in sea-water in very small quantities: these are nitrites, nitrates, and ammonia; silica and phosphates. At no time is any one of these substances present in greater abundance than about two parts per million of open sea-water, yet they rule the production of organic substance by marine plant life, and therefore the production also of all marine animal life. Owing to the constant circulation in the ocean, the gases of the atmosphere, which are everywhere absorbed at the surface of the sea, are carried down to the greatest depths, and thus living organisms may flourish throughout the whole extent of the ocean. Nitrogen remains at all times and places nearly constant; not infrequently the proportion of oxygen is much reduced in deep water, owing to the processes of oxidation and respiration. Carbonic acid free or loosely combined is abundant, and plays a most important rôle in the economy of the ocean, combining with and rendering soluble normal carbonates of lime and magnesia to solution in the form of bicarbonates. Water, as is well known, is but slightly compressible, and almost any substance that will fall to the bottom of a tumbler of water will in time fall to the bottom of the deep ocean. Still the compressibility of water must not be neglected in oceanographical questions. In the deeper parts of the ocean the pressure amounts to four or five tons per square inch; hence, in an ocean with a depth of 5 miles, were the action of gravity suddenly to cease, the ocean waters would rise 500 feet above their present level from expansion. There is evidence of very extensive chemical action on some regions of the sea-floor, and it has been suggested that this action is much intensified by the great pressure in the deeper parts of the ocean. It is probable, however, that all the reactions here alluded to may be accounted for by the decomposition of organic substances on the seabed in the presence of the sulphates in sea-water, and the long periods of time to which the materials on the sea-bed have been exposed to the action of sea-water in regions where there is a slow rate of deposition.

Life.—The colour of pure sea-water is a light shade of blue; it has, however, frequently various shades of green and brown, owing to the presence of organisms and matters in suspension. It has been definitely established that life in some of its many forms is universally distributed throughout the ocean. It has long been known that marine plants and animals abound in the shallow waters surrounding continents and islands. Algae dis-

appear from the sea-bed at depths between 100 and 200 fathoms, but a great abundance of animals has been procured in the greater depths. A *Challenger* trawling in a depth of over a mile (1000 fathoms) yielded 200 specimens of living animals belonging to 79 species and 55 genera. A haul in about two miles (1600 fathoms) yielded 200 specimens belonging to 84 species and 75 genera. A trawling in about three miles depth (2600 fathoms) yielded 50 specimens belonging to 27 species and 25 genera, not counting Protozoa. Even in depths of over four miles fishes and animals belonging to all the chief invertebrate groups have been procured. The term 'Benthos' is now used for all the animals and plants which live attached to or creep over the bottom of the ocean, 'Plankton' (q.v.) being the term for all the plants and animals which are carried along by the currents of the ocean, and 'Nekton' for all pelagic animals able to swim against the currents. In the great body of oceanic waters life is most abundant in the surface and sub-surface waters down to about 100 fathoms. Pelagic algae, such as diatoms and oscillatoria, are abundant in this region, and are the principal and original source of food for many pelagic and nearly all deep-sea animals. In the intermediate depths of the ocean life though present is less abundant. Within a few hundred fathoms of the bottom life again becomes more abundant, crustaceans and eel-like fish being especially numerous. A very large number of the organisms which belong to the pelagic Plankton, such as diatoms, radiolaria, foraminifera, and molluscs, secrete silica or carbonate of lime to form their shells and skeletons: these in falling to the bottom after the death of the organisms make up a large part of the marine deposits in many regions of the ocean.

Deposits. The explorations of the *Challenger* and other expeditions have resulted in a great extension of our knowledge of marine sediments, especially of those now forming in the deep sea. All marine deposits may be divided into three classes—viz. those made up principally of the debris from the solid land of the globe, laid down in greater or less proximity to the shores of continents and islands, called 'terrigeneous' deposits; those made up predominantly of the shells, or skeletons, of marine invertebrates and laid down mainly on sea-bottoms less than about 100 fathoms deep—these are called 'neritic' deposits; and those in which this continental or organic debris is nearly or quite absent, laid down in the abyssal regions of the ocean, called 'pelagic' deposits. Commencing with the former, there are first the littoral and shallow-water deposits, forming around the land-masses from the shore down to a depth of about 100 fathoms, consisting of sands, gravels, and muds derived almost entirely from the disintegration of the neighbouring lands. The littoral deposits, laid down between tide-marks, cover about 63,000 sq. m., and the shallow-water deposits, between low-water mark and 100 fathoms, about 10,000,000 sq. m. Proceeding seawards from an average depth of about 100 fathoms, the deposits gradually change in character, the proportion of land detritus decreasing, while the remains of oceanic organisms increase in abundance, until at a considerable distance from land and in comparatively deep water the terrigenous deposits pass insensibly into truly pelagic deposits. The terrigenous deep-sea deposits—i.e. those formed at depths greater than 100 fathoms—may be briefly summarised as follows:

Blue Mud, the most extensive, is grayish or bluish in colour, with usually a thin reddish upper layer, and is characterised by the presence of fragments of rocks and mineral particles coming from

the disintegration of the land, of which quartz is the principal species; the remains of marine organisms may be present in varying proportions, increasing with depth and distance from the land. Blue mud is found along the coasts of continents and continental islands, and in all enclosed and partially enclosed seas; in some places, as in the Yellow Sea, but notably off the coast of Brazil, the mud may be of a red colour from the large amount of ferruginous matters brought down by the rivers, and it is then called Red Mud. Blue mud is estimated to cover about 14,500,000 sq. m. of the earth's surface. Red mud covers about 100,000 sq. m. off the coast of Brazil.

Green Mud and Sand are similar to the blue muds, but are characterised by the presence of the mineral glauconite in isolated grains, or in small concretions; the dead shells of calcareous organisms are usually filled with the glauconite, which gives the green colour to the deposits. The sands occur in the shallower water nearer the coast, and in them the grains are larger than in the muds. These deposits are found usually off high and bold coasts where no very large rivers enter the sea; for instance, off the east coast of Australia, off South Africa, and off the west coast of North America. Green mud and sand cover about 1,000,000 sq. m.

Volcanic Mud and Sand are deposited around the oceanic islands of volcanic origin, and the name is derived from the presence of fragments and particles of volcanic rocks and minerals, which are larger and more numerous nearer the islands, when the deposit is called a sand, becoming smaller and mixed with a larger percentage of pelagic organic remains in the deeper water farther removed from the coast, when the deposit is called a mud. Volcanic mud and sand cover about 750,000 sq. m.

Coral Mud and Sand occur similarly around the oceanic coral islands and off those coasts and islands fringed by coral-reefs, and are characterised by the greater or less abundance of coral fragments from the reefs. The sands are found in the shallower water nearer the reefs, as in the case of the volcanic sands. Coral mud and sand cover about 2,700,000 sq. m.

Of pelagic deposits there are five types, four of organic origin, receiving their designations from the distinctive presence of the remains of calcareous or siliceous organisms, the fifth and most extensive being of inorganic origin.

Globigerina Ooze is so called from the presence of the dead shells of pelagic Foraminifera, those belonging to the genus *Globigerina* predominating, which live in the surface and sub-surface waters of the ocean, being especially abundant in tropical regions, and the shells of which after death fall to the bottom and there accumulate in moderate depths. The percentage of carbonate of lime in the deposit due to these shells and other calcareous fragments varies from 30 to over 90, and there is usually an admixture of minute mineral particles and remains of siliceous organisms. The depth at which *Globigerina* ooze is found varies from less than 500 to over 2500 fathoms, the average depth being about 2000 fathoms; but there is a marked difference between a sample collected in comparatively shallow water near land and one from deep water towards the central regions of the ocean basins, the point of union being the presence of a considerable proportion of carbonate of lime shells. *Globigerina* ooze covers about 49,520,000 sq. m.

One of the facts brought out by oceanographical researches is the gradual disappearance of these calcareous shells from the deposits of the deep sea with increasing depth in regions where they may appear to be equally abundant at the surface. In depths of over 3000 fathoms these shells are rare, and often there is not a trace of carbonate of lime even

in lesser depths, the *Globigerina* ooze being then replaced by one of the other kinds of pelagic deposits.

Pteropod Ooze resembles *Globigerina* ooze in all respects, except that there is a greater abundance of the dead shells of pelagic Mollusca, such as Pteropods and Heteropods; it is usually found in lesser depths than the *Globigerina* ooze. Pteropod ooze covers about 400,000 sq. m., principally in the Atlantic.

The names applied to these oozes are not intended to convey the idea that they are wholly made up of the organisms indicated by the names, or that these organisms form a preponderating proportion, for no deep-sea deposit can be said to be strictly homogeneous. Neither is there a sharp dividing line between the various kinds of deposits; they merge insensibly the one into the other. Often it is difficult to locate a sample, one or other of the names being equally applicable.

Diatom Ooze is distinguished by the presence of numerous remains of siliceous organisms, principally Diatoms, though fragments of siliceous Sponges spicules and Radiolaria and Foraminifera are rarely absent. It is found in the Antarctic and Southern Oceans, with a small area in the north Pacific. Diatom ooze covers about 10,880,000 sq. m.

Radiolarian Ooze in like manner contains a varying proportion of siliceous remains, in this case principally Radiolaria and their fragments. Calcareous organisms and mineral particles are nearly always present in both these oozes, being usually more numerous and the mineral particles larger in the Diatom ooze than in the Radiolarian ooze, which latter generally occurs in greater depths than the former. The *Challenger's* deepest sounding, already mentioned, brought up a typical Radiolarian ooze, and it is found in the deeper water of the central Pacific and Indian Oceans. Radiolarian ooze covers about 2,290,000 sq. m.

Red Clay occupies nearly the whole of the deeper abysses of the ocean, occurring in its most characteristic form in the central regions of the Pacific, far removed from continental land. It is of a reddish or chocolate colour, due to the presence of the oxides of manganese and iron. Fragments of calcareous organisms are sometimes tolerably abundant in the shallower depths, but in a typical red clay there is usually not more than a trace of carbonate of lime. Siliceous remains are generally present, and there is a small proportion of minute mineral particles of volcanic origin, principally derived from disintegrated pumice. Mineral particles of secondary origin, arising from the decomposition of volcanic debris, are associated with the red clay, and in some regions of the central Pacific isolated crystals and spheroidal groups of phillipsite of secondary origin formed *in situ* make up a considerable quantity of the deposit. Concretions of manganese and iron are very characteristic of the red clays, and may be of all sizes, sometimes a large quantity of the size of marbles, and sometimes the size of potatoes, being procured. These concretions are formed around various nuclei, such as sharks' teeth, carbones of whales, and pieces of pumice. The *Challenger* sometimes procured over one thousand sharks' teeth and sixty carbones of whales in a single haul. The presence of the remains of vertebrates, some of them belonging to extinct species lying alongside others belonging to existing species, as well as the formation of manganese nodules and zeolitic crystals *in situ*, and the presence of metallic and chondritic spherules of cosmic origin, appear to indicate that the red clay accumulates at a very slow rate. Red clay covers about 51,500,000 sq. m. Prof. Joly found that deep-sea deposits are much richer in radioactive substances than terrestrial rocks. Red clay and Radiolarian ooze laid down in deep water far

from land containing more than the calcareous oozes and terrigenous deposits.

It is shown now that no geological formations are known that are similar in nature to the oozes lying on the deep ocean beds. The inference is that no alysinal ocean bed has ever been elevated to form dry land. On the other hand, there is evidence that continental land has been submerged and has become alysinal ocean bed.

See the articles in this work on the Arctic, Antarctic, Atlantic, Pacific, and Indian Oceans; those on the Red Sea, Dead Sea, &c.; also CHALLENGER, CORAL, GEOGRAPHY, GEOLOGY, GULF STREAM, PHOSPHORESCENCE, PLANKTON, POLAR EXPLORATION, SAND, SEAWEEDS, SOUNDING, STORMS, TIDE, UPHEAVAL AND SUBSIDENCE, WAVE, WINDS, WRECK.

THE SOVEREIGNTY OF THE SEA.—Blackstone lays it down that the main or high seas are part of the realm of England, as the Courts of Admiralty have jurisdiction there. But the law of nations, as now understood, recognises no dominion in any one nation over the high seas, which are the highway of all nations, and governed by the public law of the civilised world. Such a right has, however, long been claimed over the four seas surrounding the British Isles. It was strongly asserted by Selden, and denied by Grocius, and measures were taken to vindicate the right in the reign of Charles I. The Dutch claimed the supremacy of the seas in Cromwell's time, but were worsted by Blake (q.v.). Every nation has undoubtedly a right to the exclusive dominion of the sea within a certain distance from the shore, now fixed at three miles. This right of lordship includes the right to free navigation, to fishing, to taking wrecks, the forbidding passage to enemies, the right of flag, of jurisdiction, &c. By the law of England the main sea begins at low-water mark; and between low and high-water mark the common law and admiralty have a divided jurisdiction, one on land when left dry, the other on the water when it is full sea. The right of seal-fishing in the Behring Sea was the subject of lengthened diplomatic controversy and arbitration between the United States and Great Britain (see SEAL). For inshore fishery regulations, see FISHERIES. See further INTERNATIONAL LAW, BLOCKADE, ENEMY, NEUTRALITY, SEASHORE; also RULE OF THE ROAD.

Sea Anemone. See ANEMONE. In like manner for Sea-beam, Sea-otter, &c., see BEAM, OTTER, &c.

Sea-bass, a name applied to some perch-like marine fishes—e.g. *Cynoscion nobilis*, an important food-fish on the western coasts of North America; *Pogonias chromis*, abundant off the coasts of Carolina, Florida, and the Gulf of Mexico; *Centropomus fulvus* and *atricrus*, along the eastern coasts of North America.

Sea-bat (*Platax*), a genus of Teleostean fishes allied to the Pilot-fish, and included among the Carangidae or horse-mackerels. The name refers to the very long dorsal, anal, and ventral fins.

Sea-beaches. See BEACHES.

Sea-bear. See SEAL.

Sea-birds' Preservation. See WILDBIRDS.

Sea-blubber. See JELLY-FISH.

Sea-Buckthorn, or SALLOW-THORN (*Hippophae*), a genus of the family Ehamnaceae, consisting of large shrubs or trees with gray silky foliage and entire leaves. They have dioecious flowers; the perianth is tubular, becomes succulent, encloses an achenium, and forms an acid fruit. *H. rhamnoidea* is a large thorny shrub or low tree, a native of parts of the sunny seacoasts of England and the continent of Europe, ranging as far as the Altai Mountains. It is sometimes used for hedges near

the sea, growing luxuriantly where few shrubs will succeed. The berries are orange-coloured, and are

Sea-Buckthorn (*Hippophaë rhamnoides*):

a, branch of the female plant, in fruit; b, branch of male plant, in flower.

gratefully acid. They are used for making fish-sauce, jellies, and condiments in some places.

Seabury, SAMUEL, the first Bishop of Connecticut, was born in that state, at Groton, 30th November 1729, graduated at Yale in 1748, studied medicine for a year at Edinburgh, and received doctor's and priest's orders in England in 1753. For some time he was a missionary of the S. P. G.; in 1757 he was promoted to the 'living' of Jamaica, Long Island, and ten years later to that of Westchester, New York. The Whigs, however, prevented his ministering, and once imprisoned him for six weeks at New Haven. He then removed to New York, where he made his medical knowledge contribute to his support, acted as chaplain of the King's American Regiment, and wrote a series of pamphlets which earned for him the special hostility of the patriots. In 1777 Oxford made him D.D. On 25th March 1783 the clergy of Connecticut met at Woodbury and elected Seabury bishop; and for sixteen months he waited vainly in London for consecration, the archbishops, though personally favourable, being timid and indisposed to move without the sanction of the civil authority. On 14th November 1784 he was consecrated in the upper room of a house at Aberdeen by Bishops Robert Kilgour, Arthur Petrie, and John Skinner, of the Scottish Episcopal Church, whose connection with the state had been severed nearly a century before. Bishop Seabury's jurisdiction embraced (by consent) Rhode Island as well as Connecticut, and he acted also as rector of St James's Church, New London. In 1792 he joined with three bishops of the English succession in consecrating a fifth, Bishop Claggett, through whom every American bishop derives from Seabury and the Scottish Episcopal Church. Seabury's further services included the securing to the episcopate of an increased share in the government of the church, and the restoring of the oblation and invocation to the Communion Office (from the Scottish Office). He died 25th February 1796. See his *Life and Correspondence*, by Dr E. E. Beardsley (Boston, 1881; Lond.

1884); and W. J. Seabury's *Memoir of Bishop Seabury* (1909).

Sea-cat is a name for the Wolf-fish (q.v.) and the Chinnera (q.v.), as *Sea-cow* is for the Manatee (q.v.) and *Rhytina* (q.v.). 'Sea Cucumbers' are Holothurians (q.v.); the *Sea-eagle* is the Osprey (q.v.); and see *EA-LE*; the *Sea-elephant* is better called the Elephant-seal (q.v.); and the *Sea-fan* is a *Gorgonia* (q.v.).

Seaford, a small and ancient watering-place on the Sussex coast, 3 miles E. of Newhaven by rail. It was a dependency of the Cinque Port of Hastings in the 15th century; and when it was disfranchised in 1832, had long been notorious for electoral corruption. Of late it has grown in size and prosperity. Pop. 7000.

Seaforth, LOCH, an arm of the sea, 14 miles long, on the east side of the island of Lewis-with-Harris (q.v.) in the Hebrides, which long gave the title of Earl (attained in 1716) to the family of Mackenzie.

Sea-fox. See FOX-SHARK.

Sea-grape (*Ephedra*), a genus of shrubby plants of the Gnetaceæ. They are much-branched switch plants of warm temperate regions, with opposite connate leaves reduced to scales, the stems performing the functions of leaves. The most notable is *E. distachya*, a small shrub inhabiting the Mediterranean coasts, with some remarkable inland stations, and penetrating into Asia. It is believed by some to be the *Soma* (q.v.) plant. Its sweetish mucilaginous berries, in some pharmacopœias called *Ucer maritima*, are eaten by the Russian peasants. In medicine they are regarded as astringent, as are the young tops of the shoots. The family Gnetaceæ, sometimes rather unhappily named Joint-firs, forms by itself an order of Gymnosperms, showing affinities to Angiosperms. The Gnetaceæ are characterised by the occurrence of a perianth in the usually dioecious flowers, the absence of resin and resin ducts, and the presence of vessels in the secondary wood. Otherwise the three genera have little in common. *Welwitschia* is separately treated. Gnetum consists of climbing (or sometimes erect) tropical shrubs and small trees, with leathery evergreen opposite leaves resembling those of dicotyledons. The type plant *Gnetum Guianen* is a dioecious tree of Papua, the Solomon Islands, and the Malay Archipelago. The fruits and young leaves are eaten; the bast serves for nets. The tropical American *G. urenis* has stinging hairs.—The name of sea-grapes is also given to the grape-like clusters of eggs laid by Sepia and some other cuttle-fish. See also SEASIDE-GRAPE.

Sea-grass, a name for Grasswack (q.v.).

Seagull. See GULL.

Seaham Harbour, a seaport in the county of Durham, 6 miles S. of Sunderland. Founded in 1828 by the Marquis of Londonderry, it communicates by railway with neighbouring collieries, and has ample docks and quays, besides blast furnaces, an iron-foundry, and chemical works. Pop. (1851) 3538; (1891) 8856; (1921) 16,957.

Sea-hares are unidbranch Gasteropoda (q.v.). 'Sea-hedgehog' is a Globe-fish (q.v.). The 'Sea-hog' is the Porpoise (q.v.), and 'Sea-horse' is used both of the Hippocampus and of the Walrus.

Sea-holly. See ERYNGO.

Sea Islands, an archipelago of low sandy or marshy islands on the south-east shores of the United States, along the South Carolina coast from Savannah to Charleston, on which—as also on part of the mainland coast strip of Georgia and Florida—rice and the famous long-stapled 'Sea Island' cotton are grown (see COTTON).

Sea-kale (*Crambe maritima*; see CRAMBE), a seashore plant with large roundish leaves, whose blanched sprouts are a favourite esculent. In winter it is forced in dark sheds or pits heated with

Sea-kale
(*Crambe maritima*).

fermenting manure or leaves, or with hot water in pipes. The plants to be treated thus are reared annually from cuttings of the roots or from seed; the latter is sown in March in rows 18 inches asunder, the seed being dropped, three or four together, at 15 inches apart, the seedlings to be thinned to one at each point. The cuttings are dibbled into the ground at the same distances apart, and by liberal cultivation they are quite strong enough to be forced the following winter. Of course the roots are lifted when to be forced in this way, and are thrown away afterwards. When they are to be blanched in the position in which they grow the rows are planted at 3 feet by 2 feet apart, the plants are covered with pots or boxes, which are also covered with leaves, tan, spent hops, or mildly fermenting manure. Plantations treated

in this way last for several years. Darkness is essential to the proper blanching of the sprouts.

Seal (Lat. *sigillum*, Fr. *sceau*), an impression on wax or other soft substance made from a die or matrix of metal, a gem, or some other material.

The stamp which yields the impression is sometimes itself called the seal. In Egypt, Mesopotamia, and India seals are of very high antiquity (see GEM, RING). Devices of a variety of sorts were in use at Rome, both by the earlier emperors and private individuals. The emperors, after the time of Constantine, introduced *bullae* or leaden seals, and their use was continued after the fall of the western empire by the popes, who attached them to documents by cords or bands. On the earlier papal seals are monograms of the pope; afterwards the great seal contained the name of the pope in full and a cross between the heads of St Peter and St Paul, while the Papal privy seal, impressed not on lead but on wax, known as the *Seal of the Fisherman*, represents St Peter fishing. In the 9th and 10th centuries we find Charlemagne, the Byzantine emperors, and the Venetian doges occasionally sealing with gold, and we have an instance as late as the 16th century of a gold seal appended to the treaty of the Field of the Cloth of Gold, between Henry VIII. and Francis I.

The most complete series of royal seals is that of the kings of France, beginning with the Merovingian dynasty. Seals were not much used in England in Anglo-Saxon times, but they came into general use after the Norman Conquest. The earliest regular great seal is that of Edward the Confessor, modelled on the contemporary French

Great Seal of William the Conqueror.

pattern. On the royal great seals was the king in armour on a caparisoned horse galloping, his arms being shown on his shield after the period when arms came into use; and the reverse represented the king seated on a throne. The great seals of Scotland begin with Duncan II. in the end of the 11th century, and have also for subject the king on horseback; the counterscal, with the seated figure, being used first by Alexander I., and the earliest appearance of the arms of Scotland being on the seal of Alexander II. In both countries there were also the privy-seals with the royal arms only.

Ecclesiastical seals first appear in the 9th century, and attained great beauty in the 13th and 14th. They are of the pointed oval form known as *l'esica piscis*, and have for subjects a figure of the bishop, sometimes of the Trinity, the Virgin, or a

putation saint, seated under an elaborate architectural canopy. The arms of the bishop are often added.

Under the Norman monarchs of England sealing became a legal formality necessary to the authentication of a deed; and from the 13th century onwards the seals of all persons of noble or gentle birth represented their armorial ensigns. The seal was generally appended to the document by passing a strip of parchment or a cord through a slit in its lower edge; and the ends being held together, the wax was pressed or moulded round them a short distance from the extremity, and the matrix impressed on it. Occasionally the seal was not pendant, but the wax was spread on the deed. The coloured wax with the impression was sometimes imbedded in a mass of white wax forming a protective border to it. In England a seal is still an

essential to all legal instruments by which real estate is conveyed; but since subscription has also become necessary the practice of sealing has degenerated into a mere formality. The custom was gradually introduced of covering the wax with white paper, on which the impression was made, and hutterly wafers have been considered a sufficient substitute for seals. In Scotland, where sealing is not now required (see *DEED*), every freeholder was obliged by statutes of Robert III. and James I. to have his seal of arms; and among the Scottish armorial seals of the 14th and 15th centuries are some of wonderful beauty of execution. In most of the states of the American union neither wax, wafer, nor anything corresponding to a seal is required for deeds.

The use of corporate seals by towns and boroughs dates us far back as the 12th century. The earlier corporate seals bear the town gates, city walls, or some similar device; the use of corporate arms did not begin till the later half of the 14th century. The study of mediæval seals is of great importance and interest in connection with many branches of archæology, including heraldic and genealogical investigations. Seals are still customarily appended to various kinds of formal and official documents, ecclesiastical, academic, masonic, &c.

The *Great Seal*, the specific emblem of sovereignty, is appended only to the most important class of public documents, such as writs for summoning parliament, treaties, and official acts of state. A new one is made for each new sovereign (or on occasion of a change of arms or style), the old one being solemnly broken. The original custodian of the English seal was the Lord Chancellor (q.v.), but by-and-by the seal was frequently put into the charge of a special official called the Lord Keeper (q.v.). Since 1757 the Chancellor is the only keeper of the Great Seal; though the seal may be put into Commission, and entrusted for the time to Lords Commissioners. It was long a rule that the Great Seal should not be used for any document without prior authority under the Privy-seal (see below). When in 1642 the Lord Keeper (Littleton) joined Charles I. at York, he carried the Great Seal with him; whereupon the parliament (illegally, no doubt) ordered a new one to be made. Charles II. had one made for himself after his father's death. James II. on his flight threw the Great Seal into the Thames opposite Lambeth, but it was soon recovered. At the union with Scotland it was provided there should be only one Great Seal for Great Britain; but a seal is provided to be used in Scotland for grants concerning offices, commissions, and private rights in that kingdom only. This seal is commonly called, for brevity, the Great Seal of Scotland, and is now held *ex officio* by the Secretary of State for Scotland. No special provision was made after the union with Ireland.

The *Privy-seal* is the seal appended to grants which are afterwards to pass the Great Seal, and to documents of minor importance which do not require the Great Seal. The officer who has the custody of the Privy-seal was at one time called the Keeper, and afterwards the Lord Privy-seal. The Lord Privy-seal is now the fifth great officer of state, and has generally a seat in the cabinet. His office is conferred under the Great Seal during pleasure. Since the reign of Henry VIII. the Privy-seal has been the warrant of the legality of grants from the crown, and the authority for the Lord Chancellor to affix the Great Seal. Such grants are styled letters-patent, and the office of the Lord Privy-seal is one of the departments through which they must pass to secure their validity. Until recently all letters-patent for the grant of appointments to office under the crown,

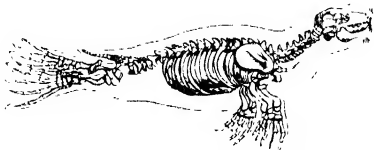

of patents of invention, charters, naturalisations, pensions; creation of honours, pardons, &c. required to pass from the Signet Office to the Privy-seal Office, in the form of Signet bills, verified by the Signet Seal and superscription; and on the Privy-seal being attached to them they were forwarded to the Lord Chancellor, by whom the patents were completed in the office of the Great Seal. By the Act 47 and 48 Vict. chap. 30, it is now unnecessary for any instrument to be passed under the Privy-seal, a warrant under the royal sign-manna duly countersigned being sufficient authority for passing any instrument under the Great Seal. There is a Privy-seal in Scotland, which is used to authenticate royal grants of personal or assignable rights. Rights such as a subject would transmit by assignment are transmitted by the sovereign under the Privy-seal. The Quarter Seal, known also as the Testimonial of the Great Seal, pertains to the Director of Chancery; the Signet is mainly used in initiating proceedings in the Supreme Court; and there are various Seals of Court.

See also *BULL, GEM, KING, DEED*; Wyon, *Great Seals of England* (1888); Breh, *Scottish Seals* (1905-7); Bloom, *English Seals* (1906); Armstrong, *Irish Seal-matrices* (1913); and books (in Ger.) by Ewald (1914) and (in Eng.) by Kingsford (1920).

Seal, the name commonly applied to all the Pinnipedia except the Morse or Walrus (q.v.). The Pinnipedia have many of the essential characters of the Carnivora (dogs, cats, lions, bears, &c.), in which order they are, therefore, classified. They may accordingly be described as carnivorous mammals adapted to a marine existence. They are not, however, so completely marine as the Cetacea, but pass part of their lives and perform certain functions—viz. the reproductive—on shores or on ice-fields. The structural peculiarities of the Pinnipedia are the following: The brain-case is smooth and rounded, the face small and short. The supraorbital processes are largely developed. The external ear is wanting altogether or very small. The skin is well covered with hair, which takes the form of fur in some species. The limbs are modified to form paddles for swimming, but still are capable of use in climbing out of the water and moving somewhat clumsily on land. The upper divisions of the limbs are shorter than the lower, and do not project beyond the skin of the body. There are five toes on each limb, and all are united together by strong webs extending to the extremities. The inner toe of the fore-foot is largest, the rest gradually decreasing, while in the hind-foot the inner and outer toes are both very long, and the intermediate ones somewhat shorter. The nails are straight, and may be reduced in number or wanting. The incisor teeth are pointed, and vary in number in the different genera. The molars and premolars are similar, and have not more than two fangs. There is a short, small tail, which is united beyond its middle to the hind-legs by the skin. The toes, particularly those of the hind-feet, are capable of being spread out very widely in swimming, so as to give great propulsive power.

The movements of seals in the water are very rapid and graceful; on land they are very peculiar, even the fore-feet in the Phocidæ being little used, but the body contracted by an upward bending of the spine, and so thrown forward by a succession of jerks; in which way, however, a seal makes its escape very rapidly from an assailant. The flexibility of the spine in seals is very remarkable, and depends on the very large intervertebral cartilages, formed of fibrous concentric rings. The muscles, which are connected with the spine on all sides, are of great strength. Seals have a remarkable

habit of swallowing large stones, for which no probable reason has yet been conjectured. Their stomachs are very often found to be in part filled with stones. The stomach is quite simple; the

Skeleton of Seal, with outline of the figure.

gullet (*oesophagus*) enters it at the left extremity; the cæcum is short, the intestinal canal long.

The respiration of seals is extremely slow, about two minutes intervening between one breath and another, when the animal is on land and in full activity. A seal has been known to remain twenty-five minutes under water. Their slowness of respiration, and power of suspending it for a considerable time, is of great use, as enabling them to pursue their prey under water. The fur of seals is very smooth, and abundantly lubricated with an oily secretion. There is in some species an inner coating of rich fur, through which grow long hairs, forming an outer covering. Another adaptation to aquatic life and cold climates appears in a layer of fat immediately under the skin—from which *Seal Oil* is obtained—serving not only for support when food is scarce, but for protection from cold, and at the same time rendering the whole body lighter. The nostrils are capable of being readily and completely closed, and are so whilst the seal is under water; and there is a similar provision for the ears; whilst the eye, which is large, exhibits remarkable peculiarities, supposed to be intended for its adaptation to use both in air and water. The face is provided with strong whiskers, connected at their base with large nerves. Seals produce their young only once a year; sometimes one, sometimes two, at a birth. Not long after their birth the young are conducted by the mother into the sea. Many of the species are polygamous. Terrible fights occur among the males.

Seals are very much on their guard against the approach of man where they have been much molested; but where they have been subjected to no molestation they are far from being shy, and approach very close to boats or to men on shore,

Common Seal (*P. vitulina*); attitude when swimming.

as if animated by curiosity. They are much affected by musical sounds. A flute is said to attract seals to a boat, where they have not learned caution from sore experience; and the ringing of the church bell at Hoy, in Orkney, has very often caused the appearance of numerous seals in the

little bay. Seals possess all the five senses in great perfection. The common seal and some of the other species are very intelligent; but there is considerable difference in this respect among the species. The common seal and some others have often been tamed, and are capable of living long in domestication if freely supplied with water. They become very familiar with those who attend to them, are very fond of caresses and of notice, recognise their name like dogs, and readily learn many little tricks, of which advantage has been taken for exhibitions.

Seals, excluding the walrus, are divided into the two families Phocidae, which have no external ears, and Otariidae, which possess distinct though small representatives of these organs. The Otariidae are, however, considered by modern specialists to be more closely related to the Walrus (*Trichechide*) than to the Phocidae, notwithstanding the great trunks and peculiar dentition of the former. The Otariidae, like the walrus, are capable of standing on all four legs, the hind-limbs being turned forward in walking on land, while in the Phocidae the hind-limbs are trailed behind both on shore and in the water, and cannot be used to support the body when the animal is on land. The Earless Seals are supposed to be monogamous, and, excepting the Sea elephant (or ELEPHANT-SEAL), exhibit little difference in size between the sexes. They bring forth their young on shore or on ice-floes, but do not resort to special breeding-places nor remain for any length of time out of the water. The Eared Seals (the Otariidae), on the other hand, are polygamous, and resort with invariable regularity to particular breeding-grounds, where they remain for months till the calves are able to travel; then they all depart and become pelagic for the rest of the year. The males are much larger than the females. The Common Seal (*Phoca* or *Callorhynchus vitulina*) occurs on British coasts, and extends southward to the Mediterranean. It is common on the north-western shores of Europe and eastward along the arctic shores. It is very common in Greenland and on the arctic shores of North America, its southern limit on the western side of the Atlantic being New Jersey. On the east side of the Pacific it extends from southern California to Behring Strait, and probably occurs also on the western shores of the North Pacific. This species is always found on shores and not on ice-floes. It is hunted in Newfoundland and Greenland for its skins, which are much valued, though the covering is hair, not fur, and for its oil and flesh; but its numbers are not very great. The Harp-seal (*P. granlandica*), so called from a crescent-shaped

Harp-seal (*Phoca granlandica*).

dark stripe on each side of the back in the adult, ranges through the arctic regions of the Atlantic, and is said to occur also in the North Pacific, in Kamchatka. It is very abundant in Newfoundland and Greenland, and numerous on the arctic coasts

of Europe—e.g. Finnmark, Spitsbergen, and Novaya Zemlya. This species is very gregarious, and breeds on ice-floes in spring. Enormous numbers are killed for the sake of their oil and skins. The Harp-seal has been taken on British coasts. It grows to 8 or 9 feet in length, but its ordinary length is about 6 feet. The Bearded Seal (*Phoca barbata*) is another species of the North Atlantic which occurs on British coasts; it reaches 9 or 10 feet in length. The Ringed Seal (*P. hispida*) also occurs as a straggler on British shores but normally lives on the arctic shores of both hemispheres. It is not of great commercial value, but is highly prized by the Greenlanders and Eskimos, who depend largely on its skin, oil, and flesh. It is a small species. Seals occur in large numbers in the Caspian and Aral Seas, where they are regularly hunted by the Cossacks. The species of this region is distinguished under the name *P. caspica*. Another species, *P. siberica*, occurs in Lake Baikal, which consists of perfectly fresh water, and is situated at a great elevation above sea level. *Halicherus grypus*, the Gray Seal, is confined to the coasts of Europe, occurring on the shores of Scandinavia, Ireland, and Scotland; it reaches a length of 8 feet. In Denmark, after about 1890, an effort was made to exterminate the seals, in the interests of the fisheries, and a

Sea lion (*Otaria stelleri*).

(From a Photograph by Gannier Bolton, F.Z.S.)

reward of three kroner per head paid for all killed (810 in the first ten months).

The distribution of the Phocidae extends to the tropics. *Monachus albenter*, called the Monk Seal, inhabits the shores of the Mediterranean, and of Africa as far south as Madeira. Another species of the same genus, *M. tropicalis*, exists in the West Indies, where it was formerly abundant, though now rare. *Cystophora cristata*, the Crested or Hooded Seal, has a remarkable dorsal dilatation of the nose, which can be inflated with air or depressed as the animal pleases; when distended, it extends backwards towards the top of the head. This species has the same geographical range as the Greenland or Harp Seal, but is not so numerous or so highly valued. Allied to the Crested Seal is the great Sea-elephant, which owes its name to its size and to the elongation of its nose, which forms a short curved proboscis. The males of this species reach a length of 20 feet, while the females never much exceed 10 feet. The Sea-elephant or Elephant-seal (q.v.; *Macrorhinus leonina*) lives on the antarctic islands and ice-fields, and is hunted for its blubber and skin. Another species of Sea-elephant (*M. angustirostris*) occurs in the northern hemisphere, having been formerly abundant on the

coasts of California and western Mexico; it is now scarce. Other species of Phocidae in the antarctic regions called Sea-leopards, are *Stenorhynchus leptonyx* and *Leptonyx weddellii*.

The second family of Pinnipedia, the Otariidae, are frequently distinguished as Sea-lions and Sea-bears, names corresponding to differences in their hairy covering; the former carry only long coarse hair, while the latter have in addition a short and soft, delicate fur, beyond which the coarse hairs project. It is this fur which, under the name of seal-skin, is so highly valued in commerce. Sea-lions are sometimes distinguished as hair-seals, and Sea-bears as fur-seals; but the name hair-seals would apply equally well to all the Phocidae also.

The Otariidae are about equally represented in the arctic and antarctic regions. By Dr J. E. Gray a large number of genera were distinguished, but recent students of the species unite them under one or two genera. The Sea-lions are as follows: *Eumetopias* (*Otaria*) *stelleri*, the Northern Sea-lion, inhabits both shores of the Northern Pacific from California and Japan northwards, and breeds on the Aleutian and other islands in the Behring Sea. The male is about 16 to 18 feet in length, and the female about half that size. *Otaria jubata*, the southern Sea-lion, inhabits the west coast of South America, the islands in the neighbourhood of Cape Horn, and the Falkland Islands. *Zalophus gilgissii*, the Californian Sea-lion, is considerably smaller than *E. stelleri*.

Of the Fur-seals there are two genera, one belonging to the northern hemisphere, *Callorhinus*, the other to the southern, *Arctocephalus*. Of the former there is but one species, the celebrated northern Fur-seal, *Callorhinus ursinus*, which during 1885-92 became the subject of such complicated diplomatic controversy between the United States, the British Empire, and European nations. This seal is entirely confined to the North Pacific, no fur-seal existing in the North Atlantic. The habits of the northern fur-seal were first thoroughly investigated by H. W. Elliott, an American naturalist. This species (with three sub-species) breeds annually on two of the Pribylov Islands in the Behring Sea, and on two of the Commander Islands further west, and on Robben Island south of Sakhalin. The seals arrive on these islands in June and July, the males in the former month, the females in the latter, and they leave them with their young about the middle of September, not returning till the following year. During the breeding time they remain on the low-lying land bordering the sea. In 1870, after the transfer of Alaska from Russia to the United States, the Pribylov Islands were leased by the United States government to the Alaska Commercial Company for twenty years, and this company also rented the Commander Islands from Russia. The company were allowed to take not more than 100,000 seals from the Pribylov Islands per annum, and the seals killed were exclusively young males, not breeding males or any females. The company paid to the government \$50,000 per annum as rent, and in addition a tax of \$2 on each skin shipped from the islands. The value of fur-seal skins shipped from the territory and sold in the London market during the first twenty-three years of American occupation is reported to have reached nearly \$33,000,000. In 1890 a new lease of the islands under similar conditions was granted to the North American Fur-sealing Company. In the earlier part of the year the vast herds of these seals, on their way to the breeding grounds, pass the coast of Washington and British Columbia, and were there hunted at sea in former times by the Indians. But British, American, and Japanese hunters killed very large numbers there and in Behring

Sea; and the attempt of the United States government to assume exclusive rights over the Behring Sea gave rise to diplomatic controversy. Meanwhile, after 1880, the killing of the seals in the ocean developed to such an extent that it was feared the careful regulation of the slaughter on the breeding islands would not be sufficient to prevent the extermination of the species. Between 1882, when systematic pelagic sealing began, and 1910 the available numbers were calculated to have been reduced from 2,000,000 to 185,000. A settlement arrived at in 1893 between the countries concerned somewhat restricted pelagic seal-taking. And the Pelagic Sealing Conference between Britain and Canada, Russia, the United States, and Japan resulted in 1911 in an arrangement by which pelagic sealing was prohibited, Canada and Japan each receiving 15 per cent. of the skins killed on the Russian and United States rookeries on shore. It was hoped thus to restore the balance between the sexes, and prevent the fighting that goes on between the males for the possession of the females. Pelagic sealing destroyed the females on their way to and from the feeding grounds, and the death of every female meant the death of two cubs, one on the rookery and one unborn. The males used to have from ten to a hundred females each, but the destructive methods of unregulated pelagic sealing have made the numbers of the sexes about equal.

Of the important Antarctic seals, *Arctocephalus nigrescens* may be said to belong to the South Pacific, though it extends also into the South Atlantic. At the beginning of the 19th century this species was abundant on nearly all the islands off the west coast of South America from Cape Horn to the equator, and was killed in large numbers at Juan Fernández, Más-a-Fuera, St. Felix, St. Ambrose Islands, and the Galápagos. It was also abundant at the South Shetlands, Falkland Islands, South Georgia, Sandwich Group, Kerguelen, and Heard Island. Fur-seals were also formerly abundant on islands off the west coast of Africa from the Cape of Good Hope northward. The seal in this region has been distinguished as a separate species under the name *Arctocephalus pusillus*. It is almost extinct at the present day. Fur-seals were also abundant formerly on Stewart's Island, Antipodes Island, and others to the south-east of New Zealand, but are now scarce. The skins of the fur-seal were at first imported into England for tanning, the wool and hair being scraped off together. It was in 1790 that Thomas Chapman invented a method for 'extracting by the root the whole of the inconceivable quantity of coarse hair that grows intermingled amongst the fur on the skin of the South Sea seal.'

Sealed Orders. In the Navy, are orders which are delivered to the commanding officer of a ship or squadron sealed up and only to be opened after the ship or squadron has put to sea, and proceeded to a certain locality previously designated. When it is considered necessary to despatch a ship or squadron on any secret service, in order to prevent the destination and the object of the expedition becoming known the commanding officer is sent to sea under sealed orders. These orders may be sent direct from the Admiralty, or may be given by any senior officer. The officer who has to act under them is generally directed to proceed a certain distance out to sea, or to a certain latitude and longitude, before he breaks the seal and acquaints himself with the orders in question; he himself equally with others under his command thus putting to sea in ignorance of his destination or the nature of the service to be performed.

Sea-lemon. See DORIS.

Sealing-wax. Before the composition of

ordinary sealing-wax was known in Europe coloured beeswax was used for sealing letters and for attaching the impressions of seals to documents. Sealing-wax with Lac (q.v.) as the principal ingredient was probably first made in India or China, since it is only in these and neighbouring countries that the lac insect is found. Beckmann states that the use of sealing-wax made of lac was apparently very common among the Portuguese about the middle of the 16th century. The best red sealing-wax consists of shellac from 5 to 6 parts, Venice turpentine 3 to 4 parts, vermilion 3 to 4 parts, to which is frequently added $1\frac{1}{2}$ part of magnesia, chalk, or gypsum, or a mixture of some of these. Inferior but still fairly good kinds have a considerably less amount of shellac and vermilion in their composition. Parcel-wax is made of shellac 3 parts, common resin 7 parts, turpentine $5\frac{1}{2}$ parts, chalk and gypsum together $3\frac{1}{2}$ parts, and either vermilion 3 parts, or red-lead 6 parts. Bottle-wax is often made of pine-resin, turpentine, chalk, and some colouring matter; but it is very brittle unless about 10 per cent. of shellac is added.

In making sealing-wax the shellac and other materials are carefully melted in metal pans, and quickly stirred to prevent heavy colouring matter such as vermilion from falling to the bottom. The melted sealing-wax is then poured into metal moulds to form it into sticks, which are removed when cold. By one method the sticks are polished by spreading them on a table and passing a red-hot bar of iron over them. Another way is to hold them into a stove, and in either case till the surface just begins to melt. Sealing-wax is made in various colours, the finer qualities, however, being most largely in red. White, used to be chiefly coloured by sublimates of bismuth, but a special kind of white-lead is now employed. Black is made by the addition of lampblack or vine-black to the other materials. For brown,umber is added; for blue, artificial ultramarine or Berlin blue; for green, Berlin blue and chrome-yellow; for yellow, either chrome-yellow (which will not stand a high heat) or ochre. For common wax some cheaper colouring materials are used, such as baryta for a white. Aniline colours have been tried with some promise of success.

Sea lion. See SEAL.

Seal Island. a name for Lobos Islands (q.v.).

Sealkote. See STALKOT.

Seaman. SIR OWEN, poet and parodist, was born in 1861, and was educated at Shrewsbury and Clare College, Cambridge. He taught at Rossall, was professor of Literature (1890) at the College of Science, Newcastle-on-Tyne, began writing for *Punch* in 1894, joined the staff in 1897, became editor in 1906, and was knighted in 1914. Collections of brilliant parodies, *Horace at Cambridge* (1894), *Tillers of the Land* (1895), *In Cup and Bells* (1899), *Salvage* (1908), &c., rank him as a worthy successor to Calverley, while *Made in England* (1916) and *From the Home Front* (1918) comprise some stirring verses written during the Great War.

Sea-margins. See BEACHES.

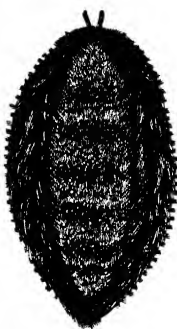

Sea-mat (*Flustra*), a very common genus of Polyzoa (q.v.), various species of which are among the commonest objects in the wreck of the sea-shore. The colonies are somewhat seaweed-like, but all over the flat leaf-like growth may be seen the minute chambers in which the individuals lived. The texture is horny, whence another common name—hornwreck. Those found on shore are usually dead, having been torn from their natural moorings on rocks, seaweed, shells, and the like. Fresh specimens have a characteristic musky odour.

Seamen are technically those persons, below the rank of officer, who are employed in navigating decked vessels on the high seas. See CRIMP, DESERTION, NAVY.

Sea-mew. See GULL.

Sea-milkwort. See GLAUX.

Sea-mouse (*Aphrodite*), a genus of Chaetopod worms, well represented by *A. aculeata*, the common British species. This worm has a compact oval body, 4 to 6 inches in length by 1 to 2 in breadth, and is thickly covered with silky hairs, whose structure is such as to produce brilliant iridescence. Along the back these hairs form a matted feltwork, protecting a double row of flat plates, in part respiratory. The ventral appendages, by means of which the sea-mouse creeps along the floor of the sea, bear bundles of very strong bristles. The head bears tentacles and eyes. Internally the animal is remarkable on account of the very much branched character of the gut. The home of the sea-mouse is at the bottom of fairly deep water, but storms often throw them ashore.

Sea-mouse
(*Aphrodite aculeata*).

Sea-nettle. See ACALEPHÆ.

Sea-owl, a name for the Lumpsucker (q.v.)

Seapen, a name sometimes applied to Pennatula (q.v.), sometimes to the chitinous, quill-like structure which lies along the posterior surface of the squid and some related cuttle-fish.

Seapie. See OYSTER CATCHER.

Sea-pike (*Centroponus underwoodi*), an edible American fish, occurring on the Florida and Texas coasts. The genus includes several somewhat pike-like fishes, at home in the warm American seas, though often thriving in fresh water. In reality they are allied to the perches, not to the pikes. On British coasts the term sea-pike is sometimes applied to the garfish or gar-pike (Belone); and gar-pike is also a name for the American Lepidosteus.

Sea-pink. See THRIFT.

Sea-porcupine. See DIODON.

Search-warrant, an authority granted to an officer of police, empowering him to enter premises and to search for and seize property. In England such warrants seem to have been illegal at common law; they were first permitted by statute for seizing stolen goods in 1782. Under acts now in force a justice of the peace may grant warrants to search for stolen goods, false coin, forged bank-notes, &c.; he may give a warrant to search any place where there is reasonable cause to suspect that an explosive substance or machine is concealed for a felonious purpose; he may also give a warrant to search any place where there is reasonable cause to suspect that any child or young person is being ill-treated or neglected, or any place where a woman or girl is being unlawfully detained for immoral purposes.

The right of searching ships on the high seas indisputably belongs to belligerents (see ENEMY, CONTRABAND OF WAR, NEUTRALITY). The right claimed by England to search United States ships for British subjects on board, with a view to

impress them into the British naval service, was one of the causes of war in 1812; and the right of search for slaves on board suspected slave-traders was repeatedly a source of difficulty. The case of the *Trent* (see TRENT AFFAIR) in 1861 nearly led to war between Britain and the United States.

The proper officers have a right to search the persons of apprehended thieves, &c.; and custom-house officers are entitled to search for smuggled goods, not merely ships but all persons on board them or who land from them. But any person may insist, before being searched, on being taken before a magistrate or superior custom-house officer and raise the question whether there is reasonable suspicion that he has smuggled goods about him.

Sea-robin, a common American name for fishes of the genus *Prionotus*, which represents in America the European gunnards (*Trigla*).

Sea-scorpion. See FATHER-LASHER.

Sea-serpent, the name given to gigantic animals, presumably of serpentine form, which have been frequently described by sailors and others, and which are believed by many naturalists to exist in the sea-depths, especially in tropical oceans. The question of the existence of a sea-serpent has long formed one of the knotty problems of zoological science. But it seems reasonable to conclude that there exists a certain basis for the supposition that huge undescribed marine forms do exist in the sea-depths, and that the most reliable tales of sea-serpents take origin from appearances of such animals. Of such tales possessing a warrantable basis of fact, and emanating from authoritative sources, that of Captain M'Quhae is one of the best known. This account was published in 1848. Captain M'Quhae commanded H.M.S. *Dredalus*, and encountered the serpentine form in 24° 44' S. lat. and 9° 20' E. long., and therefore in the South Atlantic Ocean, near the Tropic of Capricorn, and not very far from the coast of Africa. It was not, as in other cases, in bright and fine weather, but in dark and cloudy weather, and with a long ocean swell. The animal was swimming rapidly, and with its head and neck above water. Captain M'Quhae in his report to the Admiralty describes it with confidence as 'an enormous serpent, with head and shoulders kept about 4 feet constantly above the surface of the sea'; and he adds: 'As nearly as we could approximate by comparing it with the length of what our maintop-sail-yard would show in the water, there was at the very least 60 feet of the animal *à fleur d'eau*, no portion of which was, to our perception, used in propelling it through the water, either by vortical or horizontal undulation. It passed rapidly, but so close under our lee-quarter that had it been a man of my acquaintance I should have easily recognised his features with the naked eye; and it did not, either in approaching the ship or after it had passed on wake, deviate in the slightest degree from its course to the south-west, which it held on at the pace of from 12 to 15 miles per hour, apparently on some determined purpose. The diameter of the serpent was about 15 or 16 inches behind the head, which was without any doubt that of a snake; and it was never during the twenty minutes that it continued in sight of our glasses once below the surface of the water; its colour a dark brown, with yellowish white about the throat. It had no fins, but something like the mane of a horse, or rather a bunch of seaweed, washed about its back.' Regret has been very naturally expressed that Captain M'Quhae did not bestow a shot on it. Figures prepared from a sketch by him were published in the *Illustrated London News* of 28th October 1848. About the

same time the testimony of another witness, Lieutenant Drummond, appeared, and was found to differ in some important points from the account of the animal given by Captain McQuhae and the figures published with his approbation, particularly in ascribing a more elongated form to the head, in the mention of a back-fin, whereas Captain McQuhae expressly says that no fins were seen, and in a lower estimate of the length of the portion of the animal visible. Lieutenant Drummond's words are: 'The appearance of its head, which with the back-fin was the only portion of the animal visible, was long, pointed, and flattened at the top, perhaps 10 feet in length; the upper jaw projecting considerably; the fin was perhaps 20 feet in the rear of the head, and visible occasionally; the captain also asserted that he saw the tail, or another fin about the same distance behind it; the upper part of the head and shoulders appeared of a dark-brown colour, and beneath the under jaw a brownish white. It pursued a steady and undeviating course, keeping its head horizontal with the water, and in rather a raised position, disappearing occasionally beneath a wave for a very brief interval, and not apparently for the purposes of respiration. It was going at the rate of perhaps from 12 to 14 miles an hour, and when nearest was perhaps 100 yards distant. In fact, it gave one quite the idea of a large snake or eel.' Lieutenant Drummond's account is the more worthy of regard, as it is derived from his log-book, and so gives the exact impressions of the hour, whilst Captain McQuhae's was written from memory after his arrival in England. Sir Richard Owen thought the animal was a gigantic seal; a supposition, however, which does not at all agree with the description given.

In 1875 a battle between a sea serpent and a whale was viewed from the deck of the *Pauline* of London, Captain Dievar, when proceeding with a cargo of coals from Shields to Zanzibar. When the *Pauline* reached the region of the trade-winds and equatorial currents she was carried out of her course, and after a severe storm found herself off Cape San Roque, where several sperm-whales were seen playing about her. While the crew were watching them they suddenly beheld a sight that filled every man on board with terror. Starting straight from the bosom of the deep, a gigantic serpent rose and wound itself twice in two mighty coils round the largest of the whales, which it proceeded to crush in gemine boa-constrictor fashion. In vain did the hapless whale struggle, hush the water into foam, and even bellow, for all its efforts were as nothing against the supernatural powers of its dreadful adversary; whose strength may be further imagined from the fact that the ribs of the ill-fated cetacean were distinctly heard cracking one after the other with a report like that of a small cannon.

Of no less a ship than H.M. yacht *Osborne* the captain and officers in June 1877 forwarded an official report to the Admiralty containing an account of a sea-serpent's appearance off the coast of Sicily on the 2d of that month. 'The time was five o'clock in the afternoon. The sea was exceptionally smooth, and the officers were provided with good telescopes. The monster had a smooth skin, devoid of scales, a bullet-shaped head, and a face like an alligator. It was of immense length, and along the back was a ridge of fins about fifteen feet in length and six feet apart. It moved slowly, and was seen by all the ship's officers.' This account was further supplemented by a sketch from the pencil of Lieutenant W. P. Hynes of the *Osborne*, who to the above description adds that the fins were of irregular height, and about 40 feet in extent; but, 'as we were passing through

the water at 10½ knots, I could only get a view of it "end on." It was about 15 or 20 feet broad at the shoulders, with flappers or fins that seemed to have a semi-revolving motion. 'From the top of the head to the part of the back where it became immersed I should consider about 50 feet, and that seemed about a third of the whole length. All this part was smooth, resembling a seal.' These instances are but examples of the many cases in which narratives of the most circumstantial character have been recorded regarding the appearance of serpentine animals, usually in tropical seas.

As will readily be admitted, the chief point at issue is that of the zoological determination of the forms reported to have been seen. Gigantic cuttle-fishes, now proved to have a veritable existence, might in many cases imitate an elongated marine form, swimming near the surface of the sea. It is by far the most plausible theory of sea-serpent existence to suppose that most of the animals described are really giant cuttle-fishes of the *Loligo* or squid type. These creatures may attain a length of 40 feet or more inclusive of their tentacles, and as they swim along the surface of the sea backwards the tail-fin might well be mistaken for a serpentine head and its fin or ridge, while the tentacles and wash produced by the animal's movements would impart an exaggerated length to the body. Even the incident already described in the case of the *Pauline* might be explicable on the theory that giant cuttle fishes attacked the whales, and that the so-called serpents were really the arms or tentacles of the squids. As regards the *Pauline* case, it may be remarked that the latitude in which the incident occurred was one most unlikely for any sea-snakes to be found. Certain fishes, too, such as the Basking Shrub (*Selache namata*), would also under certain circumstances appear as unusual marine forms; and, as Dr Andrew Wilson pointed out, the well known Tape-fishes (*Cymatichthys rupestris*) and other Ribbon-fishes would very accurately reproduce the features of a marine snake, especially when these fishes, as sometimes happens, have grown to an immense size. The marine snakes or Hydrophidæ of the Indian Ocean would also serve to personate the 'great unknown' if unusually large. It seems certain that in the immense development of ordinary marine animals may be found a probable clue to the sea-serpent mystery. P. H. Gosse entertained the notion that it might be possible to explain certain sea-serpent stories on the theory that some of the gigantic marine reptiles with whose fossils we are well acquainted might still be in existence in the sea depths, and occasionally make their appearance at the surface of the ocean. Cases of mere serpentine appearances assumed by certain animals are not to be confused with cases in which a single animal has presented a serpentine aspect. Flocks of the birds known as shags swimming close to the water's edge might personate a sea-serpent swimming along the top of the water; but a flock of birds would have been readily detected by Captain McQuhae, and by many other observers who have beheld the unknown form from a relatively near distance.

Apart altogether from these historical or semi-historical examples, the sea-serpent has had continuous existence in folklore everywhere, whether among the Eskimo, Fijians, Japanese, Icelanders, Basques, Red Indians, or Chinese. The notion is natural and easy of belief, and the human desire for wonders is sufficient to account for any belief.

See C. Gould, *Mythical Monsters* (1886); F. S. Bassett, *Legends and Superstitions of the Sea* (Chicago, 1886); J. Gibson, *Monsters of the Sea* (1886); an article in Dr Wilson's *Leisure-time Studies* (1884); and Oudemans, *The Great Sea-Serpent* (1893).

Seashore, or land bordering on the sea, belongs partly to the crown, and the public have certain rights in relation thereto. The soil or property in the foreshore (land between high and low water mark) is vested in the crown, and the limit on the land side is defined to be the medium line of high-water of all the tides in the course of the year, or the height of the medium tides in each quarter of a lunar revolution during the whole year. But though the crown is *prima facie* the owner of the seashore, the owner of the adjoining manor has sometimes a grant of it, and he may prove this grant by ancient use—such as gathering seaweed, &c. The public have a right to walk on that part of the shore vested in the crown, but they have no right to trespass on the adjacent lands in order to get at the shore, so that it is only where a highway leads to the shore, or the public land from seaward, that the right can be made available. Thus it has been decided that the public have no legal right to trespass on the adjoining lands in order to get to the shore for the purpose of bathing. The public have a right to fish on the seashore if they get legal access to it, and may take all floating fish, but not oysters or mussels which adhere to the rock, if the soil belongs to an individual. The public have no right to gather seaweed or shells, though, as regards the latter, it is of so little consequence that nobody prevents them. Nor have fishermen a right to go on that part of the seashore which is private property to dig sand for ballast, or to dry their nets, or similar purposes, though in a few cases local customs permitting a limited class of persons (e.g. the fishermen of a township) to exercise such rights have been held valid. In Scotland the right to the seashore is also vested in the crown; when a crown grant gives land bounded by the seashore, this is held to give to the grantee the foreshore also.

See BEACHES, DENUDATION, DERELICT, DRIFT, SAND, UPHEAVAL AND SUBSIDENCE.

Sea-sickness is a variety of vomiting deserving of special notice. It is often preceded by premonitory symptoms, which appear almost immediately after a susceptible person is exposed to the motion of rolling water in a vessel or boat, and are as distressing as the vomiting itself. Amongst these symptoms may be mentioned vertigo and headache, with a peculiar feeling of sinking and distress about the pit of the stomach. Vomiting, however, in general, soon comes on, accompanied with convulsive heaving of the stomach, and such an insupportable feeling of prostration as to render the patient utterly regardless of what is going on around him, and almost indifferent to life. Moreover, pallor and cold sweat are commonly present, with disturbance of the action of the bowels, usually constipation, but occasionally diarrhoea. The susceptibility to this troublesome affection varies extremely in different persons. Some never suffer from it, others only on their first voyage, and others, again, like Nelson, in every fresh voyage they take; with some it continues but a few hours, while others suffer almost continuously throughout a long voyage. In the great majority of cases the sickness disappears in a few days, unless the weather be very boisterous. It almost always ceases on landing, although more or less giddiness may prevail for some hours. Though a very distressing malady it is rarely serious, but sometimes is so severe and prolonged as to prove fatal. Infants and aged persons are supposed to possess a comparative immunity from sea-sickness, while as a general rule women suffer more than men. According to one writer on the subject, persons with a strong heart and a slow pulse suffer little from sea-sickness, while irritable people, with a quick pulse and a tendency to palpitation, are more

liable to be affected; and he thus accounts for different liability of different nations to this affection; 'for, as a rule, the French and Italians being of a more irritable temper suffer most from the disorder, the Germans less, and the English least.'

The primary cause (or rather condition) of sea-sickness is the motion of the ship; and the *pitching* of a vessel, or alternate rising and falling of the bow and stern, is especially apt to produce it. It is less felt in large and heavily ballasted vessels, because the movements referred to are least perceptible in them. Other more or less regularly repeated oscillatory movements produce a precisely similar condition in some people; the motion of a swing or a toboggan in particular. Some suffer in a railway journey, especially when sitting with the back to the engine; while a few individuals are so intensely susceptible that even a short drive in a carriage or omnibus is enough to induce nausea and vomiting.

The mode in which such causes produce sea-sickness has been much discussed; but it is now generally believed to be by a reflex disturbance of the nervous system, induced by the unusual and violent stimulation of the sensory organs concerned in the maintenance of the equilibrium of the body, particularly the semicircular canals (see EAR) and the eyes, and also of the viscera, particularly the stomach. This is not inconsistent with the view of Dr Chapman, who gave much attention to the subject, and held that the motions of the vessel cause the accumulation of an undue amount of 'blood in the nervous centres along the back, and especially in those segments of the spinal cord related to the stomach, and the muscles concerned in vomiting.' He accordingly believed that the only scientific and really effective remedy for this disorder must be one which has the power of lessening the amount of blood in the whole of the nervous centres along the back, and this can be done by lowering the temperature of the spinal region by the local application of ice. For a description of Dr Chapman's 'spinal ice-bags' and for the method of applying them, we must refer to his work *On Sea-sickness* (1861). They have undoubtedly proved of great value in many cases. Another method of treatment which is less difficult to employ and sometimes gives good results in tiding over the tendency to sickness on a short but rough voyage, is to make the sufferer breathe deeply and regularly, timing the respirations by the watch at about fifteen to the minute.

Those who are susceptible to this distressing affection and have not the opportunity of tying the ice-bags, may, at all events, diminish the severity of the vomiting by assuming, and as long as possible retaining, the horizontal position as nearly as possible in the centre of the ship's movement, and keeping the eyes closed. Compression of the abdomen by means of a broad tight belt sometimes gives relief. Fresh air and light diet are undoubtedly of great importance. A little aniseed, flavoured with brandy or sherry, is usually a kind of food that will most easily remain on the stomach, when the severity of the symptoms is abating. Aerated water or sparkling wine, e.g. champagne, is also soothing to the stomach. The maintenance of the surface temperature, by warm blankets and hot bottles, and the application of a mustard poultice to the epigastrium are often useful. Sucking small lumps of ice also tends to diminish the tendency to vomiting. As soon as possible the sufferer should go on deck, and try to move about; if this can be done the nervous system undoubtedly becomes more quickly accustomed to the unwonted conditions under which it is placed.

With regard to drugs, no specific has been discovered, nor is it likely that there ever will be. But something can often be done by medication both before and during a voyage. First in importance are purgatives. The bowels should be freely relieved the day before the voyage begins, and should never be allowed to become constipated. The administration of a bitter tonic, together with avoidance of food either in great quantity or of irritating nature for a few days before starting, is also useful; and regular doses of the bromides, commenced just before going on board, sometimes diminish the intensity of the malady. When it has set in, chloroform (a few drops on a piece of sugar), opium, chloral may do good; and cocaine, nitrite of amyl, nitroglycerine, phenacetin, or antipyrin have all been strongly recommended. But with all such remedies disappointment is only too common.

See Dr T. Dutton, *Sea-sickness* (2d ed. 1891); and a small monograph by Rosenbach (Berlin, 1891).

Seaside Grape (*Corcoloba uvifera*), a small tree of the family *Polygonaceæ*, a native of the West Indies. It grows on the seacoasts, and receives its name from the bunches of its violet-coloured fleshy calyx enveloping the nuts or seeds. The fleshy part is pleasantly acid, and is eaten with or without sugar; it is esteemed astringent and antidiarrhetic; is used in making refreshing drinks. The extract of the wood is extremely astringent, and is sometimes called Jamaica Kino. The wood itself is heavy, hard, durable, beautifully veined, and capable of taking a fine polish.

Sea Slug. See HOLOTHURIANS.

Sea-snakes (Hydrophidae), very venomous marine snakes, inhabiting the tropical parts of the Indian and Pacific Oceans, especially about the East Indian Archipelago, and between China and Australia. The body is compressed behind, and the tail is often markedly paddle-shaped; the ventral scales are very slightly if at all specialised; the nostrils are valved, and lie on the tip of the snout; the eyes are small, and most of the sea snakes are very blind and helpless when taken out of the water; the fangs are like those of cobras, and the venom is very virulent. The sea-snakes feed on fishes, which they kill almost instantly with their poison and swallow head foremost. They are themselves preyed upon by sharks and rays. They not infrequently attain a length of eight feet, but are not large enough to be mistaken for 'sea-serpents.' All are viviparous, and some bring forth their young among the shore rocks. Among the common forms are species of *Hydrophis* and the yellow-bellied *Pelanus bicolor*, while the genus *Platurus* is in several ways half-way between the typical Hydrophidae and the terrestrial Elapidae.

Seasons. In the article EARTH the notions of the earth on which the changes of the seasons ultimately depend are explained. The chief cause of the greater heat of summer and cold of winter is that the rays of the sun fall more obliquely on the earth's surface in the latter season than in the former (see CLIMATE). Another concurrent cause is the greater length of the day in summer, and of the night in winter. Within the tropics the sun's rays have at no time so much obliquity as to make one part of the year very sensibly colder than another. But the zone of equatorial calms in which rainfall is practically continuous is shifted northward when the sun moves northward in the northern summer, and is similarly shifted southward in the southern summer. As the wet-zone swings to and fro, following the sun, the regions it traverses experience alternate wet and dry seasons. Those regions lying near the mean position of the wet-zone have thus two wet and two dry seasons in the

year, the regions near its extreme positions having one wet and one dry season. Wet and dry seasons are also produced by the Monsoons (q.v.), themselves due to the relative seasonal change of temperature between land and sea (see also RAIN). In the temperate regions of the globe the year is naturally divided into four seasons—*Spring, Summer, Autumn, and Winter*. In the arctic and antarctic regions spring and autumn are very brief, and the natural division of the year is simply into summer and winter, the winter being long, and the summer short; and this is very much the case also in regions of the temperate zones lying near the arctic and antarctic circles. In subtropical regions the distinction of four seasons is, in like manner, very imperfectly marked. Conventionally (as in almanacs) it is assumed that each season commences at the equinox or solstice—e.g. that in the northern hemisphere spring commences at the vernal equinox about March 20, and summer at the summer solstice on June 21, although this is popularly spoken of as 'Midsummer Day'; and the 'summer months' in common English parlance include May, June, and July, winter being November, December, and January, and spring and autumn accordingly. Practically our division of the seasons depends more on seedtime and harvest than on the extremes of annual heat and cold. The greatest heat of summer is reached a considerable time after the summer solstice, the period when the sun's rays are most nearly vertical, and the day is longest. The greatest cold of winter in like manner occurs after the winter solstice—the period when the day is shortest, and the sun's rays are most oblique. The reason in the former case is that as summer advances the earth itself becomes more heated by the continued action of the sun's rays; in the latter, that it retains a portion of the heat which it has imbibed during summer, just as the warmest part of the day is somewhat after mid-day, and the coldest part of the night is towards morning. The four seasons of temperate regions are distinguished by the phenomena of plant-life, such as the budding, blossoming, fruit-bearing, and leafless repose of deciduous trees. Associated with these annual changes there are modifications of structure and function adapted to the seasonal variation of climate in different localities. Similar habits of Hibernation (q.v.) or of change in the thickness and colour of fur or feathers are found in the animals of regions where the seasons are sharply contrasted in climate. The intellectual superiority of the races inhabiting temperate regions is in part traceable to the constant necessity for forethought in providing for the regularly recurring season of winter when natural resource ceases to be available.

Sea-spider. See PYCNOGONIDA; and for the Spider-crab, see CRAB.

Sea-squirt, a popular name for any of the Ascidians (q.v.); also called Sea-pear, &c.

Sea-surgeons (Acroniidae), a family of spiny-rayed Teleostean fishes, living in tropical seas, especially near coral-reefs. The name refers especially to the members of the genus *Acanthurus*—characterised by a lancet-like spine which lies ensheathed on each side of the tail, but can be erected as a formidable weapon.

Sea-swallow. See TERN.

Seathwaite, a valley and hamlet at the head of Borrowdale (q.v.) in Cumberland, remarkable for its heavy rainfall. See RAIN.

Sea-trout, a popular name for various species of the genus *Salmo*, but especially for the common *Salmo trutta* (see SALMON).

Seattle (pron. *Se-at-tel*), capital of King county, Washington, and the largest city in the state, is on Elliott Bay, an arm of Puget Sound, 18 miles by rail N. of Tacoma. It has a fine situation; the residence streets run up the slope of a hill, with the business portion built on the level ground at the foot, stretching along the excellent harbour, with its many wharves. There are important shipping connections with Asia and Alaska. Seattle owes its prodigious growth to the huge development of the state lumber trade, of which it is the chief seat, and to the abundance of cheap water-power. It now takes a leading place, too, as a grain port, from which the wheat of Washington, Idaho, and Montana is shipped. Shipbuilding and fisheries are also carried on, and there are manufactories of iron and steel. There is a large Sound trade, especially in fish and coal. Seattle is the seat of Washington University (1861). In 1889 a terrible fire destroyed most of the business portion of the city. Pop (1880) 3533; (1890) 42,837; (1900) 80,671; (1910) 237,194; (1920) 315,312.

Sea-unicorn. See NARWHAL.

Sea-urchins (*Echinoidea*), a class of Echinoderms. In the more typical genera, such as *Echinus*, the body is symmetrical and nearly globular; others, such as *Spatangus*, are heart-shaped; and others, such as *Clypeaster*, are shield-shaped and flattened. In all cases the body is walled in by continuous plates of lime, which, though capable of independent growth, are rigidly connected, except in Echinothuridae, which have plastic shells, as the extinct Palaeo-echinoidea seem also to have had.

In a typical sea-urchin, such as *Echinus esculentus* or *Strongylocentrotus ferdus*, the body is a

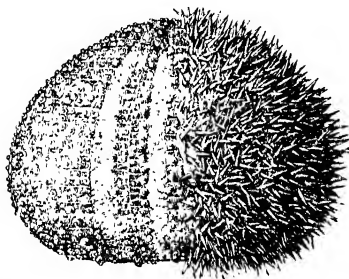

Fig. 1.—Common Sea-urchin (*Echinus esculentus*), one-half with spines removed.

slightly flattened sphere, covered with movable spines. The food-canal begins in the middle of the lower surface, and ends at the opposite pole in the middle of an 'apical disc,' which consists of a central plate surrounded by five 'ocular' and five 'genital' plates. Through each 'ocular' a sensitive 'tube-foot' projects; the 'genitals' bear the openings of the genital ducts, but one of the five is modified as a madreporic plate through which fluid enters and leaves the water-vascular system. From pole to pole extend ten meridians—each a double row of calcareous plates which fit one another firmly. Five of these meridians—in line with the ocular plates—are known as ambulacral areas, for through holes in their plates the locomotor tube-feet are extruded; the other five meridians, alternating with the former and in line with the genital plates, are called inter-ambulacral areas, and bear spines, not tube-feet. The bases of the spines fit over ball-like knobs, on which they are moved by muscles. There are also two peculiarly

modified forms of spines—the minute pedicellariae, with three snapping-blades mounted on a soft stalk, and small globular sphaeridia which seem to be of use in balancing or equilibration. The pedicellariae have been seen removing pieces of seaweed and the like from the surface of the shell. In front of the mouth project the tips of five teeth which work against one another, grasping and grinding small particles. They are fixed in five large sockets, and along with fifteen other pieces form 'Aristotle's lantern,' a complex, somewhat lantern-like masticating mill, of which Aristotle took notice. The lantern also helps greatly in locomotion and in the mechanism of respiration.

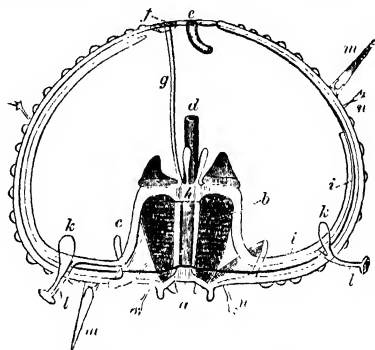

Fig. 2.—Diagram showing the Anatomy of Sea-urchin (after Huxley):

a, mouth; b, teeth of Aristotle's lantern; c, muscles which work the lantern; d, food-canal; e, end of food-canal; f, madreporic plate; g, stone-canal; h, enicular water-vessel; i, radial water-vessel; k, ampulla; l, tube-foot; m, spine; n, pedicellaria.

The liny skeleton is formed in the mesoderm, and outside of it there is a delicate ciliated ectoderm with a network of nerve-fibres and some ganglion cells. Inside the shell, lining the spacious body-cavity, there is again ciliated epithelium.

The nervous system consists of a ring around the mouth, with a radial branch up each ambulacral area, and of the superficial network. The alimentary canal passes through Aristotle's lantern, coils round the inside of the shell, and ends in the apical disc. The body-cavity contains a fluid with floating brown cells apparently of some significance in respiration.

The water-vascular system is of use in locomotion, and perhaps also in excretion. From the apical madreporic plate a 'stone-canal' extends through the body to a circular vessel round the upper end of the lantern; this circular vessel gives off five radial vessels, from which the tube-feet are supplied. When filled with fluid the tube-feet become tense and are pressed against the surface of the rock; when the fluid flows back they adhere firmly, and the sea-urchin drags itself towards the attachment. There is a blood-vascular system, but it is difficult to trace. Respiration seems to be discharged in part by the body-cavity fluid, in part by ten hollow outgrowths on the area round about the mouth.

The sexes are separate and resemble one another. The reproductive organs are five spongy masses lying beneath the apical disc. The eggs are fertilised externally by spermatozoa waited from another sea-urchin; and the free-swimming larva out of which the adult develops, as in other Echinoderms, is called a Pluteus, and has a quaint form, a little suggestive of a many-legged painter's easel.

A few sea-urchins—e.g. *Hemiaster*—carry their young about with them among their spines.

Most sea-urchins live off rocky coasts; not a few shelter themselves in holes in the rocks; many deep-sea forms are known. Most are very sluggish, moving slowly by means of their tube-feet, in some cases slightly helped by their spines, in other cases perhaps hindered. They feed in part on seaweeds, mostly on organisms and organic matter found in mud and other deposits. Many look as if they were falling victims to their constitutional tendency towards the deposition of lime, for there is hardly any part of the body which may not become limy, and in some of the flattened forms the body-cavity is much restricted by cross beams of lime.

ARTIFICIAL PARTHENOGENESIS. The ova of sea-urchins (as well as those of starfishes, some worms and molluscs, frogs, &c.) have been much used by Loeb, Delage, and others in experiments on artificial parthenogenesis. It is found that development may be induced without any fertilisation by a spermatozoon. Thus if the eggs of the sea-urchin be placed in sea-water to which has been added a little formic, acetic, or butyric acid, and after a few minutes be transferred to ordinary sea-water, they develop normally and form free-swimming larvae. In some other animals this aspermic development has been induced by many chemical reagents as well as by mechanical, electrical, and other stimuli. Thus frog's eggs will develop into tadpoles after being pricked in a platinum needle, especially if the needle has been previously dipped in frog's blood. (See Loeb, *Artificial Parthenogenesis and Fertilisation*, Chicago, 1913.)

The Echinoids include three main orders—(1) the Endocyclia or Regular Urchins, (2) the flattened Clypeastroida or Cake-Urchins, and (3) the more or less oval Spatangoida or Heart-Urchins.

The ovaries of *Echinus esculentus* are sometimes eaten, but otherwise the sea-urchins hardly come into touch with human life. See MacBride in *The Cambridge Natural History*, vol. i. (1906).

Seaweeds, a general and popular term applied to a vast collection of lower plant-forms growing on the seacoast from high-water mark (or a little above that limit) to a depth of from 50 to 100 fathoms (rarely deeper), and all belonging to the sub-class of the Thallophyta, to which the name *Algae* has been given (see *ALGÆ*). Any detailed treatment of the organisms included under the term would be impossible within the limits of a short article like the present. It must suffice, on the one hand, to indicate the chief variations in structure and life-history of typical representatives, and on the other to refer briefly to the more important points in the distribution and classification of the group. The short bibliography appended will supply a guide to the very extensive literature of the subject.

An examination of an average shore-belt exposed at ebb-tide reveals the fact that this area may be roughly divided into four regions: (a) a zone at and above high-water mark, characterised by the predominance of filamentous and encrusting, often inconspicuous, forms, exhibiting a bluish-green colour when examined under the microscope; (b) a zone from near high-water mark to half-tide level, occupied chiefly by algae of a bright grass-green tint; (c) from half-tide level to low-tide mark, where the majority of the plants are olive-brown in colour; and finally (d) from near low-water mark to depths never exposed by the lowest ebb, where the preponderance of forms are of a distinctly red colour. Although not a few shores exhibit these zones fairly clearly, it must be remembered that, owing to the nature of the shore, the character of the tides, and the absence or presence of large

influxes of fresh water, the zoning is not always clearly defined. For instance, the uppermost zone of blue-green forms is most likely to be met with on low-lying coast-lines where the seashore proper merges gradually into brackish marshes and muddy pools, such as, for example, the estuaries of the Dee and Mersey, or of the Clyde near Dumbarton. Grass-green forms are most plentiful on shelving rocky shores; whilst on such steep rocky shores as those of the fjords of the west coast of Scotland olive-brown seaweeds form the prevailing vegetation right up to high-water mark. It must be also borne in mind that certain species of algae are invariably found in regions of the littoral area not characteristically occupied by the majority of forms of a similar hue. Thus the common dwarf species, *Pelvetia canaliculata*, closely allied to the familiar bladder-wrack (*Fucus vesiculosus*), belongs to the olive division of seaweeds, and yet is invariably found at or even above high-water mark. Pangle (*Laminaria digitata*), also an olive seaweed, is, on the other hand, a deep-water form only exposed at low tides, whilst the genus *Struvea*, one of the pure-green algae, may be dredged from 30 fathoms. Very many red algae are found under cover of the olive forms between tide marks, whilst some have their habitat at or above high-water mark. For example, two species of the genus *Rhodochorton* form a crimson velvety pile on rocks from half-tide level to far above high-water mark, and another small dark purple form, *Catenella opuntia*, grows on the lee side of rocks which are seldom touched by the flood-tide.

It is worthy of note that the classification of seaweeds into four groups according to colour is strikingly supported by the morphology and life-history of the forms so brought together. This fact becomes all the more remarkable when it is remembered that colour among higher plants is in very few cases of even specific value in classification. The blue-green algae are known as Cyanophyceæ, the pure-green as Chlorophyceæ, the olive as Phaeophyceæ, and the red as Rhodophyceæ. (By some authors the lower members of the first two groups are classed together under the name of Protophyceæ; by others the Cyanophyceæ are excluded entirely from *Algae* and regarded as more closely related to the Schizomycetes or Bacteria.) All possess the green coloring matter chlorophyll, but in the blue, olive, and red forms additional coloring matters (phycoerythrin, phycochrome, and phycoerythrin) are present to a greater or less extent, masking the pure-green tint so well seen in the Chlorophyceæ. It is impossible in the present state of our knowledge to dogmatise on the precise value of these additional pigments, but we cannot be far wrong in saying that they are associated with the modification of the intensity or quality of sunlight, and aid or protect the chlorophyll in the peculiar and vitally important duties which it performs in the nutrition of the plant organism (see *CHLOROPHYLL*). It has been ascertained that certain rays of the solar spectrum are more efficient than others in the work of carbon assimilation or photosynthesis, and it is worthy of note that these rays are precisely those which are first intercepted in the passage of sunlight into sea-water. Our ignorance of the important physiological problems involved may be estimated when we place against this explanation the fact that Kjellman in his exploration of the flora of the Arctic Sea found that algae grew and reproduced at a mean temperature of -1°C . and during the long and dark arctic night of three months' duration.

Turning from the bathymetric distribution of seaweeds to their surface distribution, we find here also many interesting and difficult problems.

In the first place the medium in which seaweeds live is of a more uniform temperature than that to which land plants are exposed, although against this we must place the fact that seaweeds are more susceptible to fluctuations of temperature. Whilst ocean currents are undoubtedly the chief agents in the transport of the marine flora, long tracts of deep ocean must prove serious barriers to the migration of littoral species. It is scarcely necessary to point out that continental areas, hotter and colder regions of the sea, and long stretches of sandy shore must also act as barriers to possible migration. The effects of such barriers are well seen in comparing the floras of the tropical Atlantic and of the Indian Ocean, the north and south temperate Atlantic, and the eastern and western shores of the same great ocean.

The structure, life-history, and classification of the lower algae (both fresh-water and marine) having been dealt with in the article *Algae* (q.v.), there are left for treatment the two higher groups—viz. *Phaeophyceae* and *Rhodophyceae*. It will be most in accordance with the aim of the present article to sketch very briefly the main lines of classification, and to select a few typical examples for more detailed notice.

The *Phaeophyceae* include all the olive-brown seaweeds found on our shores, and are subdivided according to their methods of reproduction into three chief series—viz. (a) the *Phaeosporae*, represented by such forms as *Ectocarpus*, *Cutleria*, *Sphacelaria*, and the giants among seaweeds, *Laminaria*, *Macrocystis*, and *Lessonia*; (b) the *Fucaeae*—e.g. *Fuens*, *Ascephyllum*, *Polyetia*, &c.; and (c) the *Dictyotaceae*—e.g. *Dictyota* and *Padina*. The members of the *Phaeosporae* have a most

contains elongated branched tubular cells which show a marked resemblance to the sieve tubes of *Phanerogams*, whilst the small cortical cells exhibit that intercommunication of protoplasm which is of so great physiological importance in the higher plants.

Both sexual and asexual methods of reproduction are known to occur, though not as yet in all genera. Vegetative propagation by gemmae is also not uncommon. The asexual reproductive organs are in the form of unilocular gonidangia, the contents of which are transformed into zoo-

gonidia, small motile cells each furnished with two flagella, and capable after a period of activity of longer or shorter duration of settling down and forming new plants. The gonidangia are developed externally on the thallus or are the terminal cells of short branches. They are frequently collected in groups (*sori*), and are accompanied by sterile fila-

ments. The sexual organs are multilocular gametangia of diverse form, each loculus giving rise to a single motile cell somewhat like a gonidium. These cells conjugate in pairs, the product (*zygote*) behaving in a precisely similar manner to the zoogonidium. Although in most of the *Phaeosporae* the gametes are morphologically indistinguishable, gradations may be observed in some genera where the gametes are differentiated into male and female cells. *Cutleria* is especially interesting in this respect, as the female gametes are much larger than the male gametes, and come to rest before conjugation with the still motile male cell.

The *Fucaeae* are characterised by having distinctly differentiated sexual organs with non-motile ova and motile fertilising sperms. The ova are formed within the swollen cells (*oogonia*) which arise from the wall of flask-shaped cavities (*conceptacles*), and are accompanied by unbranched hairs. The fertilising cells, *antherozoids* or sperms, are produced in ovoid terminal cells (*antheridia*) of branched hairs, which likewise

varied vegetative form. Many are filamentous and branched, such as *Ectocarpus* and *Sphacelaria*, some are tubular and unbranched, as *Asperococcus* and *Seyiosiphon*, or tubular and branched—*Chordaria*. Others are ribbon-shaped—e.g. *Cutleria*; not a few are membranous and encrusting—e.g. *Ralfsia*; whilst *Laminaria* forms large expanded leathery stalked fronds. In histological differentiation several types may be distinguished. In *Ectocarpus* the fronds consist of branched filaments of cylindrical cells, whilst in other genera the fronds are composed of elongated central cells surrounded by smaller cortical cells. In the *Laminariaceae* the medullary portion of the thallus

Fig. 3.—*Fuens platycarpus* : A portion of the thallus showing receptacles ($\times 1$). (After Thuret.)

The fertilising cells, *antherozoids* or sperms, are produced in ovoid terminal cells (*antheridia*) of branched hairs, which likewise

arise from the walls of similar conceptacles. In *Fucus platycarpus* both ova and sperms are formed in the same conceptacle; in most Fucaeae, however, they are formed on different plants. Asexual

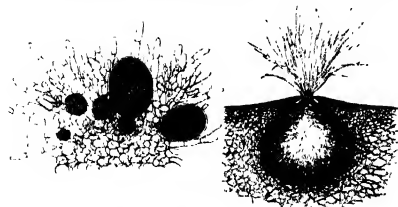

Fig. 4. *Fucus platycarpus* :

A, vertical section through a conceptacle; B, portion of the wall of a conceptacle, showing oogonia in various stages of development, and antheridia. (A, x 20; B, x 150.) (After Thuret)

multiplication is unknown. The group includes such well-known genera as *Fucus*, *Ascophyllum*, *Halidrys*, and *Pelvetia*, with branched leathery fronds, the tips of whose branches become transformed into receptacles for the reproductive organs, and *Himanthalia*, with a button-shaped thallus, from which arise the long strap-shaped reproductive branches characteristic of that genus.

The Dictyotaceae are an aberrant group of Phaeophyceae with distinct affinities to the Rhodophyceae. They resemble that group in having non-motile gonidia produced in foci in gonidangia which are clustered in sori over the surface of the frond (Dictyota) or along the midrib. The sexual organs are in the form of antheridia and oogonia. The male organs produce non-motile fertilising cells resembling the pollinoids of the Rhodophyceae, though there is evidence to show that these may be ciliated.

Fig. 6.—*Odonthalia dentata* (one-third natural size).

The oogonia are arranged in sori, each oogonium containing one ovum. In both Fucaeae and Dictyotaceae fertilisation is external.

The Rhodophyceae (Florideae) form a very large assemblage of most varied vegetative form, and every possible shade of red from a purple black to brilliant pink. The root may be a branched mass, a plate, or a disc attached to mud, other algae, or rock, whilst the fronds are filamentous, membranous, crustaceous, or calcareous. The asexual organs consist of gonidangia whose entire contents in some genera escape as a single non-motile gonidium. In the majority, however, each gonidium contains four non-motile gonidia. The gonidangia are solitary or grouped in sori, and often sunk in the tissue of the frond or in special branches. The sexual organs are antheridia and procarpia. The antheridia are generally modified terminal branches or special areas in the thallus (of the more succulent forms), from which are derived short rod-like fertilising cells, here called pollinoids. The female organ is a procarp, whose structure varies in complexity in the different orders of Rhodophyceae. In the simplest condition it recalls the female organ of Coleochaete, and consists of a rounded cell with a long filamentous apical portion, the *trichogyne*. In higher members of the series the trichogyne is separated from that portion of the procarp from which the products of fertilisation (*carpospores*) are derived by one or more intermediate cells, the *trichophore*, and the basal part itself may become multicellular, all or only some of the cells of which produce the products of fertilisation. Fertilisation is effected by fusion of a pollinoid with the trichogyne, the mediate or intermediate result being the formation of a cluster of cells, the carpospores, derived from

Fig. 7. *Corallina officinalis*, a calcareous seaweed (natural size).

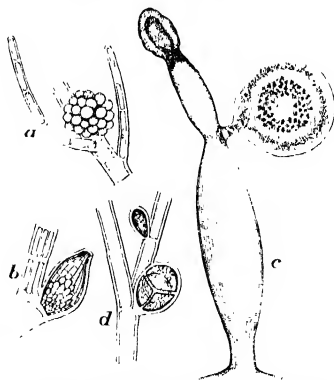

Fig. 8.—Reproductive Organs of the Rhodophyceae : a, cystocarp of *Spermothamnion tunica*; b, cystocarp of *Polysiphonia wrightii*; c, (lateral) cystocarp and (terminal) antheridium of *Catenella opuntia*; d, gonidangia of *Callithamnion tenuissimum*.

the fertile cells of the base. These carpospores may form a naked mulberry-like mass (Nemalion), or may be enclosed by a loose involution of filaments (Griffithsia), or by an ovoid capsular investment with a terminal pore (Polysiphonia). In others

again the collection of *curiosporos* (*cystocarp*) is completely enclosed within a thick-walled spherical sac (Plocamium), or may be sunk in the tissue of the frond (Dunantia). The Rhodophyceae embrace a large number of orders, the representatives of several of which form well-known objects of interest on the seashore. The best known of these perhaps are Carrageen (*Chondrus crispus*), Dulse (*Rhodomenia palmata*), and Laver (*Porphyra laciniata*). The genera *Callithamnion*, *Delesseria*, *Nitophyllum*, *Plocamium*, and *Odonthalia* are well known to collectors for the beauty of their fronds. It may be of interest to point out that the vast collection of feathery plant-like forms, popularly classed as 'seaweeds' by seaside visitors and sold as such after being fancifully tinted, are in no respect related to the forms we have been considering, but really belong to the zoophyte division (Hydrozoa) of the animal kingdom.

Sebaceous Glands. See SKIN.

Sebastian, king of Portugal (q.v.), a grandson of the Emperor Charles V., perished at the fight of Alcazar in Morocco, warring against the Moors, on 4th August 1578. Soon after the battle doubt was thrown upon his death, and impostors began to crop up—first (in 1584) an adventurer, the son of a poor Portuguese potter, who was nicknamed, half in derision, half in raillery, the King of Penamoor; then came Mathews Alvarez, a sort of brigand-insurgent; then in 1594 a Spanish cook of Madrigal in Castile. None of these people were taken seriously. A fourth impostor found more credence, one Marco Tullio Catizzone, a Calabrian, who first made his pretensions known at Venice in 1598. He was hanged at Sariláca in Spain in September 1603. The strongest support of these successive impostors was the undying belief of the common people of Portugal that their popular hero, Sebastian, would some day reappear. The belief grew particularly strong in 1807-8 during the French occupation of Portugal. And even so late as 1838 it was used as a rallying-cry by a party of insurrectionists amongst the Portuguese Brazilians. See M. D'Antas, *Les faux Don Sébastien* (1866).

Sebastian, St., a martyr of the early church, was a native of Narbonne. Under Diocletian he became a captain of the prætorian guard, and secretly a Christian. It coming to the ears of Diocletian how Sebastian personally encouraged those who were being led out to death for being Christians, the emperor had his captain tied to a stake to be shot to death by archers. But they did not wholly kill him; a pious woman, Irene by name, took him away, and tended his wounds. As soon as he was recovered Sebastian boldly faced the tyrant, and upbraided him for his cruelty. Diocletian then ordered him to be beaten to death (288) with rods. He is a protector against plague and pestilence, and is specially honoured on 20th January. His first martyrdom—a young and handsome soldier bristling with arrows—was a favourite subject for the Italian religious painters, as Mantegna, Veronese, and Domenichino.

Sébastieni, FRANÇOIS HORACE BASTIEN, COUNT, marshal of France, was born November 10, 1772, at Porta d'Ampugnano, a village near Bastia, in Corsica. Entering the French army in 1789, he became one of Napoleon's most devoted partisans,

and advanced rapidly. He fought at Marengo, executed some important diplomatic service in Turkey in 1802-3, after which he became general of brigade, and was wounded at Austerlitz. In 1806 he was again deputed to Turkey, this time to break the alliance of the Porte with Russia and England. His mission was successful, and Turkey declared war upon the allies. Thereupon the English fleet forced a passage through the Dardanelles, and cast anchor before Constantinople. Sébastiani, however, speedily put the coast batteries in a state fit for action, and got several small gunboats afloat. But the deposition of the sultan and the treaty of Tilsit put an end to the French intrigues in Turkey, and Sébastiani was recalled (June 1807). He subsequently commanded the fourth French army corps in Spain, and distinguished himself in the Russian campaign of 1812 and at Leipzig. On the exile of Napoleon to Elba he gave in his adherence to the Bourbon government, but joined his old master on his return. After the revolution of 1830 he held for brief periods the portfolios of naval and foreign affairs, and the embassies to Naples and London, but was more distinguished for his elegance and graceful demeanour in the Parisian salons than as a politician or administrator. He was made a marshal of France in 1840, and died at Paris, July 20, 1851.

Sebastiania, a tropical, mostly New World, genus of Euphorbiaceæ, trees, shrubs, and herbs, some of which, especially the Mexican *S. palmieri*, show the strange phenomenon of the jumping seed. The seeds have two flat sides and a round keeled back. Laid on a flat side they move quickly to the other; from the round side they move more slowly. Often they jerk a little forward. The movement is caused by the larva of a small butterfly, *Carpocapsa saltitans*, within the seed.

Sebastiano del Piombo, Italian painter, whose family name was LUCIANI, and who got his nickname 'Of the Seal' (*Piombo*) because at the accession of his patron, Giulio de' Medici, as pope (Clement VII.) in 1523 he was given the office of sealer of papal briefs. He was born at Venice in 1485, and learned the art of painting from Giovanni Bellini and Giorgione. After painting a St Chrysostom for the church of that saint in Venice, Sebastiano was taken to Rome by Agostino Chigi (q.v.) about 1512. He helped to decorate Chigi's palace of Farnesina with frescoes illustrating classical mythology, and by his excellence as a colourist won the esteem and friendship of Michelangelo. The two seem then to have worked in conjunction, Sebastiano carrying out in colour designs and drawings made by Michelangelo. Amongst the fruits of this artistic partnership three pictures at least are of the highest rank—viz. 'The Raising of Lazars' (in the London National Gallery), and a couple of scenes from the last days of Christ (in the church of St Peter in Montorio at Rome). Sebastiano, who possessed no great powers of invention, excelled also as a portrait-painter. An indolent man and a dilatory, Sebastiano did little painting after his appointment as papal seal-keeper; yet he invented a method of painting on slate and stone. He died at Rome in 1547.

Sebastopol, or SEVASTOPOL, a Russian seaport and fortress, is situated near the south-west extremity of the Crimea, on the southern side of one of the finest natural harbours in the world, 4½ miles long from east to west and ½ mile across. The place is celebrated for the long siege of the allies during the Crimean war of 1854-55. The town and harbour were defended by several forts and batteries. The forts were of immense strength, on which artillery was found to make but little impression. On the land side, with the exception of a slight loop-

holed wall extending partially round the western side, the town, previous to the siege, was entirely undefended; but the earthworks and fortifications then successively extemporised by the genius of General Todleben kept the armies of France and England at bay for eleven months, from October 1854 to September 1855. The place sustained repeated bombardments until the capture of the Malakoff and Redan works, on September 8, 1855, at length forced the Russians to evacuate the lines and retire to the north side. The town was completely ruined; the docks and forts still standing were blown up by French and English engineers, and by the treaty of Paris (1856) were not to be restored; but the restrictions were removed by the abrogation of the neutrality of the Black Sea by the Conference of London (1871). The town was in great part rebuilt, but at first grew slowly. After 1885 the Russian government restored the fortifications and reconstructed the docks, and Sebastopol became again the naval port for the Black Sea fleet; in 1899 the commercial port was transferred to Feodosia or Kaffa (q.v.). Under the Soviet régime, Sebastopol was only used as a naval port and a radio station, the name being changed to Akhiar. There are two cathedrals. Pop. 73,000. Sebastopol was founded on the site of a Tatar village immediately after the Russian conquest of the Crimea in 1783, under the orders of the Empress Catharine II. The promontory on which it stands was originally colonised by Greeks from Heraclea, in Asia Minor, and became known as the Heracleotic Chersonese.

See CRIMEAN WAR; Kinglake's *Invasion of the Crimea*, Hanley's *War in the Crimea* (1891), Todleben's *Vertheidigung von Sebastopol* (4 vols. Berlin, 1864-72), and Leo Tolstoy's vivid description of the siege in *Sebastopol* (Eng. trans. 1890).

Sebenico (Slav. *Sibenik*), a picturesque town of Yugoslavia, in Dalmatia, stands on a land-locked bay of the Adriatic, 43 miles by a branch-railway N.W. of Spalato. The chief monument of the place is its cathedral, built all of stone, in 1430-1555. The style is Italian Gothic. Three forts and walls on the land side defend the city. Fishing is carried on, and there is some trade in wine and olive-oil. Pop. 10,000. It was a favourite place of residence of the kings of Croatia, was made the seat of a bishopric in 1298, and repulsed a siege by the Turks in 1647.

Sébillot, PAUL (1846-1918), an eminent French folklorist, was born at Mantignon, in the department of Côtes-du-Nord. After his studies at the communal college of Dinan, and a course of law at Rennes, he came to Paris to become a notary, but soon abandoned the pen for the pencil. The pursuit of his art carried him to Saint-Brienc and Pont-Aven, and many an out-of-the-way corner of Brittany, and opened up to him stores of old-world lore in which he was to find the main interest of his life. From 1870 to 1883 he exhibited in the Salon as many as twenty pictures, but he gradually abandoned art for folklore, and made his name widely known by a long series of admirable books. He succeeded to Henri Martin's seat in the Commission for Megalithic Monuments, became *chef du cabinet* at the ministry of Public Works, and was nominated Chevalier of the Legion of Honour in 1889. He edited the *Revue des Traditions Populaires* from its foundation (1885).

Secant. See TRIGONOMETRY.

Secchi, ANGELO, astronomer, was born at Reggio, 26th June 1818, and trained as a Jesuit, became professor of Physics at Washington, United States, and in 1850 at the Collegio Romano, and director of the Roman observatory, where he

laboured till his death, 26th February 1878. His chief discoveries were in the region of spectrum analysis and solar physics; and, besides some 300 papers, he published in French *Le Soleil* (1870), and in Italian *L'Unità delle Forze Fisiche* (1869) and *Le Stelle* (1877).

Secession. See UNITED PRESBYTERIANS; also UNITED STATES.

Seckendorff, VEIT LUDWIG VON, statesman and theologian (1626-92), studied at Strasburg, and served successively the princes of Saxony and Brandenburg, being chancellor of the university of Halle at his death. He is best known for a Latin compendium of church history (1664), and a work, *De Lutheranism* (1688), in reply to Maimbourg. — His nephew, FRIEDRICH HEINRICH (1673-1763), was distinguished as a field-marshal and diplomatist in the Austrian service, and was made a Count of the Empire.

Seeker, THOMAS, Archbishop of Canterbury (1758-68), was born at Sibthorpe, Nottinghamshire, in 1693, the son of a Dissenter of independent means, who wished him to enter the ministry of his own communion. In 1716, however, the son turned to medicine, which he studied at London and Paris, ultimately taking his doctorate in physic at Leyden in 1721. Meanwhile, urged by his old schoolfellow, Joseph Butler, he had decided to take Anglican orders; in 1722 he graduated B.A. at Oxford, and in that and the following year he was ordained deacon and priest. His preferences were Houghton-le-Spring (1724), Ryton and a prebend at Durham (1727), chaplain to the king (1732), St James's, London (1733), Bishop of Bristol (1735), of Oxford (1737), Dean of St Paul's, for which he resigned the living of St James's (1750), and the primacy (1758). He was a wise, kindly, hard-working bishop, and a notable preacher in his day. He died 3d August 1768. See the *Review of his Life*, by Beilby Porteus (5th ed. 1797; originally prefixed to a posthumous edition of his sermons, &c. 1770).

Second is the sixtieth part of a minute, whether of time or of angular magnitude; formerly seconds having been distinguished as *minuta secunda*, from minutes or *minuta prima*. See CIRCLE, DEGREE, DAY.

Second Advent. See ADVENTISTS, MILLENNIUM.

Secondary, in Geology. See PETROGRAPHY, MESOZOIC.

Seconding is an arrangement by which officers of the British army, when extra-regimentally employed, become supernumeraries in their regiments, and have their places filled by others, so that the service may not suffer. Thus, a captain appointed adjutant of yeomanry, special reserve, or volunteers is placed upon the seconded list for the five years during which his appointment lasts. His place in the regiment is filled up, but his name (in italics) remains in its usual place in the *Army List*, his promotion goes on, and he is brought back at the end of his employment as soon as a vacancy occurs in his proper rank.

Second-sight, a gift of prophetic vision, long supposed in the Scottish Highlands and elsewhere to belong to particular persons. The most common form it took was to see the *verities*, *fetch*, or shadowy second self of some person soon to die, often wrapped in a shroud, or attended with some other of the special circumstances of death or burial. Of course the prophetic character may easily enough have been a mere additional assumption, the time of occurrence of distant events being apt to be confused with the time of hearing of them. In the popular mind everywhere the mystery of death, and

the instinctive human longing to believe in a continuity of conscious spiritual life and sympathy, have generated a belief in the probability of an appearance coinciding with, or soon succeeding, the death of an individual; and from this the step is easy to a belief in the possibility of similar appearances before death, in order to foreshadow or forewarn. For, if the appearance be admitted as a probability, it is not difficult to take a further step and attribute to it the function. For what more natural than to suppose that, just as the affection for a dead friend survives the separation of the grave, so the affections of the disembodied spirit or apparitional ghost-soul should continue to cling to the persons loved on earth, and that he should seek by every possible means to give them forewarnings of things soon to happen? And what agents more natural than those gifted souls that stand between the living and the dead, who have attained clearness of spiritual vision by rising above the bondage of sense, through lonely meditation and inner communion with things unseen? Such are the seers to whom the gift of second-sight was once attributed in the Highlands; and we find, as was to be expected, that most often they were reputed men of severe and virtuous life, who would gladly have lost their faculty if they could, and indeed were often sorely troubled in their minds as to whether it was not something that had come from the devil and not from God. In Aubrey's account we read of one who besought the presbytery to pray for him that he should be relieved from this burden, and how after special supplication and confession it was taken from him. Among the Covenanters too the gift of special foresight and prophecy was one vouchsafed to men like Feden, eminent for holiness and spiritual elevation. The gift seems not to have descended by succession, although this is stated to have been the case in Skye before the gospel reached it, and there was long a persistent belief that it belonged to the seventh son of a seventh son; according to some it appears in special cases to have been capable of being communicated from one person to another. Martin in his *Description of the Western Isles of Scotland* (1703) gives a full account of the second-sight, with a classification of the special visions usually seen, which is conveniently summarised in the seventh chapter of Defoe's well-known *Life and Adventures of Duncan Campbell* (c. 1680-1730), the deaf and dumb soothsayer, who inherited the faculty from his Lapland mother. With regard to the difficult question of the determination of the time between the sight and the fulfilment, we read here that if an object was seen early in the morning the event would be accomplished a few hours afterwards; if at noon, the same day; and if at night, the accomplishment would take place weeks, months, and sometimes years afterwards, according to the time of night the vision was beheld. The appearance of a shroud was an infallible prognostic of death, and the nearness or remoteness of the event was judged by the amount of the body that was covered by the ghastly sheet; if it was not seen above the middle, a delay of a twelvemonth might be hoped for; but if it ascended high towards the head, the mortal hour was close at hand. The reader will remember the splendid artistic use made of an analogous notion to this by Rossetti in *The King's Tragedy*. The vision makes such a lively impression upon the seers, continues Martin, that they neither see nor think of anything else except the vision, as long as it continues; the eyelids of the seer are rigidly fixed, and the eyes continue staring until the object vanishes. Sir Walter Scott has put the second-sight to fine use in *Waverley*, *The Legend of Montrose*, and elsewhere.

The gradation of symbolical appearances we have mentioned strikes the imagination and gives something like a system to the supernatural phenomena. But if we turn to the cases related we find no such regular order and exactness. The evidence is vague and confused, and the incidents are often of the most trivial character, the revelations, apparently mere subjective hallucinations, commonly made to poor illiterate men, predisposed from their conditions of life to melancholy and superstition. Moreover, one standing weakness is that such predictions may force their own fulfilment, and the indefiniteness of the time provides a convenient loophole of escape for the conscience. As we see in the popular notions about dreams, there is a besetting snare of a tendency unconsciously to antedate the later impression and to read back details into the dream. Even contradictory dreams are forced to the required interpretation on principles of implied symbolism or even of mere conventional and completely irrational explanation; and similarly we find unrecognised apparitions capable of symbolic explanation, as a black dog appearing before a death, phantasmal lights, and the like, as well as weeping, the screech of the *banseer*, &c., in the region of sounds. Again, coincidences, really due to pure accident, account for much; and still more the invariable learning of the primitive mind to false analogies and to confound the *post hoc* with the *propter hoc*. The savage and the enthusiast alike think in the same vicious circle; what he believes he therefore sees, and what he sees he therefore believes.

Stories of second-sight meet us also in the actual world of history. We find it in the story of Wallace and Bruce; again in the famous vision that Thomas the Rhymer had of the death of Alexander III. at Kinghorn; associated with the tragic fate of James I.; and in the unheeded warning given to the Scottish nobles before going to find their fate at Flodden. A Scottish seer is said to have foretold the unhappy career of Charles I., and another the violent death of Villiers, Duke of Buckingham. In 1652 Sir George Mackenzie, afterwards Lord Tarbat, wrote a minute account of its manifestations, addressed to the celebrated Robert Boyle, which is published in the correspondence of Samuel Pepys. Aubrey throughout life had strong interest in the superstition, and has recorded not a few examples. Next came Martin's copious description, then the Rev. John Fraser's *Authentic Instances* (1707), and in 1763 the ambitious but poor and credulous *Treatise on the Second Sight* by Theophilus Insulanus. A fresh revival of interest in the subject took place after the publication of Dr Johnson's memorable *Journey to the Hebrides* (1775). Johnson was naturally superstitious, and would willingly have believed in the possibility of messages from the other world. But his love of truth was too strong to be satisfied with the evidence, and he confessed that he never could 'advance his curiosity to conviction, but came away at last only willing to believe.' On one occasion Boswell tells us he laid down a sound canon for such questions, incapable to be shaken: 'We could have no certainty of the truth of supernatural appearances unless something was told us which we could not know by ordinary means, or something done which could not be done but by supernatural power: that Pharaoh, in reason and justice, required such evidence from Moses; nay, that our Saviour said: "If I had not done among them the works which none other man did, they had not had sin." As we have seen, spectral sights may be caused by dreams, and every night so many are dreamed that some must come true; morbid conditions of mind or body may account for many more; not to speak of accidental optical illusions, or the workings of

an abnormally vivid imagination. And again, from the other side, we may say that it is hardly a compliment to the idea of a divine providence to suppose that special miracles are wrought to announce the marriage or death of a Highland peasant, the wreck of a boat, the winner of a race, or the arrival of a stranger in a remote island of the Hebrides. Nothing wiser on this question generally has been written than Mrs Henry Sidgwick's paper, 'On the Evidence for Premonitions,' in the *Proceedings of the Society for Psychical Research* for December 1888. She defines premonitions as predictions, foreshadowings, or warnings of coming events, which afford, if believed, a knowledge of the future greater than that which human beings could obtain by exercising their faculties on the facts before them; and her conclusion is that the evidence at present collected does not seem sufficient to warrant a conclusion in favour of these. The whole of the first-hand cases up till that time before the Psychical Society amounted to 240, about 66 per cent. of these being dreams, thus falling far short both in quantity and quality of the evidence for *telepathy*. Setting aside the two-thirds dreams, she classifies the remaining third as follows: (1) Visual hallucinations - persons or objects seen when nothing was really there; (2) auditory hallucinations - voices or other sounds heard when, according to the belief of the percipient, there was no real natural sound; (3) verbal predictions, as by fortune-tellers; (4) non-externalised impressions of various kinds - namely, ideas of more or less definiteness, mental visions, mental voices, and motor impulses. See APPARITIONS, DIVINATION.

Secret. DISCIPLINE OF THE. See DISCIPLINA ARCANI.

Secretary-bird (*Serpentarius*), an aberrant and in some respects primitive genus allied to the birds of prey, but apparently requiring an order to itself. There are two African species, *S. serpentarius* from Senegambia to S. Abyssinia. The legs are very long, the toes are partially webbed, the region below the ankle is protected by large scales. The bird stands about three feet high; it has a long neck and a long tail, and bluish gray plumage. It

Secretary-bird (*Serpentarius serpentarius*).

has an occipital crest of feathers without barbs at the base, which can be raised or depressed at pleasure, and the name 'Secretary' was given to it by the colonists at the Cape of Good Hope because of the resemblance of the crest feathers to pens stuck behind the ear. It feeds chiefly on reptiles of all kinds, which it devours in great

numbers, and is so highly valued on account of the constant war which it wages against serpents that a fine is inflicted at the Cape for shooting it. It fearlessly attacks the most venomous serpents, stunning them with blows of its wing, or seizing and carrying them into the air to such a height that they are killed by the fall. It uses its feet also to overpower its prey, striking violent blows with them. Small serpents are swallowed entire; the larger ones are torn to pieces. The secretary-bird is most frequently seen in pairs, or solitary. It is tamed as a protector of poultry-yards, but if not sufficiently fed is apt to help itself to a chicken or duckling. An attempt has been made to introduce this bird into Martinique in order to reduce the number of venomous serpents in that island.

Secretary of State, an ancient and important office in the government of England. The oldest record of its existence is in the reign of Henry III., when John Mainsell is described as 'secretarius noster.' Prior to the Restoration the holder of this office was generally styled the 'king's chief (or 'principal') secretary'; he had the custody of the king's signet, and discharged his duties with the assistance of four clerks. Two secretaries are said to have been first appointed towards the close of the reign of Henry VIII. The office, always one of influence, gradually grew in importance. On the Union of 1707 Anne added a third secretary of state for Scotland, which office, however, was soon done away with. In the reign of George III. there were at first but two secretaries; for a time there was a third for America, but his office was abolished by statute in 1782. While the secretaries were two in number both equally directed home affairs; to the one were committed the foreign affairs of the northern, to the other of the southern department. Irish affairs belonged to the province of the elder secretary.

There are now seven principal secretaries of state, who are respectively appointed for home affairs, foreign affairs, war, the colonies, India, air, and Scotland. They are all appointed by the sovereign by delivery of the seals of office, followed by the issue of a patent under the great seal, and they are always members of the Privy-council and of the cabinet. Though each has his own department, he is considered capable of discharging the duties of the others; a member of the House of Commons if removed from one secretaryship to another does not thereby vacate his seat. Not more than six (since 1926) secretaries or under-secretaries of state may sit at one time in the House of Commons.

To the Secretary of State for the Home Department are entrusted the home affairs of England and Wales, as well as of the Channel Islands and the Isle of Man, except those, such as education, health, and agriculture, which are administered by other and newer departments. He has the charge of the maintenance of the internal peace of the whole country, the security of the laws, and the administration of justice so far as the royal prerogative is involved in it. He provides for the suppression of riots. He has the ultimate supervision of all that relates to prisons and criminals; and numerous statutory powers have been given him regarding police, sanitary matters, the regulation of labour, &c. He is responsible for the exercise of the prerogative of mercy; application for pardon or commutation of sentence forms no small part of the work imposed on the Home Secretary. All patents, licences, dispensations, charters of incorporation, commissions of the peace and of inquiry pass through his office. He is empowered to grant certificates of Naturalisation (q.v.) to foreigners. He also represents Northern Ireland in the British cabinet. His patronage is very considerable, including the nomination to a large

number of judicial offices. Among his powers is that of examining and committing for trial persons charged with offences against the state, a function which, though its legality has been called in question, has often been exercised.

The functions of the Home Office are now mainly confined to England and Wales, with the Channel Islands and the Isle of Man, but almost all of them formerly extended, and some of them still extend, to Scotland. Up to 1885 the Home Secretary took charge of Scottish affairs, and was assisted in their administration by the Lord Advocate. By an act of that session, supplemented by another in 1887, a Secretary for Scotland was appointed, and the Scottish Office was constituted. The Secretary for Scotland, in addition to functions previously belonging to the Local Government Board and the Scottish Education Department, had transferred to him 'all the powers and duties vested in and imposed on the Secretary of State by Act of Parliament or by custom so far as such powers and duties relate to Scotland,' with certain exceptions. Included in the transferred powers were the prerogative of mercy and the responsibility for the maintenance of order. There are certain powers of a universal nature which could not be regarded as related to any one part of Great Britain, particularly naturalisation and extradition, which the Home Secretary still retains; and in order to ensure uniform administration in the two countries in question relating to factories, explosives, vivisection, the control of aliens and the control of dangerous drugs, the powers of the Home Secretary are made to extend to the whole of Great Britain. By an act of 1926, the status of the Secretary of Scotland was raised to that of a Principal Secretary of State, and all the powers and duties of the Secretary of Scotland were transferred to the Secretary of State for Scotland.

The Secretary of State for Foreign Affairs is the responsible adviser of the crown in all communications between the government and foreign powers. He negotiates treaties, either directly with the foreign ministers resident in the country, or through the British ministers abroad. It is his duty to inquire into the complaints of British subjects residing in foreign countries, to afford them protection, and to demand redress for their grievances. The Foreign Secretary recommends to the sovereign all ambassadors, ministers, and consuls to represent this country abroad. He grants Passports (q.v.) to British subjects travelling abroad.

The Secretary for the Colonial Department has the supervision of the laws and customs of the colonies and dependencies (except India), watches over their interests, apportions the imperial troops necessary for their defence or police, appoints governors, and sanctions or disallows laws reserved for his consideration by colonial governors. The responsibilities of the colonial office in regard to the greater colonies have been much decreased by the extension of responsible government (see COLONY).

Each of these secretaries of state is assisted by two under-secretaries of state— one permanent, while the other is a political officer dependent on the administration in power.

The Secretary of State for India, whose office dates from the abolition in 1858 of the double government of India by the Court of East India Directors and Board of Control, has the same control over the government of India which was formerly exercised by these bodies, and countersigns all warrants and orders under the sign-manual relating to India. He is assisted by an under-secretary, who is also a member of the legislature and loses office with the cabinet, and by a permanent under-secretary and assistant-secretary, as also

by a council of not more than fourteen members, over whom he presides. The procedure for the sending of orders and communications to India, and in general for correspondence between the Secretary of State and the Governor-general in Council or any local government, is now prescribed by the Secretary of State in Council. All despatches from governments and presidencies in India must be addressed to the secretary.

The Secretary of State for War administers the military forces of the crown along with the other members of the army council. He is responsible to the crown and parliament for all the proceedings of the council, but the council is vested in most of the powers formerly exercised by the Secretary of State. He prepares for the royal signature and countersigns commissions in the army, and recommends to the sovereign for the order of Knighthood of the Bath. Down to the Crimean war there was also a Secretary-at-war, a high officer of the ministry, who had the control of the financial arrangements of the army, and was the responsible medium for parliamentary supervision in military affairs. He was quite independent of the Secretary of State and of the military authorities.

By the Air Force (Constitution) Act of 1917 an additional Secretary of State, for Air, was created.

For a full account of the secretarial deputations, see Todd's *Parliamentary Government in England* (new ed. by Spencer Walpole, 1892), and the *Whitehall Series* containing Sir Edward Troup's *The House Office* (1925), &c.

In the cabinet of the United States there is one Secretary of State, who is specially charged with foreign affairs.

Secretary of the Navy, now called the Secretary to the Admiralty, is the permanent secretary, generally selected from the principal clerks, though instances have occurred of a naval officer holding the post, e.g. Captain Robert Hall. The Secretary attends board-meetings, signs all orders issued, and is responsible for the discipline of the Admiralty Office. This appointment is of long standing, and was once held by Samuel Pepys. —The Financial Secretary is a ministerial supporter in the House of Commons; he is mainly responsible for the financial administration of the service. He changes, of course, with the ministry, of which he is a subordinate member.

Secret Chambers were mostly of post-Reformation construction, designed as 'priest's holes,' or hiding-places for 'trafficking mass-priests,' in the days when to say mass was either high-treason or felony. They might also, of course, conceal Jacobite or other conspirators; and that of Danby Hall, the seat of the Scropes, was found, on its rediscovery about 1800, to contain arms and saddlery for forty or fifty troopers, stored up, it would seem, against some intended rising. Brother Nicholas Owen, S.J., *alias* 'Little John,' who with Father Garnet (q.v.) was arrested at Hindlip Hall, and who is termed 'that useful cunning joiner of those times,' was a chief contriver of these secret chambers, and after his capture 'was divers times hung upon a Topcliff rack in the Tower of London to compel him to betray the hiding-places he had made up and down the land.' They were oftenest formed in the thickness of a wall, and the entrance to them might be through a panel, behind a hinged picture, beneath a hearth-stone, up a chimney, &c. About a century since at Irlham Hall, Lincolnshire, it was noticed that one of the chimneys of a cluster was unblackened, and it proved to be really a shaft to give light and air to a priest's hole, the entrance to which was gained by removing a single step between two servants' bedrooms. You then come to a panel,

with a very small iron tube let into it, through which any message could be conveyed to the occupant. This panel removed, a ladder of four steps leads down to the secret chamber, which is 8 feet long, 5 broad, and just high enough to stand upright in. Another at Ingatstone Hall, the old seat of the Petres, is 14 feet long and 10 high, but only 2 wide; this contains an old chest for vestments. How cunningly these chambers were contrived may be seen in the fact that at Hindlip the minutest search was made ten whole days in vain, till Garnet came forth himself, forced by want of fresh air, not of food, for marmalade and other sweetmeats were lying by him, and 'broths and warm drinks had been passed to him by a reed through a little hole in a chimney that lacked another chimney into a gentlewoman's chamber.' Smugglers during the 18th century had sometimes secret chambers of a sort, for the storage of 'run' goods, at farm-houses a few miles inland; nay, so late as 1860 one such was used for illicit malting in a Suffolk village, till the excise officer detected its whereabouts by pouring water over the floor above. But for the last historical instance of their use we must look abroad, to Nantes, where in 1832 the Duchess de Berri (q.v.), a corpulent lady, was, with two gentlemen, roasted out of a secret chamber at the back of a fireplace, after sixteen hours' patient endurance.

The following is a list of some of the best-known secret chambers, arranged under counties in alphabetical order, with the date sometimes of the erection of the mansion (not necessarily, of course, of the priest's hole) or of its demolition, and with the names of traditional occupants: *Berkshire*, Lyford; Milton, near Abingdon; Watcomb, Bucks, Dinton (regicide Mayne). *Berwick*, Bemersyde. *Cambridge*, Sawston. *Cheshire*, Bollington; Lyne Hall, near Disley. *Cornwall*, Bochnym. *Cumberland*, Netherhall, near Maryport. *Derby*, Bradshaw Hall, near Chapel-en-le-Frith; Hallam. *Durham*, Bishop Middleham (in which a 'tectoallier drank himself to death with brandy,' Southey's *Commonplace Book*, 4th series, 364). *Essex*, Ingatstone (temp. Henry VIII.). *Forfar*, Glamis Castle (the Toad-headed Monster). *Gloucester*, Bourton-on-the-Water (demolished 1834). *Hants*, Hinton-Ampner; Mapledurham, Moyles Court (Lady Tulse's house); Titchborne. *Hertford*, Treagoe. *Herts*, Knebworth (1553, demolished 1811). *Leicestershire*, Ashes, at Gossnargh; Burwick; Lowestock Hall in Bolton parish (demolished 1816); Lydiat; Manns Hall, in Kirkham parish (Cardinal Allen); Speke Hall; Widnes House, near Warrington; Stonyhurst (in great tower). *Leicestershire*, Long Clawson. *Lincoln*, Ingham Hall (c. 1500); Kingerby Hall; Upton. *Middlesex*, Canonbury Tower, Islington; Cromwell House, Highgate; White Welles House. *Monmouth*, Raglan Castle. *Norfolk*, Oxburgh House. *Northants*, Burghley House; Harrowden. *Northumberland*, Netherwitton (Lord Lovat?); Wallington Hall. *Notts*, Workop Manor (burned 1761). *Oxford*, Broughton Castle; Chastleton; Minster Lovel (Lord Lovel, Sumner's adherent, starved to death here, 1487, and skeleton found in 18th century?). *Pembroke*, Carew Castle (temp. Henry I.). *Shropshire*, Boscehol (Charles II.); Pitchford; Plowden; White Ladies (Charles II.). *Somerset*, Trent Manor House (Charles II.). *Stafford*, Moseley Hall (Charles II.). *Suffolk*, 'Ancient House,' Ipswich (1567; Charles II.?); Colkham Hall; Melford Hall. *Surrey*, Benton; Ham House, at Weybridge (1610, hiding-places shown to Evelyn by Duke of Norfolk); Sanderstead Court; Sutton Place, near Guildford (temp. Henry VIII.). *Sussex*, Ashbourne Place (Bishop Juxon); Cowdray (Lord Montague); Parham; Pax Hill, near Cuckfield (built by Andrew Boorde, q.v.); Slindon; Street Place, West Grinstead. *Warwick*, Coughton Court; Compton-Wynates (c. 1520). *Watts*, Hcale House, near Amesbury (Charles II.; visited by Dr Johnson, 1783). *Worcester*, Arnscoft Manor House, near Shipston-on-Stour (George Fox the Quaker); Birtmorton Court (14th century; Sir John Oldcastle?); Harborough Hall; Harvington; Hindlip Hall (eleven hiding-places, now demolished; see above); Little Malvern Court. *Yorkshire*, Abbey House, Whitby; Danby Hall,

near Bedale; Dinsdale; the Grove, Leyburn; the 'New Bidding,' near Killy Knowle; Red House (Henry slingsby). See *Notes and Queries* for 1855-56 and 1870-85; Chambers's *Book of Days* (1869); *Chambers's Journal* for 1883 and 1886; and Allan Fen's *Secret Chambers and Hiding Places* (1901).

Secretion is a vital process in which certain cells of the body form within themselves definite products, which accumulate and are usually discharged. The cells specialised for secreting are called glandular, and many are often united to form a gland. The definite products formed by the activity of the glandular cells are called secretions, this term being applied both to process and products. All the digestive juices, the silk of silkworms, the webs of spiders, the wax of bees, the nectar of flowers, and the like, are secretions. They are formed by the activity of the living matter from materials derived from the blood, or, when there is no blood, from the supplies of food which otherwise reach the glandular cells. They are discharged sometimes by a slow outpouring comparable to filtration through the free surface of the cell, sometimes by the more or less complete rupture of the cell. The process of secretion is usually periodic, intervals of quiescence alternating with those of activity. See GLANDS, PHYSIOLOGY, DIGESTION. For the secretion of plants, see PHYSIOLOGY (VEGETABLE).

Secret Service Moneys, in the widest sense of the term, include all funds placed at the disposal of ministers of state, to be expended at their discretion without giving an account. In the 18th century large sums were paid for secret service out of the king's civil list; these moneys were used chiefly for the purpose of bribing members of parliament. In 1782 Burke carried his scheme of financial reform, the amount to be paid from the civil list was limited to £10,000, and ministers expending secret service money were required to make a declaration that they had done so in accordance with the intentions of parliament. In 1886 the matter was further considered, and an act was passed under which the payment authorised by the law relating to the civil list was discontinued. All moneys required for secret service are now included in the estimates. The declarations required by Burke's Act are sufficiently stringent to prevent abuse. Almost all governments have some fund of which no public account is given; and all secret expenditure is naturally viewed with suspicion by the representatives of the taxpayers. See SPY.

Secret Society. Under this name are embraced voluntary associations which are found in many different types of human society; no general definition can be given, for the simple reason that the secrecy to which the name refers may imply no more than the existence of a password known to all members of a secret society, whose rites, &c., may be otherwise universally known. On the other hand, the secret element may be the names of members, often because the objects of the society, though generally known, are illegal; or the rites may be shrouded in mystery, because they are deemed to be too valuable to divulge to any but those who enter the confraternity; finally, the objects of the society may be secret, and this is often due to the knowledge that the feeling of mystery thus engendered will add to the influence of the society.

Among civilised peoples the secret society is often political in its objects; the Ku Klux Klan is a typical case; it was founded in the Southern states after their defeat by the North in order to redress the balance against the whites due to pro-negro legislation. Other American political societies, like

Tammany, were originally established as patriotic organisations on aboriginal models, but have now become political institutions. On the other hand, societies which originally had ulterior objects, such as the Freemasons, may become purely social in their functions.

Among non-civilised peoples secret societies often take a more prominent place than among ourselves, partly because they may fulfil judicial and other functions which with us appertain to professions or to the state, partly because in the absence of any competing organisation any body of men is able to impose its will on the unorganised mass. Secret societies of various kinds are found in Australia, Oceania, North and South America, and Africa; as the history and meaning of them seems to differ each area has to be treated independently; but this does not mean that with the progress of knowledge it may not be possible to trace all forms ultimately to a common origin.

In Australia, and perhaps in Africa, if we take the term secret society in its strictest sense, the society of adult men, which initiates youths into tribal secrets, often by means of painful rites, may be termed a secret society, because the esoteric knowledge is kept not only from the uninitiated but also from the women. As, however, all adult males are normally initiated we can hardly speak of them as forming a voluntary association; they are in many respects analogous to the age grades of other areas.

In Melanesia, especially the southern part, the secret society is found among less advanced peoples, though there are exceptions, such as the Banks Islands, and it is associated with matrilineal descent. In typical cases there are two societies, the Sukwe in the village, only partially secret, which has the men's club-house as its centre, and the Tamate, or ghost society, which is really secret and meets in the bush; an important point is that in the latter society are various grades, some open to men who do not belong to the Sukwe, others to none but members of the Sukwe. One of the features of initiation into Tamate is the pretended death of the novice, an element widely found in other secret society areas. Rivers accounted for these societies by the theory that they are due to interaction between the aborigines of the islands and a body or bodies of immigrants, each party having its own cults and rites, which they tended to keep secret from strangers; it is not impossible that the animal masks of the Tamate derive their origin from totemic clans which used the masks representing their totems in annual rites.

In Polynesia we hear most of societies associated with warriors and young men or with the higher ranks (e.g. Kairoi of the Marquesas, the Arooi of Tahiti); no systematic study of them has yet appeared; when they came to the knowledge of civilised observers they were mainly social in their functions, often notoriously licentious. But it is quite possible that they are ultimately one with the secret society of Melanesia, though their development has been different owing to the difference in the relations between aboriginal and immigrant elements of the population.

In North America some secret societies were or are connected with religious mysteries, with the keeping of records, with the dramatisation of myths, &c., while others were devoted to leechcraft, war, &c. Formal initiation into the tribe was probably rare, but the secret society was often associated with progress in clan status; it also served to create ties analogous to those of kinship. From one point of view we may classify these societies into social and esoteric, with the former being sometimes associated age grades, which are a natural element in military tribes; while the

latter were organised mainly in connection with a religious mystery, though they might have other functions; not infrequently such a society had a drama which might be publicly performed. A singular feature of the secret society among the Kwakiutl is that the year is divided into two portions, sacred and profane, each with its own social organisation. Among them the secret societies are in some respects very near to totemic clans, and may have been modelled on them. Membership may be acquired, however, by marriage or by killing a person and securing his paraphernalia. Among the Hopi, on the other hand, the secret society seems to have developed from the local group, which maintained its own ritual.

We know little of the secret societies of South America; a prominent feature of the rites seems to be the use of ordeals intended to test the courage of candidates.

In Africa there are three main areas of secret societies: (a) the extreme west beyond Liberia, (b) Nigeria and Kamerun, and (c) the Congo; societies are found elsewhere but not in such numbers; certain areas, like the Gold Coast, are for some obscure reason practically without societies of the ordinary African type, though there are religious confraternities which make use of masks. African secret societies can from one point of view be classified into initiation societies (Labi of Baya tribe), societies connected with the cult of the dead (Oro, &c., of Yoruba), or religious rites (Imandwa of Ruanda), age grades (Masai), and so on; but for practical purposes such a grouping is of little value; for it is clear that the Yoruba societies, which began by practising a cult of the dead, developed into organisations with police and judicial functions. It is therefore necessary to draw a sharp distinction between the original meaning of a society and its later developments.

The societies with political functions are confined, so far as can be seen, to the coastal area from Sierra Leone to Kamerun; three may be singled out as of special importance, the Poro of the Mendi, Timne, &c., the Ogboni of the Yoruba, and the Egbo of Calabar. The Poro society, which may be of great antiquity, though it is not supreme, yet holds in check the chief who rules the area in which there is a branch of the society; in the Yoruba country, on the other hand, the Ogboni was the actual sovereign power; it was composed of the heads of important families, and even they were accepted for membership only if they were of proved capacity and reliability. Other societies were subordinate to it, such as the Zangbeto of Porto Novo, with police duties; the Oro society was, especially among the Egbo, the executive force of the Ogboni. A striking feature of Egbo rule in Calabar was the regulation that it exercised its judicial functions only at the instance of a member; thus a non-member had to purchase the protection of a member before his case could be heard. Outside Africa the secret society seems to be confined to males in almost every case; but in Africa not only are women admitted, exceptionally, to male societies like Poro, but some societies are composed of both sexes, while others, like Bundu in Sierra Leone, are confined to women; these latter are usually for the purpose of initiating young girls; among the Mpongwe, however, the women have a powerful society, whose main object in practice is to protect women against ill-usage by men.

Some of the African societies, e.g. Poro and Egbo, protect property by a mark, such as a miniature broom near a field in which a crop is growing; this brings us near the practice of Tabu (q.v.), and finds its counterpart in Melanesia.

There are also in use in Africa secret languages for use among the members of a society; this has not been recorded elsewhere. Another feature of special importance in Africa is the belief in the existence of a tutelary spirit of a society, which is believed to kill the novice. But a complete survey of the subject is impossible in a short space, and for further details the reader is referred to works and articles cited below. Generally speaking, the rites of secret societies, and of initiation generally, are to be explained as, firstly, the removal of the candidate from the profane world for, secondly, a period of instruction prior to admission to the ranks of the adults or of the initiates; and, thirdly, a ceremony or series of ceremonies to remove him from the world in which he has lived as a candidate, and to readmit him to the profane world.

For a more extended account see *Hastings's E.R.E.*, and the authors cited in the footnotes and bibliography; to these may be added (for Africa) D. Westermann, *Die Kpelle*; (for Oceania) W. H. R. Rivers, *History of Melanesian Society*; (for America) papers by Bos, Fowkes, Cuhing, Mrs Stevenson, and others in the *Reports of the Bureau of American Ethnology*.

Secret Writing. See CRYPTOGRAPHY, INK.

Secrole. See BIGNARES.

Sector. In Geometry, is a portion of a circle included between two radii and the intercepted arc of the circumference. The area of a sector is equal to that of a triangle whose base is equal in length to the intercepted arc, and whose perpendicular height is equal to the length of the radius.

Secularism is the term applied to a system of ethical principles advocated from about 1846 by J. G. Holyoake (q.v.). It is a new form of Free Thought seeking human improvement by the instrumentality of material means; and it aims to substitute the piety of usefulness for the usefulness of piety, and to treat error as a defect of knowledge rather than a defect of right intention. It takes as its axiom that what is best for humanity will command the approval of the author of humanity; what is 'best for humanity' being determinable by reason, tested in this life by the experience of this life. Experience teaches that science is the providence of man. Science teaches that improvement and progress can be surely attained by the wise use of material agencies. Material agencies act by causation—the law alike of nature and mind. Causation in will shows that, if men can be induced to pursue that conduct which is most useful, habit will render it the most agreeable. Causation in opinion implies that error can only be eradicated by the eradication of its cause. False ideas can only be extirpated by true ideas. Hence the social aim of Secularism is to establish those material conditions in which, as far as forethought can compass them, it shall be impossible for a man to be deprived or poor. Morality of conduct—the main thing in this life—is determined by its conduciveness to the welfare of others as well as ourselves. This utilitarian rule has this advantage, that, while the strongest faith may co-exist with the greatest ignorance, utilitarian morality can only begin with intelligence, and the morality will be on the whole the greater the wider intelligence becomes.

Since the Secularist's profession is that mankind can be largely improved by well-devised material means, it belongs to him to inculcate a sense of responsibility for the condition of the world, so far as his exertions or influence can extend. The theological mind cares mainly for the souls and little for the social welfare of others. The Secularist holds that Truth and solicitude for the social welfare of others are the proper concern of a soul worth saving. Only minds with goodness in them have

the merit of future existence in them; minds without veracity and generosity die; the element of death is in them already. The majority of people conduct life by believing what they wish, not by conforming to what they know—an easy, loose, pleasant kind of faith which commands many followers; belief without inquiry and action without the sense of social responsibility are always popular. He who undertakes the duty of selecting his principles protects himself from hereditary error. Every step towards reasoned truth implies thought, investigation, patience, courage, and accountability.

But to acquire truth thought must be free, uninfluenced by any threat or penalty, legal, spiritual, or social; if inquiry must end in a prescribed conclusion or the inquirer perish everlastingly, no one but a fool would inquire at all. Unless men regard truth as higher than consequence thought must be sterile. Even inquiry, with whatever courage conducted, would be sterile without the right of free publicity of the results; the publication of new truth is the duty of the thinker, and his silence or supineness is a social crime. The free search, the free publicity, the free criticism, and free action of opinion are necessary secular conditions—conditions which have never been insisted upon as necessary to spiritual life. Though these conditions are used by science they are not claimed by it, being outside its province. Secular-minded thinkers alone have formulated and vindicated these conditions.

A main object of Secularism is to establish morality on grounds independent of Christianity, for so long as morality is supposed to have but that foundation it will not be influential on those who reject or do not accept Christianity. There is unquestionably a vast outlying class in every European country, and still more in India, who are without the pale of Christianity. Secularism is intended for these, and for all who deem theology indefinite, inadequate, undesirable, or unreliable. The object of Secularism is to afford these classes a knowledge of principles addressed to their common reason and intelligence, by an appeal to principles of a secular nature, common to humanity in every state and clime. The reality of Deity and a future state, being undeterminable by the experience of this life, are not secular questions; Atheism and Theism are alike without the means of demonstrating their own truth, and, though they may be subjects of personal belief, cannot be secular tenets—provable by experience. What is incapable of proof is usually decided by desire, and is without the conditions of uniformity or certitude. Morality, which fulfils the conditions of the highest religion, is attainable irrespective of belief in things outside this world. The uses of the universe are no more dependent upon the knowledge of its origin than the uses of a habitation are dependent on the knowledge of its architect.

Secularism does not ask to be esteemed a Christian system as Christianity is commonly accepted, but an ethical system. So far as Christianity is moral Secularism has common ground with it; but its reasons for being moral are not Christian reasons, but human considerations alone. Christianity attaches salvation to belief; Secularism seeks it in conduct. Christianity holds that inquiry must end in faith. Secularism teaches that regardless of consequences it should end in truth, and maintains intelligent sincerity to be sinless—not errorless, but without guilt. The doctrines of eternal perdition for honest dissent, of the natural depravity of man, of the wilfulness of an uncaused will, and of deliverance by prayers are immoral, discouraging, and traitorous; and

secular controversy on the moral tendencies of these tenets is alone useful as advancing and vindicating secular ideas. Upon questions of miracles, prophecy, genuineness or inspiration of Scripture Secularism troubles itself little. If miracles are good it is a pity they have ceased; morality needs no inspiration. Precepts have no force unless corroborated by experience, and it is ill with men when they take authority for truth, instead of truth for authority.

Secularism does not say there is no light or guidance elsewhere, but maintains that there is light and guidance in secular truth, whose conditions and sanctions exist independently, and act independently. Secular knowledge is that kind of knowledge which is founded in this life, which relates to the conduct of this life, conduces to the welfare of this life, and is capable of being tested by the experience of this life. Mathematics, botany, chemistry, political economy are secular subjects of instruction; Secularism includes the education of the conscience. If a sum in arithmetic is wrong it can be proved by a new way of working it; if a medical recipe is wrong the effect is discoverable on the health; if a political law is wrong this is sooner or later apparent in the disaster it brings with it; but if a theological belief is wrong we must die to find it out.

Secularism is separateness and does not confuse together distinct things. By repute there are two worlds—the unknown and known. The interpreter of the unknown is theology; the interpreter of the known is experience, which teaches the uses of this world. Since mankind would perish if all were called upon to agree upon the authorship of the world before using it for the purposes of life, the Secularist forbids no opinion and gives none on a matter beyond his knowledge. He does not undertake to say whether nature is the outcome of intellect, or intellect the outcome of nature. He believes that there is no religion higher than truth, and that the reverence of that which is honest, and just, and compassionate exalts humanity; that manliness is self-helping and not mendicant, and vexes not the ears of the All-Wise with capricious supplications. Secularism seeks to create independent thinkers in all parties, and its adherents are content when their advocacy induces others in religious, social, and political movements to follow in the path of reason, experience, and material improvement.

Seculars. See CLERGY.

Secunderabad. See HYDERABAD.

Securite, the name of a safety explosive similar to roburite. It consists of a mixture of ammonium nitrate (74 parts) and meta-dinitro-benzene (26 parts). A variety known as flameless securite contains in addition oxalate of ammonium.

Security, in legal language, means a right conferred on a creditor which makes him secure or certain to recover what is due to him. Security may be given by setting aside some part of the debtor's property to answer the creditor's claim; for the modes in which this may be done, see PAWN-BROKING and MORTGAGE. 'Securities for money' is a very wide term, including the shares, stocks, and debentures of public companies, &c. See CAVANAGH'S *Law of Money Securities* (2d ed. 1885) for a compendious account of the English law relating to the subject. And see the articles CAUTION, GUARANTY.

Sedalia, capital of Pettis county, Missouri, 188 miles by rail W. of St. Louis. It has large railway-shops, flour-mills, manufactories of woollens and machinery, and is the centre of an agricultural district. Pop. 21,000.

Sedan, a town and frontier fortress of France, dept. of Ardennes, stands on the Mense, 64 miles by rail N.E. of Reims. Colbert founded here cloth-factories, the fabrics of which have a European reputation. Various branches of metal-working are carried on, and there is an active trade in wool. Pop. 17,500. The fortress, or rather the citadel, capitulated to the Germans in 1815; but Sedan is chiefly noted for the surrender (2d September 1870) of Napoleon III. and an army of 83,000 men, with all their accoutrements and baggage, to the Germans in the Franco-German war. The fortress was dismantled after 1875. Marshals Turenne and Macdonald were born here. Previous to its incorporation with France (1642) it was the capital of an independent principality (that of the Comtes de la Marek and later dukes of Bouillon) and a Protestant stronghold. Its industrial prosperity was largely due to the influx of Huguenots; and at its theological seminary, famous until the revocation of the Edict of Nantes, notable Scotsmen such as Andrew Melville taught.

Sedan Chair, a portable covered vehicle for carrying a single person, borne on two poles by two men. The name is derived from the town of Sedan, where this species of conveyance is said to have been invented. The Duke of Buckingham used one in the reign of James I., a proceeding which gave general offence, it being made matter of public remark that this royal favourite used his fellow countrymen to do the work of beasts. In September 1634 Sir Sanders Duncombe got a letter patent, granting him the sole right and privilege for fourteen years to use and let for hire within London and Westminster 'covered chairs' to prevent the unnecessary use of coaches; according to Evelyn he got the notion from Naples. Sedan chairs were largely used during the greater part of the 18th century, being found very well adapted for transporting persons, in full dress, to public and private entertainments. Not only were there numerous public conveyances of this kind in London and all considerable towns, but the owner of every large mansion had his private sedan handsomely fitted up. In Edinburgh at the close of the 18th century sedan chairs were far more numerous than hackney coaches, and were almost all in the hands of Highlanders. They were in use in London so late at least as 1830, at Winchester as 1851, at Peterborough and Edinburgh as 1860, at Genoa as 1882, at Newcastle as 1885, and at Bury St Edmunds as 1890. Sedan chairs have also been employed as ambulances for conveying sick persons to hospitals.

Sedatives are substances or measures which exert a depressing or soothing effect on any part of the body. They are called pulmonary, nervous, gastric, cardiac, &c. sedatives according to the special part of the organism on which they exert their effects. They are employed to relieve pain, and to reduce over-activity and hyper-excitability of any organ or system. They embrace a very large number of commonly used medicines.

Sedburgh, a small town in the West Riding of Yorkshire, on the Rawthey, 45 miles by rail N.W. of Skipton. It has a Norman church and a grammar-school (1551) of high repute, where Sedgwick was educated and Hartley Coleridge was a master.

Sederunt. See ACTS OF SEDERUNT.

Sedge. See CAREX.

Sedgefield, a town of Durham, 9 miles NW. of Stockton, with a cruciform Early English church and a grammar-school.

Sedgemoor, a marshy district in the middle of Somersetshire, 5 miles SE. of Bridgwater, was the scene of the fight between 4000 soldiers of King James II. and 8000 of the undisciplined followers of the Duke of Monmouth, on 6th July 1685; the latter were defeated, with the loss of a thousand slain on the battlefield and several hundreds more in the subsequent pursuit and in the executions that followed. The account of the fight in Macaulay's *History* should be read, and also the description in Blackmore's *Lorna Doone*.

Sedgley, a town of Staffordshire, 3 miles S. of Wolverhampton, with coal-pits and ironworks. Pop. 17,300.

Sedgwick, ADAM, for more than fifty years Woodward professor of Geology at Cambridge, was born at Dent in Yorkshire in 1785, graduated from Trinity College, Cambridge, in 1808, and for the next ten years lectured as a Fellow of his college. He was then elected professor of Geology (1818); and in the following year, on the foundation of the Cambridge Philosophical Society, he was chosen one of its secretaries. For many years he took an active part in the discussions of the Geological Society of London, of which he was president in the years 1829 to 1831. Most of his writings were couched in the form of papers contributed to the *Transactions* of these two societies. His best and most successful labour was expended upon the investigation of the palaeozoic and crystalline rocks; and his longest work was a dissertation on *British Palaeozoic Rocks and Fossils* (Lond. 1851-52). Along with Murchison (q.v.) he made a systematic study of the geology of the Alps, and of the Devonian system in England. Although he did admirable service in establishing geology on a thoroughly scientific basis, Sedgwick was in other regards firmly rooted in distinctively conservative ideas: he made a trenchant attack upon *The Vestiges of Creation* in the *Edinburgh Review*, and put himself in strong opposition to Darwin's *Origin of Species*. He was canon of Norwich Cathedral from 1834, and for some years held the office of vice-master of his college. His death occurred at Cambridge, on 25th January 1873. In 1890 appeared 2 vols. of his *Life and Letters*. The Sedgwick Memorial Geological Museum at Cambridge (by T. G. Jackson) was opened in 1904.

Sedimentary Rocks. See GEOLOGY (p. 154), PTEROGRAPHY.

Sedition, a general name given to such offences against the state as fall short of treason. In the law of England it is not a strictly technical word. Writing, publishing, or uttering words tending to excite subjects to insurrection, though not urging them to rebellion or total subversion of the government, come under the denomination of seditious libel, and seditious meetings or assemblies are punishable as misdemeanours. The crime consists in the intention to excite disaffection against the sovereign, the government, or the administration of justice, or to excite the sovereign's subjects to attempt, *otherwise than by lawful means*, the alteration of any matter in church or state by law established, or to promote ill-will and hostility between different classes of such subjects.

In Scotland sedition is distinguished from Leasing-making (q.v.), in so far as the object of the latter is to disparage the private character of the sovereign, while the former crime is directed against the order and tranquillity of the state. The punishment of sedition, formerly arbitrary, is now restricted to fine and imprisonment. See Lord Cockburn's *Trials for Sedition in Scotland* (2 vols. 1888).

Sedley, SIR CHARLES, courtier and poet, was born almost certainly in London, and not at his father's seat at Aylesford, Kent, in 1639, a maternal grandson of the famous Sir Henry Savile. He was educated at Wadham College, Oxford, repaired to court at the Restoration, and soon became notorious at once for debauchery and wit. Later he sat in parliament for New Romney, retired from court, and joined the party of Mary at the Revolution, out of *gratitude* to James, who had seduced his daughter, and made her Countess of Dorchester. 'Since his majesty has made my daughter a countess,' said he, 'it is fit I should do all I can to make his daughter a queen.' Johnson's line, 'And Sedley cursed the form that pleased a king,' has kept alive the memory of this sordid amour, but it is worth noticing that the daughter, speaking of what attracted the king, decries her own beauty with something of her father's wit: 'It cannot be my beauty, for he must see that I have none; and it cannot be my wit, for he has not enough to know that I have any.' Sedley survived till 1701. He left five authentic plays, among them *The Mulberry Garden* and *Bellmoura*, but what little fame remains to him now rests solely on a few songs and *vers de société*. Even his licentiousness does not wear the open grossness of the age.

Seduction, in English law, means the act of decoying away a servant or member of a family from his or her duty; in a narrower sense it includes offences against the chastity of women, where the offender accomplishes his purpose by persuasion, not by force. It is not a criminal offence unless the facts are such as will support a charge of Rape (q.v.) or Abduction (q.v.). No action can be maintained by a woman who is seduced, however basely or deceitfully the seducer may have acted; but a master or mistress may sue in respect of loss of service caused by the seduction. If a father or mother can make out loss of service, damages can thus indirectly be recovered for the seduction of a daughter; and it is the inveterate practice of juries to give 'exemplary damages' in such cases, if the conduct of the defendant has been heartless or dishonourable. The rule of law is most irrational: a rich man, whose daughter occasionally makes his tea, can recover damages if she is seduced; a poor man, whose daughter is in a situation away from home, cannot. In Scotland the woman can sue in her own name if deceit has been used; but the difficulty of showing that the deceit was the only cause of the injury prevents such actions from being common. Redress is sometimes obtained by an action for breach of promise of marriage or (in Scotland) by an action of declarator of marriage; and the father of an illegitimate child can be compelled to maintain it.

See Smith's *Law of Master and Servant*, 7th ed. (1922); Walton on *Husband and Wife*, 2d ed. (1922).

Sedulius. See HYMN.

Sedum, a genus of plants of the family Crassulaceae, having the calyx in four to eight (usually five) deep segments, which often resemble the leaves, the same number of spreading petals, twice as many stamens, and four to eight (usually five) ovaries, each with a nectariferous scale at the base. The species are numerous, with succulent, often roundish leaves, and pretty, star-like flowers. Many of them grow on rocks, whence the English name Stone-crop. They are natives of the temperate and cold parts of the northern hemisphere; some are British. Among the British species are *S. Telephium*, popularly called Orpine, and *S. aeneum*, the most common, whose brilliant yellow flowers adorn the tops of old walls, the debris around quar-

ries, &c. Many of the dwarf-growing species are employed in the style of flower-gardening called 'carpet-bedding.'

Seed. In the higher plants, which are called Spermatophytes or 'seed-plants,' the egg-cell lies within an Ovule (q.v.), and after fertilisation grows into an embryo plant, with one or two primary leaves—all before separation from the parent plant. What is separated, to begin in favourable conditions a new and independent life, is a seed, which may be defined as a ripe ovule containing an embryo plant.

From the article OVULE the reader will understand how the seed is formed, how a mass of tissue—the nucellus—borne by the carpellary leaf contains a female spore or 'embryo-sac,' whose nucleus divides into a female nucleus or oosphere, and a number of other nuclei of minor importance. The fertilised oosphere, within the embryo-sac, imbedded in the nucellus, and surrounded by the coats of the ovule, develops into an embryo plant, and the whole structure is called a seed.

Structure of the Seed considered in relation to the Growth and Germination of the Embryo.—The segmented egg cell within the embryo-sac gives rise to the embryo and to a 'suspensor' which moors it. The figure shows somewhat diagrammatically the embryo moored to the top of the embryo sac by the suspensor; the base of the embryo next the suspensor is the region from which the radicle or young root will spring; the depressed apex at the opposite pole of the embryo is the region from which the plumule or young stem will shoot forth; the two sides form the young cotyledons or seed-leaves.

The embryo is the essential part of the seed; the other structures are subsidiary to its nurture, protection, and germination. The stored food material is of great importance, for after separation from the

the embryo. It may lie in the cells of the nucellus, around but not within the embryo-sac, as in the seeds of bananas and ginger; then we call it perisperm. Or it may lie in more intimate relation to the embryo, within the embryo-sac, formed from the secondary nucleus (see OVULE), as in the seeds of wheat and castor-oil; then we call it endosperm. Sometimes there may be both endosperm and perisperm, as in water-lilies. But in many cases there is neither endosperm nor perisperm, all the food material being stored within the embryo itself—in its cotyledons—as in the pea and wallflower, apple and almond. Such seeds are somewhat confusedly called ex-albuminons.

The food materials, which are so often and by no means happily summed up in the term albumen, vary in different kinds of seeds, but in a general way we may say that they consist of starchy, fatty, and protein substances in varying proportions.

Structure of the Seed considered in relation to the Protection of the Embryo.—As the embryo plant is a delicate structure, and as its separation from the parent plant is attended with vicissitudes, for the seed may be blown or carried into unfavourable conditions, and as most of the seeds which are liberated are not at once ready to germinate, it is important that the life of the embryo should be protected. This necessary protection is supplied in various ways. Around the ovule a double investment usually grows, and part of this investment is modified as the husk of the seed. The modification becomes marked as the seed grows ripe, as it begins to be ready for separation from the parent, as its supply of water begins to fail, as its vitality becomes more dormant; in fact the modification, which is a most useful one, is in part a necessary result of the physiological conditions of seed-ripening. In the modified husk it is generally possible to distinguish a thin, relatively unimportant internal tegmen from an outer, thicker, resistant testa. This testa may be leathery or woody, fleshy or gelatinous, smooth or hairy; it is variously adapted for the protection of the enclosed embryo. We may compare it to the shell or case which often surrounds the animal embryo. There is usually some relation between the nature of the seed-coat and that of the pericarp which surrounds the whole fruit; for in indehiscent fruits with tough walls (as in achenes and nuts) the seed-coat remains thin, while in dehiscent fruits the seed-coat is usually thick and hard. See GEOGRAPHICAL DISTRIBUTION.

Apart from the husk, the ripe seed is sometimes marked by a growth from its base or stalk. This is called the aril, and may be hairy as in willows and poplars, fleshy as in *Euronymus*, peculiarly shredded as in the mace of *Myristica fragrans* or nutmeg. When the growth from the base or from the funiculus of the seed is all on one side, it is called a caruncle, as in *Chelidonium majus*, *Viola tricolor*, and *Ricinus communis*. The outer surface of a liberated seed may also bear a mark at the place (hilum) where it separated from the funiculus; this is well seen in the common bean. Sometimes also a small opening or depression (*circutricula*) persists as a remnant of the micropyle or aperture by which the pollen-tube passed between the coats of the ovule. In many cases the region marked by an external scar, corresponding to hilum or to micropyle or to both, is of special importance, the tissue of the seed-coat being modified so as to act as a sponge through which water soaks in to the embryo within. Many of the hard coats of seeds have, instead of this special sponge, numerous minute canals perforating their dense substance.

Structure of the Seed considered in relation to

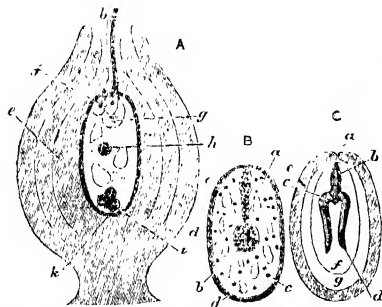

Diagram showing general structure of Seed (from Parker's *Elementary Botany*):

A, section of ovule; *n*, pollen-tube; *e*, nucellus; *f*, accessory cells or synergids; *g*, ovum or egg-cell; *h*, central nucleus of embryo-sac; *i*, antipodal cells of embryo-sac; *k*, embryo-sac. B, embryo-sac, showing *a*, suspensor; *b*, embryo or segmented ovum; *c*, nuclei; *d*, vacuoles. C, section of a seed, showing *a*, the micropyle; *b*, embryo with embryonic root; *c*, embryonic stem; *d*, cotyledons; *e*, external seed-coat; *f*, endosperm; *g*, perisperm.

parent the embryo grows and sends out its rootlet, and pushes up its stem and expands its delicate leaves, in great part on the strength of what nutritive material the seed contains. This nutritive material, or 'albumen' as it is often called, out of which the first new parts of the young plant will be in great part built up, is formed in Angiosperms and in Gnetum after fertilisation, in Gymnosperms except Gnetum before fertilisation; and is disposed within the seed in three different ways in relation to

Seed-scattering.—Already in the article FRUIT reference has been made to adaptations which secure the dispersion of the seeds. Oftenest the dispersion depends upon the fruit, which may burst violently so that the seeds are scattered, or may be juicy and palatable so that it is eaten by birds and other animals, the indigestible seeds being in this way carried far and wide. Sometimes the fruit and the seed are virtually though not technically the same, as is the case in thistle-down, in which each little winged fruit borne about by the wind contains a single seed. Sometimes, however, the seeds themselves are borne about by the wind, as in willows and poplars, willow-herbs (*Epilobium*), cinchona, *Asclepias syriaca*, &c. The hairs which serve as parachutes to the seeds of poplars, willows, and the like are accessory growths outside the seed; a similar rich growth of cottony hair is characteristic of *Gossypium* and *Eriodendron*. It should also be noted that in many cases the seed is adapted to anchor itself, for the surface is often ridged or peaked, as in *Hyoscyamus*, *Papaver*, *Nigella*, or becomes glutinous in moist places, as in flax and some species of *Plantago*.

For further details as to the structure of seeds, consult morphological works such as Sachs's *Text-book of Botany*; for further details as to seed-scattering, and the like, see Körner's *Natural History of Plants*; for hints as to the practical study of seeds, see Strasburger's *Practical Botany*.

Vitality of Seeds.—Although the seed is a complex structure, it is usually able to remain for weeks, months, or even years in a state of dormant life hardly distinguishable from death except in its power of reawakening. We usually say that a seed is ripe at its separation from the parent plant, but this ripeness is not coincident with readiness to germinate. Sometimes indeed, as in the sheaves of corn in a wet season, the seeds may germinate before they leave the parent plant; so do those of the mangroves; those of epheueral plants usually germinate as soon as they are scattered. In most cases, however, seeds are not ready to germinate until after they have remained for some time dormant. The seed of the mistletoe is ripe in autumn, but it does not germinate until April or May of the following year; that of *Draba verna* requires ten or eleven months of quiescence; that of *Euphorbia Cyparissias* remains under ground from four to seven years; that of *Euphorbia exigua* is said to lie dormant for nine years. In some cases the reason of the prolonged postponement of germination is to be found in the hardness and thickness of the husks which surround the seeds, and in the slowness with which water seems able to penetrate into the dense cells; and it is likely that time is also required for ferments which the seeds contain to do their work of preparing the reserve food material for use in germination.

Seeds vary greatly in their powers of retaining their life. Those of the willows and poplars are peculiarly short-lived; unless they land in moist places they usually die in a few days. 'Seeds rich in ferment quickly lose their power of germinating. Ripe acorns will not germinate after a year, nor coffee-beans after six months. Nor do those which are rich in oil survive nearly so long as those whose reserve-products consist mainly of starch.' There is no doubt that carelessly-made experiments have given rise to a much exaggerated estimate of the powers of retaining vitality which seeds possess. Thus, we often hear of mummy wheat which has germinated after many centuries; but this assertion rests on a deception. Indeed, modern experiments with the seeds of cereals show that they lose their vitality after ten years at most, and usually much sooner. Those of some leguminous plants may, however, survive for several decennia (whin and

melilot for fifty years). The vitality of seeds is also illustrated by the fact that some dry seeds can survive very high and very low (100° C. and -250° C.) temperatures.

Uses of Seeds.—As seeds are often rich in starchy, fatty, and protein substances, their importance as food is very great. Those of cereals and leguminous plants are especially valuable; and the seeds of hazel, chestnut, coconut, *Chenopodium Quinoa*, *Bertholletia*, *Pinus Cembra*, and many others are also edible. Others, such as mustard and nutmeg, furnish spices; many others, such as linseed, almonds, coconut, castor-oil plant, yield oil; cotton-wool surrounds the seeds of *Gossypium*, &c.; vegetable ivory is the dense endosperm of *Phytelephas*. Some seeds are rich in stimulants, as in coffee and kola plants; many, such as *Strychnos Nux vomica* and *Physostigma*, yield drugs.

Seedling Forms, or JUVENILE FORMS. See RETINOSPORA.

Seeland (Dan. *Sjælland*). See ZEALAND.

Seeley, SIR JOHN ROBERT, K.C.M.G. (knighted in 1894), was born in London in 1834, the third son of the publisher, Robert B. Seeley (1798-1886). He was educated at the City of London School, and at Christ's College, Cambridge, and graduated in 1857 first (equal with three others) in the first class in the classical tripos. Next year he became a Fellow of his college, later a lecturer there, then at his old school, but in 1863 was professor of Latin in University College, London, in 1869 of Modern History at Cambridge, with a fellowship at Christ's in 1882. *Ecce Homo* appeared anonymously in 1865, and excited an extraordinary commotion in the religious world in England, which was startled almost as much by its consummate literary excellence and its spiritual reverence as by the absence of the supernatural element. As a study of the human character of Jesus it still stands unrivalled. It was followed in 1882 by *Natural Religion*, a work hardly less valuable, though less known. He died 14th January 1895.

Other, and acknowledged, works of Seeley's are *English Lessons for English Readers*, in collaboration with Dr E. A. Abbott (1869); *Lectures and Essays* (1870); an edition of *Livy*, Book I. (1871); *Life and Times of Stein: or Germany and Prussia in the Napoleonic Age*, a work that has satisfied even German scholars (3 vols. 1879); *The Expansion of England* (1883); *A Short Life of Napoleon the First* (1885); and *Growth of British Policy* (with Life by Prothero, 1895); *Introduction to Political Science* (1896)—besides many important contributions to magazines.

Segantini, GIOVANNI (1858-99), painter, was born of humble parents in Arco on the Lake of Garda, for a time lived as herdboy on the mountains, and then was sent to study at the School of Art in Milan, but was largely self-taught. He was most successful in realistic interpretations of nature and mountain scenery, and his work, decorative in scheme, is characterised by vivid design coupled with harmony of colour.

Segesta, or EGESTA, an ancient city of the Elym, in the north-west of Sicily, 8 miles WSW. of the town of Alcamo. The Athenian expedition of 415 B.C. was ostensibly in aid of Segesta against Selinus. After this it became a dependent ally of Carthage. In 307 it was sacked by Agathocles of Syracuse. In 206 it became Roman, and soon received Latin rights. It suffered much from the attacks of the Saracens, and there is now little to be seen there but the fine ruins of a theatre and of a great Doric temple, hexastyle peripteral, with 36 columns, measuring 200 by 86 feet. It was never finished; the cella was never built, the columns have been left unfluted and the metopes flat. There are hot springs five miles to the north.

Segesvár (Ger. *Schässburg*, Rum. *Seghisoara*), a town of Transylvania, on the Great Kokel, 60 miles by rail N.E. of Hermannstadt, consists of an upper and a lower town. Pop. 12,000, who weave cotton and linen. Here on 31st July 1849 the Hungarians were defeated by the Russians; Petöfi is believed to have been amongst the slain.

Segovia, an old city of Spain, stands at the northern foot of the Sierra de Guadarrama, 32 miles NNW. of Madrid. It occupies a rocky eminence 3300 feet above sea-level, is surrounded by ruinous walls with round towers, and consists of narrow uneven streets, with old, quaint, and stately houses, and numerous parish churches and convents. The fortress or castle is perched on the west extremity of the rocky height, and was originally Moorish, but has been gradually restored since its destruction by fire in 1862; its towers and windows command magnificent views. The cathedral (1521-77) is one of the finest specimens of Late Gothic in Spain. The grand aqueduct, built in the time of Trajan, is a very fine example of Roman architectural work. It consists of two rows of arches, the one resting upon the other, some 2600 feet long and 102 feet high. Wool-scouring and the manufacture of paper, pottery, and cloth are languidly carried on. Pop. 16,000. Segovia was a place of importance during the time of the Romans, and was frequently the residence of the kings of Castile and Leon. Charles I. of England lodged at the castle, 13th September 1623, and shipped on 'certain trouts of extraordinary greatness.' The unresisting town was sacked in 1808 by the French.—The province has an area of 2635 sq. m. and a pop. of 167,000.

Segu, or **SEGU-SIKORO**, an important trading town of western Africa, stands on the Niger (here called the Joliba), 400 miles SW. of Timbuktu. It was formerly the capital of a large native state, which has lost power under the successive conquests of the Toucouleurs, the Bambarra, and the French (1890). The traders are chiefly Arabs. Pop. 36,000.

Ségur, the name of a French family, originally of Guienne, distinguished both in arms and letters, as well as for its sufferings in the Huguenot cause. Its most famous members were the following: **HENRI FRANÇOIS**, Comte de Ségur (1689-1751), an able French general in the war of the Austrian succession. His son, **PHILIPPE HENRI**, Marquis de Segur-Ponchat (1724-1801), fought in the Seven Years' War, became marshal in 1783, and outlived in his retirement the stormy scenes of the Revolution. The eldest son of this Philippe Henri was **LOUIS PHILIPPE**, Comte de Ségur d'Aguesseau (1753-1830), for five years ambassador at the court of St Petersburg, and a great favourite with Catherine II. He served in the American war of independence, hailed the great Revolution with delight, and, stranger still, retained in extreme old age that love of liberty that marked his early years—the last act of his life was a eulogium on the revolution of July. As a writer Ségur exhibits in fine perfection the national graces of style and spirit. Among his numerous writings are: *La Politique de tous les Cabinets de l'Europe* (1793); *Histoire de Frédéric-Guillaume II.* (1800); *Histoire Universelle* (1817); *Galerie Morale et Politique* (1817-23), a delightful work; *Mémoires* (1825-26). He left two sons, **OCTAVE** and **PHILIPPE PAUL**, the latter of whom (1780-1873) was a general of the first empire, took part in the fatal expedition to Russia in 1812, and wrote the story of the campaign (1824), as also on Peter the Great and Charles VIII. See the Life of him by Taillandier.

Seiche, a tide-like phenomenon first observed on the Lake of Geneva (q.v.), but now recognised

in many lakes, rivers, and land-locked arms of the sea, which have been credited to differences of barometric pressure, to the effect of winds, or to earth tremors. In longitudinal seiches the water is higher at one end of the lake, but there are binodal (when low-water occurs simultaneously at both ends) and multinodal seiches. See Dr Forel's *Le Léman* (3 vols. 1892-1905), Sir G. Darwin, *Tides*.

Selditz Powders (so named from the village of Selditz or Sedlitz in northern Bohemia, where there is a spring of natural aperient mineral-water with similar constituents) are composed of 120 grains of tartrate of soda and potash and 40 grains of bicarbonate of soda reduced to powder, mixed and enclosed in a blue paper, and 38 grains of powdered tartaric acid in a white paper. The contents of the blue paper are dissolved in from half a tumbler to a tumbler of water, and those of the white paper are then stirred in. The mixture should be taken while the effervescence from the liberation of the carbonic acid is still going on. These powders act as an agreeable and mild cooling aperient. If a stronger dose is required, either an increased quantity of the powder may be used, or a little sulphate of magnesia (about a drachm) may be added.

Seine, one of the four chief rivers of France, rises on the slope of the plateau of Langres, north-west of Dijon, and flows north-westward, with many windings, past Troyes, Fontainebleau, Melun, Paris, St Denis, St Germain, Mantes, Elbeuf, and Rouen, through a total course of 482 miles, and pours its waters into a wide estuary of the English Channel, on which stand the ports of Harfleur, Havre, and Honfleur. It is navigable for boats from Marciilly, 350 miles from its mouth, and since 1890 the canalisation of the Seine has been one of two projects (the other a ship-canal) for connecting Paris with the Atlantic (see PARIS). The Seine drains an area of 30,000 sq. m.; receives the Aube, Marne, and Oise from the right, and the Yonne, Loire, Essonne, and Eure from the left; and is connected by canals with the Somme, Scheldt, Meuse, Rhine, Saône, and Loire. Works for keeping open a navigable channel through the estuary, which is liable to silt up, were commenced as far back as 1848, and were continued for more than twenty years. In consequence of these engineering works 28,000 acres of land were reclaimed, and vessels of 2000 tons, drawing 20 feet of water, can get up to Rouen. Moreover, a canal has been constructed to give Havre connection with the Seine at Tancarville, so that vessels can avoid the uncertainties of the deeper estuary.

See the beautiful engravings in *The Seine and Loire* (from Turner's *Rivers of France*; 1886); and Sir Edward Thorpe's *The Seine from Havre to Paris* (1913).

Seine, the metropolitan dept. of France, completely enclosed by the dept. of Seine-et-Oise, is a portion of the former province of Île-de-France, and derives its name from its principal river, the Seine. One-sixth of its area is covered by the city of Paris (q.v.), and the rest is quickly studded with the suburban villages of the capital—Boulogne, Puteaux, Clichy, Montreuil, &c. It is at once the smallest and most populous dept. in the republic: its area is 185 sq. m.; its pop. in 1876 was 2,410,841; in 1921, 4,411,691; in 1926, 4,204,853. From south-east to north-west it is traversed for 37 miles by the windings of the Seine, which receives the navigable Marne at Charenton and the Bièvre at Paris. The surface is marked by undulations and low hills, the highest, Mont Valérien and Mont Bicêtre, reaching 650 feet. The scenery—of which the woods of Verrières, Meudon, and Saint-Cloud, together with those of Vincennes and Boulogne, transformed into parks, and watered by artificial

rivers and lakes, are perhaps the most striking features—is wonderfully charming. A network of canals and railways, the latter converging in the capital, afford easy means of transit in any direction. The soil is not naturally fertile, but, owing to the skill of the farmers and gardeners, who obtain abundant supplies of manures from the metropolis, the country around Paris and its suburbs has been rendered remarkably productive. The culture of vegetables and fruits for the markets of Paris is one of the most important branches of husbandry. Enormous quantities of mushrooms are cultivated in the ancient quarries of Paris near Montrouge, and in the catacombs beneath the city. Quarries of gypsum and freestone abound, and are productive. Manufacturing industry is very active and extensive, but is principally concentrated in Paris and its suburbs. The arrondissements are Paris, St Denis, and Sceaux.

Seine-et-Marne, a dept. in the north of France, is bounded on the W. by the dept. of Seine-et-Oise, and forms a portion of that wide basin in the middle of which stands Paris. Area, 2275 sq. m.; pop. (1921) 349,234. The dept. is drained by the Seine and its tributaries (Yonne and Loire) and the Marne and its tributaries (Oureq, Petit Morin, and Grand Morin). The surface is broken into a series of plateaus separated by valleys. Timber is grown in every part; and among the forests is that of Fontainebleau. The soil is generally fertile. Wheat, oats, potatoes, beet-root, and fodder crops are the chief productions. Building-stone, gypsum, clay, sand, and peat are extracted in large quantities. The manufactures are very varied, and embrace paper, sugar, porcelain and glass, spirits, flour, tiles, &c. The cheeses of Brie are well known, and so are the roses of Provins. The white grapes of Fontainebleau have a European reputation. The capital is Melun, and the arrondissements are Melun, Conlommiers, Fontainebleau, Meaux, and Provins.

Seine-et-Oise, a dept. in the north of France, encloses the metropolitan dept. of Seine. Area, 2184 sq. m.; pop. (1921) 921,673; (1926) 1,053,584. The principal rivers are the Seine and its tributaries the Oise, Marne, Essonne, Bièvre, Epte, &c. The surface is pretty level on the whole, but the country is charmingly diversified by picturesque valleys and great forests. Vast quantities of wheat, oats, potatoes, beet-root, and fodder crops are produced; and there are several fine varieties of stone and clay. There are numerous branches of manufacture, the most important being porcelain (at Sèvres), paper, cotton and woollen stuffs, iron goods, sugar, spirits, bricks, chemicals, laces, soap, and motor-cars. The dept. is divided into the arrondissements of Versailles, Corbeil, Étampes, Mantes, Pontoise, and Rambouillet, and the capital is Versailles.

Seine-Inférieure, a maritime dept. of northern France, formed out of the old province of Normandy, and bounded on the N. and W. by the English Channel. Area, 2448 sq. m.; pop. (1921) 880,671. The Seine flows through the southern districts; but a number of important though small streams flow north-west across the dept. and fall into the Channel. The hills of Caux extend from east to west, and to the south of them are rich pasture-lands, watered by the Seine and its affluents. The coasts are formed of chalk-cliffs, varying in height from 200 to 400 feet. This dept. is one of the most flourishing in all France, having many manufacturing establishments (cotton and woollen mills, dyeworks, shipyards, foundries, sugar-refineries, tobacco factories, chemical works, &c.), a large trade from Havre, Rouen, and Dieppe, and much prosperous farming (cheese, butter, cattle,

wool). Cider is extensively made. The coast-fisheries are valuable. On its coast are the favourite seaside resorts of the Parisians: Fécamp, St Valéry, Tréport, Dieppe, and others. The arrondissements are Dieppe, Le Havre, Rouen, Neufchâtel-en-Bray, and Yvetot. The capital is Rouen.

Seisin. or SASINE. See TROFFMENT, INFETMENT.

Seismometer is an instrument for measuring shakings, tremors, and tiltings of the earth (see EARTHQUAKE). In its earlier and ruder forms it was merely a seismoscope or seismograph, and its indications or records could not be interpreted quantitatively. Such, for example, is Babbage's bowl of treacle, in which the liquid, tending by inertia to remain steady as the bowl moves with the ground, leaves a high tidal mark as an evidence of the earthquake. Probably, but by no means certainly, such an instrument would indicate the direction of the largest motion occurring in an earthquake. It could not, however, record the succession of oscillations that make up the shock, or give really comparative records of different earthquakes. Similar limitations exist in all forms of liquid seismoscopes, such as Mallet's and Palmieri's, in which mercury moving in glass tubes forms the 'steady body.' A complete seismometer must, indeed, be capable of recording the entire earthquake motion in time, so that the amounts and rates of motions in all directions can be readily estimated from the records. The practical realisation of such an instrument we owe to the labours of Ewing, Gray, and Milne, who, working simultaneously and more or less in concert, brought to bear upon the problem of Japanese earthquakes a rare combination of scientific knowledge and mechanical skill. Gray and Milne's Seismometer (see *Philosophical Magazine*, 1887) is perhaps the most complete of its kind, and is identical in principle with Ewing's Bracket Seismometer, which was the earliest instrument constructed for recording on the same sheet both the horizontal and vertical motions of small earthquakes. In these instruments there are three weights suspended by brackets, so that each has somewhere within it a 'steady point' with reference to one of the three directions, N. and S., E. and W., up and down. To these weights suitable levers are attached, which trace out on a smoked surface any desired magnifications of the relative motions of the earth and the corresponding steady points. Thus we obtain records of the three components of an earthquake motion; and from these the whole motion can be reconstructed and a model made of the complex motion of an earth particle, as was done by Professor Sekiya of Japan. When the vertical motion is large, so that the earth's surface is thrown into distinct waves, these bracket seismometers fail to act as such. The precise meaning of a 'steady point' may be best obtained from consideration of a long pendulum with a heavy bob. We may suppose a pencil fixed to the bob and bearing lightly upon a sheet of paper resting on the ground. In an earthquake the ground moves, and with it the pendulum support. But the pendulum bob, because of its inertia, remains steady during the first motion, of which, consequently, we get a tracing on the paper. The subsequent tracing is a combination of the real earthquake motion and the slow swing of the pendulum itself. To get a perfectly steady point we should have to use an infinitely long pendulum. By a combination of an inverted unstable pendulum with an ordinary stable pendulum of convenient size, the stability may be reduced to neutrality,

and a very satisfactory steady point obtained. This plan, first suggested by Principal Forbes, is very effectively realised in Ewing's Duplex Pendulum Seismometer. The record is a superposition of the whole horizontal motion, and gives definitely little more than the maximum displacement in direction and magnitude. For earth tremors and earth tiltings much more delicate instruments are needed than have been described. Of these Bertelli's Tromometer is the best known. For large and disastrous earthquakes the havoc wrought is the only seismoscope that can be depended upon.

Seistan, or HAMUN-I-HELMAND, a large, irregularly shaped, shallow lake or swamp in the west of Afghanistan, close to the frontier of the Persian province of Khorasan, a division of which province (mainly steppe) is named Seistan after it. The lake is not a single expanse of water, but is divided into three depressions. Great part of the area is generally dry; but, as the basin has no outlet, when the Helmand (q.v.) is in flood the lake overflows and fertilises large tracts of country.

Seisanns. See **THEIRIUS**.

Selachoidel. See **CARTILAGINOUS FISHES**.

Selaginella, a genus of heterosporous Pteridophytes, closely allied to the so called Club-moss (see **LYCOPODIACEÆ**), many of the species cultivated in conservatories. The sole genus of the family Selaginellaceæ, Selaginella chiefly inhabits regions between the equator and 35° N. lat. One species, *S. selaginoides*, is found in Britain.

Selangor, one of the Federated Malay States. It has been since 1874 under British protection. It lies between Malacca and Perak, has an area of 3156 sq. m. and a pop. (1921) of 401,000, including many Chinese; contains rich deposits of tin, is well forested, and grows tapioea, rubber, rice, and sugar. The capital is Kuala Lumpur (with 80,000 inhabitants), which is connected by rail (27 miles) with Klang and Port Swettenham, the principal ports of the state, on the Klang River. See **MALAY STATES**.

Selborne, a pleasant Hampshire parish of 12 sq. m., 5 miles SSE. of Alton station and 20 E. of Winchester. Gilbert White (q.v., 1720-93) has made it for ever famous by his *Natural History of Selborne* (1789). 'The Wakes,' the ivied house where he lived and died, still stands, though added to; the church, where he lies, was restored in 1877. Nothing remains of an Augustinian priory (1232).

Selborne, **ROUNDELL PALMER, EARL OF**, was born at Mixbury Rectory, Oxfordshire, November 27, 1812, and had his education at Rugby and Winchester and at Trinity College, Oxford. His course was exceptionally brilliant; he carried off the Chancellor's prize for Latin verse (1831), the Newdigate (1832), the Ireland scholarship (1832), took a classical first-class in 1834, was elected to a Magdalen fellowship, and took both the Chancellor's prize for the Latin essay (1835) and the Eldon Law scholarship. He was called to the bar at Lincoln's Inn in 1837, and became a Q.C. in 1849; sat for Plymouth in the House of Commons from 1847 till 1852, and again from 1853 till 1857; became Solicitor-general in 1861 under Palmerston, being at the same time knighted and returned for Richmond; and was Attorney-general from 1863 till the fall of the Russell government in 1866. His inability to accept Mr Gladstone's whole Irish Church policy prevented his succeeding Lord Hatherley in 1872, and was created Baron Selborne. The year before he had represented the government as counsel before the Arbitration Court at Geneva. Selborne was ever active as a reformer in legal procedure, and his reign will

remain memorable from the fusion of law and equity effected by his Judicature Act (1873). He fell with his party in February 1874, but returned to the woolsack in May 1880, and sat till the dissolution of 1885. He was raised to the rank of Earl of Selborne in 1882. He found himself unable to accept Mr Gladstone's Irish policy, and therefore in February 1886 declined a third term of office. Chairman of the Oxford University Commission, he was made D.C.L. (1863), and was Lord Rector of St Andrews University in 1877. His *Book of Praise* (1863; 9th ed. 1892) is an admirable collection of hymns. Other books are *Notes on some Passages in the Liturgical History of the Reformed English Church* (1878), *A Defence of the Church of England against Disestablishment* (1886), and *Ancient Facts and Fictions as to Churches and Tithes* (1888). He died 14th May 1895. See his *Memorials* (4 vols. 1896-98).

Selby, a market-town in the West Riding of Yorkshire, on the right bank of the Ouse, 15 miles S. of York and 20 E. of Leeds. The great cruciform parish church, measuring 283 by 59 feet, was the church of a mitred Benedictine abbey, founded in the 12th century by Hugh, sheriff of Yorkshire. It exhibits every style from Norman to Perpendicular; lost its south transept by the fall in 1690 of the central tower (mainly rebuilt twelve years later); and was completely gutted by fire in October 1906, but the repairing of the fabric, happily not destroyed, was at once undertaken and completed in 1909. The river is navigable for small vessels up to 400 tons. Selby has manufactures of flax, ropes, leather, beer, &c., besides shipbuilding and the making of bricks, oil-cake, sauces, flour. It is the traditional birthplace of Henry I. (1068), and in the Great Rebellion was recaptured from the royalists by Fairfax (1644). Pop. 10,000. See W. W. Morrell's *History of Selby* (1867).

Selden, **JOHN**, an illustrious English scholar and jurist, was born at Salvington near Wootling in Sussex, 16th December 1584, studied at Hart Hall, Oxford, for three years, and then removed, first to Clifford's Inn, London, and afterwards to the Inner Temple, to study law. It was here that his great learning began to attract attention, and won for him the friendship of Camden, Usher, Sir Robert Cotton, and Sir Henry Spelman. As a conveyancer and chamber counsel he acquired wealth, yet found time for studies at once profound and wide in range. Selden wrote his first treatise, relating to the civil government of Britain previous to the Norman Conquest, and entitled *Analecton Anglo-Bretannicæ* (pub. 1615), when twenty-two years of age. In 1610 appeared his *Jani Anglorum Facies Altera* (Eng. trans. 1683), giving an account of the common and statute law of English Brittany to the death of Henry II., and also *The Duello, or Single Combat*, a history of trial by battle; and in 1614 was published his *Titles of Honour*, still an authority. Three years later appeared his erudite work on the Syrian gods, especially in their connection with the Old Testament, entitled *De Diis Syris Syntagmata Duo*. His *History of Tithes* (1618) demolished their divine right, and brought down upon his head the fulminations of the clergy, much more noisy than convincing. Fortunately for his assailants the Privy-council suppressed the book and forbade him to reply. In 1621 Selden suffered a brief imprisonment for advising the parliament to repudiate King James's doctrine that their privileges were originally royal grants; in 1623 he was elected member for Lancaster, in 1626 for Great Bedwin, and in 1628 for Ludgershall, both in Wilts, and henceforward till his death he took a considerable part in public affairs.

He was sincerely attached to the cause of the

parliament, and as sincerely opposed to the views of the court party and the king; but he was above all things a constitutional lawyer, and derived his ideas of the rights of the subject from the history of the nation, and not from religious fanaticism or metaphysical considerations. Still he 'loved his ease,' as Clarendon says, and so let things be done without protest of which he did not approve. In 1628 he helped to draw up the Petition of Right, and the year after he was committed to the Tower with Eliot, Holles, and the rest. After eight months' rigorous imprisonment he was transferred to the Marshalsea, but soon after was released through the favour of the Earl of Arundel, and retired to Wrest in Bedfordshire, the seat of the Earl of Kent. In 1640 he was chosen member of the Long Parliament for the university of Oxford; and now, when the struggle between the king and the nation began to point towards the fatal rupture, he was suspected of not being zealous enough by such as were themselves perhaps over-zealous. Already in 1635 he had dedicated to the king his *Mare Clausum* (an answer to the *Mare Liberum* of Grotius and the Dutch claims to fish off the British coasts), and there is evidence that Charles personally looked on him with favour. Selden was one of the committee of twenty-four appointed to draw up a remonstrance, and at this point his path first diverged from that of Hyde, yet without their friendship being impaired. He opposed vigorously the policy that led to the expulsion of the bishops from the House of Lords, and finally to the abolition of Episcopacy. Yet he adhered in the main to the cause of the parliament, driven by the complete arbitrariness of the king's later measures. He took no direct part in the impeachment of Strafford and voted against the Attainder Bill, and though he furnished precedents for the measures taken against Laud, had no share in his prosecution.

He sat as a lay-member in the Assembly of Divines at Westminster (1643), and perplexed his clerical colleagues sadly with his irony and his learning. Soon after he was appointed keeper of the rolls and records in the Tower. In 1644 he was appointed one of the twelve commissioners of the Admiralty, and elected master of Trinity Hall at Cambridge, which office he declined. In 1646 he subscribed the Covenant, and the year after the sum of £5000 was voted to him by parliament in consideration of his services and sufferings. In 1647 he was appointed one of the university visitors, and always used his influence to moderate the tyranny of his fanatical colleagues. One of his last public acts was to join in the last effort for a reconciliation between the king and the parliament. After the execution of Charles, of which it is certain he strongly disapproved as both unlawful and inexpedient, he took little share in public matters; and when requested by Cromwell to answer the *Eikon Basilike*, he refused. His death occurred at Whitefriars, November 30, 1654, and he was buried in the Temple Church, London. His last years he had spent in the house of Elizabeth, dowager-countess of Kent, with whom, between her husband's death in 1639 and her own in 1651, the intimacy had been so great as to colour Aubrey's statement that they were privately married. He left about £40,000; his 8000 books were given by his executors to the Bodleian. The principal writings of Selden, besides those already mentioned, are: *Marmora Arundeliana* (1624); *De Successionibus in Bona Defuncti secundum Leges Ebraeorum* (1634); *De Jure Naturali et Gentium, juxta Disciplinam Ebraeorum* (1640), a work more learned than critical, like most of Selden's bibliographical productions, who thought far too much of the

opinions of the Rabbins; *Uxor Ebraica*; and *De Synedris et Praefectura Juridicis Ebraeorum* (1650 et seq.); besides a great variety of posthumous tracts and treatises, of which the most famous, and also the most valuable, is his *Table-talk*, recorded and published by his amanuensis, Richard Milward, in 1689 (ed. by Singer, 1847, and by Reynolds, 1892). Of this Coleridge says, with some exaggeration, however: 'There is more weighty bullion sense in this book than I can find in the same number of pages of any uninspired writer.' Selden's best character stands in the gallery of Clarendon, who adds excellently: 'His style in all his writings seems harsh, and sometimes obscure; which is not wholly to be imputed to the abstract subjects of which he commonly treated, out of the paths trod by other men, but to a little undervaluing the beauty of a style, and too much propensity to the language of antiquity; but in his conversation he was the most clear discourses, and had the best faculty in making hard things easy and present to the understanding, of any man that hath been known.' Selden's works were collected and published at London in three folio vols. (1726).

See Singer's Biographical Preface, Dr John Aikin's *Lives of Selden and Usher* (1811), and G. W. Johnson's *Memoir* (1835). The Selden Society was founded in 1887 for promoting the study of English legal history.

Selection. See DARWINIAN THEORY, SEXUAL SELECTION.

Selectmen. See MASSACHUSETTS.

Selene, the Greek moon-goddess, a daughter of Hyperion and Thetis, and sister of Helios (the Sun) and Eos (the Dawn). As sister of Helios or Phoebus ('shining') she had the name of *Phoebe*, and latterly was identified with Artemis, though the identification was never quite exact, as Artemis always retained her reputation for chastity, while Selene had fifty daughters by her lover Endymion and several by Zeus. She is represented by the poets as a lovely woman with long wings and a golden diadem, riding across the heavens in a chariot drawn by two white horses, cows, or mules. See *Ueber Selene und Verwandtes*, by W. H. Roscher (1890-5).

Selenga, a river (740 miles) of Mongolia and Siberia, flowing by three arms into Lake Baikal. It is navigable from May till October for 200 miles from the Chinese frontier, and steamers and lighters ply on it.

Selenite (Gr. *Selēnē*, 'the moon'). This name is given to the transparent variety of Gypsum (q.v.). It occurs in distinct crystals belonging to the oblique or monoclinic system, or in folia. It is usually white (colourless), but sometimes it is tinged with red, yellow, green, gray, &c. Selenite is soft, easily cut, and capable of being split into very thin plates. These are much used in polarising apparatus (see POLARISATION). Selenite is a comparatively common mineral, although it rarely occurs in large quantities. Finely crystallised specimens are found at Bex in Switzerland, in Sicily, and at different places in the United States. There is a magnificent group of crystals of this mineral in the British Museum from Reinhardtsbrunn in Gotha. In Nova Scotia, where, in the vicinity of Oxford, near River Philip, there are vast deposits of gypsum (large quantities of which are sent to the United States), selenite is found abundantly. At Petitedouac, New Brunswick, where extensive deposits of gypsum also occur, there is a vein of nearly pure selenite one mile long and eight feet wide. Selenite, being a pure form of gypsum, is used for making the finest kind of plaster of Paris. Plates of selenite are said to have been used by the ancients for some of the purposes for which we use glass.

Selenium (sym. Se; at. number, 34; at. weight, 79.2) is an element having two forms. In the *vitreous* form, at ordinary temperatures, it is a solid of a dark-brown colour, and when broken presents a conchoidal vitreous fracture; thin splinters of it are, however, of a dark-red tint when seen by transmitted light. It is tasteless and inodorous, a non-conductor of electricity. Its specific gravity is 4.28; its melting-point is 217° C., and its boiling-point 700° C. When selenium is very slowly cooled from the fused condition its appearance is quite different; the structure being *granular* or *crystalline* (sometimes called 'metallic'). Crystalline selenium is of a dull leaden colour; it is very opaque to light even in thin films; its specific gravity is 4.8, its melting-point 200° C., and its boiling-point 680° C. It is a conductor of electricity at ordinary temperatures. Crystalline selenium varies in electrical conductivity with its state of aggregation and the time during which a current has been passing through it; and up to 270° C., which is above the melting-point, it acts unlike a metal in respect that its conductivity increases with the temperature. When crystalline selenium is acted upon by light (especially the yellow and the red), and to a less extent when acted upon by dark rays, it increases in conductivity; in the case of very bright sunlight this increase being sometimes even tenfold. Light of variable intensity produces corresponding and rapidly-responding variations in the conductivity of the crystalline selenium upon which it may fall—a circumstance utilised in 1880 in the Photophone (q.v.), and since then in numerous practical applications. The vapour of selenium is inodorous and deep yellow; it is 164 times as heavy as hydrogen at 1400° C.; this corresponds nearly to the molecular formula Se_2 . When heated in the air selenium does not very readily take fire; but it is combustible, and burns with a blue flame, and gives off an irritating and malodorous vapour, while a portion of it is volatilised in red fumes. The product of combustion is oxide of selenium, SeO_2 .

Selenium is of rare occurrence in nature; it is chiefly found as a selenide in combination with lead, silver, copper, or iron; but it has also been discovered in sulphur, and in certain sulphides of iron. It forms with oxygen a suboxide and a binoxide (SeO_2 , selenious anhydride); and as it forms also a selenic acid, $\text{H}_2\text{SeO}_4 + x \text{aq}$, the existence of a selenic anhydride SeO_3 is inferred, though it has not been isolated. With hydrogen selenium forms seleninretted hydrogen, or hydroselenic acid, H_2Se . Selenium was discovered in 1817 by Berzelius, in the refuse of a sulphuric-acid manufactory. He named it selenium (Gr. *selēnē*, 'the moon'), because in many respects it resembled tellurium (from Lat. *tellus*, 'the earth').

Selucia, the name of several ancient cities in Syria, Pisidia, Pamphylia, Cilicia, Caria, and Mesopotamia, founded during the earlier existence of the dynasty of the Seleucidæ (q.v.). Of these two were especially distinguished. (1) **SELEUCIA PIERIA**, founded by Seleucus Nicator, a few miles north of the mouth of the Orontes in Syria, was the seaport of Antioch, and became of great importance during the wars between the Seleucidæ and the Ptolemies for the possession of Syria. It rapidly declined under the Roman dominion. The ruins have been fully explored and described in modern times by Pococke (*Observations on Syria*) and Chesney (*Royal Geographical Society's Journal*, vol. viii.). The remarkable tunnel of 1088 yards in length, which was excavated out of the solid rock and formed the only communication between the city and the sea, and the remains of its triple line of walls, citadel, temples, amphitheatre,

necropolis, &c. attest the former importance and splendour of the city. (2) **SELEUCIA ON THE TIGRIS** was also built by Seleucus Nicator, on the west bank of the Tigris, 40 miles (according to Strabo 33) north-east of Babylon, which was despoiled to supply materials for the construction of the new city. Situated in a district of great fertility, and commanding the chief trading routes of Assyria, Babylonia, and western Persia, it rapidly rose to wealth and splendour, supplanted Babylon as the capital of the eastern portion of the Seleucid monarchy, and when in the acme of its greatness contained a population of more than 600,000. When the Seleucid empire fell before the Romans the fate of Seleucia was sealed. It was partly burned by Trajan (116 A.D.), and in 165 was completely destroyed by Avidius Cassius.

Selucidæ, the dynasty of kings to whom fell that portion of Alexander the Great's Asiatic conquests which included Syria, a large portion of Asia Minor, and the whole of the eastern provinces (Persia, Bactria, &c.). The founder of the dynasty was **SELEUCUS I.**, surnamed Nicator, who in the second partition of Alexander the Great's empire obtained Babylonia, to which, with the aid of Antigonus, he subsequently added Susiana; but a quarrel having arisen with that powerful chief, Seleucus took refuge in Egypt (316 B.C.). The course of events, however, allowed him to return to his satrapy in 312; his re-entry into Babylonia marked the beginning of the *era of the Selucidæ*. Having recovered Susiana, he conquered Media, and extended his power to the Oxus and Indus. In 306 he assumed the regal title; and four years afterwards he joined the confederacy of Ptolemy, Lysimachus, and Cassander against Antigonus, and obtained the largest share in the conquered territories of that ruler, a great part of Asia Minor and the whole of Syria falling to him. Towards the close of his reign he gained by war the rest of Asia Minor, but was assassinated (280) by one of his own officers. Seleucus cherished the ambition of building up a second empire equal in extent to Alexander's, and he pursued with great zeal the plan of 'Hellenising' the East, by founding numerous Greek and Macedonian colonies in various parts of his dominions; he also built numerous cities, several of which—as Antioch in Syria and Seleucia on the Tigris—rose to be among the most populous and wealthy in the world. In the reign of his feeble grandson, **ANTIOCHUS II.** (200-246), Bactria was lost and the foundations were laid of the kingdom of Parthia. His son, **SELEUCUS III.** (246-226), surnamed Caliniceus, was greatly beset by Ptolemy of Egypt, by his own brother, and by the Parthian prince, but managed to hold his own with some difficulty. The glories of Seleucus I. were revived in the second son of Seleucus II., **ANTIOCHUS III.** (q.v.), 'the Great,' who was the first of the Eastern 'great kings' of Iran to come into collision with the Romans. His second successor was his own able son, **ANTIOCHUS IV.** (q.v.), Epiphanes (i.e. 'the Illustrious'), who conquered Coelo-Syria and Palestine from the Egyptians, but withheld his hand from Egypt at the bidding of the Romans. He practised atrocious cruelties on the Jews, whose religion he endeavoured to root out in favour of the Greek religion; but the heroic resistance of the Maccabees (q.v.) completely foiled his project. He died in a state of raving madness, which was attributed by his subjects to his sacrilegious crimes, and so they in derision converted his surname into Epimanes ('the Madman').—The succeeding rulers were for the most part a set of feeble and incompetent sceptre-holders, none of whom was able to delay the gradual disintegration of the empire. Babylonia, the original centre of their power, was conquered by the Parthians in

the reign of Demetrius II. (146-125). From that time the Seleucids were restricted to Syria, until that region was taken from them by Pompey and converted into a Roman province (65 B.C.).

Self-defence. See ASSAULT, MANSLAUGHTER.

Self-denying Ordinance, a measure carried through parliament in 1645 by the influence of Cromwell and the Independents, by means of which generals who were either less efficient or but half-hearted in the cause were removed from the command of the army. After Manchester's lack of energy at the second battle of Newbury (October 27, 1645) Cromwell had determined upon a change of tactics, and attacked Manchester in parliament, but he soon found the more sweeping measure a better means towards his ends. The Lords threw out the measure, whereupon the Commons proceeded to form a New Model Army under Sir Thomas Fairfax as general-in-chief. The Lords now passed the measure with some alterations and called on all existing officers to resign. Thus Essex, Waller, and Manchester were got rid of, while Cromwell was specially reappointed to the command of the cavalry as lieutenant-general. For a similar measure, but one suicidal to good government, in the history of the French Revolution, see MIRABEAU, and ROBESPIERRE.

Selim I., Sultan of Turkey, son of Bajazet II., was born in 1467, and dethroned his father by the aid of the Janizaries, 25th April 1512. Then he caused his father, brothers, and nephews to be put to death. This gives the key to his character—warlike, energetic, unscrupulous, and fanatical. In 1514, after massacring 40,000 Shiites, he declared war against Shah Ismail of Persia, whom he defeated at Chaldiran in the neighbourhood of Tabriz; but a spirit of disaffection breaking out in his army, he was compelled to content himself with this success, which gave him possession of the provinces of Diarbekir and Kurdistan. In 1517 he conquered the Mameluke rulers of Egypt, and annexed that country, Syria, and the Hejaz. Moreover he won from the Abbasside khalif, then living as a spiritual prince at Cairo, the headship of the Mohammedan world, the title of imam, and the standard of the Prophet, and gained possession of the sacred cities of Mecca and Medina. He also laid the foundation of a regular marine, constructed the arsenal of Pera, chastised the insolence of the Janizaries with savage severity, and laboured to ameliorate, by improved institutions, the condition of the various peoples he had conquered. He died 22d September 1520, while planning an expedition against Rhodes. Strange to say, this savage fanatic was a lover of literature, and even himself cultivated the poetic art. He was succeeded by his son, Solymán (q.v.) the Magnificent. For other sultans named Selim, see TURKEY.

Selinus, an ancient Greek colony in the western end of Sicily, now represented by ruins close to the modern Castelvetro. It was founded by Dorians about 628 B.C., conquered by the Carthaginians in 409, and utterly destroyed by them in 249, the inhabitants being deported. The most notable ruins still extant are seven great Doric temples.

Seljuks, a division of the Ghuzz confederacy of the Turkish tribes, who were settled on the Jaxartes and in Transoxiana in the 11th century, when they became converts to Islam. Toghrul Beg, grandson of a chief named Seljuk (whence the name of the several successive dynasties), severely crippled the empire of Ghazni (1040), and then turning westwards conquered all Persia. Ten years later he marched upon Bagdad, to the assistance of the Abbasside Khalif (q.v.), a mere *faux* sovereign, who existed by the favour and protection of a powerful family of the Shiite faith.

The head of this family (the Bowides) was, however, the master rather than the protector of the khalif. Him Toghrul seized and supplanted; and, being of the orthodox Sumite faith, he was nominated by the khalif 'Commander of the Faithful.' Dying in 1063, Toghrul was succeeded by his nephew Alp-Arslan. This sovereign wrested Syria and Palestine from the rival Fatimite khalif of Egypt, and in 1071 defeated the Byzantine emperor Romanus Diogenes, and captured him. The price of his release was a heavy ransom and the cession of great part of Anatolia or Asia Minor to the Seljuk. Alp-Arslan was stabbed by a captive enemy in distant Turkestan (1072), and was succeeded by his distinguished son Malik Shah. His reign is chiefly remarkable for the enlightened rule of his grand-vizier, Nizam-ul-Mulk, the school-fellow of Omar Khayyam (q.v.), and of Hassan ibn Sablah, founder of the Assassins (q.v.). This statesman founded a university at Bagdad, an observatory, and numerous schools and mosques, and with the help of his old friend Omar Khayyam revised the astronomical tables and introduced a new era, the Jelalian. After the death of Malik (1092) the extensive empire began to break up into smaller kingdoms. But already during his lifetime, and even that of his predecessors, powerful tributary princes had ruled over separate provinces in Syria (see NUR ED DIN MAHMUD and SALADIN), in Kerman (beside the Persian Gulf), and in Asia Minor. During the first half of the 12th century the most powerful of these provincial rulers was Sinjar, who governed Khorasan, with Meiv for his capital. He spent his life fighting against the Ghaznevids, against the Turkestan chiefs, and lately against the Mongols. But a stronger and more immediate interest attaches to the province of Syria and that of Asia Minor, or Rumi, as the Seljuks preferred to call it. It was the rulers of these two provinces or kingdoms who persecuted the Christian pilgrims and so provoked the Crusades (q.v.), and it was the rulers of the same two kingdoms against whom the crusaders of Europe principally fought. The capital of Rumi was fixed at Iconium (Konia) in the first half of the 12th century. This dynasty reached the acme of its power under Kaikavus (1211-34), who ruled over nearly the whole of Asia Minor and extensive territories in Mesopotamia and northern Persia. During the reign of his son Kaikhorasan II. the poet Jelal-ed-Din Rumi flourished and the various orders of dervishes arose; and at the same time the Mongols began to threaten the eastern borders of the state. Indeed from about 1253 the real sovereign power of that part of Asia was in the hands of the Mongol chiefs, Hulagu and his successors, until the rise of the Ottoman princes. These last, Turks like the Seljuks, had retreated westwards before the all-conquering Mongols about the middle of the 13th century, and at the end of it they entered the service of the Seljuk ruler of Asia Minor. After that the name Osmanli or Ottoman soon superseded that of Seljuk as the appellation of the Turkish rulers and ruling classes in Asia Minor. And out of the Ottoman supremacy grew the empire of Turkey (q.v.). The Seljuks, however, had centuries before, whilst they were still settled in Transoxiana, lost a good many of their peculiarly Turkish characteristics and had become 'Turkomans,' i.e. 'Like the Turks;' and with their conversion to Islam they also adopted the Perso-Arabian civilisation and customs, though still retaining their own language as well as using those of the peoples they had conquered.

See De Guignes, *Histoire des Huns*, &c. (4 vols 1756-58), the German translation (by Vullers, 1838) of Mirkhond's Persian *History of the Seljuks*, and Laurent, *Byzance et les Turcs Seldjoucides dans l'Asie occid.* (1913).

Selkirk, a Scottish royal burgh, the county town of Selkirkshire, on an eminence 400 to 619 feet high, that flanks the right bank of Ettrick Water, 6 miles S. by W. of Galashiels by a branch-railway (1856) and 39 SSE. of Edinburgh. The county buildings (1870), the town-hall (1803), with a spire 110 feet high, and the statues of Scott (1839) and Mungo Park (1859) are the chief features of the place, with the beautiful grounds of the Haining. The 'souters of Selkirk' were long famous for their 'single-soled shoon;' but to-day the staple manufacture is that of tweeds, which dates from 1835. With Hawick and Galashiels, Selkirk returned one member to parliament from 1868 to 1918. Pop. (1831) 1880; (1861) 3695; (1911) 5946; (1921) 5775. About 1113 Earl David founded at *Schelechyre* ('kirk of the shields') a Tironensian abbey, which as David I. he removed about 1126 to Kelso (q.v.). The story of the eighty Selkirk men who marched to Flodden (1513), but of whom one only returned, bringing a captured pennon, dates, according to Mr Craig-Brown, only from 1722. Andrew Lang was a native.

Selkirk, ALEXANDER. See JUAN FERNÁNDEZ.

Selkirk, EARL OF. See DOUGLAS, MANITOBA.

Selkirk Mountains, an outlying range of the Rocky Mountains, in British Columbia, extending southwards from about 52° N. lat. to near the United States frontier. The range contains enormous glaciers, and is the home of bears, big-horn sheep, the Rocky Mountain sheep, &c. One pass-valley (Rogers') has been reserved as a national park. The Canadian Pacific Railway climbs over the mountains at a point 4300 feet above the sea.

Selkirkshire, an inland county in the south of Scotland, bounded by Peebles, Edinburgh, Roxburgh, and Dumfries shires. Measuring 28 miles by 17, it has a land area of 267 sq. m. or 170,793 acres, of which barely one-tenth is under crops. Silurian in formation, and drained by Ettrick and Yarrow Waters to the Tweed, it is a pastoral region of grassy rounded hills—Minchmoor (1856 feet), Dun Rig (2433, the highest), Ettrick Pen (2269), and eight others exceeding 2000 feet above sea-level. Sheep-farming (over 170,000 head) is an important industry; and the manufactures are confined to the two towns of Selkirk and Galashiels. Since 1918 Selkirkshire has united with Roxburghshire to return one member to parliament. Pop. (1801) 5388; (1851) 9809; (1871) 14,005; (1911) 24,601; (1921) 22,607, of whom 7068 were in Selkirk, and 12,846 in Galashiels. Smaller than Middlesex, and than all but seven of the thirty-three Scottish counties, Selkirkshire yet contains within its narrow bounds almost all the old Forest of Ettrick; St Mary's Loch; the whole course of the Yarrow; the vale of Ettrick, where the 'Shepherd' was born and lies buried; the birth-places, too, of Laidlaw and Mungo Park; of the 'Flower of Yarrow' and Alison Cockburn; Ashiesteel, where Scott wrote *Marmion*; the scenes of the ballads of 'The Douglas Tragedy,' 'The Dowie Deans,' 'The Outlaw Murray,' and 'Young Tam-lane;' the battlefield of Philiphaugh; and the ruins or sites of the castles and peel-towers of Newark, Dryhope, Tushielaw, Oakwood, and Bieleuch. See the articles **ETTRICK WATER**, **YARROW**, **PHILIPHAUGH**; and T. Craig-Brown's county history (2 vols. 1886), and Sir G. Douglas's (1899).

Sellar, WILLIAM YOUNG, was born at Morvich near Golspie in Sutherland, 22d February 1825, and educated at Edinburgh Academy, of which at fourteen he was head-boy. He next went to Glasgow University, from which he passed at seventeen, a Snell Exhibitioner, to Balliol College, Oxford.

He graduated with a classical first-class, in 1850 was elected to a fellowship at Oriel, next acted as assistant-professor at Durham, Glasgow (1851-53), and St Andrews (1853-59), filled for four years the Greek chair at St Andrews, and was elected in 1863 to the Latin chair at Edinburgh, which he retained till his death near Dalry in Galloway, 12th October 1890. He made his name widely known by his learned and brilliant books, *The Roman Poets of the Republic* (1863; revised and enlarged, 1881), *The Roman Poets of the Augustan Age—Virgil* (1877), and *Horace and the Elegiac Poets* (1892), the latter edited from his papers by his nephew, Andrew Lang, with a brief memoir prefixed. Of the last volume—the completion of his task—the part treating of Ovid alone is unfinished. The whole forms a noble *corpus* of criticism on the greatest poets of Rome, marked by full knowledge, insight at once keen and sympathetic, and a fine dignity of style.

Selma, capital of Dallas county, Alabama, on the Alabama River, and at the intersection of a number of railways, 165 miles by rail NNE. of Mobile. It has a large trade in cotton, and possesses ironworks, cotton-factories, planing-mills, car-works, &c. Pop. 15,600.

Selous, FREDERICK COURTNEY, explorer and big-game hunter, was born in London, 31st December 1851, and educated at Rugby and on the Continent. When only nineteen years old he began a life-long association with South Africa, his love of natural history taking him to South Central Africa, where he carried out much pioneer work. In 1890 he became attached to the British South Africa Company, and conducted work for it in Mashonaland. Later Selous took part in the Matabele wars. He engaged in many big-game hunting expeditions all over the world, and on the outbreak of the Great War, offered himself for service at the age of 62. He was killed at Beho Beho during the East African campaign on 4th January 1917. See Life by J. G. Millais (1918).

Selsey, or **SELSEA**, a village on a flat and dreary but fertile peninsula on the Sussex coast, 7 miles S. of Chichester. Here in the middle of the 7th century the cathedral church of the South Saxons was founded by Wilfrid of York; and Selsey was the see of a succession of twenty-two bishops, till in 1079 the seat of the bishopric was transferred to Chichester by Bishop Stigand. The sea has made great encroachments on the peninsula, which ends in Selsey Bill, and the site of the old cathedral is now submerged.

Seltzer Water (Ger. *Seltzwasser*) takes its name from the village of Nieder Selters near Limburg, in the Prussian district of Wiesbaden, where several springs, in one basin, yield 5000 cubic feet an hour of this sparkling and effervescent mineral water. Its chief ingredients are carbonic acid, bicarbonate of sodium, and common salt. It acts as a mild stimulant of the mucous membranes and as a diuretic, and is employed in chronic disorders of the digestive, respiratory, and urinary organs. It is much used as a beverage and as a table-water by those suffering from liver complaint, and in hot climates and seasons, and is widely exported to all quarters of the world. The spring was discovered early in the 16th century, but was at first little prized. Artificial Seltzer Water is extensively manufactured both on a large scale and for domestic use. See **AERATED WATERS**, **MINERAL WATERS**.

Selwyn, GEORGE, wit, was born of a good old Gloucestershire family on 11th August 1719, and was educated at Eton and Hertford College, Oxford, whence, after making the grand tour, he was expelled in 1745 for a blasphemous travesty of the Eucharist. He entered parliament for a pocket

borough in 1747, and, siding generally with the court party, was rewarded with several sinecures; in 1751 succeeded his father in the Maitson property; and for the best part of half a century led the life of a man about town, dozing in the House, gaming pretty deeply, corresponding much, and haunting executions. He often visited Paris, where he had the *entrée* of the best and the highest society, whilst at home his chief intimates were the Duke of Queensberry, Horace Walpole, 'Gilly' Williams, and Lord Carlisle. Grown at last 'like the waxwork figure of a corpse,' he died 25th January 1791. He left £33,000 to Maria Fagniani ('Mie Mie'), and the residue of his fortune to 'Old Q'—to whom, as to Selwyn himself, was referred by gossip the paternity of that future Marchioness of Hertford.

See Jesse's *George Selwyn and his Contemporaries* (1843), Hayward's *Lord Chesterfield and George Selwyn* (1854), Roscoe's *George Selwyn* (1899), and S. P. Kerr's *Selwyn and the Wits* (1909).

Selwyn, GEORGE AUGUSTUS, bishop, was born 5th April 1809. He was educated at Eton and at Cambridge. He rowed in the first inter-university boat-race (1829), and was a great pedestrian and swimmer. In 1841, while curate of Windsor, he was consecrated first and only bishop of New Zealand and Melanesia—now divided into many sees. On the voyage out he studied Maori and navigation, so that he could preach to the natives in their own tongue on his arrival, and could steer his own vessel on his missionary voyages. He visited every portion of his huge diocese before setting about his great work of organising it. A visit to England in 1854 brought back John Coleridge Patteson, afterwards the martyred bishop of Melanesia, to whose see Bishop Selwyn's second son was consecrated in 1877. In 1867 Bishop Selwyn attended the first Pan-Anglican Synod at Lambeth, and against his own inclinations was appointed Bishop of Lichfield, where upon his initiative the first Diocesan Conference in which the laity were duly represented met in 1868, and where he died 11th April 1878. Possessing in a special degree the gift of organisation, and always regarding himself as 'a man under authority,' he expected the same soldier-like obedience from those under him.

See *Life* by Rev. H. W. Tucker (2 vols. 1879) and the more popular *Life* by Rev. G. H. Curtis (1 vol. 1889). For Selwyn College, see CAMBRIDGE.

Semang, a pigmy people of the Malay Peninsula and Sumatra. See NEGritos.

Semaphore (from *sema*, 'a sign,' and *pherō*, 'I bear') was the name applied to the system of telegraphy in use before the application of the electric current. Semaphores were invented by Richard Lovell Edgeworth in 1767 (cf. p. 91 of his *Memoirs*, ed. 1854), but were first regularly established by the French in 1794 as a plan for conveying intelligence from the capital to the armies on the frontier. In the following year Lord George Murray introduced them in England; and by their means the Board of Admiralty were placed within a few minutes of Deal, Portsmouth, or Plymouth. These semaphores consisted of towers built at intervals of from 5 to 10 miles on commanding sites. On the top of each tower was the telegraph apparatus, which at first comprised six shutters arranged in two frames, by the opening and shutting of which in various combinations sixty-three distinct signals could be formed. In 1816 Sir Home Popham substituted a mast with two arms similar to many of the present railway signals. The arms were worked from within the tower by winches in the lookout room, where a powerful telescope in either direction constantly commanded the mast of the next station.

If a fog set in at any point on the route the message was delayed; otherwise when a sharp lookout was kept the transmission was very rapid. For instance, the hour of one by Greenwich time was always communicated to Portsmouth when the ball fell at Greenwich; the semaphores were ready for the message, and it commonly passed from London to Portsmouth and the acknowledgment back to London within three-quarters of a minute. Each station was in the charge of a naval officer—usually a lieutenant—with one or two men under him. To save the cost of this establishment the Deal and Plymouth lines fell into disuse soon after the peace of 1815; and the superior advantages of the electric telegraph being incontestable, the Portsmouth line sent its last message on the 31st December 1847, and in this capacity the semaphore closed its career of usefulness for ever. Railway signals are, however, a form of semaphore. See RAILWAYS, and, for the semaphore used for communicating with ships, SIGNALING.

Semecarpus, a genus of Anacardiaceae trees, of which *S. Anacardium* is the Marking-nut Tree of India, a deciduous tree growing in the sub-Himalayan tract. An ink much used in that country for marking cotton cloths is obtained from the acid juice of the pericarp of the fruit. Lime-water is added to improve the ink. The fleshy cup of the ripe fruit is eaten raw, but it is better roasted. Bird-lime is made of the fruit in its green state. The wood also contains an acid juice which causes swelling and irritation, in consequence of which the timber is not put to any use.

Semele. See DIONYSUS.

Semendria (Serh. *Smederevo*), a ruined fortress of Serbia, on the right bank of the Danube, 26 miles S.E. of Belgrade. Here the Turks defeated the Hungarians in 1411. The place was taken by the Turks in 1459, by Prince Eugene in 1717, by the Germans and Austrians in 1915. Pop. 7000.

Semgallen. See COURLAND.

Semicircular Canals. See EAR.

Seminole, a tribe of American Indians, originally (1750) a vagrant branch of the Creeks, whose name Seminole signifies 'wild' or 'wanderer.' In 1817 they joined with the Creeks and some negroes who had taken refuge with them, ravaged the white settlements in Georgia, plundering plantations, and carrying off slaves, whom they refused to surrender. General Jackson was sent to punish them, and his expedition hastened the negotiations which ended in the cession of Florida to the United States (1819). By a treaty of 1823 the Seminoles, who numbered some 4000, gave up most of their lands for an annuity, and agreed to return fugitive slaves; but in 1832, to satisfy the settlers, the chiefs were deluded into signing a treaty agreeing to the removal of the whole tribe west of the Mississippi. This treaty was repudiated by the tribe at the instigation of Osceola (q.v.), one of their chiefs; and a long and costly war against a handful of savages ensued. In the end the remains of the tribe were removed to Indian Territory, now part of Oklahoma, where (except a few still left in Florida, Texas, and Mexico) all the Seminoles are now settled; they number 3000.

Semipalatinsk, a district of Asiatic Russia, stretching northwards from Lake Balkash, and constituting the eastern corner of the Cossack (Kirghiz) Republic. It embraces outlying of the great Altai and other lofty chains of central Asia, rising to 10,000 feet, and enclosing between them wide stretches of steppe-land. The principal river is the Irtysh, which flows north-westwards to the

Obi. The climate ranges between wide extremes, and the whole region is undergoing desiccation. The people are mostly Kirghiz. The chief town, Semipalatinsk, standing on the right bank of the Irtysh, is an important trading centre for that part of Asia. Pop. 44,000.

Semi-Pelagianism. See PELAGIUS.

Semiramis, wife of Ninus, mythical founder of Nineveh to Ctesias and the Greek historians. A daughter of Derecto the fish-goddess, she was exposed in infancy, but miraculously fed by doves, then brought up by Sininus a shepherd, whose name she took. Onnes, one of the king's generals, charmed by her beauty, married her, but she won the heart of the king himself by her heroic capture of Bactra, whereupon her husband had the loyalty to make away with himself. Ninus soon died, leaving Semiramis to reign gloriously for forty-two years, conquering in Persia, Libya, Ethiopia, unsuccessful in India alone. At the end of this time she left the throne to her son Ninus and disappeared, thereafter to be worshipped as a divinity. The historical germ of the story seems to be the three years' regency (B.C. 811-808) of Sammu-ramat, widow of Shamshi-Adad V. and mother of Adad-Nirari III. The name of the mighty queen survived in place-names, and was familiarly attached to the great works of antiquity, as the hanging gardens of Babylon. Many things in her story, and such points of detail as her personal beauty and her voluptuousness, point to an identification with the great Assyrian goddess Ishtar or Astarte (q.v.). See Lenormant, *La Légende de Semiramis* (1873); Frazer, *The Golden Bough*.—The Semiramis of the North was a name not inappropriately applied to Catherine II.

Semiretchinsk, formerly a province of Asiatic Russia, lying East Turkestan on the SE., Fergana on the SW., and Lake Balkash on the N. It is a mountainous region, being crossed from east to west by the Ala-tau and Tian-Shan Mountains, whose peaks run up to 16,000 feet. Between them lies the mountain-lake of Issyk-kul. In the north are level-tracts, partly fertile, partly barren sand. The climate is temperate; earthquakes occur—e.g. at Vyernyi (renamed Alma-Ata). The northern part now forms the south-eastern corner of the Cossack (Kirghiz) Republic, and the southern falls into the Kara-kirghiz autonomous territory. The people of the region are mostly engaged in pastoral pursuits, rearing large herds of horses, camels, and sheep.

Semites, the name given to one of the great divisions of mankind occupying south-west Asia, namely, Arabia and its northern extension, the lands lying between the Mediterranean, Asia Minor, and Armenia, Persia, the Persian Gulf, the Red Sea, and Egypt. The inhabitants have always been closely inter-related in language, custom, religion, and physical features; but not only is Arabia geologically and ethnically connected with north-east Africa, the whole area is so exposed that a dividing line can hardly be drawn between the Semitic area and the rest of the Near East. The term itself is derived from Genesis, chap. x., where the world as known to the Hebrews is divided among the 'sons' of Shem. But the classification follows no clear rule, as Canaan, along with Heth (the Hittites), is named with Egypt as 'son' of Ham, although Canaan was part of Palestine, and Egyptians, Canaanites, and Hittites were quite distinct politically and linguistically. Moreover, Shem's 'sons' include Lud or Lydia, in Asia Minor, and Elam to the east of the Tigris; and these, too, linguistically, and especially as regards culture, differ most markedly. On the

other hand, Elam certainly came under the influence of Babylonia and Assyria, and at times the connexion between Lydia and the Semitic area was an intimate one; similarly Canaan, and especially the Phœnician coasts, had close relations with Egypt from an early date; and the Hittites (q.v.) of Asia Minor had offshoots in Syria and Palestine. Accordingly the list in Genesis, chap. x. is so far in harmony with the facts when it maintains the homogeneity of the Semites and their historical and cultural relations with their neighbours; but it is preferable to apply the term 'Semite' to certain languages and the people speaking them in south-west Asia, rather than to any specific type of civilisation.

The SEMITIC LANGUAGES form a well-defined group, the members of which are as nearly related as those of any one of the Indo-European divisions (e.g. the Slavonic or the Romance or the Scandinavian). They may be arranged in four classes: (I.) The *East Semitic*, the practically identical languages of Babylonia and Assyria (q.v.), known as early as the third millennium B.C. As proved by the tablets discovered at Amarna in Egypt, and also elsewhere, the language was the *lingua franca* of the middle of the second millennium, used for diplomatic and official purposes in Egypt, by the Hittites of Asia Minor, and in Palestine and Syria (see TELL EL-AMARNA). In what circumstances the very complex and difficult Cuneiform (q.v.) attained such importance is uncertain, though it was used by a colony in Cappadocia by the 21st century B.C. The script itself—not the language—was later simplified and used in Persia; but the language was already dying out in the Neo-Babylonian period (6th century B.C.), though tablets have been found down to the 1st century B.C.

To the (II.) *West Semitic* belong the languages of early Syria and Palestine, traces of which are found among the 'Amorite' influences in the First Babylonian Dynasty (see BABYLONIA, vol. I. p. 639), in Egyptian references, and more especially in the various 'glosses' in the Amarna tablets, 1400 B.C. These languages, called for convenience Amorite, or better, Canaanite, come before us after the 'Amarna' age in a simple consonantal script from which (or from collateral branches of which) so many alphabets have been directly or indirectly derived (see ALPHABET). They differ only dialectically. Moabite is known from a famous historical inscription (see MOABITES). Phœnician, carried by traders over the Mediterranean, persisted in Carthage in the Christian age (see PHœNICIA, vol. viii. p. 107). Hebrew (q.v.), of which the Old Testament preserves indications of different dialects, was kept alive in the schools, and, assuming a modified form, has been maintained by the Jews for literary purposes. Recent energetic efforts to elaborate the language and utilise it for the most modern requirements of life and learning will be watched with keen interest. See JEWS.

(III.) From an early date both these classes were threatened by the *North Semitic* or Aramæan (see ARAMÆA). Sporadic traces apart, it becomes prominent about the 8th century B.C., primarily in Syria. The extensive conquests of Assyria, her mixed armies, and her policy of transporting whole tribes, led to its spread. At the fall of Assyria, and amid the political and social unrest that mark the middle centuries of the first millennium B.C., Aramæan increased in importance and became the *lingua franca* of the Persian age (5th-4th centuries). Sardis in Lydia, Elephantine in Upper Egypt, and the Indian Taxila testify to its rapid extension. Of its many dialects those of the Jews and other colonists at Elephantine (5th century), and, later, of the Arab Nabatæans (q.v.), and of Tadmor or Palmyra (q.v.), most nearly resemble

the Aramaic portions of the books of Ezra and Daniel. That Aramaic was the language of the people in the Christian era is shown by a few words preserved in the Gospels (*Talitha cumi*, &c.), and by the popular translations and expositions of the Old Testament known as *Targums* (q.v.). Most important of all Aramaic dialects was that of Edessa, the literary language which played so vital a part in the history of eastern Christianity. Syrian missionaries carried their language and script as far as India and China; and while a Syrian community has continued to exist in Travancore, the Syriac alphabet was the source of several strange scripts in Central Asia (see ALPHABET, Vol. I, p. 190). Apart from this literary language a few popular Aramaic dialects were preserved, the most interesting being that of the Mandaeans (q.v.).

Meanwhile (IV.) Aramaic itself was being gradually displaced by another *lingua franca*—Arabic—a member of the *South Semitic* class. (a) The earliest representatives of this are found in the Minaean and Sabaeen inscriptions of South Arabia, which have a characteristic script of their own (see SABAENS). Their archaic character has suggested to some scholars a very remote date—the second millennium B.C.; but the Sabaeen inscriptions reach down to the 6th century A.D., and the oldest of all may not be earlier than the 10th century B.C. Continued intercourse between Arabia and Egypt, culminating in the latter part of the Sabaeen period, led to the rise of Geez or Ethiopic, which has ever since had an independent linguistic history in Africa. But in Arabia proper the dialects used by the Bedouin tribes coalesced by the 6th century A.D. into what is known as (b) *Classical Arabic*. Through Islam this became a fixed literary language, though in course of time various popular dialects can be traced throughout the Mohammedan world. The Arabic script itself, originally derived from an Aramaic alphabet, and in this respect quite distinct from *Old Arabic* (a, above), has had a no less extensive career. See ARABIA.

Although classical Arabic is relatively a recent language, it has many primitive features; and its subsequent vicissitudes so explain the linguistic processes in the other Semitic languages that Arab life and thought have commonly been regarded as typically Semite, and Arabia itself as the original home of the Semites. This is disputed; at all events the Semitic languages have well-marked peculiarities, which, as a whole, sever them from Egyptian (and African) languages on the one side, and the Sumerian of Babylonia on the other. Consonants only are written (so also in Egyptian), with the exception of (1) Babylonian-Assyrian, where, however, similar consonantal sounds are not very carefully distinguished, and the gutturals have been smoothed down; and (2) Ethiopic (originally vowelless). But there was a tendency in Hebrew, more especially in the Aramaic of the Mandaeans, to use vowel-letters, and systems of vowel-signs were carefully framed, more elaborate for Syriac and especially for Hebrew, and an exceptionally simple one for Arabic. It is not difficult, however, to read unvocalised Semitic, though of course serious ambiguities often occur. Semitic roots are commonly triconsonantal and the vowel changes regular: *K-T-N* 'he wrote,' *AKTUNA* 'he taught or caused to write,' *YAKTUNU* 'he will write,' *KATIB* 'a writer,' *KITAB* 'secretaryship.' The bare roots (e.g. *K-T-N*) do not exist by themselves, and the inter-relationship between the derivatives is often instinctive and suggestive, as *Saddik* 'righteous,' *Sedakah* 'righteousness, alms,' *Asdik* 'legitimate kin,' *Šadik* 'congruent, as it should be.' Pronouns are expressed by suffixes: *ani* 'I,' *u* 'to me,'

othi 'me' (accusative), *nalki* 'my king,' *himlikani* 'he made me king'; adjectives are often expressed by nouns ('idol of silver,' 'prince of peace'), and by a characteristic usage (the 'construct state') two words can be closely united to express a general compound idea: 'The fear-of-the-king' (which could also mean 'caused-by-the-king'), 'clean-of-hands,' 'grieved-in-spirit,' 'seekers-after-good.' The tense system is undeveloped, but there is great richness of verbal idea, and nouns and verbs overlap. There is co-ordination rather than subordination. In Hebrew, scenes are juxtaposed and each determines the other. Hebrew lacked subordinate particles, and was not adapted for abstract thought and continuous argument. The one exception—the book of Ecclesiastes—differs notably from earlier and 'classical' Hebrew. There is much more flexibility in the later languages, viz. in Syriac (perhaps owing to contact with Greek-speaking people), and in Arabic, which, though linguistically primitive, is well developed as regards forms, vocabulary, and syntax. In general the languages are concrete (rage = nostril, anger = heat), and ideas of 'life,' 'salvation,' 'righteousness' have a more concrete, material significance. They admitted of spiritual interpretation; and spiritual ideas could be, but were not necessarily hidden in such concrete ritual as washing of the body in order to remove the taint of sin. Hebrew constantly represents a more primitive stage of thought, as when the same root expresses two sides of a process (hear or beget, guilt or punishment, act prudently or prosper, work or reward, possess or dispose, look keenly and recognise or regard as a stranger). In consequence, in translating and interpreting the Old Testament it is often very difficult to do justice to a stage of thought which Western peoples have outgrown. 'Holy' or 'sacred' did not necessarily convey an ethical idea; and what was not normal (ecstasy, madness, enthusiasm) was readily treated as supernatural, if not sacred. The distinction between the order of nature and the social order was not clearly recognised; and offences, whether ethical or merely ceremonial, might not only offend the Deity, but react upon the land and its produce.

The Semite peoples have a fine physical organisation, and are extremely virile. Though mentally quick and clever, they have not been persistent in progress. Impatient of restraint, they have often been too arbitrary to be good rulers and teachers; and the world has perhaps learnt more from them than ever they could have taught it. With brilliant but often untutored imagination and a keen sense of beauty, their temper has been averse to sustained thought. Their art has been manifested now in Assyrian sculpture, now in Phoenician fabrics and silver-work; but Egypt, Persia, and Greece have been among the models, and not only in art have they been indebted to their neighbours. As middle-men they have played a proud part, leaving their stamp on what they have received—myths from Babylonia, wisdom from Egypt, transmitting, with improvements, the 'Arabic' numerals from India, and in the 'Dark Ages' keeping alive the learning which had come to them through the Syrians, and, in the first instance, the Greeks. Arab travellers and propagandists, Syrian missionaries and traders, the scattered Jews of the 'Diaspora,' and Phoenicians of the Mediterranean are characteristic of the restlessness of the Semite, whose function in spreading elements of civilisation and in making history is but imperfectly known. Thrown back upon himself by desert life or by travel, a nomad trader or a caravaner, the Semite, self-centred and confident, carried his world and his faith with him. That the three great religions, Judaism, Christianity, and Islam, are of Semitic origin gives the Semites a unique

place in history. Much has been written on Semitic monotheism and its transcendent God. But of polytheism there is no lack of evidence; and intermediaries between man and the Deity abound, as subordinate deities, angels, and saints, a specific intercessor (Marduk, Michael), and as priestly kings and priests. Nor, as Robertson Smith has shown, is Divine Immanence contrary to the Semitic mind. Semitic religion is characterised by a remarkable intimacy, which led to convictions of magical control of processes otherwise associated with the gods, as also to the superb confidence and assurance which characterise the prophets of the Old Testament. Hence the religion is one of astonishing paradoxes: a familiarity that did not always breed awe or reverence, and a fear and trembling before a majesty if not rather arbitrary Deity. The much-discussed Semitic monotheism is essentially a passion, a vehemence: man's nothingness before the Deity alternating with a proud consciousness of this knowledge and the relationship it implied. As in days of old (Isaiah xxix. 13), Allah's name may be commonest in use, but the 'constitutionally irreligious habit of the Arab mind' (Robertson Smith) is as striking as the phases of Semitic life and thought which justify the conviction that religion is the Semites' gift to the world.

The history of Semitic religion goes back to the old Oriental religions of the Near East, to the days of Egyptians and Sumerians, Hittites, and doubtless the Cretans, and other peoples of the Ægean. Even Persia, whose fine ethical religion of Zoroaster (q.v.), subsequently impressed the Jews, had its forerunner about 1400 B.C., when an Iranian influence can be traced in Syria and Palestine. In point of fact, the religion of Israel in the Old Testament is rather a reaction against the civilisations amid which it grew up. Historically it unites an ancient and decaying Oriental world with that of the Greek and Roman age. Christianity arose during an Oriental revival, or rather a reaction against the powerful wave of Hellenism which had swept over the East. In tracing its victories over other Oriental cults of the age, we have to observe that though primarily a Jewish sect it is a remarkable fusion of specifically Jewish and entirely non-Semitic thought. Not unnaturally, it did not take root in the land of its birth, but it underwent its most striking developments at the hands of European rather than Oriental minds. When at length Mohammedanism (q.v.) arose in Arabia (7th cent. A.D.), it was upon the last remains of the old Oriental civilisations. Like the Arabic language itself, Islam both is primitive and shows the influence of its older environment. With its simple theism and most intelligible of promises and threats, it rapidly spread over non-European areas where Greek thought had not permeated. Its development was due to other than Semites (Greek-Syrian, Persian), and its learning actually made a deeper impression upon Jews and Christians than upon Mohammedans, and Islam can hardly be said to have made any further intellectual progress. Semitic religion as a whole is concrete and of 'this world'; even its mysticism is practical. In this way it stands apart from Indian pantheism, pessimism, and the repudiation of 'this world' as 'illusion.' Semitic religion is typically averse to Greek rationalism and anthropomorphism; and it is the influence of the Greek spirit in the larger sense (that is, including western Asia Minor) which both marks the essential difference between western thought and that of India, and has had such varying effects upon the Semitic religions themselves. The religion of the Old Testament owes its uniqueness to the great teachers of ethical monotheism and to the constructive events of about

the 6th and 5th centuries B.C. (see PENTATEUCH). It was indeed followed by a sort of social philosophy (e.g. the book of Proverbs), which took a strangely un-Semitic form under direct Greek influence in Alexandria (in the book of Wisdom). But the most pregnant religious ideas were developed further only in early Greco-Semitic Christianity. The share that the Hebrew Old Testament, as an integral part of the Bible, has had in shaping life and thought in western Christendom is of course incalculable, and cannot but be contrasted with its influence, as the sacred book of the Jews, upon the history of Rabbinical Judaism. Although Judaism has its great and influential creative thinkers (notably Maimonides and Spinoza), it is by no means the simple elemental theism of the later Arabs, which developed its own elaborate though scarcely progressive theology and jurisprudence; nor was it able to avail itself, as Christianity did in order to live, of the fruits of the Greek mind. Thus the Bible both is and is not a Semitic product. The religion of Israel owes its strength to the extreme self-consciousness of a people, its belief in its destiny, and the prophets' teaching of the price of mission. The 'holiness' of a God, Who was in a real sense Israel's own, demanded a 'holy' people; and ideas of 'holiness' and 'righteousness,' divine and human, were hammered out under the stress of hard events. Tragic crises shaped and tested the profoundest religious convictions; internal, political, and social vicissitudes led to the democratisation of a religion which was the religion of a people and not of a class. Inspiring traditions of national origin afforded stability and continuity; and, in the course of relatively few centuries—when compared with the lengthy history of Egypt and Babylonia—Israel saw the rise and fall of one age and the beginning of a new one. So, a reconstructed religion issued in the Old Testament, but was unable to make a further advance when, a few centuries later, Christianity sprang from it, and the line of Israel's prophets came to an end. The religion of the Old Testament, standing apart from the outworn surrounding civilisations, has a certain primitiveness, comprehensiveness, and completeness. Its most effective ideas were developed ('fulfilled') at what proved to be the beginning of a new era; and through this continuity and development the whole Bible itself covers a unique series of creative and progressive movements in history. The Semites have produced some famous historians, and their ideas of history are invariably of great interest. The Bible, covering as it does the greatest epoch-making developments, has stimulated further development; and, extending over so large a field of life and thought, it has implicit in it, as subsequent ages found, a philosophy of history and religion which is far from proving sterile. While the very attractiveness of Jewish theosophy, in the Kabbalah (see CABALA), awakened Christians of the 15th and 16th centuries to serious Semitic study, continued research has but enhanced the absorbing and fascinating questions which the Semites raise; and a fair estimate must seek to do justice to the Semitic genius, its conspicuous merits, and no less conspicuous defects, and to weigh the achievements of this remarkable people with what progressive humanity has been able to learn from them.

For the Semitic languages in general, see especially Noldeke's article under that heading in *Encyc. Brit.*, and the German work by Brockelmann (Berlin, 1908). For the religion, see W. Robertson Smith, *Religion of the Semites*, and Lagrange, *Études des Rel. Sémitiques* (1905). F. Hommel's *Ethnologie und Geographie des alten Orients* (Munich, 1926) is extraordinarily elaborate. See also *Camb. Anc. Hist.*, vol. i. chap. v. (and the Bibliography).

Semler, JOHANN SALOMO, one of the most influential German theologians of the 18th century, was born 18th December 1725, at Saalfeld in Thuringia, and educated at Halle. After editing for a year the *Coburg official Gazette*, and lecturing on philology and history at Altdorf for six months, he was in 1752 appointed professor of Theology at Halle, where he taught with great success. He died at Halle on 14th March 1791. For many years he enjoyed a wonderful popularity as a teacher, and exercised so wide and profound an influence as pioneer of the historical method that he has been called the 'father of Biblical Criticism.' Yet, of course, he contributed little to the science; his chief merit is to have pointed out the way and indicated the right methods to those who came after. He was distinctively a rationalist, and one of the most influential in enunciating theology from the fetters of tradition. But he sincerely believed in revelation; and he lost favour through his opposition to the *Wolfenbützel Fragments*, and his adverse criticism of the 'naturalism' or extreme rationalism of Bahrdt. Both friends and enemies found it difficult to reconcile his defence of revelation with his own critical freedom. In insisting on the distinction of the Jewish and Pauline types of Christianity he (possibly influenced by the deists Toland and Morgan) clearly anticipated a main position of the Tübingen school. As a thinker he was deficient in philosophical consistency and breadth of view; and as a writer he possessed no literary skill or grace. He wrote a vast number of books; but none of much value at the present day.

See his own *Lebensbeschreibung* (1871-82); Schmid, *Theologie Semlers* (1858); Thielack, in his *Vermischte Schriften*; and for the influence of the Deists, an article by David Patrick on 'English Fore-runners of the Tübingen School' in the *Theological Review* for 1877.

Semliki, a river of equatorial Africa, flowing north-east into Lake Albert. It was discovered by Stanley in 1888.

Semlin (Serb. *Zemyn*; Mag. *Zimony*), formerly a frontier town of Hungary, since 1918 Yugoslav, stands on a tongue of land at the junction of the Save and the Danube, on the right bank of the latter, above Belgrade. It contains the ruined castle of John Hunyady, who died here. Pop. (1921) 18,625, mostly Serbs. See Kingslake's *Bohem*.

Semmering, a mountain on the borders of Styria and Lower Austria, 60 miles SW. of Vienna, and 4577 feet above the sea, over which the Vienna, Gratz, and Trieste Railway has been carried by a series of ingenious engineering contrivances. The railway, built in 1850-53, passes through 15 tunnels and numerous galleries, and crosses 16 viaducts. It extends from Gloggnitz on the north to Marz-zuschlag on the south, a distance of 25 miles. The greatest elevation is reached at 2940 feet in the Semmering tunnel (4692 feet long). The steepest gradient for any distance is 1 in 40.

Semmes, RAPHAEL (1809-77). See ALABAMA.

Semnopithecus, the genus of monkeys to which the Entellus Monkey (q.v.) belongs.

Semolina, an article of food consisting of granules of the floury part of wheat. The name semolina is often applied to the larger sizes of 'middlings' made in the process of flour milling (see MILL), and these products are sometimes sold under the name semolina in the granular state after thorough cleaning, instead of being ground into flour. Semolina is chiefly used for making puddings and soups.

Semon, RICHARD (1859-1918), German physiologist, born at Berlin, was educated there and at the universities of Jena and Heidelberg. After

graduating in medicine, he did some exploration work in Africa, and was subsequently (1887-97) professor of anatomy at Jena. He committed suicide at Munich shortly after Christmas in 1918. Semon is chiefly known for his elaboration of the thesis of Ewald Hering, Samuel Butler (q.v.), and others, that unconscious memory can be attributed to all substances. By the 'mnemic' principle—'the principle of conservation in the mutability of all organic happenings'—he endeavoured to link up the phenomena of memory, heredity, and habit. In 1904 he published *Die Mneme, als erhaltendes Prinzip im Wechsel des organischen Geschehens* (Eng. trans. by L. Simon, 1921). A less biological and more psychological treatment was afforded in 1909 in *Die mnemischen Empfindungen in ihren Beziehungen zu den Originalempfindungen* (translated by Bella Duffy into English as *Mnemic Psychology*, 1923). A posthumous work, *Bewusstsein, sensorgang und Gehirnprozess*, appeared in 1920.

Sempach, a small town of Switzerland, 9 miles by rail NW. of Lucerne, on the east shore of the lake of Sempach. Under its walls Leopold, Duke of Austria, with 4000 men, was met on 9th July 1386 by the confederated Swiss to the number of 1500. The nature of the ground being unfitted for the action of cavalry, the horsemen (1400 in number) dismounted, and formed themselves into a solid and compact body, which was at once charged by the Lucerners; but the wall of steel was impentrate, and not a man of the Austrians was even wounded, while many of the bravest of the Swiss fell. But, as the legend runs, Arnold von Winkelried, a knight of Unterwalden, seized with a noble inspiration, rushed forward, grasped with outstretched arms as many pikes as he could reach, buried them in his bosom, and bore them by his weight to the earth. His companions rushed over his body into the breach thus made, slaughtered the armour-encumbered Austrian knights like sheep, and threw the remainder into the utmost confusion and dismay. The result was a decisive victory for the Swiss, who thus asserted their independence, and finally broke the efforts of the Austrian dukes to subdue them. The anniversary of this great victory is still celebrated by religious solemnities on the field of battle.

Semper, KARL, naturalist, was born at Altoma on 6th July 1832, studied at Kiel, Hanover, and Würzburg, and, after travelling in the Philippines and South Sea Islands, became professor of Zoology at Würzburg. He wrote on the Philippines, on several problems of comparative anatomy, and *The Natural Conditions of Existence as they affect Animal Life* (trans. 1880). He died 30th May 1893.

Sempervivum. See HOUSE LEK.

Sempringham. See GILBERTINES.

Sen, KESHUB CHUNDER, an Indian religious reformer, was born at the village of Garla (Gorripore) in Bengal, on 19th November 1838, and received an education partly English, partly Hindn. About 1858 he was attracted by the Brahama Samāj (q.v.), and soon afterwards began the work of his lifetime, a steady endeavour to promote the religious regeneration of his countrymen. In 1866 he founded the more liberal 'Brahma Samāj of India.' After a visit to England in 1870 he organised in Calcutta several schemes of charitable philanthropy on the lines of what he had seen in England. In 1878 a schism broke out in his church, caused by his own autocratic temper, and by his leanings to mysticism. His last years were years of controversy, waning influence, and disappointment; and he died on 8th January 1884. See Max-Müller, *Biographical Essays* (1884).

Senaar. See SENNAAR.

Sénancour, ÉTIENNE PIVERT DE, author of *Obermann*, was born at Paris in November 1770. In a sickly and secluded boyhood he read eagerly, especially travels; at fifteen entered for four years the Collège de la Marche; and here devoured Malebranche, Helvétius, and the 18th-century philosophers, losing his faith completely in the process. At nineteen, with the connivance of his mother, he left home to escape the course at Saint Sulpice required by his imperious father, turned his steps to the lake of Geneva, the next year at Fribourg married a young girl who did not long survive, lost his patrimony through the Revolution, but returned to Paris about 1798, and thereafter made a modest living by his pen, eked out with a pension granted by Louis-Philippe on the recommendation of Thiers and Villenain. He died at Saint-Clond in February 1846, asking that on his grave might be placed these words only: *Éternité, deviens mon asile*. His fame rests securely on three books: *Réveries sur la Nature primitive de l'Homme* (1799), *Obermann* (1804), and *Libres Méditations d'un Solitaire Inconnu*. In the first book we see the student of Rousseau weighed down by the absorbing dogma of necessity, full of aversion for all human society, returning to his ideal in the patriarchal nomad, the vegetative instinct, and the primordial sensations of man. In *Obermann* his hero travels in the Valais, next to Fontainebleau, and again to Switzerland, writing his thoughts the while in letters to a friend. Here the atheism and dogmatic fatalism of the *Réveries* have given place to universal doubt no less overwhelming. Nowhere is the desolating 'maladie du siècle' more effectively expressed than in this book, which, with affinities enough to Chateaubriand and Madame de Staël, is yet completely original in its inwardness, its sincerity, the delicate feeling for nature it exhibits, and the melancholy eloquence of many of its passages. 'Though he may be called a sentimental writer,' says Matthew Arnold, 'and though *Obermann*, a collection of letters from Switzerland treating almost entirely of nature and of the human soul, may be called a work of sentiment, Sénancour has a gravity and severity which distinguish him from all other writers of the sentimental school. The world is with him in his solitude far less than it is with them; of all writers he is the most perfectly isolated and the least attitudinising. His chief work, too, has a value and power of its own, apart from these merits of its author. The stir of all the main forces, by which modern life is and has been impelled, lives in the letters of *Obermann*: the dissolving agencies of the 18th century, the fiery storm of the French Revolution, the first faint promise and dawn of that new world which our own time is but now more fully bringing to light—all these are to be felt, almost to be touched, there. To me, indeed, it will always seem that the impressiveness of this production can hardly be rated too high.'

Sénancour was neglected in his day, but he has found fit audience in George Sand, Sainte-Beuve, and, amongst ourselves, Matthew Arnold, whose two elegies are known to all lovers of poetry.

See Sainte-Beuve's two essays in *Portraits Contemporains*, vol. i.; the *Cornhill Magazine*, vol. xlv.; the first complete translation of *Obermann*, with introduction, by A. E. Waite (1903); and a study by Merlant (1907).

Senate, the deliberative assembly of the Roman people (see **ROME**). In some modern states, as France (q.v.) and the United States (q.v.), the senate is the upper chamber of the legislature. The governing body of universities is usually called the senate (see **UNIVERSITY**).

Sendai, a town on the east coast of the main-

land of Japan, 220 miles NNE. of Tokyo by rail, seat of the Tohoku Imperial University (1907); pop. 119,000.

Seneca. ANNÆUS Seneca (prænomen unknown), a Spaniard from Corduba (Córdoba), was born about 54 B.C., and, having come to Rome as a youth, studied eloquence under Marullus. We next find him again in Spain, married to Helvia, by whom he had three sons—Novatus, Lucius Annæus, and Mela (father of Lucan the poet). About 3 A.D. he returned to the capital a second time to busy himself with rhetoric, till, under Tiberius, he sought his native country once more, and died there, 39 A.D. He was a great admirer of Cicero. With much of the antique Roman fibre, he had moral ballast enough to steer clear of the excesses on which contemporary rhetoricians made shipwreck. Besides a historical work, now lost, he wrote in later life *Oratorum et Rhetorum Sententiæ*; *Divisiones*; *Colores*; ten books of 'Controversiæ', of which the first, second, seventh, ninth, and tenth are complete, the remainder surviving only in extracts; and one book of 'Suasoriæ'—the whole, fragmentary as they are, of high importance for the history of Roman rhetoric. The best edition is that of H. J. Müller (Prague, 1887), while Sander's *Sprachegebrauch des Rhetors Annæus Seneca* (1880) is of special value to the student of Latin style.

Seneca, L. ANNÆUS, son of the preceding, also a native of Corduba, was born about 4 B.C., and carefully educated for the bar, under his father's eye, in Rome, where, in Caligula's reign, he narrowly escaped the death to which that emperor, jealous of his enlightened liberalism, had destined him. After years of exclusive devotion to philosophy and rhetoric, he entered the Curia, but, 41 A.D., lost the favour he had won with Claudius by getting involved, through the emperor's infamous wife Messalina, in a state-trial which ended in his banishment to Corsica, whence he did not return till after an exile of eight years. Entrusted by Agrippina with the education of her son Nero, he acquired over the youth an influence as strong as it was salutary, and, having already at Agrippina's instance become prætor, he was, at that of Nero (now emperor), made consul, 57 A.D. His high moral aims and intellectual gifts, possibly through defect of the courtier's tact, gradually incurred the aversion of the rapidly deteriorating emperor, who at length came to regard him with jealousy and hatred. He has been taxed by imperial apologists, but unjustly, with vanity and ambition—more plausibly, perhaps, with love of wealth and the power it brings. His wealth, accumulated under Nero's profligate extravagance, excited, it is said, the rapacity of the emperor, whose sinister designs he anticipated by offering to refund it, with the exception of a pittance on which he proposed to retire. These overtures Nero rejected, whereupon, under pretence of illness, he withdrew from the public gaze. An attempt on Nero's part to poison him having failed, he was drawn into the Pisonian conspiracy, accused, convicted, and condemned. Left free to choose his mode of death, he elected to open his veins, and gradually succumbed to syncope, 65 A.D. His second wife, Pompeia Paulina, who wished to die with him, and actually had her own veins incised for the purpose, survived him a few years.

A noble, upright character, Seneca was yet the object of calumnious detraction—to such a degree that the utmost caution is necessary in passing judgment on him. In philosophy he inclined to the Stoic system, though not indisposed to engraft upon it the tenets of the Epicurean school. But

his moral independence is an outstanding feature in his voluminous *dicta*, which, often profound, are always sharply and distinctly reflected in the steel-mirror of his style. Earnestness and self-abnegation are their most memorable note, especially in their inculcation of man's duty to himself and to his neighbour. The relations of his teaching to Christianity have recently evoked a number of treatises, attempting to prove his correspondence, if not personal association, with the apostle Paul, his contemporary in Rome. The points of divergence, however, between him and the teacher of the Gentiles are more numerous than the points of coincidence (see the Dissertation in Lightfoot's *Com. on Philipians*). His writings, apart from much that has been fathered on him, include three books *De Ira*; three consolatory pieces addressed to his mother Helvia, to Polybion, and to Marcia (*De Consolatione*); treatises *De Providentia*, *De Animi Tranquillitate*, *De Constantia Sapientis*, *De Clementia* (ad *Neronem Casarem*), *De Brevitate Vitae* (ad *Paulinum*), *De Vita Beata* (ad *Gallionem*), *De Otio* (ut *Secessu Sapientis*); seven books *De Beneficiis*; 124 *Epistulae ad Lucilianum*, comprising five speculations on philosophical questions of every kind, in which his characteristic powers appear to special advantage; a scathing satire on the Emperor Claudius, in the form of a parodical apotheosis (*Apocolocyntosis sive Ludus de Morte Caesaris*); finally, seven books *Quaestionum Naturalium*, addressed to Lucilius the Younger—the only surviving Roman treatise on physics, if not the first in Latin literature (of the same compass at least). It reveals a decidedly exacter and wider knowledge and a sounder critical faculty than the later work of the elder Pliny.

Seneca had also a poetical side, if we may accept as his the epigrams (mainly referring to his banishment) and the eight tragedies (*Heracles Furens*, *Thyestes*, *Phaedra*, *Edipus*, *Troades*, *Medea*, *Agamemnon*, and *Heracles Etruscus*, along with two scenes from a *Thelus*) usually comprised among his *opera omnia*. These are imitations of Greek models, and are distinguished by great mastery of style, vigorous imagination, and keenness of psychological insight. But their purely rhetorical, eminently undramatic, character unfits them for the stage, if indeed they were ever intended for it. In versification they are 'correct' to a fault, till the monotony of their cadences becomes as wearisome as their declamatory strain.

Of editions of his prose writings that of Gronovius (1661-82), of Ruhkopf (1797-1811), and, best of all, that of Fickert (1842-45), still hold their place, while some of his special treatises have been carefully edited by Koch and Vahlen, and by Gertz. His tragedies may be most conveniently read in the editions of Gronovius (1661-81), of Schröder (1728), of Bothe (1819 and 1822), of Feiper and Richter (1867-1902), of Leo (1878), and of Haase (1898). The Loeb Library includes translations (with texts) of the *Apocolocyntosis* by Rome (1913), the *Tragedies* by F. J. Miller (2 vols. 1917), and the *Epistulae Morales* by R. M. Gummere (3 vols. 1917-26). The *Minor Dialogues* were translated by A. Stewart (1889), and the *Tragedies* by Dr Ella Isabel Harris (1904). See (for a portrait of the philosopher-statesman) Westbury's novel *Acté*, Hochart's *Études* (1885), A. P. Ball on the *Apocolocyntosis* (1903), and S. Dill's *Roman Society from Nero to Marcus Aurelius* (1905). There is a Life by F. Holland (1920). For influence on English tragedy, see a book by F. L. Lucas (1922).

Seneca Falls, a 'village' of New York, on the Seneca River, 10 miles from the lake and 41 miles by rail WSW. of Syracuse. The river falls 50 feet here, and the place contains a number of mills, foundries, and manufactories of pumps, woollen and leather goods, &c. Pop. 6400.

Seneca Lake, one of a range of narrow lakes in the western part of the state of New York. It

is 36 miles from north to south, 2 miles in average width, and 530 feet deep. Steamers ply from end to end.—For the Seneca Indians, from whom the lake takes its name, see IROQUOIS.—Senega (q.v.) is a form of the same word.—Seneca Oil is an old name for Petroleum (q.v.).

Senecio, a very numerous genus of the great family Compositae, having a hairy pappus, a naked receptacle, and a cylindrical involucre of linear equal scales, with a few smaller scales at their base. The species are natives chiefly of the temperate and cold parts of the world, the half-shrubby species being from the warmer latitudes, with some trees in Central Africa. Eleven species are reckoned as British, and commonly known as Groundsel (q.v.) and Ragwort (q.v.). *S. saracenicus*, perhaps not a true native of Britain but introduced in the middle ages, has undivided lanceolate leaves, and was once in repute as a vulnerary. *S. hieracifolius* is one of the plants called Fireweed in North America. It receives its name from appearing abundantly wherever a part of the forest has been consumed by fire. Many species of Senecio have a strong, disagreeable smell. A few are rather ornamental as flowers; see CINCERARIA.

Senefelder, ALOYS. See LITHOGRAPHY.

Senefle, or SENEFL, a town in the province of Hainault, Belgium, 27 miles by rail S. by W. of Brussels, with a pop. of 4000, is the centre of a district in which manufactures of pottery and glass are extensively carried on, but is chiefly notable as the battlefield on which William of Orange (III. of England) was defeated after a bloody contest by the Great Condé, 11th August 1674. Here, too, on 2d July 1794 the French general Marceau defeated the Austrians.

Senega, or SNAKE ROOT, is the dried root of *Polygala Senega* used as a cure for snake-bites in America. See MILKWEEDS.

Senegal, a river of West Africa, has two main sources, the Bafing which flows north from the plateau of Futa-Jallon, and the Bakhoï which comes from the south-east, the country of Buré, not far from the north bank of the Joliba (Niger). These streams meet at Bafulabé, 700 miles from the coast, and from there the united Senegal flows north-west, west, and south-west, and reaches the Atlantic some 10 miles below St Louis. For three months of the year (July-October) boats drawing 20 feet can get up to Kayes, 40 miles below Bafulabé. The channel is, however, in those higher reaches greatly obstructed by falls and 'narrows,' and in its lower course it is sudded with numerous low, flat islands. Although the river is navigable all the year round for about 200 miles up, it is not so serviceable to navigation as it might be because of a formidable bar that lies across its mouth. The difficulties of the navigation are in part overcome by a railway along the left bank of the river, between Kayes and Dioubéba, a place 25 miles beyond Bafulabé, and the French have continued the line to Bamnake and Kulikoro on the Niger, communication being continued by steamer to Timbuktu and further.

For the French colonies of Senegal and Upper Senegal-Niger, see SENEGAMBIA.

Senegambia is a general name for the region drained by the rivers Senegal and Gambia, from whose names the word was compounded. In a wider sense it is applied, unofficially, to the French possessions in West Africa that lie to the north of French Guinea, the Ivory Coast, and Dahomey. The French first settled in this part of Africa early in the 17th century; but the settlements (more than once captured by the English, and again restored) languished until the appointment of General Faid-

herbe as governor of Senegal in 1854. He vigorously subdued the Berber chiefs, who prevented the French advance inland, and annexed their territories. This policy was pursued in the same spirit by his successors; districts were annexed and protectorates proclaimed with extraordinary celerity, in spite of great trouble occasioned by two powerful chiefs Ahmadou and Samory from 1887 to 1898. The chief danger was from British rivalry, but the French succeeded in penetrating fast enough down the Niger to cut off the hinterland of the British and German colonies; and by the convention of 1890 their title to the country as far east as Lake Tsad was recognised. A succession of later treaties (1898, 1904, 1906, 1914) further defined the limits of French West Africa. There have been many changes in the number and administration of the individual colonies, but at present the country under the Governor-General of West Africa consists of the colonies of Senegal, French Sudan, French Guinea, Ivory Coast, Dahomey, Upper Volta, Mauritania, and the colony of the Niger, a total area of nearly one and a half million square miles. The governor-general superintends the interests of the colonies as a whole, while each colony has a lieutenant-general to supervise local affairs.

In the north are nomad tribes, Moors, and Tuaregs, but the people belong for the most part to the Peuhl and Mandinga tribes of negroes; they are in part Moslems, in part fetish-worshippers. The total population in 1923 was 12,583,111, of whom only 11,747 were Europeans, mostly French.

The principal geographical feature in these united regions is the plateau (2000-4000 feet) of Futa-Jallon; from its valleys issue many rivers that flow west and south-west to the Atlantic (e.g. the Gambia), north to the Senegal, and east and north-east to the Joliba (Niger). The villages of the natives are chiefly planted along these watercourses. In the north rainfall is scant and vegetation is stunted, but farther south there are grass-lands and dense forests thriving on a tropical rainfall. The baobab, butter-tree, kola tree, oil-palm, and banana are typical. Ground-nuts, gums, fruits, rubber, cotton, cocoa, and timber (including Senegal ebony—see DALBERGIA) are exported; imports are mostly food, textiles, liquor, and machinery. Maize and millet are grown and there is some stock-raising.

The colony of Senegal lies west of the Faleme River and south of the Senegal (along with the north bank of the river). It includes four municipal communes: St Louis, the capital; Dakar, the seat of the governor-general; Rufisque, a port; and Gorée, a small fortified island off Dakar. The natives of the communes are French citizens. The colony sends a deputy to the French Chamber, but has also its own council of twenty representatives of French citizens and twenty of native chiefs. Area 74,112 sq. m.; pop. 1,270,000 (5700 Europeans). French Sudan, called Upper Senegal-Niger till 1920, was formed out of the territories of Senegambia and Niger in 1904. It is hemmed in by the colonies of Senegal, Mauritania, French Guinea, Ivory Coast, Upper Volta and Niger, and by the Sahara. The chief towns are Bamako, the capital (29,000), Kayes (11,000), and Timbuktu (7000). Area 356,471 sq. m.; pop. 2,562,000. Upper Volta, created a colony in 1919, lies in the southern portion of the bend of the Niger; it was formerly part of Upper Senegal-Niger. The chief town is Ouagadougou (20,000). Area, 142,820 sq. m.; pop. 3,000,000. The colony of the Niger was constituted in 1922. Formerly a military territory, it stretches from the Niger to the region of Lake Tsad. The capital is Zinder (5900). Area, 404,914 sq. m.; pop. 1,150,000. See separate articles on DAHOMEY, FRENCH GUINEA, IVORY COAST, MAURITANIA, also NIGER, SENEGAL, TIMBUKTU.

Seneschal (Old French; from the same roots as the Gothic *sins*, 'old,' and *skalks*, 'a servant'; compare *marshal*), a functionary in the household of the Frankish kings corresponding to what in England and Scotland was designated 'steward,' usually rendered into Latin as *senescallus*.

Senigaglia, or SINGAGLIA (anc. *Sena-Gallia*), a seaport on the Adriatic coast of Italy, 16 miles by rail NW. of Ancona, was down to 1869 celebrated for its annual fair, 20th July to 8th August. It was founded by the Senonian Gauls, and colonised by the Romans 289 B.C. The Guelph and the Ghibelline wars brought it to such a condition that it is mentioned by Dante as the type of a ruined city. There are here a cathedral (1787) and a Gothic castle, restored in 1480 by Baccio Pontelli for Giovanni della Rovere, nephew of Sixtus IV. Pius IX. was born here. Pop (1921) 25,327.

Senior, NASSAU WILLIAM, political economist and 'prince of interviewers,' was born on 26th September 1790, at Compton in Berkshire, the eldest son of the vicar of Durnford, Wilts, and from Eton passed to Magdalen College, Oxford, where in 1812 he took a distinguished first-class in classics. In 1819 he was called to the bar at Lincoln's Inn; during 1825-30, and again during 1847-62, was professor of Political Economy at Oxford; in 1832 was appointed a Poor-law commissioner; and from 1836 to 1853 was a Master in Chancery. He travelled much, and wrote much for the *Edinburgh Review* and other leading periodicals, his twenty works including, besides treatises on political economy, *Biographical Sketches* (1863); *Essays on Fiction* (1864); *Historical and Philosophical Essays* (1865); *Journals, Conversations, and Essays relating to Ireland* (1868); *Journals kept in France* (1871); *Conversations with Distinguished Persons during the Second Empire* (4 vols. 1878-80); and *Conversations and Journals in Egypt and Malta* (1882). He died 4th June 1864.

Senlac. See BATTLE, HASTINGS.

Senlis, a very ancient town of France, dept. of Oise, 33 miles NNE. of Paris. Its older portion is surrounded by walls, flanked with towers, which date from Roman times. The cathedral, a small edifice, with a striking bell tower (1140), is a beautiful example of early Gothic; Senlis ceased to be a bishop's seat in 1801. Here was signed on 23d May 1493 a treaty between Charles VIII. of France and the Emperor Maximilian I. There still exist the ruins of an old royal castle. The town suffered severely in the Great War. Pop. 6500.

Senna is the dried leaflets of two species of Cassia, various preparations of which are used in medicine as purgatives. The Alexandrian senna leaves are obtained from *Cassia acutifolia*, and the Tinnivelly senna leaves from *Cassia angustifolia*. *Alexandrian senna* is chiefly grown in Nubia and Upper Egypt, and is imported in large bales from Alexandria. *Tinnivelly or East Indian senna* resembles Alexandrian senna in odour and taste. The leaflets are, however, larger and finer, 'about 2 inches long, lanceolate, acute, unequally oblique at the base, flexible, entire, green, without any admixture.' Senna pods (*Senna fructus*) are also largely used for making purgative medicines.

The active principle in senna is a glucoside, which has been named cathartic acid, and which is closely allied to chrysarobin and the purgative principle in rhubarb; there are also other substances which impart to senna its peculiar odour and taste, as well as a variety of sugar. The different pharmaceutical preparations of senna act as moderately active cathartics, but tend to cause griping. To obviate this, and to disguise the nauseous taste of the drug, they are all made up

with a number of carminative and flavouring substances. The active principles in senna are excreted in the urine, which is coloured yellow,

Cassia obovata.

and by the milk, which is rendered purgative. The official preparations comprise the *confection of senna* (dose about a tea-spoonful), the *infusion of senna* (dose 1 to 4 table-spoonfuls), the *syrup of senna* (dose 1 to 2 tea-spoonfuls), and the *compound mixture of senna or black draught* (dose 1 to 4 table-spoonfuls). *Compound*

liquorice powder consists largely of senna. The dose of senna itself is 10 to 30 grains.

BLADDER SENNA (*Colutea*) is a genus of shrubs of the family Leguminosae, sub-family Papilionaceae, having pinnate leaves, red or yellow flowers, and remarkably inflated pods, whence the English name. One species (*C. arborescens*) is common in shrubberies in Britain. It is a native of the south of Europe.

Sennaar (properly *Sennar*, sometimes also *Sennar*), a city of the Eastern Sudan, stands on the Blue Nile, about 160 miles SSE. of Khartoum. Pop. 8000. It is the chief town of a district lying between the Blue and the White Nile, an old kingdom, now a province of Anglo-Egyptian Sudan. For the disastrous expedition of Hicks Pasha into this province in 1883 see Colborne, *With Hicks Pasha in the Sudan* (1885), and Wingate, *Mahdism and the Egyptian Sudan* (1891). See also article GEZIRA (E.).

Sennacherib, an Assyrian king, son of Sargon, reigned 705 to 681 B.C. The chief events of his reign are enumerated under Assyria (q.v.). He was the originator of great public works, as the embankment of the Tigris, the making of canals, watercourses, and the erection of gigantic palaces at Nineveh.

Senonian. See CRETACEOUS SYSTEM.

Sens, an old town of France, dept. Yonne, stands on the right bank of the Yonne, 70 miles by rail SE. of Paris, and is still surrounded by its ancient walls. It was known anciently as Agelincum or Agendicnum, and was the principal town of the Gallic tribe of the Senones. Its chief ornament is the Gothic cathedral of St Stephen, founded, some say, in the 10th century, but built mainly in the 12th, and restored twice or thrice since. It has splendid portals, fine stained glass, and two large bells; in its treasury are preserved the vestments of Thomas à Becket. There are also the palace and ancient public offices of the archbishop, and a town museum. The chemist Thénard was born in the place. Population, over 15,000.

Sensation may be defined as the change in consciousness which results from the transmission of nervous impulses to the brain. Such impulses arise in sensory end-organs at the periphery of the

body where elaborate nervous mechanisms are developed in connection with the various senses of smell, sight, hearing, and taste. The surface of the skin is a mosaic of tiny sensorial areas, not necessarily connected, and furnished with end-organs known as 'touch-spots,' 'cold spots,' 'heat-spots,' and 'pain-spots.' From these, impulses are carried to the brain by sensory or afferent nerves, which are separate from the motor nerves. It must be noted, however, that afferent impulses are being constantly carried to the brain from all parts of the body, resulting in motor and other acts necessary to our life, without exciting any sensation at all.

It has been customary to speak of all varieties of general somatic sensibility in terms of touch, pain, heat and cold, for these seem to accord best with what we find by introspection. As these may all be preserved and the patient be still unable to recognise the relationship of a limb in space, or to appreciate movements carried out passively, a hypothetical 'joint-sense' or 'muscular-sense' has been added, and this whole complex was supposed to be transformed by cerebral association and judgment into the mental processes by which we become aware of the physical qualities of the world around. According to the doctrine of specific nerve energy, it was also held that each physical act of sensation was associated with distinct processes which started in the peripheral end-organs and passed unaltered to the cortex of the brain.

The pathway by which sensory impulses find their way from the peripheral end-organs up to the brain is fairly well established, and involves at least three nerve fibres. The nerve cells from which the peripheral fibres arise are situated in the posterior root ganglia. Their axis cylinder processes bifurcate, one branch passing to terminate in the sensory end-organ, the other passing into the spinal cord to terminate round nerve cells in the gray matter. A number of these fibres pass directly upwards in the posterior columns of the spinal cord to terminate round nerve cells in the medulla oblongata constituting the cuneate and gracile nuclei. From these a second neurone, known as the mesial fillet, passes to the opposite optic thalamus, which is thus sensory in function. The final connection with the post-central convolution immediately behind the fissure of Rolando in the cortex is not yet established.

The sensory pathway may thus be divided into three parts, the first *peripheral*, the second *intramedullary*, and the third *cerebral*. The fact that a sensation arising in an end-organ cannot pass unaltered to the cerebral cortex has been discovered from the fact that injuries to the peripheral nerves, to the spinal cord, and to the brain, all tend to disturb sensation in a different way. This is now known to be due to a regrouping that afferent impulses undergo on their way to the highest receptive centres. Each end-organ is to be regarded as a resonator tuned to some aspect of physical vibration. It responds by producing an afferent impulse stamped with the characteristic peculiar to the organs in which it has arisen. Each of these impulses acts in turn on a series of receptive mechanisms within the central nervous system which are themselves attuned to certain physiological qualities, and thus here those of like sensory disposition are gathered together whatever their peripheral origin.

Afferent fibres in the *peripheral* nerves may be divided into three systems: (1) Those which subserve *deep sensibility*, and conduct impulses produced by pressure and by movements of joints, tendons, and muscles. They run mostly with the motor nerves, and are not destroyed by division of all the sensory nerves to the skin. They allow recognition of passive movement and the position

of a limb in space. (2) Those which subserve *protopathic* sensibility, and which respond to painful stimuli and to extremes of heat and cold. At least three different types of end-organs are associated with this system. After division of a peripheral nerve, protopathic sensibility returns in from seven to ten weeks. (3) Those which subserve *epicritic* sensibility, and which respond to light touch with a well-localised sensation, thus allowing of the discrimination of two points and appreciation of the finer grades of temperature called cool and warm. After division about six months elapses before return of function occurs. Head regards the epicritic system as a cutaneous system of later development and higher function which is superposed on the older protopathic system. This latter system has certain primitive characteristics, namely, rapid regeneration, strictly specific response, and reaction on the 'all or none' principle, while all sensations arising from uncontrolled protopathic activity tend to radiate widely and to be referred to remote parts. Epicritic sensibility, which is so much longer in returning after injury, causes a more strictly limited response, radiation no longer takes place into remote parts of the affected area, and the 'all or none' reaction of the heat and cold spots gives rise to one graduated more closely according to the intensity of the stimulus. The activity of the epicritic system is essentially modulated according to the intensity and locality of the excitation. It is concerned with the finer degrees of tactile and thermal discrimination, and thus is opposed to and controls the 'all or none' reaction of the protopathic system. The internal organs are supplied from the protopathic system alone, no controlling epicritic mechanism being developed.

When these impulses reach the secondary or *intramedullary* level in the spinal cord, they undergo a regrouping, and it is no longer a question of protopathic, epicritic, and deep sensibility. They become shunted into tracts which are devoted to the conduction of one specific impulse, such as pain, touch, heat and cold. A lesion of the spinal cord may thus interrupt any one of these tracts independently of the others. This rearrangement and recombination takes place on the same side as that by which the impulses enter the cord. The secondary paths for sensory impulses then cross with greater or less rapidity, so that ultimately all except those subserving the sense of passive position and movement and tactile discrimination have passed to the opposite side within the limits of the spinal cord. Even those sensory impulses cross after reaching the nuclei of the posterior columns. At the same time, within the spinal cord, afferent impulses become separated into sensory and non-sensory, many of the latter being destined for the cerebellum which they reach by the uncrossed cerebellar tracts.

The termination of the intramedullary portion of the sensory pathway is the optic thalamus of the opposite side. The exact localisation of the third portion of this pathway, namely, from the thalamus to the post-central cortex, is not yet known. Destruction of the optic thalamus, as may occur in apoplexy, causes loss of sensation on the opposite side of the body. Destruction of the post-central convolution, on the other hand, also profoundly affects sensation, but the sensory changes which result have to be considered in terms of the psychical act and not the physical stimulus. The part played by the cortex is concerned with those physiological processes which underlie projection and discrimination, and fall into three categories: (1) recognition of relationship in space; (2) graduated response to stimuli of different intensities; and (3) appreciation of similarity and differ-

ence in external objects brought into contact with the surface of the body. These three aspects of cortical activity are not all equally represented in different parts of the sensory cortex. The optic thalamus is the seat of those physiological processes which underlie crude sensations of contact, pain, heat and cold, together with the feeling tone they evoke. The optic thalamus is thus the centre for the affective aspect of sensation, while discrimination and spacial projection are the product of cortical activity. The prick of a pin is thus felt by the optic thalamus, while the sharpness or bluntness of the pin is recognised by the cortex. If a glass of water be held in the hand, the recognition of contact, heat, cold, or pain are all due to the optic thalamus, but the roundness, size, and weight of the glass together with the power to appreciate the posture of the hand in which it lies, is a function of the cortex.

The sensations experienced in daily life thus result from excitations of the end-organs of the peripheral nerves. These are complex and cause many diverse afferent impressions. They are sorted out and regrouped in the central nervous system, some facilitated and others repressed, and many remain permanently on the physiological level and never form the basis of a sensation: such control reflex activity and co-ordinate movements of the body and limbs. The remainder undergo a process of prolonged qualitative integration, a struggle takes place between these various impulses for functional dominance, the victor alone appearing in consciousness as a sensation. Otherwise incompatible sensations would co-exist in consciousness, mental activity would be chaotic, and discrimination impossible. The origin of sensory impulses is a physico-physiological problem; their passage through the central nervous system is a process of regrouping of excitations at different physiological levels, and their final fate—i.e. the appearance in consciousness of a sensation—is a psycho-physiological problem.

Pain is a function of the intelligence, a psychical element superposed upon the subconscious protective reflexes. It is one of the most effective weapons of defence of the organism, but appears to be unequally developed at different stages in the animal scale. We have no proof that it exists in the lower animals, the afferent impulses which give rise to pain in higher animals subserving reflex action in lower members of the series. When certain worms have been divided into half, the anterior part has continued to move quietly as though it had felt no pain. Herbivora are less sensitive than carnivora. In imbeciles, idiots, and dementes, pain sensibility is low. As it runs parallel with the development of intelligence, it is more developed in the human race as they become more civilised.

LITERATURE.—Papers by Sir Henry Head (London) in *Brain*, vols. xxviii, xxxi, xli, 1905, 1906, 1918.

Sensitive Plant, a name commonly given to certain species of *Mimosa* (see *MIMOSACEÆ*), on account of the peculiar phenomena of irritability which their leaves exhibit in their collapse when touched or shaken. Numerous species of *Mimosa* possess this property, and, indeed, most of the species in a greater or less degree; but those in which it is most conspicuous are humble herbaceous or half-shrubby plants. They have leaves beautifully divided, again and again pinnate, with a great number of small leaflets, of which the pairs close upwards when touched. On repeated or rougher touching the leaflets of the neighbouring pinnae also close together, and all the pinnae sink down, and at last the leaf-stalk itself sinks down, and the whole leaf hangs as if withered. If the

stem is shaken all the leaves exhibit the same phenomena. After a short time the leaf-stalk rises, and the leaflets expand again. On account of this curious and interesting property some of the sensitive plants are frequently cultivated in our hothouses. They are generally treated as annuals, although capable of longer life. *M. sensitiva*, one of the best-known species on the continent of Europe, is a native of Brazil, with prickly stems and leaf-stalks, and small heads of rose-coloured flowers. *M. pudica* is the species most commonly cultivated in British hothouses: it is a branching annual growing from 1 to 2 feet high. *M. casta*, *M. soumaria*, and *M. vivra* are also among the most sensitive species. See the section on the movement of plants at PLANTS.

Sensorium, the supposed centre of sensation or seat of the soul, once believed to be some spot in the brain. See BRAIN, PINEAL GLAND, SENSATION.

Sentinel, Sentry (from the Lat. *sentire*, 'to feel or perceive,' through the Ital. *sentinella*), a soldier or sailor marine at a point with the duty of watching for the approach of an enemy, or guarding the gun-park, camp, magazine, or other locality. When an army is in the field its front and flanks are protected by 'outposts.' These consist of a chain of pickets (some fifty men each), covered in front by the sentries they throw out, and assisted in rear by other bodies called 'supports.' Each picket would furnish two to four double sentry posts, so that no portion of ground along the front is unwatched. These double sentry posts must be visible to one another and to other sentries (single) who, posted over the piled arms of each picket, report their signals. Sometimes groups of three to six men, one watching, the rest lying down, are used instead of the double sentries. If attacked, sentries fall back on the pickets, and with them retire upon the supports. Each is entrusted with the 'parole' or countersign, and no person, however exalted in position, may approach or pass him without giving that as a signal. As the safety of the army depends upon the vigilance of the sentries, the punishment for sleeping when on sentry-duty on active service is death.

Sentis. See SANTIS.

Senussi (*Senūssiya*), a Moslem confraternity of austere and fanatical doctrines, which has done much to unite the Mohammedan population of the north-eastern Sahara in hostility and resistance to foreign and infidel influences. The founder, Sidi Mohammed ben Ali es-Senussi ('of the Senus mountains'), from Mostaganem in Algeria, became famous about 1830 in Fez for his sanctity. He preached his doctrine of a pure and ascetic Islam from Morocco to Mecca, but his teachings met with most success amongst the Bedouins of Cyrenaica, and to that country he repaired to build a college (*zawia*) at Baida. In 1855 he removed to Jaghlabub, near the oasis of Siwa. Here he established a prosperous college, and here in 1860 he died, being succeeded by his son, who claimed to be the promised Mahdi (q.v.). The second Senussi lived a saintly life, but came into conflict with the French, who were advancing from Lake Tsad. The French were victorious, and Senussi died in May 1902. He was succeeded by Sidi Ahmad, his nephew, who continued to oppose the French advance, and also aided the Turks against the Italians in Cyrenaica. Siding with Turkey and Germany in the Great War, Sidi Ahmad threatened serious trouble in 1915 to the British forces in Western Egypt. He was finally defeated at Siwa (1917), and abdicated in favour of Sidi Mohammed el Idris es-Senussi, son of Senussi el Mahdi. Sidi

Mohammed wields a powerful spiritual authority over the Sennssi confraternity, and has restored the prestige of his house lost by his predecessor. See Rosita Forbes, *The Secret of the Sahara* (1921); Hassanein Bey, *The Lost Oases* (1925).

Seoni, a town in the Central Provinces of India, half-way between Nagpur and Jabalpur on the great Deccan road. Pop. (1921) 12,772.—There is a smaller Seoni (pop. 6000) 35 miles SW. of Hoshangabad.

Seoul, or SOUL, the capital of Korea, stands on the river Han, 75 miles from its entrance into the Yellow Sea and 57 miles from its port Chemulpo (q.v.). It lies in a natural basin, amongst granite hill-ranges, and is surrounded with walls. The streets are very narrow and very dirty, and the houses beggarly in the extreme. The city includes several wide, desolate squares. The royal palace and its adjuncts cover 600 acres of ground. Silk, paper, tobacco, mats, fans, and similar commodities are the principal products of native industry. Pop. 270,000.

Sepal. See CALYX, FLOWER.

Separate Estate. See HUSBAND AND WIFE.

Separation of married persons is either judicial or voluntary. If the parties enter into a deed or other arrangement to live separate, this is called a voluntary separation, and in general the legal rights of the parties are not altered, except that if the wife is provided with maintenance she has no longer an implied authority to bind the husband. And though voluntary separation is not encouraged by courts of law, yet effect will be given frequently to deliberate contracts of this kind entered into between the parties. Formerly the intervention of a trustee was in all cases necessary, but now an arrangement made directly between husband and wife is enforced by the English courts. In the United States the law of several states confers the right to contract, to maintain actions, &c., on a married woman who, for good cause, is living apart from her husband. See also JUDICIAL SEPARATION.

Separators. See CREAM.

Sephardim. See ASHKENAZ.

Sepharvaim. See BABYLONIA.

Sepia, a brown pigment used as a water-colour.

It is prepared from the dark-brown colouring matter of the ink-bag of a few species of Cuttle-fish (q.v.), particularly *Sepia officinalis*, which, though chiefly fished for in the Adriatic and Mediterranean, is also found in British seas. The pigment from the dried ink-bags is dissolved in a solution of ammonia or soda and then precipitated by neutralising the alkali with hydrochloric acid, the precipitate being afterwards washed and dried. An ounce of the natural pigment will darken several thousand ounces of water. Sepia excels all other water-colours in the ease with which its tints can be evenly put on paper with a brush. It is much used by itself for sepia drawings, and also in combination with other colours for various subdued tints. It is, however, not suitable for oil-painting. Sepia is permanent when not exposed to sunshine. Most of the modern sepia is made artificially.

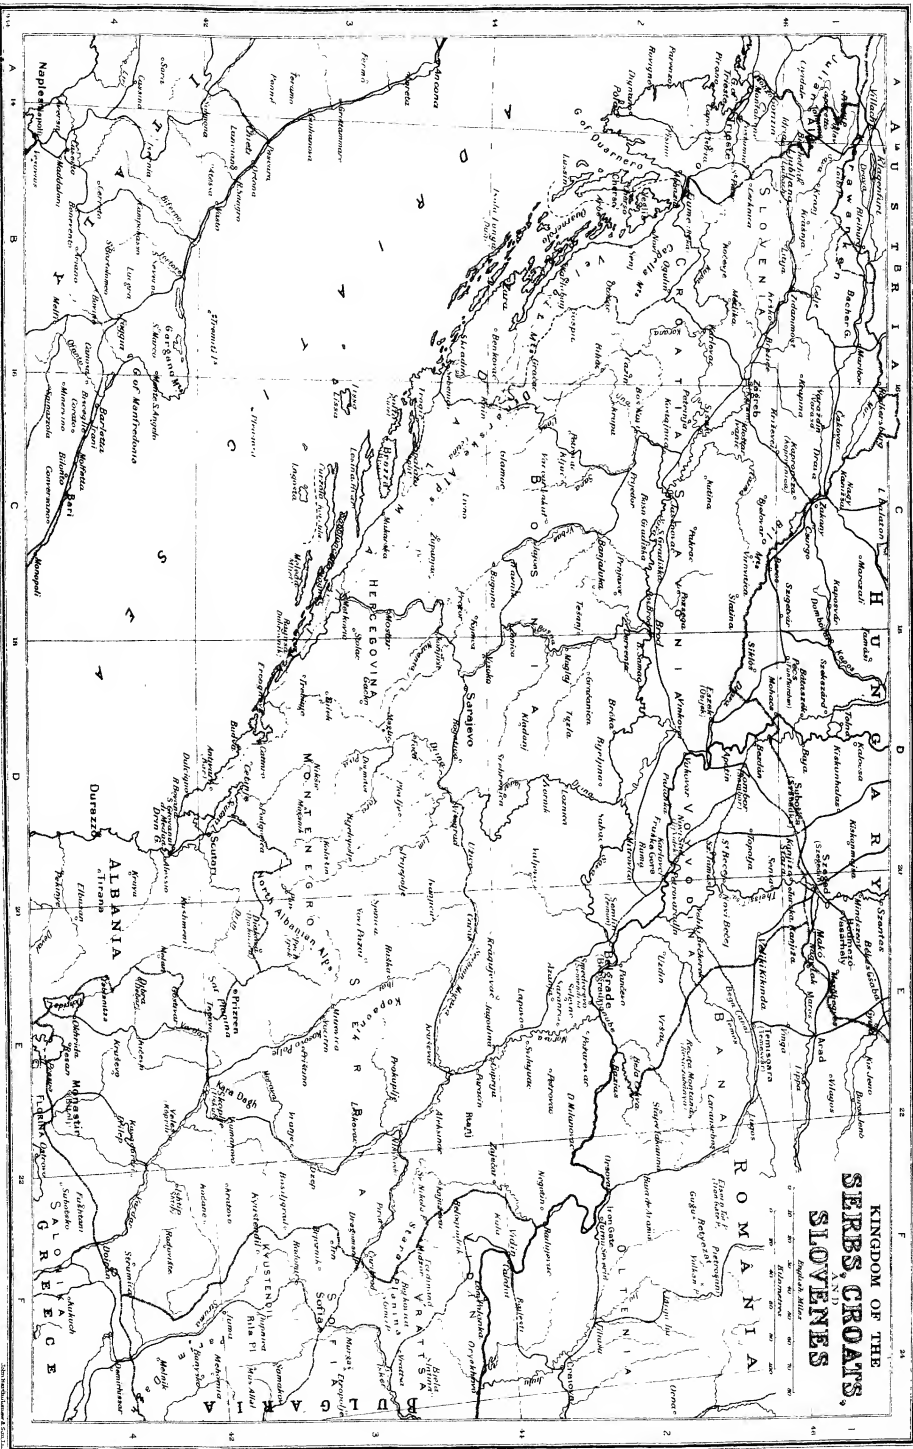

Sepoy, corrupted from the Persian *sipahi*, 'a soldier,' denotes a native Hindu soldier as distinguished from a European soldier (*gora*).

Seps. See SKINK.

Sept. See CLAN.

Septaria are ovate, flattened nodules of argillaceous limestone or ironstone, internally divided into numerous angular fragments by reticulating fissures radiating from the centre to the circumference, which are filled with some mineral substance, as carbonate of lime or sulphate of barium, that has been infiltrated subsequent to their formation. The fissures have been produced by the cracking of

KINGDOM OF THE SERBS, CROATS, SLOVENES

the nodule when drying. They are largest and most numerous in the centre, and gradually decrease outwards, showing that the external crust had first become indurated, and so, preventing any alteration in the size of the whole mass, produced wider rents as the interior contracted. The radiating figure and the striking contrast between the dark body of argillaceous limestone or ironstone and the more or less transparent sparry veins when the nodule is cut and polished have caused them to be manufactured into small tables and similar objects. Calcareous septarian nodules are extensively employed in the manufacture of cement. As they are composed of clay, lime, and iron, they form a cement which hardens under water, and which is known commercially as Roman cement, because of its properties being the same as a famous hydraulic cement made of ferruginous volcanic ash brought from Rome. Such septaria occur in layers in clay deposits, and are quarried for economical purposes in the clays of the London basin. Large numbers are also dredged up off Harwich, which have been washed out of the shore-cliffs by the waves. The septarian nodules of the Carboniferous strata consist generally of clay ironstone, and are sometimes employed in the manufacture of iron. The nodules generally contain a scale, shell, plant, fruit, coprolite, or some other organic substance, forming the nucleus that has apparently excited the metamorphic action which withdrew from the surrounding clay the calcareous and ferruginous materials scattered through it, and aggregated them around the fossil.

September. See CALENDAR.

Septembrists, the perpetrators of the atrocious September massacres in the prisons of Paris, which went on continuously for six days and five nights, September 2-7, 1792. Every violent movement in the history of Paris during the fever of Revolution was a counterpart to some menace or disaster on the frontier, and the immediate occasion of this crowning atrocity was the reaction of panic at the capture of Longwy and Verdun by the Prussians. It assumed the political power of the Commune and controlled the elections to the Convention. Las Cases tells us that Napoleon found himself able to suggest apologies for the atrocity in the exigencies of the moment. Taine gives the number of victims as follows: 171 at the Abbaye, 169 at La Force, 223 at the Châtelet, 328 at the Conciergerie, 73 at the Tour-Saint Bernard, 120 at the Carmelites, 79 at Saint-Firmin, 170 at Bicêtre, 35 at the Salpêtrière; among them 250 priests and the Princess de Lamballe. See DANTON, MARAT, and ROBESPIERRE.

Septennial Act. See PARLIAMENT.

Septicæmia. See PYÆMIA.

Septuagesima. See QUINQUAGESIMA.

Septuagint is the name given to the Greek translation of the Old Testament. The name is derived from the account of the origin of the Septuagint which is given in the *Epistle of Aristeas*. According to the story King Ptolemy of Philadelphus (285-247 B.C.) at the instigation of Demetrius of Phalerum, determined to have a Greek translation of the Hebrew Scriptures made for his library at Alexandria, and in pursuit of this purpose despatched an embassy to the High Priest Eleazar at Jerusalem, asking him to send a commission of the most erudite Jewish scholars of the day to carry out the work of translation. Eleazar responded to the request with alacrity and despatched 72 elders—six from each tribe—for the task. Elaborate preparations were made at Alexandria for the comfort of the guests—and at the end of 72 days they were able to present their

translation to the king. In later times the story was embellished by legendary accretions. In the anonymous Christian apology *Colortatio ad Græcos* (c. 13) it is said that the translators were isolated from each other and placed in separate huts or cells. They all worked independently but at the end it was found that their translations were in complete agreement without the slightest trace of any verbal variations. It is probable that there is a modicum of truth in the story as it is told in the *Epistle of Aristeas*—though there are many discrepancies and inaccuracies in the narrative. It is impossible that the whole of the LXX could have been translated into Greek at so early a date as the reign of Ptolemy Philadelphus, but it is not improbable that a Greek version of the Pentateuch may have been made about this time, and there is every likelihood that the tradition as to the Alexandrian origin of the LXX is correct. It is certain that the other books of the Hebrew Old Testament were translated by other hands and at different times. The main conclusions of modern scholarship may be summarised in the words of Otley: 'We may believe without hesitation that the Law—the Pentateuch—was translated at Alexandria within fifty years of the date indicated in *Aristeas*. The translation of the other books followed bit by bit during the next century and a half. In some cases one book of a group may have been translated first, as the *Kingdoms* among the historical books or *Isaiah* among the prophets; or again some separate passages, used as lessons in the synagogue, may have been first interpreted when the lessons were read, then committed to writing, and later used as instalments of the translation of those books in which they occur. Various hands would of course be employed in the work, as it extended over several generations.' The use of the LXX soon became popular in the Jewish Diaspora and in many parts of the world threatened to supplant the Hebrew original altogether. When we remember that out of a total Jewish population in the ancient world of some four and a half millions, only 600,000 lived in Palestine—while the rest were scattered throughout the rest of the world, where at the time Greek was the *lingua franca*, it is easy to see the motive for the LXX and the wide field of circulation it would be able to command.

When we compare the LXX with the Hebrew original numerous differences between them at once become obvious. Sometimes the differences extend even to the subject matter and contents of the books. The LXX, for instance, makes very extensive additions to the book of Esther (about 107 verses) and the book of Daniel. In the book of Job, on the other hand, it omits a considerable section of the Massoretic text (about 200 verses). Moreover it contains many books not found in the Hebrew Canon, e.g., the Wisdom of Solomon, Ecclesiasticus 1 and 2, Maccabees, &c. (see APOCRYPHA). In many cases, too, the Greek version departs from the Hebrew original in the matter of translation. Sometimes the variation is due to a misunderstanding of the Hebrew word, sometimes to a different vocalisation from that which appears in the traditional Massoretic text—and in some cases the LXX has preserved an original reading which afterwards became corrupted. The LXX is therefore of immense value for the purpose of textual criticism and is very widely used to-day as a means of correcting the Hebrew text.

In the early period of the Christian era three attempts were made to improve upon the Septuagint translation—viz. (1) the version of Aquila (c. A.D. 130) who aimed at producing an absolutely literal translation of the original; (2) the version of Theodotus (c. A.D. 180) which more closely

resembles the text of the LXX; (3) the version of Symmachus which had more pretensions to Greek style than any of its predecessors. These three versions together with the LXX were put in parallel columns by Origen in his great critical work *The Hexapla*. Most of the *Hexapla* has unfortunately been lost, but the surviving fragments have been collected by Field (1875).

The first printed edition of the LXX was the Complutensian which was published in 1521. This was followed two years later by the Aldine edition. These were superseded by the Sixtine edition, published in Rome in 1587, which formed the basis of many other editions, e.g. the London Polyglot (1657). The first attempts at a critical text were made by Grabe in 1707, and Hobbes and Parsons in 1798, and the work received great impetus from the contributions in more recent times of Tischendorf and Lagarde. The standard modern edition is the Cambridge Septuagint, which was edited by Swete (1887-1894, new edition 1902). A larger edition with fuller and more comprehensive textual material is in process of writing under the editorship of Canon Brooke and Mr N. McLennan. Genesis was published in 1906 and the Octateuch completed in 1918.

An incalculable service to the study of the LXX was rendered by Hatch and Redpath who compiled and published an invaluable *Concordance to the Septuagint* (1892-1897). The study of the grammar and philology of the LXX has recently attracted a great deal of attention, especially in the light of the Papyri, and valuable contributions have been made by Thackeray in England and Helbing in Germany.

LITERATURE.—In addition (to the works already mentioned) Otley, *A Handbook to the Septuagint* (1919); Swete, *Introduction to the Septuagint* (1901); editions of the *Epistle of Aristotle*, by Thackeray (1917); Andrews (the Oxford Apocrypha and Pseudepigrapha, 1913); and Wendland (1900); a valuable article on 'Septuagint' by Nestle in Hastings's *Dictionary of the Bible*; Hatch, *Essays in Biblical Greek* (1889); Pschiri, *Essai sur le Grec de la Septante* (1908).

Sepúlveda. JUAN GINÉS, a Spanish historian, was born at Pozoblanco, in the neighbourhood of Córdoba, about 1490, studied first at Córdoba and Alcalá de Henares, and went to Bologna in 1515, where and at Rome he became acquainted with the most celebrated savants of Italy and Spain. In 1536 he returned to Spain as historiographer to Charles V. and preceptor to his son, afterwards Philip II. After living successively in Valladolid, Córdoba, and Madrid, he was made a canon of Salamanca. In that town he died on 23d November 1574. He won a reputation as the champion of humanism against the prevailing scholasticism. His principal work is entitled *Historie Caroli V.*, published with a biography and Sepúlveda's other works by the Madrid Academy in 4 vols. in 1780. His other works include a *Life of Albornoz*, a *History of the Reign of Philip II.*, and a *History of Spain in the New World*.

Sequestration. the Scots legal term for Bankruptcy (q.v.).—In English law sequestration is a prerogative form of process, by which commissioners are empowered to take possession of the property of a person who is in contempt. There is also a special form of sequestration issued against a clergyman, by which the bishop is commanded to sequester the profits of the debtor's benefice to answer the plaintiff's claim. On sequestration the

bishop is required to appoint a curate and assign him a stipend.

Sequin (Ital. *zecchino*, from *zecca*, the name of the Venetian mint), a gold coin of Venice, equivalent to the gold Ducat (q.v.).

Sequoia, a small genus (two species) of evergreen coniferous trees belonging to California. *S. gigantea*, better known in Britain as *Wellingtonia*, is the 'Mammoth Tree' of California. Sequoia is a Latinised form of the name of the famous Cherokee chief, Sequoyah (see CHEROKEES). The existence of this mammoth tree, which is rivalled in height only by the Eucalyptus (q.v.) of Australia, is said to have been recorded by Meunier in 1796; the tree was introduced into Britain in 1853 by Lobb. The tree, though found at elevations varying from 4000 to 7000 feet above sea-level, affects only sheltered valleys, in which it occurs in groves intermixed with other trees. The most remarkable of those groves is in Calaveras county; only less remarkable is that of Mariposa near

Fig. 1. *Sequoia gigantea*—the 'Three Graces.'

the Yosemite Valley. The 'Mammoth Grove' of Calaveras consists of from 90 to 100 trees of gigantic proportions. A notable Sequoia was the 'Mother of the Forest' (327 feet, girthing 75 feet near the base). The bark, about 18 inches thick, was removed in sections to the height of 116 feet (causing the death of the tree), and fitted up as it came from the tree in the Crystal Palace, Sydenham, to illustrate the proportions of the mammoth tree; this erection was destroyed by fire in 1866. Near by the 'Mother' lies prostrate the trunk of the 'Father of the Forest,' which girths at the ground 110 feet. In falling the trunk had broken over at the height of 300 feet. At that point the girth is 40 feet, and taking the average taper of the surrounding trees, this dead giant may reasonably be computed to have exceeded 400 feet at the time of its fall. Inside the fallen trunk there is a tunnel 35 feet long, and from 8 to 10 feet high. The 'Pioneer's Cabin,' a cavity in the trunk of another giant in this grove, is large enough to accommodate a numerous party at dinner. The 'Three Graces' (see fig. 1), growing within a few feet of each other, became famous for their symmetry and beauty; they attain almost equally to the height of 265 feet. The age of these larger specimens is variously estimated at from 1000 to 3000 years; such estimates, however, based as they are on the enumeration of the concentric rings of the trunk, are not to be implicitly relied upon, particularly in the case of evergreen trees. The timber of the mammoth tree is reddish in colour when matured, non-resinous, and inodorous, the fibre short, porous, and brittle; it is not regarded as durable. In Britain, when planted

in rich alluvial soil in well-sheltered positions, it is found to rival the Larch or any of the more rapid growing timber-trees in the production of timber in a given time. The tree is hardly enough to resist the severest frost likely ever to be experienced in Britain, but will not endure wind, especially that from the north and east. There are several varieties in commerce, the result of cultivation—viz. *S. g. pendula* and *S. g. aurea*, which cannot be said to be in either case improvements on the faultless cone-like symmetry of growth which characterises the typical form. *S. sempervirens*, the other species, is the Redwood or Bastard-tree of the Californian settlers, a handsome tree also of gigantic proportions. Though apt to assume a misty appearance in winter in Britain, the effect of wind, the tree is perfectly hardy, and grows with great rapidity when planted in good soil and in sheltered

places. The timber is light, beautifully grained, and durable, but splits with remarkable facility; it is used in California and also exported to China and Australia to be made into furniture. Both species are prized as ornamental trees, and no collection of choice conifers can be regarded as complete without them. See CONIFERÆ.

Sequoyah. See CHEROKES.

Seraglio, an Italian word meaning 'enclosure' (from *sera*, 'a bolt'), once used in English for any enclosure such as the Jews' Ghetto at Rome, but now restricted to mean a harem or suite of women's apartments, apparently from a confusion with the similar but totally distinct Persian (and Turkish) word *serai*, 'a king's court,' 'palace,' also 'a caravanserai.' The Old Seraglio (*eski serai*, 'old palace'), the ancient residence of the sultans at Constantinople, stands in a beautiful situation, where Stamboul juts farthest into the Bosphorus, and encloses within its walls a variety of mosques, gardens, and large edifices, the chief of which is the Harem (q.v.). Conversion into a museum was announced in 1926. See CONSTANTINOPE.

Seraievo. See SARAJEVO.

Seraing, a town of Belgium, 4 miles by rail SW. of Liège, stands on the right bank of the Meuse, and is connected by a handsome suspension bridge with the village of Jeneffe. It is the seat of a colossal manufactory of steam-machinery, locomotives, &c., which was established by an Englishman, John Cockerill (q.v.), in 1817 in the old summer palace of the bishops of Liège. On his death in 1840 the concern passed into the hands of the John Cockerill Society. In this establishment were made the first locomotive used on the Continent (1825), the machinery for boring the Mont Cenis tunnel, and the great lion on the field of Waterloo. Pop. (1827) 2000; (1922) 39,000.

Serampur, a town of India, built in the European style, and extending a mile along the

right bank of the Hugli, 13 miles by rail N. of Calcutta. Paper and mats are manufactured. It was at one time a Danish settlement, but was transferred by purchase to the British in 1845. It is celebrated for the labours of the Baptist missionaries Carey, Marshman, and Ward. Pop. (1921) 33,197.

Serang. See CERAM.

Serao, MATILDE, an Italian novelist, was born at Patras in Greece, on 7th March 1856, the daughter of an Italian political refugee and a Greek lady. She was brought up partly in Greece, partly in Italy, and, as a telegraph clerk (see her *Telegrafi dello Stato*), began her literary career in 1878 by writing tales and sketches for various journals. Her fame was established in 1881 and 1883 by two ambitious romances, *Cuore Inferno* and *Fantasia*, which, whilst giving evidence of her study of French models of the realistic school, revealed also her own high talents of observation and description. Her defect, indeed, is a too liberal use of these talents, for her canvas is often overcrowded. Her best books are those dealing with various phases of Neapolitan life. Worthy of note are *Il Ventre di Napoli*, *Riccardo Joanna*, *All' Erta Scituella*, *Piccole Anime*, *Addio Amore*, *Il Pace di Caceragna*, *Nel Paese di Gesù*, *La Ballerina*. Most of them exist in English translations. With her husband she founded a daily journal at Rome, *Il Corriere di Roma*; it was followed by *Il Corriere di Napoli*, *Il Mattino* and *Il Giorno* (Naples).

Seraphim, celestial beings on either side of the throne of Jehovah, seen by Isaiah (vi. 2-6). They have each six wings, two of which cover their faces in awe of the divine glory, and two cover their feet—an oriental sign of reverence—as the cherubim do their bodies (Ezek. i. 2), while the two remaining outspread wings support them. They stand above on both sides of the throne like two semicircular choirs, worshipping Him that sits on the throne. The cherubim of Ezekiel are three-fourths in animal form, and the writer of the Apocalypse gives animal forms to three of the four *ῥῶα* ('beasts'; R.V., 'living creatures'), which are six-winged like the seraphim of Isaiah (Rev. iv. 7, 8); the seraphim thus appear, apart from what was human-shaped in them, necessarily to be represented as winged dragons; for the serpent lifted up by Moses is called *Saraph* (Num. xxi. 8). They recall the winged griffins of Egyptian tombs and the animal guardians of Assyria.

Seraphine, a keyed musical instrument in which the sounds were produced by the action of wind on free vibratory reeds. It was the precursor of the Harmonium (q.v.).

Serap'is, or SARAPIS (also found as *Osorapis*), the Greek name of an Egyptian deity, introduced into Egypt in the time of Ptolemy I. or Soter, and really a combination of the Greek Hades and Egyptian Osiris. He was not an Egyptian, but the Greek deity, with some Egyptian characters superadded; and his temple was not admitted into the precincts of Egyptian cities, finding favour only in the Greek cities founded in Egypt. It is said that forty-two temples were erected under the Ptolemies and Romans to this god in Egypt. His resemblance to Osiris consisted in his chthonic or infernal character, as judge of the dead and ruler of Hades. The god had a magnificent temple (the *Serapeum*) at Alexandria, to which was attached the celebrated Library; another at Memphis, in the vicinity of the cemetery of the mummies of the Apis, which was excavated by Mariette in 1850; and another temple at Canopus. It appears that he represented or was identified with the Hesiiri Api, or Osorapis, the 'Osirified' or 'dead Apis,' who was also invested

with many of the attributes of Osiris. The worship of Serapis, introduced into Egypt by the Ptolemies, subsequently became greatly extended in Asia Minor; and his image, in alliance with that of Isis and other deities, appears on many of the coins of the imperial days of Rome, where the worship was abolished by the senate, on account of its licentious character. A celebrated temple of Serapis also existed at Puteoli (see POZZUOLI), near Naples, and the remains of it are still seen. In Egypt itself the worship of the deity subsisted till the fall of paganism, the image at Alexandria continuing to be worshipped till destroyed, at the end of the 4th century, by Theophilus, archbishop of that city. Busts of Serapis are found in most museums, and his head or figure engraved on certain stones was supposed to possess particular mystic virtues.

Seraskier, the name given by the Turks to the commander-in-chief of the army or to the minister of war.

Serbia (*Srbija*), formerly a kingdom of the Balkan Peninsula, now the south-eastern part of the kingdom of the Serbs, Croats, and Slovenes (Yugoslavia). The name is often loosely used for the whole. Serbia in the narrower sense has an area of about 37,000 sq. m. out of the whole kingdom's 96,000. The surface is on the whole mountainous. There are, however, few well-defined mountain-chains, except the Koponik Mountains (6382 feet) in the centre of Serbia; but there are a great number of isolated mountain peaks and mountain groups, clothed in many parts with fine forests of oak, beech, walnut, chestnut, and other trees, and parted by fertile valleys, which afford excellent pasturage. The valleys of the Morava and Vardar open up the country from north to south, and form the main artery of communication. Serbia is essentially an agricultural country, especially in the northern plains and in the river valleys. The principal crops are wheat, maize, and other cereals, grapes for wine, sugar-beet, and tobacco. Fruit is grown in very great abundance, especially plums, which are dried and exported, and from which also the brandy of the Serbians is extensively made. Great numbers of cattle, sheep, and pigs are reared. Large herds of swine used to be fed on the acorns and beech-mast of the forests, and then driven into Hungary to be sold. Maize is largely used now as provender for pigs and cattle. The exports are live-stock, pork, wheat, and other cereals, timber, wine, prunes, cordage. The imports consist principally of cottons, woollens, salt, timber, iron, steel, and other metals, hides, sugar, coffee, glass, paper, machinery, &c. Before the Great War Austria-Hungary practically controlled the foreign trade of Serbia in her own interests. Serbia survived a tariff war with the Dual Monarchy (1906-11), and the reaction against foreign interference prevented a speedy recovery after the events of 1914-18. The export and import trade is largely with Italy, Austria, and Czechoslovakia. Industry suffers from lack of capital. Manufacturing is still in its infancy, though the government is trying to encourage it by the system of monopolies. There are, however, now in operation flour-mills, sugar-factories, breweries, brick-works, cooperages, sawmills, and factories for making cloth, paper, tobacco, and gunpowder. Clothing and carpets are made by the women in their own homes. The country is naturally rich in minerals, though they are not extracted to anything like the extent they might be; nevertheless lignite, coal, copper, quicksilver, lead, silver, antimony, bauxite, pyrites, manganese, and oil shales are mined. Trade is concentrated at Belgrade (*Beograd*), the capital of the country, though some is done by

Niš, the chief town of south-eastern Serbia, by rail (since 1889) through Salonika (q.v.), where Yugoslavia has possessed a free zone since 1923. Along the valley of the Morava passes part of the chief railway line connecting Vienna with Constantinople. Belgrade is also the terminus of a line running through Zagreb to northern Italy. There is rail connection between the Morava and lower Danube regions and the port of Dubrovnik (Ragusa) on the Adriatic.

The Serbians are a well-built, stalwart race, proud and martial by temperament, with a warm love of home and country, of dance and song, hospitable, brave, and energetic, but at the same time quick-tempered and prone to violence. They are a primitive people, cling to old customs and beliefs, and are thoroughly democratic in their institutions. A striking feature of their social life is the family community or *Zadruga*, which, however, has for long been disappearing. The farms are small in size, and worked by their owners; agriculture, though still backward, is improving. Pop. (1884) 1,901,736; (1900) 2,493,770; (1921) 4,129,638. The whole kingdom had in 1921 12,017,323 inhabitants. —See article by G. Djurić in the *Journal of the Royal Statistical Society* lxxxii., pt. iii. (May 1919); article by Miss M. R. Shackleton in the *Scottish Geographical Magazine* (November 1925); Foreign Office Handbook No. 20, *Serbia* (1920); Admiralty Handbook, *Serbia* (1920); N. Krebs, *Beiträge zur Geographie Serbiens und Russiens* (Stuttgart, 1922); D. A. Wray, *The Geology and Mineral Resources of the Serb-Croat-Slovene State* (1921).

HISTORY.—The Serbians emigrated with the Slovenes from the slopes of the Carpathians to the regions now called Yugoslavia in the 6th, 6th, and 7th centuries. For long they had no organisation that could be called a state, but government was on the basis of family groups, and was more or less on democratic principles. Their religion was originally a type of nature-worship, but in the 9th century they accepted Christianity in the form adopted by the Eastern or Byzantine Church. Meanwhile a state known as Raska, the germ of the later Serbia, began to take shape. It had to fight sternly for the preservation of its independence, and in the long run successfully withstood the power of Byzantium, as well as resisted the unceasing attacks of the Bulgarians. Stefan Nemanja, a powerful chieftain, extended the boundary of Raska from the Morava to the Adriatic before he abdicated in 1196. Under his son Serbia definitely adopted the Orthodox creed, and was granted an archbishopric, and virtually a national church. The next great ruler of Serbia was Stefan Dušan (1331-55), who after subjugating Bulgaria, Macedonia, Albania, and the greater part of the peninsula, conceived the ambitious design of welding Serbia, Bulgaria, and Byzantium into an empire strong enough to resist the assaults of the Osmanli Turks. In 1346 Dušan was proclaimed emperor of Serbia and Greece. In 1355 he was preparing an attack on Constantinople, but death cut short his career. Under his feeble son and successor the great nobles divided the power amongst them, and consequently weakened the country. This favoured the aggressive advance of the Turks, who routed the chief Vukašin of the Maritza in 1371, and Prince Lazar at Kosovo, on the celebrated 'Field of the Blackbirds,' in 1389. By this last fight, which figures very prominently in the national ballads, the independence of Serbia was virtually lost; she was made tributary to the sultan, and gradually became a pashalik of the Ottoman empire, though hopes of freedom were revived for a time by the great successes of the Hungarian captain and ruler Hunyady and the Albanian chief Scanderbeg in the middle of the 15th century.

During the next three hundred years the Turkish rulers, supported by the ruthless janizaries, ground down the unhappy people, taxing and subjecting them to almost every kind of injustice and barbarity: many of the chief families were exterminated, 200,000 persons were carried off as slaves. In 1691, at the invitation of the Emperor Leopold, many thousands of families left their country for good and settled in Hungary. The people who remained behind were little better than serfs, and every seven years their boys were taken from them to be brought up in the Moslem faith and forced into the corps of the janizaries. The victories of Prince Eugene brought about the peace of Požarevac (1718; see PASSAROVITZ), by which Serbia was ceded to Austria; but Austria had to restore it to the sultan twenty-one years later. At length the exasperated people, goaded to desperation, rose in 1804 under the leadership of Kara George, a stalwart and determined, though morose, swine-owner, a rich man and a man of influence, who by 1807 effectually drove the tyrannical janizaries out of the country, and stormed and took possession of Belgrade and the other fortresses. The struggle before its conclusion had taken on the character of a racial and religious war, Christian Serbians against Mohammedan Turk. In 1809 and 1810 the Turks made determined efforts to recover their hold upon the country, and did overrun the districts east of the Morava; but with the assistance of the Russians they were at length beaten off again. By the treaty of Bucharest, which Russia made with Turkey (1812), it was decreed that the sultan's troops should regarrison the fortresses, but that the Serbians should govern themselves in respect of all internal affairs. But the Turks refused to observe these terms, and in 1813 assailed Serbia on both sides with such vigour that Kara George fled to Austria and the enemy recovered the country. Turkish oppression again provoked an uprising of the people in 1815; they chose as their leader Miloš Obrenović, a herdsman, who in a single campaign expelled the enemy, except the garrisons in the fortresses. This man was henceforth the leading spirit in the struggle of the Serbians for independence. In 1817 he caused his rival Kara George, who had returned, to be assassinated, and was himself proclaimed chief ruler of Serbia. In 1829 the Ottoman government at last formally agreed to the provisions of the treaty of Bucharest, and in the following year recognised Miloš as hereditary prince of Serbia. But his rule was arbitrary and despotic, and in 1839 he was compelled to abdicate in favour of his son Milan (died same year). Before he abdicated the Turkish minister of Foreign Affairs and the Russian ambassador at Constantinople had drawn up a constitution, curtailing the power of the prince and giving much authority to a senate of the nobles. Milan's brother and successor, Michael (1839-42), was driven out of the country by a rival faction, who elected Alexander, son of Kara George, as their prince. Alexander leaned to Turkey and to Austria rather than to Russia, whose tsar regarded himself as the rightful 'Protector of Serbia,' and by this policy and his incapacity he lost the sympathy of his people and provoked many enemies about him. In 1859 he was compelled to abdicate, his successor being the aged exile, Miloš Obrenović.

On his death, less than two years later, the chief power passed to his son Michael, who had been expelled in 1842. Under his rule a new era began for harassed Serbia; the animosities of faction were smoothed away, the supremacy of the law was successfully vindicated and maintained, the national spirit was encouraged and foreign interference lessened, the national militia was organised,

armed, and trained, and the country began to move forward along the path of progress and prosperity. In 1867 Michael procured the departure of the last Turkish garrisons from Serbian soil, namely those of Belgrade, Sabac, and Smederevo; all the others had been withdrawn in 1862. In 1868 Prince Michael was assassinated near Belgrade, partisans of the rival Kara George faction being blamed for the deed. He was succeeded by Milan IV., a grand-nephew of the heroic Miloš. In 1875 a revolt broke out in Bosnia and Herzegovina against Turkish oppression; Serbia joined in, was hopelessly defeated and only saved from humiliation by an armistice enforced by Russia. She had more success in the Russo-Turkish war of 1877, obtaining possession of Nik. In 1878 the Treaty of Berlin placed Bosnia-Herzegovina under Austro-Hungarian administration, and gave Serbia complete independence from Turkey and considerable territorial accessions. At the same time she was effectively hemmed in on the N.W., and SW. by Austria-Hungary, while Milan did not improve matters by entertaining secret dealings with that country. Prince Milan was proclaimed king in 1882. In 1885 he entered into a war with Bulgaria, and was defeated at Slivnica. A futile monarch, he resigned his throne in 1889, and was succeeded by his equally futile son, Alexander, who, with his wife, was assassinated in 1903. Prince Peter of the rival Karageorgević dynasty was acclaimed king the same year, and the tide seemed to turn. Economic bullying by Austria, who attempted to control Serbia's exports, resulted in a tariff war—the Pig War—which had no worse effect for Serbia than the diversion of her trade into other and better channels. Hatred for Austria was fanned when that country in 1908 formally annexed Bosnia-Herzegovina, but war was averted. Turkish oppression in Macedonia and the ineffectiveness of intervention by the European powers led to the formation of the Balkan League of 1912. Alliances were concluded between Serbia and Bulgaria, Serbia and Montenegro, and Greece and Bulgaria. Two short and highly successful wars were waged against the Turks (1912-13). Trouble arose over the division of Macedonia. Serbia was suddenly attacked by her late ally, Bulgaria, but was soon victorious, and dictated severe terms in the Treaty of Bucharest, extending her boundary southwards to include Old Serbia, and restoring contiguity with Montenegro. Austrian apprehension at the increasing power of Serbia became more and more conspicuous until the murder of the Archduke Franz Ferdinand at Sarajevo on 28th June 1914 gave a pretext for war (see WAR, GREAT). After initial successes the Serbians were ruthlessly crushed, and their country was overrun by German, Austrian, and Bulgarian forces. But in 1918, after three years of waiting, the Serbians drove out their enemies, and on 1st November entered Belgrade. On 1st December the formation of a Yugoslav kingdom—the kingdom of the Serbs, Croats, and Slovenes—was announced.

YUGOSLAVIA OR JUGOSLAVIA.—The main threads of the Yugoslav (South Slav) movement may be conveniently indicated here, as its fortunes came to be linked up with those of Serbia. The name Yugoslav should strictly apply to all those Slavs who migrated to the north and north-west of the Balkan Peninsula; the Bulgarians, however, though linguistically akin to the others, have so far not been regarded as Yugoslavs. It was the misfortune of these peoples that they should find themselves on the border-line between East and West, that they should act as buffers to the European aspirations of the Turk and the *Drang nach Osten* of Germany and Austria. Divided politically, they also came under the influence of different religious

creeds—Catholic, Orthodox, and Moslem—as well as the different civilisations of east and west. Yet they remained linked together by linguistic affinity and a common heritage of tradition and folklore. During the 19th century the bonds were gradually strengthened by the growth of a spirit of nationality among Yugoslav peoples. Serbia threw off the Turkish yoke in 1878. In Croatia a Yugoslav academy and university were established at Zagreb. The movement simmered gently during the last quarter of the 19th century, but, with the new dynasty in 1903, Serbia's rise from virtual impotence awoke a new enthusiasm in Croatia. In 1905 representatives of Croats and Dalmatian Serbs met at Zara and identified themselves with a policy of national unity. A few years later a Serbo-Croat coalition became a major force in the Croat parliament at Zagreb, and remained so till 1918 in spite of opposition and repression by Austria-Hungary (see CROATIA). Indeed the Yugoslav movement was costing Austria much thought. Expediency had led her definitely to annex Bosnia-Herzegovina in 1908, and her treatment had bred disaffection, which culminated in the assassination of the Archduke Franz Ferdinand in 1914. Meanwhile Serbia had humbled Turkey and Bulgaria, and in the early days of the European War proceeded to invade Austrian territory. Here was indeed a saviour for the southern Slav peoples. But Serbia fell upon evil days, and Yugoslav schemes had to be cast differently. While Austrian oppression of the Yugoslavs now within her military dominions alienated their sympathies more than ever, an important committee of Yugoslav refugees in London began to lay plans for a united Yugoslavia—a service premature perhaps, but nevertheless invaluable. The movement was aided in 1917 by the Russian revolution, which abstracted Russia from Balkan politics—Russia did not favour a united Yugoslavia—and by the crumbling away of Austrian power. From Corfu in 1917 came a manifesto issued by the Yugoslav Committee and the Serbian government announcing a projected kingdom of the Serbs, Croats, and Slovenes, under the Karađorđević dynasty. Thus formulated, the idea gathered momentum. The Austrian Yugoslavs were united under a Slovenian priest, Korošec. Croatia supported the movement, and hopes ran high when Serbia began to clear her country of the enemy in the autumn of 1918. At Zagreb on 19th October a Yugoslav National Council, representing the Yugoslav lands of the Austro-Hungarian monarchy, declared for a state of the Slovenes, Croats, and Serbs, and a few weeks later a union with Serbia was announced, the kingdom being proclaimed at the beginning of December as that of the Serbs, Croats, and Slovenes. There were initial jealousies and uncertainties, chiefly owing to Serbian preponderance in the new scheme, but now Yugoslavia seems to be consolidating her position as a new power. At the Peace Conference the principle of nationalities largely guided the delimitation of the frontiers. The new kingdom comprises Serbia, Montenegro, Bosnia-Herzegovina, most of Dalmatia, Croatia, Slavonia, the Banat, Bačka, and Baranya regions, a part of Carinthia, and of Carinthia, and the Stranica salient taken from SW. Bulgaria. The north-western frontier with Italy was settled by the Treaty of Rapallo. Lawlessness on the Albanian and Bulgarian frontiers has caused the new kingdom considerable trouble.

King Peter died 16th August 1921, and was succeeded by his son Alexander, Prince Regent since 1914. Provisional governmental arrangements had been made in 1918, but on 21st June 1921 a new constitution was adopted. It is a constitutional and hereditary monarchy. The king is

commander-in-chief of the forces, concludes treaties, promulgates laws, appoints and dismisses ministers, and dissolves the National Assembly, but all his actions are subject to the approval of the Assembly or his cabinet of eighteen ministers. There is a single chamber, the Narodna Skupština, of 313 deputies elected for a term of four years on a basis of proportional representation. The Council of State is the supreme court of justice. There is complete freedom for all religions recognised by law. In 1921 47 per cent. of the people were of the Orthodox confession (see GREEK CHURCH), 39 per cent. Roman Catholics. By arrangement with the Vatican in 1914 an archbishopric was established in Belgrade. Education is compulsory, and, in its primary forms, free. Military service is obligatory for all men between the ages of twenty-one and forty-five; eighteen months are spent with the colours. The army numbers normally some 115,000 men, and there are sea, river, and air squadrons. See separate articles on the constituent regions of the kingdom.

See L. Leger, *Serbes, Croates et Bulgares* (Paris, 1913); H. W. V. Temperley, *History of Serbia* (1917); R. G. D. Laffan, *The Guardians of the Gate* (1918); H. Baerlein, *The Birth of Yugoslavia* (2 vols, 1922); J. Biehan (ed.) *Yugoslavia* (Nations of To-day Series, 1923); A. Moussé, *Le Royaume Serbe Croate Slave, son organisation sa vie politique et ses institutions* (1926). A four-volume work in Serbian on Serbian history began to appear in 1921.

LANGUAGE AND LITERATURE. — The Serbian language belongs to the southern division of Slav tongues, having for its nearest congeners Bulgarian, Slovenian, and Russian; and it is the language of Croats, Montenegrins, and Bosniaks also. The Slav apostles, Cyril (q.v.) and Methodius, introduced a modified form of the Greek alphabet among the Serbians, who have retained it as the Cyrillic. The Croats, influenced more by western civilisation, use the Latin alphabet.

Slovene fragments of the 10th and 11th centuries exist, but the earliest productions in Serbian date from the 12th century. Cultural life of mediæval Serbia was centred in the abbeys. Studenica, Gračanica, Decani, and others—whence emanated monkish chronicles and letters; in the 13th and 14th centuries various lives of the saints and kings, and annals, were written by Stefan Nemanja, St Sava, Archbishop Daniel, and others. But perhaps the most interesting production of this period is the collection of laws (*Zakonik*) made in 1349, when Stefan Dušan was king. Then came the battle of Kosovo and the long period of Turkish oppression, and during all that time there was no Serbian literature except annals. But the language was not wholly unenlivened. From the end of the 15th down to the end of the 17th century a vigorous school of writers in Serbian, or Croato-Serbian, flourished at Ragusa (q.v.) and other towns on the Adriatic. It was not, however, a purely national literature, but was strongly influenced by Italian culture. The literary productions of the Ragusa epoch were nearly all in verse, chiefly lyrics (modelled after the Italian love-poems), poetic dramas (sacred and profane), epics, and eulogies. The greatest writers were Gundulić (1588–1638), author of the epic *Osman*, which celebrates the war of 1621 between Poland and Turkey; Julius Palmotić (1606–57), a writer of dramas, songs, and epics, most of these last clever imitations and foreign models; Marulić (1450–1524 or 1528), author of the poetic *History of St Judith*; Cubranović (died 1550), author of a celebrated masque, *The Gypsy Girl*; Menčetić Vlahović (1457–1501) and Džurđić (died 1510), who both excelled in love-poems, the latter also being a dramatist; Lucić (1480–1540), the 'father' of

the Ragusan drama; Vetranić-Cavčić (1482-1576), who wrote several mystery-plays; Naljesković (1510-87), author of pastorals, comedies, and love-poems; Jorjić (1676-1737), who wrote (like some others of the above mentioned) in Latin, Italian, and Serbian, in the last-named tongue chiefly didactic and religious poetry; and Kacić-Miošić (1690-1760), a very popular writer of songs with a good deal of the ring of the national poetry in them.

When the Serbians began to awaken, towards the middle of the 18th century, to a renewal of their national life, their literature began to revive at the same time. The movement passed the bounds of Serbia, and stirred all the Yugoslav peoples to a sense of unity, a cultural unity that fostered the desire for political unity. The pioneer in this renaissance was Dositej Obradović (1739-1811), a man of wide travel and self-acquired learning, who laboured for the enlightenment of his people, and bade Serb, Croat, and Slovene forget their differences. But the foremost person in the revival was Vuk Karadžić (1787-1864): he made the first collection (in 1814-15) of the national folk-songs of the Serbians, the greatest literary treasure they possess, encouraged education, codified the laws, collected the fairy-tales and proverbs of his people, translated (1847) the New Testament into the Serbian vulgar tongue, effected after a hard struggle a reform of the orthography, prepared a grammar and a dictionary of Serbian, and in fact converted the vulgar tongue into a literary language. Several of Vuk's folk-songs have been translated into English by Sir J. Bowring (*Serbian Poetry*, 1827) and Lord Lytton (Owen Meredith, *Serbski Pesme* 1861, new ed. 1917), and in another collection by Mrs Mijatović (*Kosovo*, 1881); into German by Mrs Robinson or 'Talvj' (*Volkslieder der Serben*, 1853); and into Swedish, very well done, by Runeberg (1833). These national songs are the product of different periods and of different, mostly unknown, authors. Their chief themes are the deeds of the national heroes, especially Marko Kraljević, and the occurrences of domestic life. The former class are written in a uniform metre of ten-syllabled trochees, and are recited to the accompaniment of a simple one-stringed lute, called a *gusle*. The metre of the second class is varied; they are generally sung by a youth and a maiden, and are very often the accompaniment to the *kolo*, or national dance. One of the greatest names in modern Serbian literature is Mihailović (1791-1847), who wrote poems, a eulogy on Serbia (*Serbianka*, 1826), a *History of Montenegro* (1835), a *History of Serbia*, 1813-15 (1837), and published a collection of national songs. Other writers worthy of note are: Raić (1726-1801), who wrote a good *History of the Serbian People* (1794-95); J. Popović (1806-56), the author of lyrics and historical dramas; Lazarević, who wrote one of the best of Serbian dramas (*Vladimir and Kosara*, 1829); J. Subotić (1817-86), author of *Stefan Dečanski* (1846), which caught the spirit of the national poems; Radićević (1724-1853), who has been called 'the Serbian Burns,' and Prince Peter Njegoš (1813-51), of Montenegro, the two most celebrated lyrists of modern Serbian literature; F. Prošern (1800-49), the father of modern Slovene literature, who wrote ballads, sonnets, and an epic, *The Baptism on the Savica*; and P. Preradović (1818-72), a Croatian, who wrote a famous *Ode to Slavery*. L. Kostić (1841-1910), Serbian poet and dramatist, translated several of Shakespeare's plays; S. Matavulj (1852-1908), Serbian novelist, born in Dalmatia, wrote vivid novels of Yugoslav life; A. Askerz (1856-1912), Slovene poet, wrote ballads and romances; V. Ilić (1862-94), Serbian poet,

wrote under the influence of the Russian romantic poets. Other writers of merit are A. Šantić (b. 1868), Serbian poet, a master of metre, who translated Heine's *Intermezzo*; J. Dučić (b. 1874), Serbian poet, whose verse betrays French symbolistic influence; V. Nazon (b. 1876), Croatian poet, a writer of charming lyrics and sonnets; M. Rinkić (b. 1876), Serbian poet and patriot; S. Stefanović (b. 1877), Serbian poet and disciple of the English Pre-Raphaelites, a distinguished sonneteer and translator; J. Kosor (b. 1879), Croatian poet, novelist, and dramatist, of peasant stock and self-taught, a writer of plays which have been translated into English. Towards the middle of the 19th century an attempt was made on the western side of the Balkan Peninsula to create a sort of revival of the Ragusan period. The centre of the new movement was Agram, and its leader Dr Lindevit Gaj (1809-72). Its strongest feature was an aggressive sympathy with the Pan-slavist agitation. The reform of language and spelling carried out by Karadžić in Serbia was adopted, though the Latin alphabet was retained. A similar revival and reform took place among the Slovenes. Besides Gaj the most important writers of this school were Vraz (1810-51), a Slovene, and author of some beautiful lyrics; Bleiweis, also a Slovene; Vukotinović, who wrote lyrics and historical tales; Bogović, from whose pen came dramas, poems, and historical novels; Ivan Mazuranić, a Croat, whose *Death of Ismail Agha*, the 'epic of hate,' is one of the most popular poems in Serbian. Kukuljević-Sakeinski is the author of poems, dramas, stories, and very valuable historical records of the southern Slavs. Daničić (1825-82) was a first-rate philologist. Jagić and Novaković have each written a good *History of Serbian Literature*. The chief literary organ is the *Glasnik*, published at Belgrade since 1847.

Dozon, *L'Épopée Serbe* (Paris, 1888); and Mijatović, *Serbian Folklore* (Eng. trans. by Denton, 1874); V. M. Petrović, *Hero Tales and Legends of the Serbians* (1914); M. A. Mugge, *Serbian Folk-songs Fairy Tales, and Proverbs* (1917); M. S. Stanoyević, *Early Yugoslav Literature* (1921).

Serenade (Ital. *serenata*), originally music performed in a calm night; hence an entertainment of music given by a lover to his mistress under her window—especially in Spain and Italy.—A piece of music characterised by the soft repose which is supposed to be in harmony with the stillness of night is sometimes called a serenade, more usually a Nocturne (q.v.).

Seres, a town of Greece (since 1913), 43 miles NE. of Salonika; pop. 20,000.

Sereth, an affluent of the Danube, rises in the Bukovina (Rumania), runs southward through almost the whole length of Moldavia, and joins the Danube just above Galatz, after a course of nearly 300 miles.

Serf (Lat. *servus*, 'a slave'), the term usually given to the villains of mediæval Europe. The *serf* was distinguished in a general way from the *slave* by being attached to the land and having certain definite rights, whereas the *slave* was the absolute chattel of his master. But serfdom falls to be treated as part of the subject of Slavery (q.v.).

Serge, a kind of twilled worsted cloth which has a wide range of quality, strength, and thickness. The surface of the fabric is not smooth like that of a milled woollen cloth. Serges are generally dyed a dark blue or black, and good qualities are very durable.

Sergeants, or **SERGEANTS** (through the Fr., from Lat. *servicius*, 'serving'), are non-commissioned officers of the army and marines in the grade next above corporal. In the infantry each commands a section, of which there are four in each company, and there is one colour-sergeant in each company. They also command small bodies of men as guards, escorts, &c. (see also **NON-COMMISSIONED OFFICERS**). Each squadron of cavalry has ten sergeants, including sergeant-major and quartermaster-sergeant. In the Household Cavalry the corresponding non-commissioned officers are called corporals of horse (two per troop). In the Royal Horse Artillery there are per battery seven sergeants, one quartermaster-sergeant, and one battery sergeant-major. A regimental sergeant-major is a warrant officer on the staff of a battalion of infantry, regiment of cavalry, or corresponding body of troops. Unlike the sergeants, the sergeant-major does not command any particular portion of the corps, but generally superintends the whole of it, and in respect of discipline, &c., is the assistant of the adjutant. There is a separate article on **COLOUR-SERGEANT**. For the Quartermaster-sergeant, see **QUARTERMASTER**; for Sergeant-drummer and Sergeant-trumpeter, see **BAND**.—In ancient times the rank of sergeant was considerably more exalted. In the 12th century the sergeants were gentlemen of less than knightly rank, serving on horseback. Later the sergeants-at-arms were the royal bodyguard of gentlemen armed *cap-à-pie*.

Sergeanty. See **GRAND SERGEANTY**.

Sergipe, a maritime state of Brazil, the smallest in the republic, is bounded on the N. by the São Francisco, which separates it from Alagoas, and on the W. and S. by Bahia. Area, 15,000 sq. m.; population, 477,000, about 75 per cent. of whom are negroes, with very few Europeans. The shores are low and sandy, the interior mountains. The east part is fertile, well wooded, and produces sugar and cotton; the western plateaus are devoted principally to the rearing of cattle. The capital is Aracaju, a port with 37,000 inhabitants.

Serieite. See **MICA**.

Series, in Algebra, is the sum of a set of terms formed according to some definite law. For example, let n be any integer, and $\phi(n)$ a definite function of n . Then, by giving n the successive values 1, 2, 3, &c., and forming the corresponding functions $\phi(1)$, $\phi(2)$, &c., we are able to construct the series $S = \phi(1) + \phi(2) + \dots + \phi(m)$, where m is the highest value of n that is to be involved. If $\phi(n)$ is simply a multiple of n , we get an Arithmetical Progression (q.v.), viz. $a + 2a + 3a + \dots$. Again, if $\phi(n)$ is of the form a^n , we get a Geometrical Progression (q.v.), viz. $a + a^2 + a^3 + \dots$. These simplest cases of series are considered under their special headings, and shall not be again referred to except by way of illustration.

It is evident that if a finite number of terms be taken, and if no term has an infinite value, the series itself will have a finite and determinate value. We may suppose, however, that no limit is to be assigned to the number of terms that are to be taken—in other words, that the highest value (m) of n is to be larger than any assignable quantity. We thus get a series with an infinite number of terms. But it does not follow that such an Infinite Series, as it is called, has necessarily an infinite value. Consider, for example, the Geometrical Series $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \dots$ to infinity. Draw a line ABC equal in length to two

units. AB (= 1) will represent the first term of the series; the second term may be represented

by BD, the half of BC; the third by DE, the half of DC; and so on indefinitely. It is evident that, however far we may go, we shall always fall short of C by an amount equal to the last bit added on. Thus

$$1 + \frac{1}{2} + \frac{1}{4} + \dots + \frac{1}{2^n} = 2 - \frac{1}{2^n}$$

But by taking n large enough we may make $1/2^n$ as small as we please. Hence the value of the Infinite Series is 2.

It will be seen that the terms in this series approach zero indefinitely, while the sum approaches a definite limit. Any series in which the latter condition is satisfied is called a Convergent Series. In all convergent series the former condition just stated must also be satisfied. But it does not follow that a series whose successive terms approach zero indefinitely is necessarily convergent. For example, the series $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \dots$ to infinity has not a finite value, is not convergent, although its infinite term is zero. Such a series is divergent, and cannot be summed to infinity. To prove this throw the series into groups of terms, the first group being the first term, the second the next *two*, the third the next *four*, the fourth the next *eight*, and so on. Thus the fifth group will consist of sixteen terms, beginning with $\frac{1}{16}$ and ending with $\frac{1}{512}$. Each of these fractions is greater than $\frac{1}{32}$ or $1/2^5$, so that their sum is greater than sixteen times this quantity or $24/2^5$ or $\frac{3}{2}$. Hence, if we go as far as m groups, the series will be greater than $1 + \frac{1}{2}m$. Thus by taking m large enough we can make the sum as large as we please. The series is divergent and cannot be summed. We may, however, by simply changing the algebraic sign of every alternate term, obtain a series which is convergent—viz. $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$ to infinity. That this series has a finite sum may be made evident graphically thus: Take AB equal to unity; this is the first

term. Move back half-way to C; this gives the second term *minus* one-half. Move forward to D, where CD is one-third; then back to E, where DE is one-fourth; and so on indefinitely. It is clear that we shall ultimately oscillate through diminishing ranges about some point between C and B; so that the sum of this series is less than 1 but greater than $\frac{1}{2}$. The series, in fact, is the Napierian logarithm of 2, and has the value .69315... A series like that just given, which is convergent only when the signs of the successive terms differ according to some definite rule, is usually called *semi-convergent*. A series which converges when all its terms have the same sign is said to be *absolutely convergent*. Sir G. B. Stokes long ago distinguished them as *accidentally* and *essentially* convergent, a terminology which seems in many respects superior to that in common use.

It is important to have a test of convergency; and the most useful test is to take the ratio of two consecutive terms, and consider what value this ratio approaches as we take the terms higher and higher. This ratio is called the ratio of convergency; if it is ultimately less than unity the series is convergent; if greater than unity, divergent. This test, however, gives no information when the ratio is ultimately unity. As an example, consider the exponential series:

$$1 + x + \frac{x^2}{1.2} + \frac{x^3}{1.2.3} + \frac{x^4}{1.2.3.4} + \&c.$$

Here the ratio of the $(n+1)$ to the n th term is $x/(n+1)$, which is ultimately zero, since whatever value x may have n can be taken as large as we

please, so that the ratio may be made smaller than any assignable quantity. As is well known, the value of this series is e^x , where e has the value 2.71828... (see LOGARITHM). Convergent series are of indispensable service in the calculation of logarithms and trigonometrical functions and in many important physical applications. Not a few of their properties were consequently known to the earlier analysts; but it is to Cauchy (1827) that we owe the foundation and partial development of the modern theory of convergence. Dirichlet, Abel, Gauss, De Morgan, Bertrand, Kummer, Du Bois Reymond, and others have ably supplemented Cauchy's work. A very complete introduction to the whole subject is given in Chrystal's *Algebra* (vol. ii.). There also will be found a discussion of certain parts of the subject which we can only name, such as oscillating series, double series, infinite products, reversion of series, and the like. See CIRCLE and TRIGONOMETRY for some particular cases of series.

Seringapatam (properly *Sri Ranga Patanam*—'City of Vishnu'), the capital of Mysore state in Southern India from 1610 to 1799, is built on an island in the Kaveri, 10 miles N.E. of the city of Mysore. The island is three miles long and one broad; at its western end stands the fort, surrounded by strong walls of stone, and enclosing the palace of Tippoo Saib and the principal mosque. Outside it are the garden in which was built the mausoleum of Tippoo and his father, Hyder Ali, and Tippoo's summer palace. The fort was besieged by Lord Cornwallis in 1791, and again in 1792. On the second occasion the terms dictated by the British to Tippoo were very severe. A British army appeared before the walls again in 1799, and on the 3d May of that year the fort was stormed and Tippoo slain in the vicinity of his own palace. Pop. 150,000 in Tippoo's day; 32,000 in 1800; and in 1921 7217, mostly in the suburb of Ganjam. The ancient city is very ruinous; but a railway now runs through it, and various improvements have made it look somewhat more prosperous.

Seringham (*Srirangam*), a town in the Madras Presidency, on an island in the Kaveri, 11 miles W. of Trichinopoly, with a pop. (1921) of 23,153. The place is noted for its great temple of Vishnu, a vast complex of halls and gopuras (colossal gateways) built on no very regular plan, but enclosing so large an area that most of the houses of the town are within the temple walls. Notable is one 'hall of a 1000 columns' (960 really), 450 feet by 130.

Serjeant-at-Arms, in the English Court of Chancery, is the officer who attends upon the Lord Chancellor with the mace, and who executes by himself or deputies various writs of process directed to him in the course of a Chancery suit, such as apprehending parties who are pronounced to be in contempt of the court. A similar officer attends on each House of Parliament, and arrests any person ordered by the House to be arrested.

Serjeant-at-Law used to be the highest degree of barrister in the common law of England. The degree is of great antiquity, and formerly a barrister could only be appointed after being of sixteen years' standing. Formerly, also, they had exclusive audience in the Court of Common Pleas. The proper forensic dress of serjeants was a violet-coloured robe with a scarlet hood, and a black coif, represented in modern times by a patch of silk at the top of the wig. A serjeant was appointed by a writ or patent of the crown. The Chief-justice of the Common Pleas recommended the barrister to the Lord Chancellor, who advised the crown. The degree of serjeant was entirely honorary, and merely gave precedence over barristers; and when he was appointed he was rung out of the Inn of

Court to which he belonged, and thereafter joined the brotherhood of Serjeants, who formed a separate community. By ancient custom the common-law judges were always admitted to the order of serjeants before sitting as judges, but this practice was abolished in 1874. The society of Serjeants' Inn was dissolved not long after, leaving the title to become extinct with the death of the last survivor, Lord Lindley (1828-1921). See the article COIF; Pulling's *Order of the Coif* (1884); and Worbyde's *Eminent Serjeants-at-Law* (1869).

Sermons. See PREACHING.

Serous Fluids, various fluids occurring in the animal body, are arranged by Gorup-Besanez under three heads: (1) Those which are contained in the serous sacs of the body, as the cerebro-spinal fluid, the pericardial fluid, the peritoneal fluid, the pleural fluid, and the fluid of the tunica vaginalis testis; (2) the tears and the fluids existing in the eyeball, the amniotic fluid, and transudations into the tissue of organs; (3) morbid or excessive transudations, such as dropsical fluids, the fluids occurring in hydatids, and in blebs and vesicles on the skin, and transudations from the blood in the intestinal capillaries, as in cases of intestinal catarrh, cholera, or dysentery. All these fluids bear a close resemblance to one another, both in their physical and chemical characters. In so far as relates to their physical characters they are usually clear and transparent, colourless or slightly yellow, of a slight saline, mawkish taste, and exhibiting an alkaline reaction with test-paper. They possess no special formal or histological elements, but on a microscopic examination blood-corpuscles, cells of various kinds, molecular granules, and epithelium may occasionally be observed in them. The ordinary chemical constituents of these fluids are water, fibrin (occasionally), albumen, the fats, animal soaps, cholesterin, extractive matters, urea (occasionally), the same inorganic salts which are found in the serum of the blood, and the same gases as occur in the blood.

Serous Membranes. There are seven of these membranes in the human body, three being median and single, while two are double and lateral. They are the pericardium, the peritoneum, and the cerebro-spinal, with the two pleurae and tunicae vaginales testis. They are all closed sacs; and each sac or continuous membrane consists of two portions—a parietal one, which lines the walls of the cavity, and a visceral or reflected one, which forms an almost complete coating or investment for the viscera contained in the cavity. The interior of the sac contains a small quantity of fluid, usually merely enough to moisten the contiguous surfaces and thereby enable them to glide easily upon each other. With regard to their structure, it is sufficient to state that they consist essentially of (1) endothelium; (2) basement membrane; (3) a stratum of areolar or cellular tissue, which constitutes the chief thickness of the membrane, and is the constituent on which its physical properties are mainly dependent. This layer is more liable to variation than the others, and one of the most common alterations is an augmentation of the yellow fibrous element, by which an increased elasticity is given to the membrane, which is thus better adapted for distention, and for a subsequent return to its original bulk. The situations in which this augmentation is found are, as Dr Brinton (*Cyclopaedia of Anatomy and Physiology*, vol. iv. p. 524) pointed out, in exact conformity with this view: in the peritoneum, which lines the anterior abdominal wall and covers the pelvic surface of the bladder, it attains its maximum; in the elongated folds of the mesentery, in the costal pleurae, and in the suspensory ligament of the liver it is still

very prominent; while on the posterior wall of the belly, and in serous membranes covering the heart, liver, &c. it is almost absent. For some of the principal serous membranes, see the articles PERICARDIUM, PERITONEUM, PLEURISY, and RESPIRATION.—Synovial membranes (q.v.) present many points of similarity to serous membranes.

Serpent, an obsolete bass musical wind instrument. It is said to have been invented by a

Serpent.

French priest at Auxerre in 1590. It consists of a tapered tube 8 feet long, built of wood and covered with leather, and twisted about like a serpent, whence the name. It is sounded through a cupped mouthpiece like that of the bass Trombone (q.v.). It had originally six holes for three fingers of each hand, but in its later years had keys added. The form of its bore and the material of which it is made give it a tender and soft tone which is very effective in certain kinds of music, but its difficulties and the uncertainty of its intonation have led to its disuse.

Serpentine, a mineral composed of silica and magnesia in almost equal proportions, with about 13-15 per cent. of water, and a little protoxide of iron. Serpentine occurs generally massive; never in crystals, save as pseudomorphs; colour some shade of green, also red and brownish yellow; has a smooth but sometimes greasy feel; is soft enough to be scratched with calcite. *Precious Serpentine*, or *Noble Serpentine*, is of a rich, dark-green colour, hard enough to receive a good polish, translucent, and sometimes contains imbedded garnets, which form red spots, and add much to its beauty. It is a rare mineral. It occurs at Balreuth in Germany, in Corsica, at Portsoy in Banffshire, in the Shetland Islands, &c. It is generally found along with foliated limestone associated with schistose rocks. The ancient Romans used it for pillars and for many ornamental purposes; and vases, boxes, &c. are still made of it, and much prized. The ancients ascribed to it imaginary medicinal virtues. *Marmolite* is a scaly, foliated serpentine; *Chrysotile* is a delicately fibrous variety, with a silky lustre, often met with as veins in ordinary serpentine. *Common Serpentine* is a rock rather than a mineral. It often occurs in winding irregular veins; hence the name serpentine. It is generally green or red, the colour being sometimes uniform, at other times mottled, spotted, streaked, veined, or clouded. It occurs not only in veins, but forming irregular sheets and masses, and is usually associated with crystalline schists and granitoid eruptive rocks. The mineral serpentine is always a product of the chemical alteration of other minerals; and there is reason to believe that most of the masses of serpentine are highly altered igneous rocks which were rich in olivine or peridotite. Many peridotites are proved to have been altered into serpentine. Concerning the origin of some of the serpentines associated with the crystalline schists there is still much uncertainty.

Serpents (Lat. *serpere*, 'to creep'), the more formal and old-fashioned term for all members of the genus Ophidia, more popularly known as Snakes (q.v.), under which heading the general characters and classification of the Ophidians are treated, as also snake-charming.

SERPENT-WORSHIP.—The cult of the serpent is old and widespread. In the mythology of all races

the serpent plays an important part, sometimes as a kindly and beneficent power, sometimes as hostile to man. The origin of the cult of the serpent is a problem whose solution depends on the answer to the wider question of how men came to make gods at all.

Four of the more important theories may be mentioned. The psychological school of anthropologists regard both the cult itself and its universal spread as due to the fear caused by the serpent's deadly venom, its mysterious movements, its habit of dwelling in holes beneath the earth, its strange power of casting its skin, and other characteristics. Closely connected with this point of view is the explanation of the serpent cult as due to its widespread adoption as a totem. Secondly, the cult is connected with nature myths: the serpent is the celestial river of the Milky Way, or the constellation Hydra. It is also identified with certain attributes of the sun. Thirdly, the Freudian school regard the serpent as the most important phallic symbol, and explain the presence of the serpent in myths, cults, and folklore as the racial counterpart of the individual dream, that is, as evidence of a deep-rooted sex-interest in the sub-conscious memory of the race. Lastly, and most recently, is the theory of Elliot Smith in *The Migrations of Early Culture*, that serpent-worship was carried about the world as the result of a migration of culture. This theory, while providing for the rise of serpent-worship in outlying parts of the world, still leaves the question of its origin unsolved.

Turning next to the distribution of the serpent-cult in time and space, we find evidence of the use of the serpent as a symbol in pre-historic times in Europe. Serpents are found depicted on the painted pebbles of the Mas d'Azil. In Sumerian and Babylonian civilisation we find that the terrible goddess of the underworld Ereshkigal or Allatu is identified with a serpent. The pair of twined serpents on a vase of Gudea is the emblem of Ningishida. We find a very early serpent deity of doubtful gender called the lord, or lady, of life. The serpent is frequently depicted on early boundary stones with the divine emblems. One of the earliest pictorial representations of Tiamat, the goddess of primeval chaos, is in the form of a great serpent.

The serpent abounds in Egyptian myth and cult under the dual aspects of good and evil. The monstrous Apep serpent, enemy of the gods, corresponds to the Babylonian Tiamat. The cobra, not found in Babylonian pictorial representations, is an attribute of the sun-god, and in the ureus is an invaluable divine and royal symbol. In an early papyrus a serpent-headed goddess stands before the throne of Osiris, while an enormous serpent with upraised head lies before the god. In Minoan Crete we have representations of the Great Mother grasping a serpent, and with serpents in her hair. In Greece of pre-Homeric times, as well as later, the serpent appears constantly in art and myth. Zeus Meilichios appears as a snake. Among his many transformations Dionysus assumes the form of a serpent. The Erinyes are serpent-goddesses. The serpent also represents the ancestor, and the Agathos Daimon, the good luck or guardian deity of various cities.

The cult of the serpent in India goes back to pre-Aryan times, and is still assiduously practised everywhere. In spite of the number of fatalities due to snake-bite it is impossible to induce a native to kill a snake. Everywhere are shrines sacred to the serpent-god in his various forms. In the Panjab snake-worship is associated with the cult of Devi, the mother goddess. In Central India Nāg-deo is worshipped, sometimes at a shrine, sometimes at the snake's hole; while the Nathas

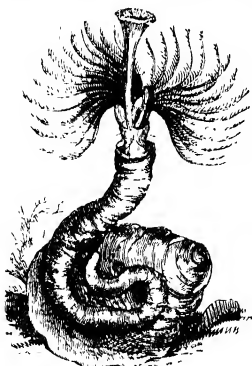

carry snakes about at the Nagpunchami festival for worship.

In North America the serpent abounds in folklore and cult. The Zuni carry the image of Koloowisi, the plumed serpent, in procession at their initiation and fertility rites. The rattlesnake is the species whose cult is most widespread. The Hopi have a remarkable annual snake-dance whose object is to gain fertility. The great serpent mound of Wisconsin points to the early practice of the cult. Both Maya and Mexican culture show the great plumed serpent under various forms as the most important of their gods. The serpent is widely worshipped in Africa, where the python is usually the species represented in the cult. In Australia the serpent occurs chiefly in folklore and as a totem. A great serpent lies in the Milky Way, and is connected with the rites of initiation.

Serpukhov, an ancient Russian town, 57 miles by rail S. of Moscow, on the Nara, 3 miles from its confluence with the Oka. It contains a cathedral (1380), and is a place of considerable commercial and industrial importance, manufacturing chiefly cottons, woollens, leather, paper, furniture, and earthenware. Pop. 28,000. It was formerly a fortress protecting Moscow on the south.

Serpula, a genus of sedentary Chetopod worms, living in twisted calcareous tubes fastened to shells and rocks in the sea, or even to other animals, such as crabs. From the mouth of the tube the

Serpula contortuplicata (with gill-filaments), on the back of an Oyster-shell. The horny stopper is also shown.

head of the worm is stretched out into the water, and bears numerous exquisitely coloured gills and a stopper or operculum which closes the mouth of the shell when the head is retracted. It is a transformed gill-filament. The colour of the gills is in great part due to the blood which is seen through the thin skin. The food consists of minute organic, and especially vegetable, particles, which are wafted into the mouth by the cilia on the gills. The

process by which the worm makes its tube of lime is not clearly understood; it is interesting to observe that in situations where the light comes in one definite direction the calcareous tubes point that way. Several species of *Serpula* are common on British coasts, and large forms of this genus and of nearly related genera are common in warmer seas.

Serrano y Domínguez, FRANCISCO, DUQUE DE LA TORRE, a Spanish statesman, was born at San Fernando near Cádiz on 17th December 1810, and pushed himself to the front in the war against the Carlists. Having gained an intimate place in the favour of the dissolute Queen Isabella, he made

the most of his influence and played an active part in the dismal political changes of that sovereign's reign, sometimes being in arms against the ministers of the day and sometimes himself holding the highest administrative posts of the kingdom. He was by profession a liberal, and for some years (1854-66) lent faithful support to O'Donnell. On the overthrow of O'Donnell's government by Narváez Serrano was banished, but returning two years later (in 1868) he defeated the queen's troops, and, having driven her away into France, became the chief ruler (as regent) of Spain until the accession of Amadeus of Savoy (1870). He waged successful war against the Carlists both in 1872 and in 1874. During the greater part of this latter year he was again at the head of the government, until he resigned the power into the hands of Alfonso XII. He was ambassador at Paris in 1883-84, and died at Madrid on 26th November 1885.

Serres, OLIVIA. See **OLIVE** (PRINCESS).

Sert, JOSÉ MARIA, Spanish artist, was born at Barcelona in 1876, but in Italy was much impressed by Tintoretto and Tiepolo; since 1900 he has lived in Paris. He has produced mural decorations for various large mansions, but his chief work has been the splendid decorations, commissioned in 1904, for the whole interior of the cathedral (1780) of Vich in Catalonia.

Sertorius, QUINTUS, one of the ablest Roman commanders in the later ages of the Republic, was a native of Nursia, in the country of the Sabines. He began his military career in Gaul, and fought (105 B.C.) in the disastrous battle on the Rhone in which the Roman proconsul, Q. Servilius Cæpio, was defeated by the Cimbri and Teutones, and took part in the splendid victory at Aquæ Sextiæ or Aix (102 B.C.), where Marius annihilated the same barbarians. On the breaking out of the sanguinary struggle between the party of the nobles under Sulla and the popular party headed by Marius (88 B.C.), he espoused the cause of the latter, though he could not respect Marius himself. For morally Sertorius was much superior to the military adventurers of his time; and the impression we have of him from Plutarch's picturesque biography is that of a valiant, resolute, honest, and stubborn Roman, such as was commoner in the 3d than in the 7th century of the Republic. None of the Marian generals held out so long or so successfully as he against the victorious oligarchy. He fought in conjunction with Cinna the battle at the Colline Gate, which placed Rome at the mercy of the Marians. But he took no active part in the bloody massacres that followed; on the contrary, he slew 4000 of Marius' cut-throat slaves who had committed the worst excesses. On the return of Sulla from the east (83 B.C.) Sertorius, finding it impossible to act in concert with the other military leaders of his party, went to Spain, where he continued the struggle in an independent fashion. At first he was unable to maintain his ground, and was obliged to put to sea. In the Mediterranean and in Morocco he led an adventurous life, sometimes fighting against the partisans of Sulla, sometimes mixing in the quarrels of native chiefs. But his fame grew, and at length he was invited back to Spain by the Lusitani; and from them and Roman refugees he formed troops who successfully defied the power of Rome for eight years or more. Sulla sent army after army against him commanded by such men as L. Domitius Ahenobarbus, Q. Metellus Pius, and young Pompey; but none of them was a match for him and his methods of guerrilla warfare. The contest was at last terminated by the assassination of Sertorius in 72 B.C. The assassins were all Romans, men proscribed by Sulla, who were fighting under Sertorius.

The chief of them was Perperna, who was jealous of his chief, and cherished ambitions of his own. Sertorius seems to have aimed at establishing a strong, stable government in Spain: he created a senate of 300 members from amongst the Romans of his party, and founded a school at Osca (Huesca) for the education of the sons of the Spanish chiefs. But jealousies broke out between the Spaniards and the Romans, and the sternness of Sertorius descended to cruelty and tyranny. But when at the height of his power he was regarded with almost superstitious veneration by the Lusitanians, and the feeling was enhanced by the fact that the great commander was constantly followed about by a tame fawn.

A Sertularia Colony
natural size).

Sertularia, a common genus of Hydroids, in which the branched horny investment of the plant-like colony forms a sessile cup around each polyp. The polyps are arranged in a double row, and the colony is attached to stones, shells, seaweeds, and the like. Among the hydrothecae or cups surrounding the polyps larger pear-shaped capsules or gonothecae occur, within which the reproductive elements are formed from special generative zooids. The Sertularians never liberate medusoid reproductive 'zooids.' See HYDROZOA.

Serum. See BLOOD; and for serum-therapy, the preventive treatment of certain contagious diseases by inoculation with blood-serum (generally of horses that have been infected with the malady in question), see ANTITOXIN, DIPHTHERIA.

Serval (*Felis serval*), Tijger-bosch-kat of the Cape Dutch, widely distributed in Africa, commonest in the south. It frequents thick vegetation

Serval (*Felis serval*).

near water and grassy plains; it hunts small antelopes and other game. The body is about a yard long; the tail only about sixteen inches. The general colour is tawny with black spots. The fur is in request, and known as *Tiger Cat*.

Servant. See MASTER AND SERVANT.

Servetus, MICHAEL, or MIGUEL SERVETO, a theologian and physician, was born at Tudela in Navarre in 1511, though he stated that he was born at Villanova near Lérida, and from about 1535 always styled himself Michael Villanovanus. His father sent him to study law at Saragossa and at Toulouse. His interest in theological discussions was awakened whilst he was yet a student, and having gone to Italy (1530) in the company of

Quintaña, confessor to Charles V., he passed on from there into Germany, and came into contact with Luther, Ecolampadius, Bucer, and others of the Reformers. But his own views, especially in respect of the Trinity—he denied that there are three Persons in the Trinity and refused to acknowledge the eternity of the Son, and in other respects professed tenets similar to those of Socinus (q.v.)—were in discord both with those of the Reformers and the authoritative teaching of the Roman Catholic Church. The essay in which he propounded his speculations—*De Trinitatis Erroribus* (1531)—provoked considerable discussion. In 1536 he began to study medicine at Paris, and after a few years of wandering settled down to practise at Vienne (1541). Four or five years later he began to correspond with Calvin, and in spite of Calvin's openly avowed enmity wished to visit him at Geneva. At length, having secretly reprinted (1553) his collection of theological tracts, he was betrayed, and denounced, it is alleged at the instance of Calvin, to the inquisitor at Lyons. He was arrested, but managed to escape from prison; yet rashly venturing into Geneva he was again arrested, and after a time of more than two months was burned alive (27th October 1553), the day after sentence was pronounced, at Champel near Geneva. As a scientific inquirer he is best known by a popular book on syriacs and by his demonstration of the pulmonary circulation of the blood.

See CALVIN; Tollu, *Charakterbild Michel Servet's* (1876), *Das Lehrgesystem M. Servet's* (3 vols, 1876-78), and other books; Trechsel, *Die protestantischen Antitruinitarianer vor F. Socin* (1839); Panjer, *De M. Serveti Doctrina* (1876); Wilks, *Servetus and Calvin* (1877; to be used with great caution); Osler, *Michael Servetus* (1910).

Servia. See SERBIA.

Service (*Pyrus domestica*, the *Sorbus domestica* of many botanists; see PYRUS), a tree of rarely more than 30 feet in height, with leaves and flowers like the Rowan Tree (q.v.), but the former downy beneath. The chief distinction between the two is in the fruit, which in the service is much larger than in the rowan, and shaped like a small pear. The service has found a place in British floras solely on the strength, it appears, of a single tree having been found in the forest of Wyre near Bewdley, which in all probability had been planted where it stands. On the continent of Europe and in Russian Asia it appears in company with the rowan. It is more cultivated in Italy, Germany, and France than in Britain. The tree is of very slow growth and attains a great age. The timber is valuable, very heavy, fine-grained, and susceptible of a high polish, possessing a strength and durability which particularly adapt it for some purposes of the machine-maker. It is used also for making mathematical rulers, &c. The name Wild Service is given to an allied species, *Pyrus torminalis*, also called the Sorb, a

Service Tree (*Pyrus domestica*),
branch in flower;
a, fruit, showing section.

common native of the middle and south of England and of the middle and south of Europe—a small tree with a spotted fruit considerably larger than that of the common hawthorn, which, like the fruit of the true service, becomes mellowed and pleasant by keeping, and is regularly brought to the market in many parts of Europe. Large quantities are brought to London from Hertfordshire. The dried fruit is used in some places as a cure for diarrhoea. The wood is highly valued. It is hard and tough, yellowish white, with brownish-red and dark-brown streaks.

Service, MUSICAL. The musical arrangements of a full cathedral service in the Church of England are usually as follows: The introductory prayers of morning and evening service, up to the conclusion of the Lord's Prayer, are sung in monotone. The verses and responses before the Psalms, after the Creed and Lord's Prayer, and the Litany are sung to the plain-song adapted to them by Marbeck from the equivalents in the Catholic Directory, with some traditional variations; the responses are, however, usually sung in harmony, either in the festal form by Tallis, with the plain-song mostly in the tenor, or in the everyday or ferial form, in simpler harmony. The remaining prayers are sung in monotone, with plain-song inflections and endings. The *Venite* (Psalm xc.) and Psalms of the day are sung antiphonally to appropriate chants, of which many different collections are in use. Various collections of anthems are also found in different churches. The Canticles (*Te Deum*, &c.) are sung sometimes to chants, but usually to special settings by the various English writers from Tallis downwards; the term 'service' is used as denoting a complete set of music for these parts of the ritual, and is distinguished by the composer's name and the key. An ordinary Morning Service consists of settings of the *Te Deum* and *Jubilate*, or its alternative the *Benedictus*. The *Benedicite* is seldom sung. An Evening Service contains settings of the *Magnificat* and *Nunc Dimittis*, or more rarely of their alternatives the *Canticle Domino* and *Deus Misereatur*. A Communion Service includes choral settings of the *Kyrie Eleison* (the response after each of the Ten Commandments), the Nicene Creed, the *Sanctus* and the *Gloria in Excelsis*, and recent composers add the Doxologies before and after the Gospel, the *Surreau Corda*, the *Agnus Dei*, and the *Benedictus*. The style of music of a service (in the latter restricted meaning) varies very considerably with the different periods to which the composers belong. Among the most eminent of these are Thomas Tallis (c. 1515–85), Orlando Gibbons (1583–1625), John Blow (1648–1708), Henry Purcell (1658–95), William Croft (1677–1727), William Boyce (1710–79), Thomas Attwood (1765–1838), and Samuel Wesley (1766–1837). The style of the last has been largely followed by the innumerable modern writers. The most outstanding are Dykes, Stainer, Sullivan, Parry, Stanford, Davies. See the collections of Boyce, Arnold, Rimbault, and Onseley, containing also biographical notices. There are also what are known as Chant Services, the music of which is a free form of chant, of which the well-known 'Jackson in F' is a hackneyed example. See Stainer's *Cathedral Prayer-book*, and J. S. Bumpps, *History of English Cathedral Music, 1549–1889* (2 vols. 1908).

Servile Wars. See ROME, SPARTACUS.

Servites, the common name for the order of the 'Religious Servants of the Holy Virgin,' founded in 1233 by seven Florentine merchants, who soon removed to Monte Senario, 9 miles from the city. They adopted the rule of St Augustine, with many modifications, receiving papal sanction

in 1255 and definitely in 1304. In 1487 Innocent VIII. bestowed on them all the privileges of the other mendicant orders. The movement spread rapidly to Germany, France, Spain, Poland, and even to Crete and India. Houses were established in England at the end of the 16th century and in America at the beginning of the 20th. They number at present about sixty, mostly in Italy. The habit is black.

Servitude, in Scots law, is a burden affecting land or other heritable subjects, by which the proprietor is either restrained from the full use of his property or is obliged to suffer another to do certain acts upon it, which, were it not for that burden, would be competent solely to the owner (Erskine, *Inst.* II. ix. 1). The term is also used to express the correlative right or privilege of the proprietor of the land or other heritable subject which is benefited. The name is borrowed from Roman law, and most of the rules regulating this class of rights in the countries of western Europe are derived more or less directly from the same source.

In Roman law servitudes are either predial or personal. Predial or real servitudes are those constituted over one subject or tenement in favour of the proprietor of another subject or tenement. It is only as owner of the property that a person enjoys the predial servitudes accessory thereto; and when the property is transferred the servitudes pass along with it. The tenement in respect of which the servitude is enjoyed is called the dominant tenement, and its owner the dominant owner; while the tenement in or over which the right is exercised is called the servient tenement. There is thus always a right on the one side and a corresponding obligation on the other. Personal servitudes, on the other hand, are those constituted over any subject in favour of a person in his own right, and not as owner of another subject. The rights classed under this head in Roman law are the different kinds of usufruct. Real or predial servitudes are divided in Roman law into urban and rural—the former including all servitudes which are for the advantage of a building, the latter all those which are for the advantage of a piece of land, whether situated in town or country. *Urbanum praedium non locus fuit, sed materia* (Dig. 50. 16. 198). Rural servitudes comprise rights of road or way, of drawing water, of pasturage, as well as rights of burning lime on, and taking away sand or gravel from, the ground of the servient subject. Urban servitudes comprehend such rights as easements or stillicide, support, and various rights in respect of light, air, or prospect. Roman law also recognises another division, very useful in practice, of servitudes into two principal classes, which are termed positive and negative. By a positive servitude the dominant owner is entitled to perform some act, affecting the servient tenement, which, but for the servitude, the servient owner could have prohibited; thus, all the rural servitudes above mentioned are positive. By a negative servitude the owner of the servient tenement is prohibited from the exercise of some natural right of property—as where he is prevented from building on his own land to the obstruction of light.

These classifications of servitudes, obtaining in Roman law, have been adopted in Scots law. The only personal servitude recognised in Scotland, however, is usufruct or liferent, which is a right to use and enjoy a thing during life, the substance of it being preserved. In modern Scots law this right has ceased to be regarded as a servitude, and the term 'servitude' is applied only to a burden imposed on a tenement, consisting of lands or other heritable subjects, for the benefit of another tene-

ment. There must be two tenements, and these tenements must be owned by different persons. A positive servitude may be constituted by grant in writing. The written grant, if it is to be effectual against singular successors of the grantor, must either be recorded or be followed by exercise of the right. Positive servitudes may also be constituted by implication, where one property is severed into two or more distinct properties. Thus, where the proprietor of a tenement transfers the ownership of part of it to another, there will pass by implication to the transferee all those rights of servitude over the part remaining in the ownership of the transferor which are necessary to the reasonable enjoyment of the part transferred, and which, prior to the severance, were exercised by the owner of both parts for his own convenience. Further, a positive servitude may be acquired by prescription; that is to say, by the exercise of the right for forty years. Negative servitudes, on the other hand, can be constituted only by express written grant; but, if the servitude granted be one of the known servitudes, it is not necessary that the grant be published in the records.

The benefit of a servitude is confined to the dominant tenement; but the owner of that tenement must exercise his rights *civiliter*—in the way least burdensome to the servient tenement. The servient proprietor must refrain from doing anything to diminish the use or convenience of the servitude; but he is not bound to do anything—e.g. to keep in repair for the use of the dominant proprietor a road or a drain. The dominant proprietor is entitled to access for doing, at his own cost, any work which may be necessary for the proper use or preservation of the servitude. Servitudes may be extinguished by express discharge granted by the dominant proprietor in a holograph or tested writing; by acts of the dominant proprietor inferring an abandonment of the right, or acts of the servient proprietor which are inconsistent with the servitude and are acquiesced in by the dominant proprietor; by the two tenements coming into the ownership of the same person; by nonuser, prolonged for the prescriptive period of forty years; or by force of statute. See EASEMENT.

Servius, a commentator on Virgil and one of the most intelligent of the Latin 'grammatici,' lived at Rome about 400 A.D. But much of what is ordinarily cited as his work is by later hands.

Servius Tullius, the sixth king of Rome (q.v.).

Sesame, an annual herbaceous plant of the genus *Sesamum*, family Pedaliaceae, a family related to Bignoniaceae but characterised by wingless seeds, and placentae with woolly lobes attached to the inner wall of the fruit. The calyx of *Sesamum* is five-parted; the corolla irregular five-parted; the stamens four, two longer than the others, and a rudimentary fifth stamen; the capsule is oblong, almost four-celled, two-valved, many-seeded. *S. indicum* is cultivated in a vast number of varieties, especially in India. *S. radiatum* is grown more in Africa. Sesame is cultivated throughout the East for the sake of the seeds, which yield by expression *gingili-oil*. The oil is used in cookery—as a substitute for butter in the same way as olive-oil—for lighting, for soap-making, and for lubrication. It is inodorous, has a sweet taste, and keeps for years without becoming rancid. In Egypt and Arabia it is preferred to olive-oil. It is used in connection with medicine. Egyptian women consider it the best of cosmetics and the most perfect preservative of the hair. Nine pounds of the seeds yield two quarts of the sweet oil. The sweet oleaginous seeds are used

in some countries, as in Central Africa, for making a kind of hasty-pudding. The oil-cake is a cattle-food, and, mixed with honey and preserved citron, is an oriental luxury. The leaves abound in a gummy substance, which they readily impart to water, making a rich bland mucilage, which is used in the southern parts of the United States (where it is grown a little) as a demulcent drink. Sesame is sometimes called *til-seed*.

Sesamoid Bones are small bones met with in the substance of tendons in the neighbourhood of certain joints. They derive their name from their resemblance to grains of sesame. In the human subject the patella is the best example; and besides it they are commonly met with on the palmar aspect of the joint which unites the metacarpal bone of the thumb with the first phalanx, and in the corresponding position in the great toe, there being two in each position, and their object to increase the leverage of the short flexor muscles of the thumb and great toe. They are much more numerous in the great majority of mammals than in man.

Sesostris, the Greek name of a celebrated Egyptian monarch, whose name has passed into the series of those conquerors who have almost achieved universal empire. According to the Greek legendary history, Sesostris at the head of a large army invaded Libya, Arabia, Asia (penetrating farther east than Darius), Europe, Thrace, and Scythia, leaving a colony at Colchis on his return. In the south he subdued Ethiopia, and, placing a fleet on the Red Sea, conquered the adjacent isles, and extended his dominions to India itself. He brought back with him large numbers of captives, who were employed on public works, the building of temples, and the construction of canals and mounds. Memorials of his reign were left as steles or tablets in the conquered countries; Herodotus saw some in Palestine, which in reality are supposed to have been the tables of Rameses II. There has always existed the greatest divergence of opinion amongst historians as to the identity of Sesostris. Herodotus places his reign long before that of Cheops of the 4th dynasty. Dicaearchus makes him rule 3712 B.C., and is followed by Aristotle and other authors. Bunsen supposes that there were more than one monarch of this name, and that one was a king of the 3rd dynasty, another a king of the 12th dynasty. Lepsius conjectures that his exploits are confused reminiscences of Sethos I. and Rameses II. of the 19th dynasty. Modern scholars now consider that the three kings of the 12th dynasty, who all bore the name Semsut, were confused by the Greeks into one heroic figure.

Sessa Aurunca, a city of Southern Italy, 32 miles N.W. of Naples, and 27 W.N.W. of Caserta, has a fine Romanesque cathedral, and ruins (amphitheatre, a bridge of brickwork with twenty-one arches, &c.) of the ancient *Suessa Auruncorum*. On its hills was grown the famous Falerian wine of the Romans, and it was a place of some importance. The more ancient stronghold of the Anunci probably lay on the summit of the S.W. edge of the extinct crater of Rocca Monfina. Pop. (1921) 21,388.

Sessions. See JUSTICE OF THE PEACE, QUARTER SESSIONS, COURT OF SESSION.

Sestertius, a Roman coin, was the fourth part of the *Denarius* (q.v.), and thus contained at first $2\frac{1}{2}$ asses or *librae*. The symbols for it were indifferently HS or IIS, the former being only a modification of the latter, which expresses two units and S for the additional half unit (*semitis*). In the Latin classics the phrase *sestertius nummus*, or merely *nummus*, is frequently employed to denote this coin. When the denarius was made to contain

16 asses the relation between it and the sestertius was preserved, and the latter from that time contained 4 asses. Till the time of Augustus, when the relation of the denarius to the as was changed, the sestertius was worth fully 2d., but after this about an eighth less. *Sestertium* (before Augustus = £8, 15s. sterling) came to be used as if a nenter singular for 1000 sestercies; but with a numeral adverb attached, as *decies sestertium*, was used to signify 100,000 sestercies. It was the 'money of account' (never a coin) used in the reckoning of large sums. HSX = *decem millia sestertium*; HSXI = *decies sestertium*.

Sestos. See ABYDOS.

Sestri Ponente, a suburb of Genoa, 4½ miles to the west, has shipbuilding-yards, machine-shops, and manufactures of tobacco, leather, &c., and in the neighbourhood alabaster mines; pop. 23,417.

Sethites, or SETHIANS, a division of the Ophites (q.v.), described by Hippolytus, and so called either from the part played by Seth in their cosmogony or from the fact that their doctrines were taught in a book bearing the name of Seth.

Sette Comuni. See VICENZA.

Setter, a breed of dog employed in shooting, where he fills the same vocation as the pointer. The setter is divided into three varieties—the English setter, the Gordon setter, which is native to Scotland, and the Irish setter. There was also at one time a variety known as the Welsh setter, but it is now extinct, and probably never differed widely from the English setter. As early as the 16th century the then Duke of Northumberland owned a dog trained by himself to set game, an idea soon followed by others. For many years, however, the spaniel or any other suitable dog

Setter, 'Heather Grouse.'

was selected to train to the habit of setting game; and it is not until the beginning of the 19th century that any reliable record of a distinct breed of setting dogs can be found. The English setter is bred from the spaniel probably by crossing with the pointer. Though at one time setters were known of nearly all colours, at the present time the English setter is generally white with red markings, or ticked with black spots known as a 'blue Belton.' Edward Laverack of Manchester founded a distinct strain, known as Laverack setters, all bred from one brace of dogs, a strain which has become widely diffused. The Gordon setter was founded by the Duke of Gordon about 1800, by crossing the existing setter with a collie bitch which had been trained to set. The Gordon was originally a black, tan, and white dog, though white has gradually disappeared from the breed. The Gordon setter should now be a rich and glossy black marked with tan on face, chest, and legs. The origin of the Irish setter is unknown,

and it is hard to say where the peculiar blood-red colour was obtained. In conformation the three varieties differ very slightly, though the Irish setter is a lighter and more leggy dog than the others. The setter should be a smart and active dog, not built on too heavy a scale; chest very deep, though not wide; shoulders sloping back; and with good strong legs and feet. Though the setter can endure much more fatigue and hard weather than the pointer, yet he is more headstrong and requires repeated breaking. The Irish setter is the chief sinner in this respect, but is a splendid dog when properly broken. See Colonel J. K. Millner, *The Irish Setter* (1924).

Settle, a little gray town in the West Riding of Yorkshire, on the Ribbles, and at the base of the Castlebergh cliff (300 feet), 43 miles NW. of Leeds. Dr Birkbeck was a native. Pop. 2600.

Settle, ELKANAH, was born at Dunstable, 1st February 1648. He entered Trinity College, Oxford, at eighteen, but soon betook himself to London, to make a living by his pen. In 1666 he made something of a hit by his tragedy of *Cambyses*, and the Earl of Rochester and others, to annoy Dryden, loudly hailed him as the superior genius of the two. Rochester got his next tragedy, *The Empress of Morocco*, played at Whitehall by the lords and ladies of the court, and in this way a great run was secured for it when it came before the public. In the insolence of success the author panted along with it a Preface, in which Dryden was severely assailed. In his great satire, *Absalom and Achitophel*, Dryden scolded him with his scorn, and so gave him immortality, if only as a shrieking ghost. Having no real strength of talent, Settle speedily relapsed into obscurity. By writing as poet for the city verses for pageants and festivities, and producing pieces to be acted in the booths of Bartholomew Fair, the some-time rival of Dryden was fain to eke out a wretched subsistence. In his destitute age he was admitted to the Charterhouse, where in 1723 or 1724 he died, and his works followed, if indeed they did not predecease him.

Settlement, in English law, includes any deed, will, or other instrument by which successive interests are created in the same property, the use or income being given to one person, while the corpus of the property is preserved for his successor. A will is revocable in its nature; a settlement made by deed is irrevocable unless it contain an express power of revocation. See the articles DISPOSITION, ENTAIL, ESTATE, LAND LAWS, HUSBAND AND WIFE; in the last of which the distinction between ante-nuptial and post-nuptial settlements is explained. In Scotland the term settlement includes any general will or disposition to take effect after death. In the United States settlements other than marriage settlements are little in use; and marriage settlements are of less importance, most of the states having long since adopted the principle of the married women's property act. A person is said to have a settlement in a parish when by residence or otherwise he has acquired a claim to be relieved out of the rates if destitute; see POOR LAW.

Settlement, ACT OF. See ELIZABETH (Queen of Bohemia).

Setu'bal (once called by the English ST UBES), a seaport of Portugal, stands on the north side of the Bay of Setu'bal, 17 miles by rail SE. of Lisbon. The harbour is protected by five forts. The town owes its importance chiefly to its trade in wine, sea-salt, and oranges. Fishing is carried on with considerable activity. Setu'bal being the centre of the sardine industry. Setu'bal is the old Roman *Cetobriga*. In 1755 it suffered severely from the earthquake that devastated Lisbon. Pop. 37,000.

Pilgrimages are made to the monastery of Arrabida, with its neighbouring stalactite cave. The poet Bocage (see PORTUGAL) was born at Setúbal.

Seurat, GEORGES (1859-91), French painter, was born at Paris, and studied there at the École des Beaux-Arts under Lehmann. Seurat and Signac are credited with the introduction of Pointillism (q.v.), in which it was sought, by means of Charles Henry's theory of complementary colours, to establish direct relation between the sciences of light and colour, and the empiric laws of painting. Seurat's work is remarkable; it is full of vibrating and shimmering light, but it also possesses a strong decorative effect that is thoroughly individual.

Sevastopol. See SEBASTOPOL.

Seven was frequently used as a mystical and symbolical number in antiquity. The origin is doubtless astronomical, or rather astrological viz. the observation of the seven planets and the phases of the moon, changing every seventh day (see WEEK). As instances of this number in the Old Testament, we find the Creation completed within seven days; every seventh year was sabbatical, and the seven times seventh year ushered in the jubilee year. The three *Regalim*, or pilgrim festivals (Passover, Festival of Weeks, and Tabernacles), lasted seven days; and between the first and second of these Feasts were counted seven weeks. The first day of the seventh month was a 'Holy Convocation.' The Levitical purifications lasted seven days, and the same space of time was allotted to the celebration of weddings and the mourning for the dead. In innumerable instances in the Old Testament and later Jewish writings the number is used as a kind of round number. In the Apocalypse we have the churches, candlesticks, seals, stars, trumpets, spirits all to the number of seven, and the seven horns and seven eyes of the Lamb. The same number appears again either divided into half (3½ years, Rev. xiii. 5, xi. 3, xii. 6, &c.), or multiplied by ten—seventy Israelites go to Egypt, the exile lasts seventy years, there are seventy elders, and at a later period there are supposed to be seventy languages and seventy nations upon earth. To go back to the earlier documents, we find in a similar way the dove sent out the second time seven days after her first mission, Pharaoh's dream shows him twice seven kine, twice seven ears of corn, &c. Among the Greeks the seven was sacred to Apollo and to Dionysus, who, according to Orphic legends, was torn into seven pieces; and it was particularly sacred in Euboea, where the number was found to pervade, as it were, almost every sacred, private, or domestic relation. On the many ancient speculations which connected the number seven with the human body and the phases of its gradual development and formation, its critical periods of sickness—partly still extant as superstitious notions—we cannot here dwell. The Pythagoreans made much of this number, giving it the name of Athene, Hermes, Hephaistos, Heracles, the Virgin unbegotten and unbegotten (i.e. not to be obtained by multiplication), Dionysus, Rex, &c. Many usages show the importance attached to this number in the eyes not only of ancient but even of our own times, and it is hardly necessary to add that the same recurrence is found in the folklore of every race.—The Seven Champions of Christendom are St George for England, St Andrew for Scotland, St Patrick for Ireland, St David for Wales, St Denis for France, St James for Spain, St Anthony for Italy.—The Seven Churches of Rev. i. i-iii. are Ephesus, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia, and Laodicea.—The Seven Principal Virtues are faith, hope, charity, prudence, temperance, chastity, and fortitude.—The Seven Gifts of the Holy

Ghost are wisdom, understanding, counsel, ghostly strength or fortitude, knowledge, godliness, and the fear of the Lord.—For the Seven Free Arts, see ARTS.

Seven Bishops. These were Archbishop Sancroft of Canterbury, and Bishops Ken of Bath and Wells, Lake of Chichester, White of Peterborough, Turner of Ely, Lloyd of St Asaph, and Trelawny of Bristol, who were tried on the charge of publishing a seditious libel, but acquitted (June 30, 1687) amid the greatest popular enthusiasm, the very soldiers cheering even within hearing of the king. Their seditious libel was none other than a petition to James II. against his injunction that the clergy should read his Declaration of Indulgence at divine service, in London on the 20th and 27th of May, in other parts of England on the 3d and 10th of June. The order was obeyed in but four out of the hundred parish churches of London, and by not one in fifty all over England. All became Nonjurors except Lloyd and Trelawny. See Miss Strickland's *Lives of the Seven Bishops* (1866).

Seven Deadly Sins. The early Christian fathers singled out certain sins as being more heinous than others (cf. Acts xv.), and later, under the influence of mediæval monasticism, a definite list of seven (sometimes eight or more) mortal sins was formulated. Gregory the Great arranged them as a climax of evil, thus: *Superbia* (pride), *avaritia* (covetousness), *luxuria* (lust), *invidia* (envy), *gula* (gluttony), *ira* (anger), *acedia* (sloth)—*saligia* being a convenient mnemonic formed from the initial letters. The list, however, was varied by some of the schoolmen. The Deadly Sins had a considerable place in mediæval Christian philosophy, and they made a ready appeal to imaginative poets, as Dunbar and Spenser. See CONFESSION.

Seven Dolours of the Blessed Virgin Mary. FEAST OF, a festival of the Roman Catholic Church, dating from 1423, and since 1725 celebrated on the Friday preceding Palm Sunday. The 'dolours' or sorrows of the Blessed Virgin have long been a favourite theme of Roman Catholic devotion, of which the pathetic hymn *Stabat Mater* (q.v.) is the best known and most popular expression; and the festival of the Seven Dolours is intended to individualise the incidents of her sorrows, and to present them for meditation. The seven incidents referred to under the title of 'dolours' are (1) the prediction of Simeon (Luke ii. 35; of which, indeed, the whole seven are the fulfilment); (2) the flight into Egypt; (3) the loss of the child Jesus in Jerusalem; (4) the sight of Jesus bearing the cross; (5) the sight of Jesus upon the cross; (6) the descent from the cross; (7) the entombment. The festival is now observed as a 'greater double' (see FESTIVALS). A second one, instituted by Pius VII. in 1814, falls on the third Sunday of September.

Sevenoaks, a pleasant town of Kent, on an eminence 22 miles S.E. of London. It has a perpendicular church with some interesting monuments, the Walthamstow Hall (1882) for 100 daughters of missionaries, and a grammar-school founded in 1432 by Lord Mayor Sir W. Senecock, incorporated by Queen Elizabeth, and reconstituted as a first-grade modern school in 1877, at which Grote and Bishops Christopher and Charles Wordsworth were educated. Knole, the magnificent seat of Lord Sackville, is close by. It was mainly built between 1460 and 1608 by Archbishop Bourchier and Thomas Sackville, first Earl of Dorset, and has a park of 1000 acres, 5 miles in circumference. Pop. 9000.

Seven Sleepers, the heroes of a celebrated legend, which is first related in the West by Gregory of Tours (*Passio Septem Dormientium*

apud Ephesum) in the close of the 6th century, but assigned to the 3d century, and to the persecution of the Christians under Decius. The earliest text is of Syrian origin, and probably belongs to the early 6th century. According to the story, during the flight of the Christians from the persecution, seven Christians of Ephesus took refuge in a cave near the city, where they were discovered by their pursuers, who walled up the entrance in order to starve them to death. They fell instead into a pletenatural sleep, in which they lay for nearly 200 years. This is supposed to have taken place in 250 or 251; and it was not till the reign of Theodosius II. (447) that they awoke. They imagined that their sleep had been but of a single night; and one of the seven went secretly into the city to purchase provisions, and he was amazed to see the cross erected on the churches and other buildings. Offering a coin of Decius in a baker's shop he was arrested, his startling story not being believed until he guided the citizens to the cavern where he had left his comrades. The emperor heard from their lips enough to convince him of the life beyond the grave of the dead, whereupon they sank again to sleep till the resurrection. Gregory explains that his story is of Syrian origin—it is widely current in the East, and was adopted by Mohammed (*sic*, xviii.), who even admits their dog Kithur also into Paradise. The Roman Catholic martyrology commemorates them on June 27. The names usually given are Maximianus, Malchus, Martinianus, Dionysius, Joannes, Serapion, and Constantinus. Paulus Diaconus (8th century) locates a similar story in Germany, and Rydberg makes out a good case that the myth is of Teutonic origin intimately connected with the return of the dead Balder and of the other dead men from the lower world, with the idea of resurrection and the regeneration of the world, but possibly enough first Christianised in Syria or Asia Minor. The seven sons of Mimer awakening from their long sleep at the blast of Hemdal's trumpet to take their part in the final struggle of the universe is a close parallel to the seven saints of Ephesus. Both in Germany and Sweden the seven sleepers are connected with the weather—if it rains on their day rain will follow for seven weeks together. They are supposed also to take especial care of sailors. See Koch, *Die Siebenschläferlegende* (Leip. 1882); Huber, *Die Wanderlegende von den Siebenschläfern* (Leip. 1910); and Rydberg, *Teutonic Mythology* (Eng. trans. 1889).

Seventh-day Baptists. See SABBATH.

Seven Wise Masters, the most common title given to a famous mediæval collection of stories, grouped round a central story, the history of which is almost the most important among the problems of historiography. The leading story itself is briefly as follows: A young prince is born in answer to prayer as the only son of the aged king Kûrish, and the astrologers foretell a great danger overhanging his fate at twenty. At seven years he is entrusted to masters, but at thirteen he has not learned anything. The sages then recommend Sindibâd as the best master, but for six and a half more years the young prince studies under him uselessly, and at nineteen and a half he has still learnt nothing. The king again assembles the wise men, and Sindibâd offers to teach the prince everything in six months or forfeit his life. He now shuts himself up with his pupil, who this time succeeds to his master's satisfaction. Before bringing him back Sindibâd consults the stars, and sees that the prince will die if he should speak before seven days. Sindibâd therefore hides himself, and the prince at court is found to be dumb. One

of the king's women now tempts him as the wife of Potiphar did Joseph, and in the fury of disappointed rage accuses him to the king of an attempt on her virtue. The king condemns him to death, whereupon the seven viziers resolve to intercede to stay his execution. The first goes to the king, and by two tales against women obtains the suspension of the execution for that day. Next day the woman by a tale of contrary character obtains a confirmation of the sentence; but a second vizier again procures a suspension by two tales; and so on till the end of the seventh day when the prince is free to speak. He now comes to the king attended by the sages and by Sindibâd, whereupon the woman is duly punished, and the king, after seeing proof of his son's wisdom, gives him his throne and retires into solitude to serve God.

Of variant versions there are two principal groups, the Eastern and the Western, the first including all the texts in Eastern languages, and some more or less free translations from Oriental texts; the other including the *Dolopathos*, the *Historia Septem Sapientum*, the *Erasto*, and many others. The Oriental texts have so many elements in common that they obviously spring from one book as a common basis, of which they are more or less faithful translations, at different epochs and in different literatures. The Western texts, though derivable from the Eastern, show great divergences alike in the fundamental story and in the tales inserted in it. The real cause of this is that in the Western cases oral tradition has transmitted the contents.

The earliest version of a *Book of Sindibâd* is found in Arabian writers of the 10th century. The more important Eastern versions are the following: (1) The *Syrtipus*, a Greek text translated from the Syriac by Michael Andreopoulos during the last years of the 11th century (ed. by Dr A. Eberhard in vol. i. of *Fabulae Romanenses Graece Conscripse* (Leip. 1872). A Syriac text was found by Rodiger, and was edited, with a German translation, by Dr Baethgen (Leip. 1879). (2) The Hebrew version entitled *Parables of Sandubar* (*Mischle Sandubar*), translated from the Arabic, probably in the first half of the 13th century. There is a German translation by Sengelmann (Halle, 1842), a French by Carnoly (Paris, 1849). (3) The *Sindibâd-Nâmeh*, an unedited Persian poem, written in 1375. (4) The eighth night of the *Tûht-nâmeh* of Nachscheli, a Persian poet who died in 1329. Of this there is a German translation by Professor Brockhaus (Leip. 1845). (5) *The Seven Viziers*, an Arabic text, forming part of some reductions of the *Thousand and One Nights*, of uncertain age, but not ancient. (6) An ancient Spanish translation of an Arabic text existing in a 15th-century codex—the version closest to the *Syrtipus*. It was first printed by Comparetti in his *Ricerche intorno al Libro di Sindibâd* (Milan, 1869; Eng. trans. of Comparetti's study and the old Spanish text, Folklore Society issues, 1882).

Western versions exist in the most perplexing variety and number—Latin, French, Italian, Catalan, Spanish, English, German, Dutch, Icelandic, Swedish, Danish, Polish, Russian, Hungarian, and Armenian. The *Dolopathos* is a French metrical version supposed to have been made by Herbert in the reign of Louis IX. from the Latin romance of Jean de Haute-Scille, *Historia de Rege et Septem Sapientibus*. This Latin text (*Johannis de Alta Silva Dolopathos*) was edited by Oesterley (Strasb. 1873) and Hilka (Heid. 1913); other Latin versions varied widely. A French metrical version was printed by Keller (Tüb. 1836); *Li romans de Dolopathos*, by Ch. Brunet and A. de Montaiglon (1856); two prose versions of the *Sept Sages de Rome*, by Gaston Paris (1876). A Scottish metrical version is included in the early 16th-century Asloan MS. (ed. Craigie, 1925). To

the middle of the century belong an English prose version and a second Scottish metrical version (by John Rolland of Dalkeith; ed. Laing, 1837). One English metrical version was printed by Henry Weber (1819), another by T. Wright for the Percy Society (1845). Among Italian versions we have a 13th-century translation from a French prose version, printed by Professor A. d'Ancona (*Il Libro dei Sette Saggi di Roma*, Pisa, 1864); the latest is the 16th-century book, *I Compassionevoli Avvenimenti di Erasto*. German versions begin with the metrical rendering of 1412 by Hans v. Tübel, *Diocletianus Leben*, edited by A. Keller (Quedlinb. 1841). A second and anonymous poetical version is given in Keller's *Alte deutsche Gedichte* (Tub. 1846). The prose *Volksbuch* was first printed in the 15th century, and will be found in Simrock's collection. See Professor Mussafia, *Beiträge zur Literatur der sieben weisen Meister* (Vien. 1868); Dr. Marcus Landau, *Die Quellen des Dekameron* (2d ed. 1884); and W. A. Clouston, *The Book of Sindbad*, from Pers. and Arab. (1884).

Seven Wise Men, the collective designation of a number of Greek sages, whose moral and social experience, according to the ancients, was embodied in certain brief aphorisms. Their names, as usually given, and their characteristic aphorisms are as follows: Solon of Athens—'Nothing in excess'; Thales of Miletus—'Suretyship brings ruin'; Pittacus of Mitylene—'Know thine opportunity'; Bias of Priene in Caria—'Too many workers spoil the work'; Chilon of Sparta—'Know thyself'; Cleobulus, tyrant of Lindus in Rhodes—'Moderation is the chief good'; and Periander, tyrant of Corinth—'Forethought in all things.'

Seven Wonders of the World were in ancient times reckoned to be the Pyramids of Egypt, the Hanging (i.e. terraced) Gardens of Semiramis at Babylon, the Temple of Diana at Ephesus, the Statue of Jupiter at Athens by Phidias, the Mausoleum, the Colossus at Rhodes, and the Pharos of Alexandria. This cycle of seven wonders originated among the Greeks after the time of Alexander the Great, and they were described in a work by Philo of Byzantium, edited by Orelli (1816) and by Hecker (Paris, 1858). See also E. J. Banks, *The Seven Wonders of the Ancient World* (1916).

Seven Years' War, THE, was the third, and by far the longest (1756-63) and most terrible, of the contests for the possession of Silesia (q.v.). During the two former wars the Empress Maria Theresa had been too much engrossed in maintaining her claims to the Austrian dominions to offer any very effective resistance to the aggression of Frederick the Great of Prussia; but after emerging triumphantly from that contest she began to concert measures for the recovery of her lost province. Frederick, however, with his usual astuteness, foresaw her purpose and resolved to anticipate her. Accordingly in August 1756 he made a sudden advance upon Dresden with 60,000 men; and, when the elector refused either to side with him or to promise strict neutrality in the coming struggle, he shut up the Saxon army (17,000 strong) between Pirna and Königstein. An Austrian army, commanded by Marshal Browne, advanced to relieve the Saxons, but was defeated by Frederick at Lobositz (October 1). The Saxons then surrendered (October 14), and were mostly incorporated with the Prussian army, whilst their country was treated by Frederick, in the absence of the elector, who fled to Poland, as a conquered province. This action on the part of Frederick thoroughly roused his enemies, and made them rapidly perfect their alliances, so that, when the second campaign began in the following year, the Prussian king was opposed by 100,000 Russians, more than that number of French troops, and by armies raised by Sweden and the empire. His own armies,

including 40,000 Hanoverians, English, and Hessians, numbered less than 200,000. In April Frederick, leaving a corps of 24,000 under Lehwaldt to oppose the Swedes and Russians, invaded Bohemia and managed to shunt up the Austrian army under Duke Charles of Lorraine in Prague; but Marshal Daun headed another army for the Duke's release, and inflicted a crushing defeat upon Frederick at Kolin (June 18). Meanwhile a large French army under Marshal d'Estrées advanced into Hanover, defeated the incapable Duke of Cumberland at Hastenbeck (July 26), and intimidated him into disbanding, by the Convention of Closter-Seven, the whole of his army excepting the Hanoverians. Another French army under Soubise effected a junction with the Imperialists under the Prince of Hildburghausen in the direction of Saxony; but Frederick turned and smote them at Rossbach, and after half an hour's fighting put them completely to rout. This diversion left the victorious Austrians unopposed, and they soon made themselves masters of Silesia and Breslau. Frederick, however, taught them what stuff he was made of by defeating an Austrian army three times as numerous as his own at Leuthen (December 5), and thereby recovered Silesia. These victories induced the Russians to vacate the province of East Prussia, which they had seized after defeating Lehwaldt at Grossjagersdorf (August 30). The English government, rejecting Cumberland's engagements of Closter-Seven, raised another army in 1758 and put it under the leadership of Duke Ferdinand of Brunswick, who effectually held his own against the French, and even drove them out of Westphalia and beyond the Rhine, defeating them at Krefeld (June 23) and Minden (August 1, 1759). The king of Prussia had in the spring of 1758 pushed into Bohemia, but could make no headway before he was called back northwards to meet the Russians, who had invaded Brandenburg. He defeated them in a desperate battle at Zorndorf (August 25). At this time Frederick's brother, Prince Henry, was being hard pressed in Saxony by Daun with superior forces, and the king, the Russians being in rapid retreat for Poland, sped back to his help. Daun, however, contrived to take Frederick completely by surprise, and gave him a terrible beating at Hochkirch (October 14). Nevertheless, before the end of the year the Prussians were again in possession of Saxony.

The fourth campaign (1759) in the east of Prussia was altogether disastrous to the Prussians. The king was not able to carry out his desire of hindering the conjunction of his enemies, the Russians and Austrians, through the defeat of his general Wedell near Zullichau (July 23). He himself suffered terrible losses against the allied armies at Kunersdorf (August 12). Three months later Daun compelled a Prussian force under General von Finck to capitulate at Maxen in the south of Saxony, and thereafter established himself in that country. With greatly diminished strength, an exhausted treasury, a desolated territory incapable of affording either men or supplies, and gloomy forebodings of the final issue, though with unflinching resolution never to yield, Frederick prepared for the fifth campaign (1760). His army in Prussia, now reduced to 90,000 men, mostly foreigners and raw recruits, was still further diminished by the capture of Fouqué with 8000 men in Silesia, followed by Marshal Loudon's conquest of that province, though by the brilliant victory of Liegnitz (August 15) Frederick successfully prevented the Austrians and Russians from uniting their forces. In spite of this his strength was now becoming ominously insufficient

for the task he had set himself: the Russians and Austrians captured and plundered Berlin (October 9), the Swedes came down from the north, and London closed in upon the king from Silesia. But he fell with incredible fury upon Daun at Torgau (November 3), slew 12,000 of his men and took 8000 more prisoners, and by the retreat of the Austrians was once more left in possession of Saxony. In the following year (1761) the French were again worsted by Duke Ferdinand at Vellinghausen (July 15). In Silesia Frederick as usual attempted, but in vain, to prevent the Austrians from joining the Russians, and only found relief when scarcity of provisions compelled the Russians to retreat to Poland. London, however, captured Schweidnitz, whilst farther north the Russians and Swedes drove the Prussians out of Pomerania. To add to Frederick's difficulties, all subsidies from Britain were stopped by the Earl of Bute after George III.'s death, and Prussia was utterly at the end of her resources of all kinds.

But suddenly the death of the empress Elizabeth (January 5, 1762) freed him from one of the most powerful of his enemies. At the same time the new tsar (Peter III.) induced Sweden to retire from the war. Thereupon Frederick took up the contest with renewed vigour: on July 21 he stormed the Austrian entrenchments at Burkersdorf, and, following up this success, routed Daun at Reichenbach (August 16) and took Schweidnitz (October 9), thus recovering Silesia. Contemporaneously with these events his brother, Prince Henry, by a series of fortunate manœuvres possessed himself of the passes of the Erzgebirge, and overthrew the imperial forces at Freiberg (October 29). In the west the Duke of Brunswick still held his ground gloriously against the French, routing them at Wilhelmsthal (June 24), capturing Cassel, and recovering the whole of Hesse. France now gave up a contest from which she had gathered nothing but military disgrace, and concluded treaties with Britain and Prussia; and towards the end of the year the minor German states also withdrew from the coalition. Maria Theresa was now left alone, and Austria being exhausted as well as Prussia, was compelled, sorely against her will, to conclude the peace of Hubertsburg (February 15, 1763; England made peace with France by the treaty of Paris on the 10th), which finally acknowledged Frederick as the lord of Silesia.

This long and desperate struggle cost Europe a million lives, and prostrated the strength of almost all the powers who had engaged in it. It made no change in the territorial distribution of Europe, but it increased tenfold the moral power of Prussia, and gave its army a prestige which it retained till the battle of Jena. But outside of Europe, in North America and India, it brought about a new epoch. According to Parkman, it crippled the commerce of France and blighted her colonial power; it gave England the mastery of North America and India, and made her the first commercial nation.

See Carlyle's *History of Frederick the Great*; Frederick II., *Histoire de la Guerre de Sept Ans*, and histories by Auchenholz (11th ed. 1879), the officers of the Prussian General Staff (8 vols. 1827-47, and 1901-5), Masłowski (Russian account), Longman (in 'Epochs of History' series), H. Lloyd (1781-90), and R. Waddington (in French; Paris, 1903-4); Corbett, *England in the Seven Years' War* (1907); H. St Paul, *First Two Campaigns of the Seven Years' War* (1914); Charteris, *Duke of Cumberland and the Seven Years' War* (1925); and vol. vi. of *Cambridge Modern History*; also the article FREDERICK II. for America and India, see Parkman, *Montcalm and Wolfe* (1884); Seeley, *The Expansion of England* (1883); and the articles CANADA, CLIVE, HAWKE, INDIA, WOLFE.

Severalty. An estate in severalty is held by one owner without being joined with others having common interests, as opposed to Coparcenary (q.v.), Joint-tenancy, Tenancy in common, Tenancy by entireties, which were the four distinct kinds of co-ownership recognised by the law. After 1925 Joint-tenancy is the only co-ownership recognised as regards real estates. In the Indian legislation of the United States land in severalty is that allotted to individuals which was once held by the tribe. In English law a contract of several persons is joint and not several—i.e. one cannot be sued separately, but they must all be sued together—unless the words 'we jointly and severally promise' are introduced into the contract, promissory note, &c. In Scotland the general rule is the reverse; in a *conjunct* contract each is liable for the whole.

Severn (Lat. *Sabrina*), one of the most important and beautiful and, after the Thames, the largest of the rivers of England, rises, 1500 feet above sea-level, from a chalybeate spring on the eastern side of Plinlimmon, 12 miles west of Llanidloes, in Montgomeryshire, North Wales. Flowing eastward from its source to Llanidloes, to which town it retains its original British name of Hafren, it afterwards flows north-east past Newtown (465 feet) and Welshpool to the eastern boundary of Montgomeryshire, then east-south-east past Shrewsbury and Bridgnorth in Salop, and finally southward through Worcester and Gloucester, in which last it begins to form the estuary that merges in the Bristol Channel (q.v.). Its entire length is 210 miles (though the distance from source to mouth as the crow flies is only 80), and it drains an area of more than 6000 sq. m. The chief affluents of the Severn are the Teme and the Upper and Lower Avon on the east, and the Teme and Wye on the west. A ship canal from Sharpness near Berkeley materially shortens the navigation of its lower course; and from Gloucester up to Stourport the river is canalised. Various canals establish communication between the Severn and the Thames, Trent, Mersey, and the other important rivers of the middle districts of England. In some of the reaches below Gloucester, especially near Newnham, the tide, which flows with great velocity, produces from the peculiar configuration of the estuary a bore (locally termed *hygre*) or wave sometimes 5 or six feet high, which not infrequently overwhelms lighters navigating the river. The railway twice crosses the estuary—near Berkeley by a viaduct (1879), 1194 yards long, and near Chepstow by a tunnel (1873-85), 4½ miles long. Schemes have been discussed for a road and railway bridge and barrage (to utilise the tides) near Chepstow. See TIDES.

Severn. JOSEPH (1793-1879), an artist chiefly known as the faithful friend of Keats (q.v.). From 1861 to 1872 he was British consul at Rome. See Sharp, *The Life, Friendships, and Letters of Joseph Severn* (1892).

Severo, CAPE. See CHELYUSKIN.

Severus, I. SEPTIMIUS, a Roman emperor and a soldier of great vigour and courage, was born of equestrian rank, near Leptis Magna in Africa, 146 A.D. He became prætor at Rome in 178, and was at length appointed to the command of the army in Pannonia and Illyria. After the murder of Pertinax (193) he was proclaimed emperor at Carnuntum, and promptly marched upon Rome, where the puppet Julianus had by purchase obtained the imperial purple. His arrival before Rome was the death-signal for Julianus; and after taking vengeance on the murderers of Pertinax, converting his most formidable rival, Clodius Albinus, into an ally by creating him Cæsar, and distributing an extravagant largess to his soldiers,

he marched against his second rival, Pescennius Niger, and conquered him at Issus (195). A glorious campaign in the East, and the three years' siege and capture of Byzantium, were followed by a desperate struggle with his jealous rival, Clodius Albinus, whom, after an obstinate conflict near Lyons, he conquered (197). After the usual games to the degenerate citizens of Rome and largesses to the troops, Severus returned to Asia, accompanied by his sons Caracalla and Geta, had the most brilliant success in the campaign of 198 against the Parthians, and took and plundered their capital, Ctesiphon. He returned to Rome in 202, and gratified the popular taste by the exhibition of shows of unparalleled magnificence, also distributing another extravagant largess to the citizens and praetorians. A rebellion in Britain drew him thither in 208, and at the head of an immense army he marched, it is said, to the north of the island, encountering enormous hardships. To secure to some extent the natives of South Britain from the incursions of the Meatae and Caledonians, Severus repaired or partially built the wall which is often called after him, and died soon after at Eboracum (York), 4th February 211. Some authorities believe that the wall has as much right to bear his name as that of Hadrian; see *Life* by M. Platnauer (1918); also article *HADRIAN'S WALL*.—For the emperor *ALEXANDER SEVERUS*, see that article; and for *SULPICIUS SEVERUS*, see *SULPICIUS*.

Sévigé, Madame de, the queen of letter-writers, and one of the most charming figures in the literature of France, was born at Paris of an ancient Burgundian family, February 6, 1626. Her maiden name was Marie de Rabutin-Chantal, and she was the second and only surviving child of her parents. Her father's mother had entered a convent under the advice of Saint Francis de Sales, became founder of the Order of the Visitation, and was afterwards canonised. When the child was but one year old her father fell fighting against the English at *Ré*; a few years later her mother followed, leaving her to be brought up at Livry by her maternal uncle, the Abbé de Comblains, the 'Bienbon' of her life-long affection. She received a careful education under Ménage and Chapelain, and learned Latin, Italian, and Spanish. From her childhood she saw clearly the whole comedy of life, and all her days she was 'une grande dévotieuse de livres'—history, Virgil, Plutarch, Tacitus, Nicole, Montaigne, and even Rabelais. At eighteen (August 4, 1644) she married the young and handsome Marquis Henri de Sévigé, the head of an ancient family of Brittany, but unfortunately for her happiness a spendthrift and a libertine. Her daughter Françoise Marguerite was born at Paris, October 10, 1646; her son, Charles, at her famous country-house, the Rochers, in 1648. She loved her husband in spite of his infidelities and indifference; forgave him even his passion for Ninon de Lenclos, who lived to cast for a moment the same evil spell upon her son; and when he was killed in a duel by a rival in a more sordid intrigue (February 5, 1651), mourned him sincerely, yet forgot him so completely that in the long correspondence of later years with her children she does not once mention his name. Madame de Sévigé at the moment of her widowhood was but twenty-five, brilliant in her beauty and fascination; yet without hesitation she embraced that holy vocation of undivided motherhood to which she was to give such complete and exquisite expression. Her handsome figure, splendid complexion, fair, wavy hair, and brilliant eyes are spoken of by all who have described her; but her beauty was more that of expression than of feature, and she herself has

told us that her nose was somewhat square, her blue eyes ill-matched (*bigarrés*). Her portraits are not satisfactory, and do not give the idea of beauty, but doubtless her charm was of that subtle kind that eludes the painter. After about a year's retirement at the Rochers she returned to society, but all the flatteries of the most brilliant court in the world failed to touch her heart. The Prince de Conti, Turenne, Fouquet the *Surintendant* of Finance, Rohan, and her cousin Bussy-Rabutin (1618-93) sighed for her in vain; and, stranger still, in the midst of that age of gilded corruption, her name remains without a stain. She was virtuous by temperament, with warmth only in the intellect, says Bussy in his malicious portrait of her; but the intended sneer recoils upon himself, as if it were no virtue for that warm heart and impulsive temperament to be virtuous! Her heart was entirely occupied by a purer love—an intense devotion to her children, and a warmth of friendship almost beyond example. For no one ever had so many and such devoted friends—no woman ever knew like her how to transform a lover into a friend. La Rochefoucauld said she fully satisfied his ideal of friendship, and Madame de la Fayette said, almost at the close, after forty years of friendship without a cloud, 'Croyez, ma très chère, que vous êtes la personne du monde que j'ai le plus véritablement aimée.' The real secret of this affection was her own goodness, which is reflected on every page of her letters; even the follies of her friends she touches with a light hand; her wit never stings, she has a charitable interpretation for everything. Her sweet and happy temper played lightly even with sorrow and wrong-doing. She was pure in an age when purity was rare, and if she had a single fault it is that she was merely something too lenient in her tolerance. She was a general optimist, not from general indifference, but from love, for her friendships made a real part of her existence. The graphic letters to Pomponne describing the trial of Fouquet prove a noble fidelity of heart that defies misfortune and disgrace. Some of her own letters, discovered among the fallen surintendant's papers and read by the king, caused for a moment much talk and scandal, in allaying which Bussy did his cousin a good service. Yet furtively he had done her a grievous wrong. Having been in difficulties about 1656 he had applied to her for a loan of 10,000 écus (£2400), but, some delay being occasioned by Bienbon's desire to look into the securities, he took offence, found the money from the Marquise de Montglas, and, during the enforced solitude of a short banishment to his country-house for some scandalous impieties, wrote a few satirical sketches of the courtiers for the amusement of this mistress—the *Histoire amoureuse des Gaules*. In this unclean company a cruel and lying description of Madame de Sévigé was inserted, and when the book was printed at Liège (1665), without Bussy's knowledge, she had the mortification to find herself in the months of all the scandal-mongers of the day. Bussy was arrested on the 17th April, imprisoned in the Bastille for thirteen months, and sentenced to banishment from Paris for seventeen years. It needed only to be unfortunate to ensure the sympathy of Madame de Sévigé, and the reconciliation, which was complete by 1668, perhaps left the repentant Bussy, says Mesnard, 'with a more tender and serious feeling than he had ever experienced in his life before.' She herself invented the word *Rabutinage* to express the family ties and the common sympathy which substantially bound the two together.

Meantime her daughter had grown up with a beauty, if not a personal charm, that far surpassed

her mother's, and Madame de Sévigné's heart was filled with joy at the sensation made by 'the prettiest girl in France' on her first appearance at court in the winter of 1662-63. In January 1669 she married François Adhémar, the Comte de Grignan, then Lieutenant-général of Languedoc, but ere the close of the year, of Provence—an office which obliged him at once to leave Paris. He had been twice married already, was thirty-seven, of ancient race, honourable in his life and dignified in manners, but he was overwhelmed in financial difficulties which were yet to cause much trouble to Madame de Sévigné. The great grief of her life was this separation from her much-loved daughter, but it is mainly to it that we owe those letters extending, with intervals of union (longest as well as most frequent between 1677 and 1688) over the twenty-five years until her death.

At fifty her splendid health was first shaken at the Rochers by a violent fit of rheumatism; thereafter till the close her only troubles were her son-in-law's vast expenditure and ever-increasing debts, and one by one the deaths of her dearest friends. Her life wore itself away in a round of duties at Paris, at the Rochers, and in visits to the country-houses of her friends and to her daughter in Provence. Nothing in her was more wonderful than her adaptability of disposition; she is happy alike by the bedside of a sick friend, in her drives with Madame Scarron, soon to be the virtual queen of France, in the society of the court, and alone under the dense leafage of her park at the Rochers. One thing only we would have had otherwise than it is, but it would be a complete anachronism to ask for more sympathy than she has to show for the miserable Breton peasants under the cruel campaign of 1675. Her son Charles had some follies which cost money, before his marriage (1683); but he stands out an attractive figure enough, generous and warm-hearted, content with an unequal half of his mother's heart. Bienbon died in 1683; Bussy and Madame de la Fayette in 1693. Her letters grow sadder as she begins to find herself alone, yet some of the latest stand among the best in literary value. She never grew old, for her heart retained its warmth; yet she lived to see son and grandson married, and after nursing her daughter through a tedious illness was herself attacked by smallpox, and died calmly and without fear, 18th April 1696.

Madame de Sévigné's twenty-five years of letters to her daughter reveal the inner history of the time in wonderful detail, but the most interesting thing in the whole 1600 (one-third letters to her from others) remains herself. She was genuinely religious without superstition, a strong sympathy with Port-Royal manifest throughout; she had read widely and gained much from conversation, and she had lived in the time of Pascal, Molière, Racine, Bossuet, and La Rochefoucauld. Still more, she possessed the great natural gifts of a solid understanding and strong good sense. But it needed the warm touch of affection to make all these qualities live, and to give her letters the freedom, the rapidity, the life of spoken words. Hence her sparkling wit, her swiftly changing emotions, her unstudied yet admirable phrase, clear, firm, and natural, the tenderest sentiments and gayest flights of fancy ever expressed with unfeigned grace and the indefinable charm of style. Her imagination, warmed by sympathy and love, realises the conditions of those to whom she writes, and enables her to enter into the thoughts of others, as well as to reflect as in a mirror the world around herself. Yet over all there is a gravity and reserve characteristic of that stately and ceremonious age. She never once *thous-and-thees* anybody; a certain dignity remains even in the most intimate relations. The perfection of her

letters was from the first moment recognised, and the question has often been asked did that piquant grace of detail, that charming variety in the repetition of the same thoughts, cost her pains? No doubt she knew she wrote well, however little she thought of fame, yet this knowledge did not exclude sincerity, and she must have written fast to have written so much—'Je fais de la prose avec une facilité qui vous tue,' she says.

The earliest of her letters that were published were those to Bussy, printed in his *Mémoires* (1696-97). The first edition of the *Lettres* was printed in 1726 by Bussy's son, the Abbé de Bussy, to whom her granddaughter Pauline (Madame de Simiane) had given transcripts of the originals. A more complete edition, authorised by the family, was the final one of those edited by the Chevalier Marius de Ferra (8 vols. 1767). Further editions were innumerable—three only need be mentioned, those of the Abbé de Vauxcelles (1701), Gonville (1806), and M. de Mommerquén—an abiding monument of patient industry (10 vols. 1818-19). The final edition is, however, that in the 'Grands Écrivains de la France,' begun by M. de Mommerquén, and finished by A. Régner, Paul Mesnard, and E. Sommer (14 vols. 1865-67; vol. i., with Mesnard's life; vols. xiii.-xiv. a *Lexique* by Sommer), especially as supplemented by Ch. Capmas in *Lettres inédites de Madame de Sévigné* (2 vols. 1876). See Waldenauer, *Mémoires touchant la Vie et les Écrits de Madame de Sévigné* (5 vols. 1842-52; vol. vi. by Aubenas, 1865); the Comtesse de Puliga, *Madame de Sévigné, her Correspondents and Contemporaries* (2 vols. 1873); the admirable studies by Miss Thackeray in 'Foreign Classics' (1881) and Gaston Boissier in 'Les Grands Écrivains Français' (1887), as well as those by Combes (1885) and Valléry-Radot (1888); Léon de la Brière's *Madame de Sévigné en Bretagne* (2d ed. 1882); and Saporta's *La Famille de Madame de Sévigné en Provence* (1889). See also Sainte-Beuve's *Portraits de Femmes, Causeries de Lundi* (vol. i.), and *Nouveaux Lundis* (vol. i.); E. Scherer's *Études sur la Litt. Contemp.* (vols. ii. and iii.); Annela Core-Mason's *Women of the French Salons* (1891); Janet Aldrich's *Queens of Letter Writers* (1907); Fagniez's *Mme. de Sévigné* (1910).

Seville (Span. *Sevilla*), one of the most famous of Spanish cities, stands on the left bank of the Guadalquivir, 62 miles N. by E. of Cádiz, and is connected with a large lower class suburb (Triana) on the right bank by an iron bridge (1848). It has had two periods of great splendour in its history, first as the capital of a Mohammedan emirate, and later in the 16th and 17th centuries as the headquarters of Spanish painting and the chief port of Spanish commerce; and it is now rapidly recovering a good deal of its former commercial prosperity as the result of dredging of the Guadalquivir. Seville had long the appearance of a picturesque Moorish town—the streets narrow, tortuous, and shady, the houses built round handsome court-yards and gardens, the squares studded with fountains. But it has been greatly modernised by the clearing away of the narrower quarters to make room for wide straight streets and modern houses and shops, with fine gardens and parks. The climate is delightful, and the city is very gay with its white houses and masses of coloured flowers. Seville is famous for its religious festivals, especially those of Holy Week, and for its annual *Feria* in April—a cattle-market, but also a holiday outing for all ranks and classes. Only a few fragments now remain of the former circular city wall, which was adorned with sixty-six towers. The water-supply was formerly brought from Alcañal de los Panaderos by an old Roman aqueduct of 410 arches, but this was superseded by water-works constructed by Englishmen in 1833. The greatest ornament of the city is the vast cathedral, built in 1401-1519 on the site of a Moorish mosque. Of superb proportions, it is the largest Gothic church in the world, and contains important paintings by Murillo (a native

of Seville), Valdés Leal, De Vargas, and other masters; magnificent Flemish stained glass of the 16th century; one of the largest organs in the world; the tombs of King Ferdinand III. of Castile, of Christopher Columbus and his son Ferdinand, and other notabilities; and much most excellent artistic work in bronze, wood-carving, and sculptured work, besides a valuable treasury. Close beside the cathedral stands the beautiful Campanile (q.v.) or bell-tower called Giralda, 285 feet high, two-thirds of it built by the Moorish Abu Jussuf Jakub in 1196; the upper part, with its beautiful open work, dates from 1568. The Giralda has twenty-two sweet-toned bells, and is surmounted by a bronze statue of Faith, serving as a weather-vane. Both cathedral and tower were damaged by earthquakes in 1884 and 1899. Another of the glories of Seville is the gorgeous Alcázar, or Moorish royal palace, begun in the end of the 12th century, but considerably enlarged and beautified by Peter the Cruel and other Spanish monarchs; its halls and gardens are surpassed only by those of the Alhambra, the Hall of the Ambassadors being especially wonderful for its rich ornamentation and wealth of detail. Amongst the other interesting buildings and public institutions of the city must be mentioned the House of Pilate, built by a Spanish nobleman in 1533 in imitation of the reputed palace of Pilate in Jerusalem; the museum, with masterpieces by Murillo, Zurbarán, Pacheco, Valdés Leal, Herrera, and other artists of the Seville school, but containing nothing by Velázquez (also a native of Seville); the charity hospital, with fine pictures by Murillo and Valdés Leal; the exchange, built by Herrera in 1585, sheltering the valuable archives of the Americas; the university, which was founded in 1254, though the present buildings were erected in 1567; the ornate town-hall (1526-64); the bull ring, which can accommodate 18,000 spectators, being exceeded in size by that of Madrid only; and numerous churches and palaces. Seville is famous also for its association with the play of Beaumarchais, *The Barber of Seville*, with the operas of Mozart and Rossini, and with Bizet's *Carmen*.

There is considerable manufacturing industry, especially in the production of cigars, iron, machinery, pottery, silks, cottons. There is a considerable river trade. The exports consist chiefly of lead, quicksilver, wine, copper, oranges, olives and olive-oil, and corks. Pop. (1878) 133,938; (1910) 155,366; (1920) 205,520. This city was the Roman *Hispalis*, a place of trade in those days. Here two provincial synods of the church were held, in 590 and 619, and a Spanish council in 782. From 712 to 1248 the city (*Ishbīlīa*) was an important Moorish town, usually the seat of an emir, in more or less close dependence on the khalifs of Córdoba. In 1091 the Almoravides dispossessed the Abbadites of the town. When Ferdinand III. of Castile captured it (1248) about 300,000 Moors abandoned the place, and it was a century or two before it began to recover. In 1493 Christopher Columbus was formally received here after his first voyage. Its second period of prosperity gradually closed in as Cádiz rose into importance. Seville was the seat of the Spanish government in 1808-10, and suffered severely from Soult's troops in 1810.—The province has an area of 5428 sq. m. and a pop. of 703,747.

Sèvres, a small town of France, dept. Seine-et-Oise, 10½ miles SW. of Paris by rail, is celebrated for its manufacture of artistic porcelain (see PORTERY), an industry carried on under state control since the establishment of the factory by Boileau in 1756. The Sèvres vases are of great value and are known the world over. Painted glass and mosaic are also made. The factory was moved in 1876

to the present situation in the park of St Cloud, the old building being now occupied by an École Normale Supérieure for girls. The Porcelain Museum in the new building contains a large and curious collection of articles in china and earthenware from all parts of the globe. The abortive Treaty of Sèvres (imposed by that of Lausanne) was signed on 10th August 1920 between Turkey and the Allied Powers, disposing of the former of large parts of its ancient territories. Pop. 11,500.

Sèvres, DEUX-, a dept. in the west of France, part of the old province of Poitou. Area, 2337 sq. m.; pop. (1891) 354,282; (1921) 310,060. It takes its name from two rivers of the same name, the Sèvre-Niortaise, which flows west into the sea, and the Sèvre-Nantaise, an affluent of the Loire. The northern portion is taken up with the woody plateau of Gâtine. In other parts the soil is fertile, yielding large crops of wheat, oats, barley, potatoes, clover, lucerne, and vegetables. The mules and cattle are celebrated. The principal industries are in cloth, leather, linen, spirits, flannel, &c., and there are potteries, and weaving of wool and cotton. The arrondissements are Niort, Bressuire, Melle, and Parthenay. Niort is the capital.

Sewage. See SEWERAGE.

Seward, ANNA, the 'Swan of Lichfield,' was born in 1744 at the rectory of Eyam in Derbyshire, but from the age of ten lived all her days at Lichfield, where her father, himself a poet, became a canon residentiary. Dr Darwin and Mr Day were notable figures in the society of Lichfield; her dearest friend was Honora Sneyd, who married Edgeworth; Dr Johnson, like the prophet of the proverb, had more honour everywhere else than among his own people. Miss Seward only escaped a nearer connection with the lexicographer by the death of her only surviving sister Sarah on the eve of marriage with Lucy Porter's brother. Her own father died in 1790, but she continued to live as before in the bishop's palace, dear to her friends and correspondents—Mrs Piozzi, Hayley, Southey, Scott—and died 23d March 1809. She published her poetical novel, *Louisa*, in 1782; her *Sonnets* in 1799; her *Life of Dr Darwin* in 1804; but bequeathed to [Sir] Walter Scott the care of the collected edition of her poems (3 vols. 1810). Her long-winded, florid letters, on which she piqued herself even more than her poems, were collected in six volumes (1811-13). Boswell received from her 'some obliging communications concerning Johnson,' but after his book was published quarrelled with her, accusing her of malevolence towards his hero. Her monody on Major André and an elegy on Captain Cook were thought her best poems. In the letters she is Johnsonian without strength, metaphorical beyond all measure, feeble and absurd to a degree. Horace Walpole says of her and some other harmonious virgins, 'Their thoughts and phrases are like their gowns—old remnants cut and turned.' See *A Swan and her Friends*, by E. V. Lucas (1907).

Seward, WILLIAM HENRY, an American statesman, was born at Florida, Orange county, New York, 16th May 1801, graduated at Union College in 1820, was admitted to the bar at Utica in 1822, and thenceforth made his home at Auburn. He early took an active interest in politics, and in 1827 presided over a young men's convention held at Utica to advocate the re-election of John Quincy Adams to the presidency. In 1830 he was elected, as an anti-Mason, to the state senate, where he remained four years, leading the opposition to the dominant Democratic party. In 1834 he was the unsuccessful Whig candidate for the governorship of the state of New York, but was elected to that

position in 1838, and again in 1840. A noteworthy incident of his administration was a controversy with the governor of Virginia in regard to three negro seamen, whom the latter claimed as fugitives from justice, on the charge of inciting a slave to escape, and whom Governor Seward refused to surrender. Having declined a third nomination, he was engaged from 1843 to 1849 in the practice of his profession, being especially sought after in criminal and patent cases. In 1847 he defended John van Zandt, accused of aiding in the escape of fugitive slaves, and incurred obloquy by his defence of the negro murderer, Freeman, on the plea of insanity. His argument in this case was pronounced by Gladstone 'the greatest forensic effort in the English language.' Seward continued to give active support to his party, while at the same time making himself remarked as an opponent of the pro-slavery policy. In a speech against the admission of Texas into the Union he said: 'To maintain the slave-holding power is to subvert the constitution;' and at (Cleveland, during the campaign of 1848, he told his hearers, in speaking of slavery: 'It must be abolished, and you and I must do it.' In February 1849 he was elected to the United States senate, where he served two full terms, being re-elected in 1855. He was much consulted by President Taylor, but declined to be put on any important committee lest his opinions on slavery should embarrass the administration. In 1850, while urging the admission of California into the Union, he declared that the national domain was devoted to liberty, not only by the constitution, but by 'a higher law than the constitution'—a phrase which became famous. He opposed the Compromise Bill of 1850; separated himself from those Whigs who followed President Fillmore in his pro-slavery policy; opposed the Know-Nothing (q.v.) party; and on the formation of the Republican party became one of its leaders. His speeches in the senate on the repeal of the Missouri Compromise and the admission of Kansas made a great impression, as did also an address delivered at Rochester in 1858, in which he spoke of the 'irrepressible conflict' between freedom and slavery.

In 1860 Seward was a candidate for the presidential nomination, but on failing to receive it gave his hearty support to Lincoln, whose cabinet he entered as Secretary of State, an office which he held through two administrations, from 1861 to 1869. The civil war, which was in progress during the first half of this period, rendered the foreign relations of the United States unusually delicate, especially in view of the attitude of the governments of France and Britain. In the 'Trent' affair he was obliged, in opposition to popular clamour, to admit the justice of England's claim and to advise the president that the Confederate envoys should be given up. He protested against the fitting out of the *Alabama* and similar vessels in British ports, and declared that the United States would claim from the English government indemnities for damages resulting from this breach of the obligations of a neutral power. On the subject of the French invasion of Mexico he maintained a prudent reserve, until the conclusion of the war enabled him to insist on the withdrawal of the French troops. On April 14, 1865, while confined to his bed with a broken arm and jaw, the results of a carriage accident, he was attacked and severely cut on the face and neck by an accomplice of J. B. Booth. He supported President Johnson's reconstruction policy, thereby placing himself in opposition to the majority of his own party and incurring much bitter censure. In 1867 he negotiated with Russia the treaty for the purchase of Alaska. After leaving office he

travelled in 1869 to California and Alaska, returning through Mexico, where he was warmly welcomed as the guest of the nation; and in 1870-71 he made a tour round the world, his narrative of which was edited and published (1873) after his death by his adopted daughter, Olive Ritsley Seward. He died at Auburn, 10th October 1872. Without being a creative statesman, Seward had great practical ability controlled by sound notions of truth and justice; always a party man, he was never an extreme partisan, and rather made public opinion than followed it. Strong convictions joined to a conciliatory disposition rendered him a fitting representative of the moderate anti-slavery sentiment and a worthy fellow-worker with Lincoln in preserving the Union.

See his Autobiography, continued to 1846 in a memoir by his son (1877), and to 1872 in his *Life and Letters* (2 vols. 1891); *Life* by the same (3 vols. 1896); also C. F. Adams's *Address on his Life, &c.* (1873), the memoir by G. E. Baker, with his *Works* (3 vols. 1853; 2 other vols. 1862-84); the *Life* by F. Bancroft (1900); and by E. E. Hale (1911).
